
BASE, bits [63:12]

Trace Buffer Base pointer address. (TRBBASER_EL1.BASE << 12) is the address of the first byte in the trace buffer. Bits [11:0] of the Base pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBBASER_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log_2(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing TRBBASER_EL1

The PE might ignore a write to TRBBASER_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRBBASER_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b010

TRBIDR_EL1, Trace Buffer ID Register

The TRBIDR_EL1 characteristics are:

Purpose

Describes constraints on using the Trace Buffer Unit to software, including whether the Trace Buffer Unit can be programmed at the current Exception level.

Configuration

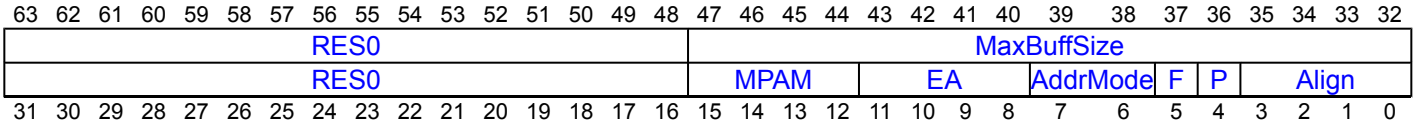
AArch64 System register TRBIDR_EL1 bits [63:0] are architecturally mapped to External register TRBIDR_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBIDR_EL1 are UNDEFINED.

Attributes

TRBIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

MaxBuffSize, bits [47:32]

Maximum supported trace buffer size. Reserved for software use.

The only permitted value is `0x0000`, indicating there is no limit to the maximum buffer size.

Note

Permitted values relate to the values an implementation is permitted to set this field to. A hypervisor might trap accesses to this register and use other values to describe limitations of its virtualization support to a guest operating system, as follows:

- MaxBuffSize bits[8:0] encodes a mantissa value, M.
- MaxBuffSize bits[13:9] encodes an exponent value, E.
- MaxBuffSize bits[15:14] are reserved.

The maximum buffer size, in bytes, is expressed using the following function:

if IsZero(E) then UInt(M:Zeros(12)) else UInt('1':M:Zeros(UInt(E)+11))

For example:

- A value of `0x0001` means a maximum buffer size of 4KB.
- A value of `0x3FFF` means a maximum buffer size of 4092TB.

Reads as `0x0000`.

Access to this field is **RO**.

Bits [31:16]

Reserved, RES0.

MPAM, bits [15:12]

When FEAT_TRBE_EXT is implemented:

MPAM extensions. Indicates Memory Partitioning and Monitoring (MPAM) support in the Trace Buffer Unit when using External mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM	Meaning
0b0000	Trace Buffer External Mode is not implemented or MPAM is not implemented by the PE.
0b0001	MPAM implemented by the Trace Buffer Unit, using default PARTID and PMG values in External mode.
0b0010	Trace Buffer MPAM extensions implemented.

When FEAT_MPAM is not implemented by the PE or FEAT_TRBE_EXT is not implemented by the PE, the only permitted value is 0b0000.

When FEAT_MPAM and FEAT_TRBE_EXT are both implemented by the PE, the value 0b0000 is not permitted.

FEAT_TRBE_MPAM implements the functionality identified by the value 0b0010.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

EA, bits [11:8]

External Abort handling. Describes how the PE manages External aborts on writes made by the Trace Buffer Unit to the trace buffer.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EA	Meaning
0b0000	Not described.
0b0001	The PE ignores External aborts on writes made by the Trace Buffer Unit.
0b0010	An External abort on a write made by the Trace Buffer Unit generates an asynchronous SError exception at the PE.

All other values are reserved.

From Armv9.3, the value 0b0000 is not permitted.

TRBIDR_EL1.EA describes only External aborts generated by the write to memory. External aborts on a translation table walk made by the Trace Buffer Unit generate trace buffer management events reported as MMU faults using TRBSR_ELx.

Access to this field is **RO**.

AddrMode, bits [7:6]

Address Modes. Describes the addressing modes available for the trace buffer.

AddrMode	Meaning
0b00	Virtual and physical address modes are supported.
0b01	Only virtual address mode is supported.
0b10	Reserved for software use under virtualization, to show that only physical address mode is supported.

Other values are reserved.

If the Effective value of TRFCR_EL2.DnVM is 1 and the value returned for TRBIDR_EL1.P is 0, then this field reads as 0b01. Otherwise, this field reads as 0b00.

Note

A hypervisor might trap accesses to this register to describe limitations of its virtualization support to a guest operating system.

F, bit [5]

Flag updates. Describes how address translations performed by the Trace Buffer Unit manage the Access flag and dirty state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F	Meaning
0b0	Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is always disabled for all translation stages.
0b1	Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is controlled in the same way as explicit memory accesses in the trace buffer owning translation regime.

Note

If hardware management of the Access flag is disabled for a stage of translation, an access to a Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor and might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

From Armv9.3, the value 0 is not permitted.

Access to this field is **RO**.

P, bit [4]

Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the trace buffer owning Exception level is a higher Exception level or the trace buffer owning Security state is not the current Security state.

P	Meaning
0b0	Programming is allowed.
0b1	Programming not allowed.

The value read from this field depends on the current Exception level and the Effective values of MDCR_EL3.NSTB, MDCR_EL3.NSTBE, and MDCR_EL2.E2TB:

- If EL3 is implemented, MDCR_EL3.NSTB is 0b0x, and either FEAT_RME is not implemented, or Secure state is implemented and MDCR_EL3.NSTBE is 0, then this field reads as one from:
  - Non-secure EL1 and Non-secure EL2.
  - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
  - If Secure EL2 is implemented and enabled, and MDCR_EL2.E2TB is 0b00, Secure EL1.
- If EL3 is implemented, MDCR_EL3.NSTB is 0b1x and either FEAT_RME is not implemented or MDCR_EL3.NSTBE is 0, then this field reads as one from:
  - If Secure state is implemented, Secure EL1.
  - If Secure EL2 is implemented, Secure EL2.
  - If EL2 is implemented and MDCR_EL2.E2TB is 0b00, Non-secure EL1.
  - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
- If FEAT_RME is implemented, and MDCR_EL3.{NSTB, NSTBE} is {0b1x, 1}, then this field reads as one from:
  - Non-secure EL1 and Non-secure EL2.
  - If Secure state is implemented, Secure EL1 and Secure EL2.
  - If MDCR_EL2.E2TB is 0b00, Realm EL1.
- If EL3 is not implemented, EL2 is implemented, and MDCR_EL2.E2TB is 0b00, then this field reads as one from EL1.

Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to TRBPTR_EL1 and TRBTRG_EL1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Align	Meaning
0b0000	Byte.
0b0001	Halfword.
0b0010	Word.
0b0011	Doubleword.
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

Access to this field is **RO**.

Accessing TRBIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRBIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b111

```
if !IsFeatureImplemented(FEAT_TRBE) then

TRBLIMITR_EL1, Trace Buffer Limit Address Register

The TRBLIMITR_EL1 characteristics are:

Purpose

Defines the top address for the trace buffer, and controls the trace buffer modes and enable.

Configuration

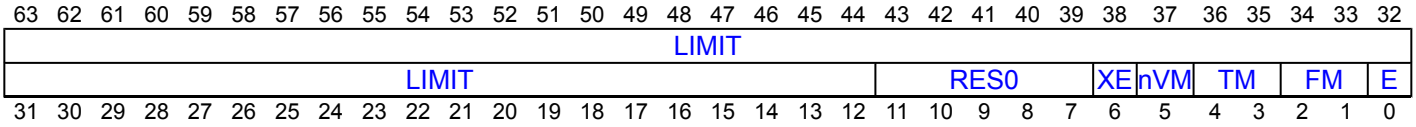
AArch64 System register TRBLIMITR_EL1 bits [63:0] are architecturally mapped to External register TRBLIMITR_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBLIMITR_EL1 are UNDEFINED.

Attributes

TRBLIMITR_EL1 is a 64-bit register.

Field descriptions



LIMIT, bits [63:12]

Trace Buffer Limit pointer address. (TRBLIMITR_EL1.LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBLIMITR_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log_2(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

XE, bit [6]

When FEAT_TRBE_EXT is implemented:

Trace Buffer Unit External mode enable. Used for save/restore of TRBLIMITR_EL1.XE.

XE	Meaning
0b0	Trace Buffer Unit is not enabled by this control.
0b1	If SelfHostedTraceEnabled() is FALSE, the Trace Buffer Unit is enabled.

Software must treat this field as UNK/SBZP when the OS Lock is unlocked.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When !OSLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

nVM, bit [5]

Address mode.

nVM	Meaning
0b0	The trace buffer pointers are virtual addresses.
0b1	The trace buffer pointers are: • Physical address in the owning security state if the owning translation regime has no stage 2 translation. • Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations.

If FEAT_TRBE_EXT is implemented and SelfHostedTraceEnabled() == FALSE, then the PE ignores the value of this field and the trace buffer pointers are always physical addresses.

If FEAT_TRBEv1p1 is implemented, SelfHostedTraceEnabled() == TRUE, and the Effective value of TRFCR_EL2.DnVM is 1, then the PE ignores the value of this field, and the trace buffer pointers are always virtual addresses.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES1** if all the following are true:
  - FEAT_TRBE_EXT is implemented.
  - !SelfHostedTraceEnabled().
- Otherwise, access to this field is **RW**.

TM, bits [4:3]

Trigger mode.

TM	Meaning
0b00	Stop on trigger. Flush then stop collection and raise maintenance interrupt on Trigger Event.
0b01	IRQ on trigger. Continue collection and raise maintenance interrupt on Trigger Event.
0b11	Ignore trigger. Continue collection and do not raise maintenance interrupt on Trigger Event.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

FM, bits [2:1]

Trace buffer mode.

FM	Meaning
0b00	Fill mode. Stop collection and raise maintenance interrupt on current write pointer wrap.
0b01	Wrap mode. Continue collection and raise maintenance interrupt on current write pointer wrap.
0b11	Circular Buffer mode. Continue collection and do not raise maintenance interrupt on current write pointer wrap.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Trace Buffer Unit enable. Controls whether the Trace Buffer Unit is enabled when SelfHostedTraceEnabled() == TRUE.

E	Meaning
0b0	Trace Buffer Unit is not enabled by this control.
0b1	If SelfHostedTraceEnabled() is TRUE, the Trace Buffer Unit is enabled.

If FEAT_TRBE_EXT is implemented and SelfHostedTraceEnabled() == FALSE, then TRBLIMITR_EL1.XE controls whether the Trace Buffer Unit is enabled.

If FEAT_TRBE_EXT is not implemented, then the Trace Buffer Unit is disabled when SelfHostedTraceEnabled() == FALSE.

All output is discarded by the Trace Buffer Unit when the Trace Buffer Unit is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRBLIMITR_EL1

The PE might ignore a write to TRBLIMITR_EL1 if all the following are true:

- TRBLIMITR_EL1.E == 0b1.
- Either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- The write does not set TRBLIMITR_EL1.E to 0.

If FEAT_TRBE_EXT is implemented, the PE might ignore a write to TRBLIMITR_EL1 if all the following are true:

- TRBLIMITR_EL1.XE == 0b1.
- The Trace Buffer Unit is using External mode.
- The write does not set TRBLIMITR_EL1.XE to 0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRBLIMITR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b000

TRBMAR_EL1, Trace Buffer Memory Attribute Register

The TRBMAR_EL1 characteristics are:

Purpose

Controls Trace Buffer Unit accesses to memory.

If the trace buffer pointers specify virtual addresses, the address properties are defined by the translation tables and this register is ignored.

Configuration

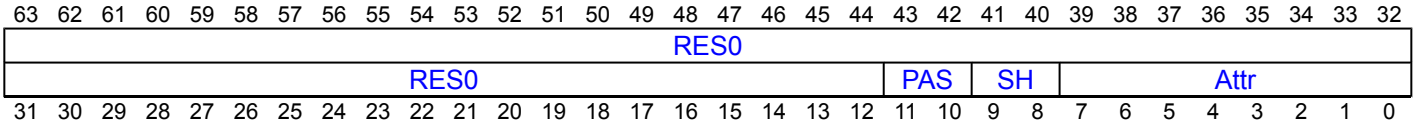
AArch64 System register TRBMAR_EL1 bits [63:0] are architecturally mapped to External register TRBMAR_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBMAR_EL1 are UNDEFINED.

Attributes

TRBMAR_EL1 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

PAS, bits [11:10]

When FEAT_TRBE_EXT is implemented:

Physical address specifier. Defines the PAS attribute for memory addressed by the buffer in External mode.

PAS	Meaning	Applies when
0b00	Secure.	When Secure state is implemented
0b01	Non-secure.	
0b10	Root.	When FEAT_RME is implemented
0b11	Realm.	When FEAT_RME is implemented

All other values are reserved.

If the Trace Buffer Unit is using external mode and either TRBMAR_EL1.PAS is set to a reserved value, or the IMPLEMENTATION DEFINED authentication interface prohibits invasive debug of the Security state corresponding to the physical address space selected by TRBMAR_EL1.PAS, then when the Trace Buffer Unit receives trace data from the trace unit, it does not write the trace data to memory and generates a trace buffer management event. That is, if any of the following apply:

- `ExternalInvasiveDebugEnabled()` == FALSE.
- TRBMAR_EL1.PAS is `0b00`, and either `ExternalSecureInvasiveDebugEnabled()` == FALSE or Secure state is not implemented.
- TRBMAR_EL1.PAS is `0b10`, and either `ExternalRootInvasiveDebugEnabled()` == FALSE or FEAT_RME is not implemented.
- TRBMAR_EL1.PAS is `0b11`, and either `ExternalRealmInvasiveDebugEnabled()` == FALSE or FEAT_RME is not implemented.

This field is ignored by the PE when `SelfHostedTraceEnabled()` == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bits [9:8]

Trace buffer shareability domain. Defines the shareability domain for Normal memory used by the trace buffer.

SH	Meaning
`0b00`	Non-shareable.
`0b10`	Outer Shareable.
`0b11`	Inner Shareable.

All other values are reserved.

This field is ignored when TRBMAR_EL1.Attr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

Attr, bits [7:0]

Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the cacheability attributes, for memory addressed by the trace buffer.

The encoding of this field is the same as that of a MAIR_ELx.Attr<n> field, as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000		If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing TRBMAR_EL1

The PE might ignore a write to TRBMAR_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRBMAR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b100

TRBMPAM_EL1, Trace Buffer MPAM Configuration Register

The TRBMPAM_EL1 characteristics are:

Purpose

Defines the PARTID, PMG, and MPAM_SP values used by the trace buffer unit in external mode.

Configuration

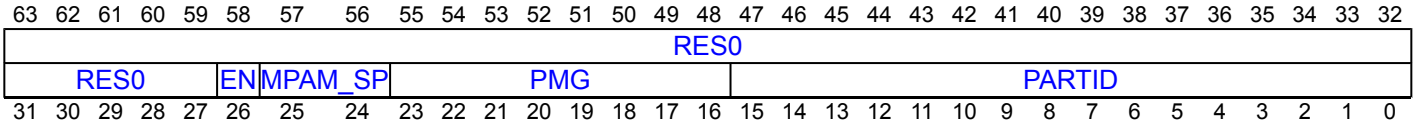
AArch64 System register TRBMPAM_EL1 bits [63:0] are architecturally mapped to External register TRBMPAM_EL1[63:0].

This register is present only when FEAT_TRBE_MPAM is implemented. Otherwise, direct accesses to TRBMPAM_EL1 are UNDEFINED.

Attributes

TRBMPAM_EL1 is a 64-bit register.

Field descriptions



Bits [63:27]

Reserved, RES0.

EN, bit [26]

Enable. Enables use of non-default MPAM values.

EN	Meaning
0b0	Use default MPAM values.
0b1	Use TRBMPAM_EL1.{PARTID, PMG, MPAM_SP}.

This field is ignored by the PE when `SelfHostedTraceEnabled()` == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

MPAM_SP, bits [25:24]

Partition Identifier space. Selects the PARTID space.

MPAM_SP	Meaning	Applies when
0b00	PARTID is in the Secure PARTID space.	When Secure state is implemented
0b01	PARTID is in the Non-secure PARTID space.	
0b10	PARTID is in the Root PARTID space.	When FEAT_RME is implemented
0b11	PARTID is in the Realm PARTID space.	When FEAT_RME is implemented

If the Trace Buffer Unit is using external mode and either TRBMPAM_EL1.MPAM_SP is set to reserved value, or the IMPLEMENTATION DEFINED authentication interface prohibits invasive debug of the Security state corresponding to the Partition Identifier space selected by TRBMPAM_EL1.MPAM_SP, then when the Trace Buffer Unit receives trace data from the trace unit, it does not write the trace data to memory and generates a trace buffer management event.

The interface prohibits invasive debug of the Security state if any of the following apply:

- `ExternalInvasiveDebugEnabled()` == FALSE.
- Secure state is implemented, `ExternalSecureInvasiveDebugEnabled()` == FALSE and TRBMPAM_EL1.MPAM_SP is `0b00`.
- FEAT_RME is implemented, `ExternalRootInvasiveDebugEnabled()` == FALSE, and TRBMPAM_EL1.MPAM_SP is `0b10`.
- FEAT_RME is implemented, `ExternalRealmInvasiveDebugEnabled()` == FALSE, and TRBMPAM_EL1.MPAM_SP is `0b11`.

This field is ignored by the PE when `SelfHostedTraceEnabled()` == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PMG, bits [23:16]

Performance Monitoring Group. Selects the PMG.

Only sufficient low-order bits are required to represent the TRBDEVID1.PMG_MAX. Higher-order bits are RES0.

This field is ignored by the PE when `SelfHostedTraceEnabled()` == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition Identifier. Selects the PARTID.

Only sufficient low-order bits are required to represent the TRBDEVID1.PARTID_MAX. Higher-order bits are RES0.

This field is ignored by the PE when `SelfHostedTraceEnabled()` == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBMPAM_EL1

The PE might ignore a write to TRBMPAM_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == `0b1`, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == `0b1`, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRBMPAM_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b101

TRBPTR_EL1, Trace Buffer Write Pointer Register

The TRBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the trace buffer.

Configuration

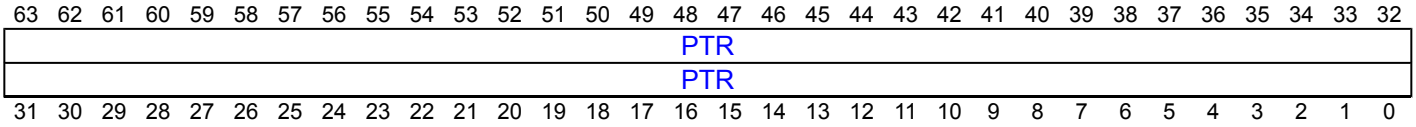
AArch64 System register TRBPTR_EL1 bits [63:0] are architecturally mapped to External register TRBPTR_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBPTR_EL1 are UNDEFINED.

Attributes

TRBPTR_EL1 is a 64-bit register.

Field descriptions



PTR, bits [63:0]

Trace Buffer current write pointer address.

Defines the virtual address of the next entry to be written to the trace buffer.

If TRBIDR_EL1.Align is not zero, then it is IMPLEMENTATION DEFINED whether bits [M-1:0] are RES0 or read/write, where M is an integer between 1 and TRBIDR_EL1.Align inclusive.

The architecture places restrictions on the values that software can write to the pointer. For more information, see 'Restrictions on Programming the Trace Buffer Unit'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBPTR_EL1

The PE might ignore a write to TRBPTR_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == `0b1`, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == `0b1`, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRBPTR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b001

TRBSR_EL1, Trace Buffer Status/syndrome Register (EL1)

The TRBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software for a trace buffer management event.

Configuration

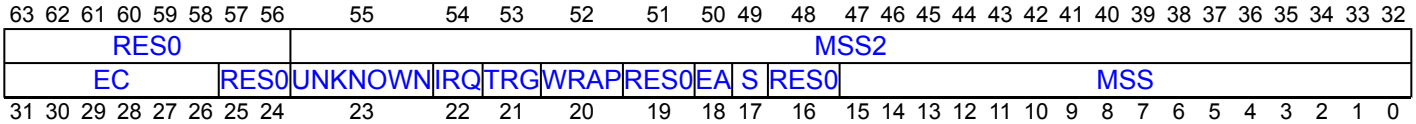
AArch64 System register TRBSR_EL1 bits [63:0] are architecturally mapped to External register TRBSR_EL1[63:0].

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBSR_EL1 are UNDEFINED.

Attributes

TRBSR_EL1 is a 64-bit register.

Field descriptions



Bits [63:56]

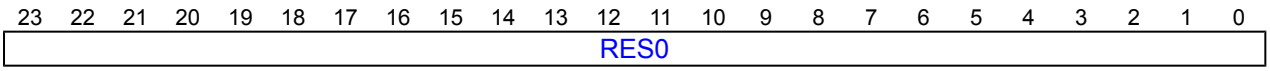
Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

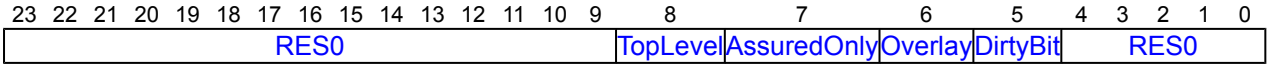
MSS2 encoding for other trace buffer management events



Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer



Bits [23:9]

Reserved, RES0.

TopLevel, bit [8]

When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented, TRBSR_EL1.EC == 0b100101, and GetTRBSR_EL1_FSC() IN {0b0011xx}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]

When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetTRBSR_EL1_FSC() IN {0b0011xx}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]

When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetTRBSR_EL1_FSC() IN {0b0011xx}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

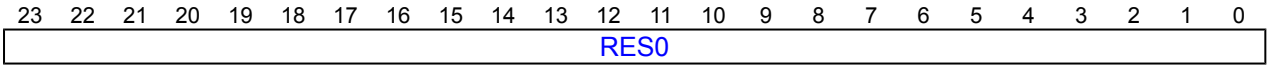
Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

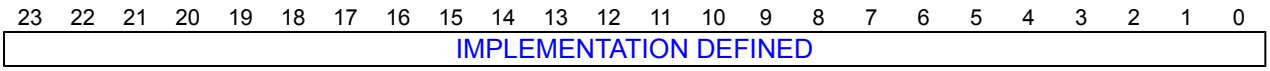
MSS2 encoding for Granule Protection Check faults on write to trace buffer



Bits [23:0]

Reserved, RES0.

MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason



IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the trace buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.	MSS encoding for other trace buffer management events	MSS2 encoding for other trace buffer management events	
0b011110	Granule Protection Check fault on write to trace buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • Synchronous External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to trace buffer	MSS2 encoding for Granule Protection Check faults on write to trace buffer	When FEAT_RME is implemented
0b011111	Trace buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	
0b100101	Stage 2 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:24]

Reserved, RES0.

Bit [23]

When FEAT_TRBE_EXT is implemented:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

IRQ, bit [22]

Maintenance status. Indicates that a trace buffer management event has been recorded.

IRQ	Meaning
0b0	No trace buffer management event for EL1 has been recorded.
0b1	A trace buffer management event for EL1 has been recorded.

When FEAT_TRBE_EXC is implemented, this field indicates a management event for EL1.

If FEAT_TRBE_EXC is implemented and the TRBE Profiling exception for EL1 is enabled, then when this field is 1, a TRBE Profiling exception for EL1 is pending

If FEAT_TRBE_EXC is not implemented or the TRBE Profiling exception for EL1 is disabled, then this field drives the **TRBIRQ** trace buffer interrupt request signal.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

TRG	Meaning
0b0	No Detected Trigger has been observed since this field was last cleared to zero.
0b1	A Detected Trigger has been observed since this field was last cleared to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

WRAP	Meaning
0b0	The current write pointer has not wrapped since this field was last cleared to zero.
0b1	The current write pointer has wrapped since this field was last cleared to zero.

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]

From Armv9.3:

Reserved, RES0.

When the PE sets this bit as the result of an External abort:

External Abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Trace Buffer Unit.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Stopped.

S	Meaning
0b0	Collection has not been stopped.
0b1	Collection is stopped.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

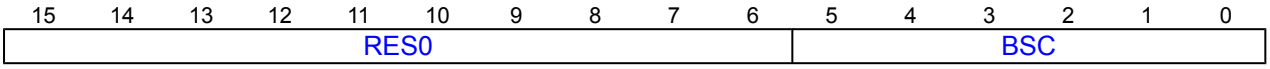
Reserved, RES0.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the trace buffer management event.

The syndrome contents for each trace buffer management event are described in the following sections.

MSS encoding for other trace buffer management events



Bits [15:6]

Reserved, RES0.

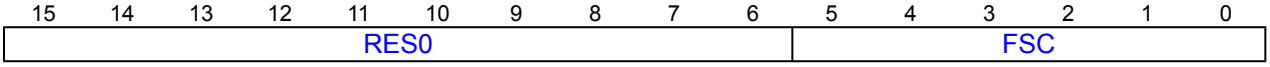
BSC, bits [5:0]

Trace buffer status code

BSC	Meaning	Applies when
0b000000	Collection not stopped, or access not allowed.	
0b000001	Trace buffer filled. Collection stopped because the current write pointer wrapped to the base pointer and the trace buffer mode is Fill mode.	
0b000010	Trigger Event. Collection stopped because of a Trigger Event. See TRBTRG_EL1 for more information.	
0b000011	Manual Stop. Collection stopped because of a Manual Stop event. See TRBCR.ManStop for more information.	When FEAT_TRBE_EXT is implemented
0b000100	Buffer size. The requested trace buffer size was too large.	

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer



Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented

0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to trace buffer

Bits [15:0]

Reserved, RES0.

MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing TRBSR_EL1

The PE might ignore a write to TRBSR_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TRBSR_EL1 or TRBSR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRBSR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b011

TRBSR_EL2, Trace Buffer Syndrome Register (EL2)

The TRBSR_EL2 characteristics are:

Purpose

Provides syndrome information to software for a trace buffer management event.

Configuration

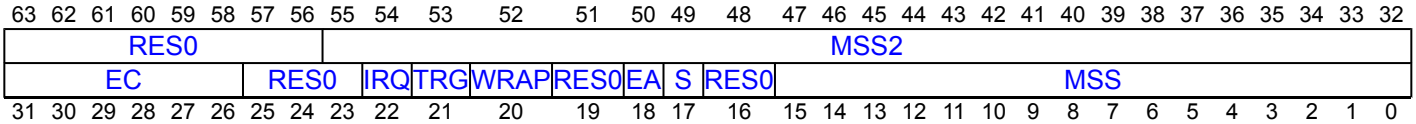
This register is present only when FEAT_TRBE_EXC is implemented. Otherwise, direct accesses to TRBSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TRBSR_EL2 is a 64-bit register.

Field descriptions



Bits [63:56]

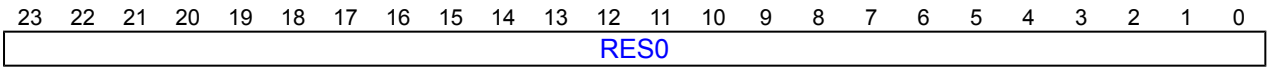
Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

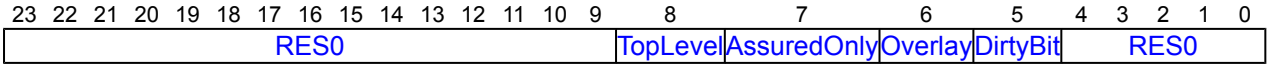
MSS2 encoding for other trace buffer management events



Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer



Bits [23:9]

Reserved, RES0.

TopLevel, bit [8]

When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented, TRBSR_EL2.EC == 0b100101, and GetTRBSR_EL2_FSC() IN {0b0011xx}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]

When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetTRBSR_EL2_FSC() IN {0b0011xx}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]

When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetTRBSR_EL2_FSC() IN {0b0011xx}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

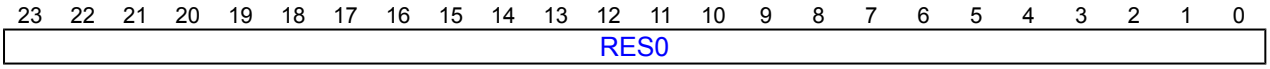
Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

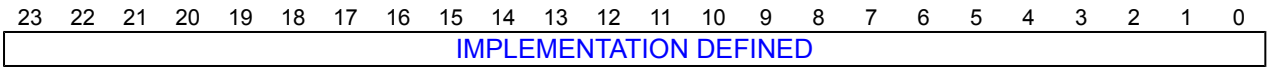
MSS2 encoding for Granule Protection Check faults on write to trace buffer



Bits [23:0]

Reserved, RES0.

MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason



IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the trace buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.	MSS encoding for other trace buffer management events	MSS2 encoding for other trace buffer management events	
0b011110	Granule Protection Check fault on write to trace buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • Synchronous External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to trace buffer	MSS2 encoding for Granule Protection Check faults on write to trace buffer	When FEAT_RME is implemented
0b011111	Trace buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	
0b100101	Stage 2 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:23]

Reserved, RES0.

IRQ, bit [22]

Maintenance status. Indicates that a trace buffer management event has been recorded.

IRQ	Meaning
0b0	No trace buffer management event for EL2 has been recorded.
0b1	A trace buffer management event for EL2 has been recorded.

When FEAT_TRBE_EXC is implemented, this field indicates a management event for EL2.

If the TRBE Profiling exception for EL2 is enabled, then when this field is 1, a TRBE Profiling exception for EL2 is pending

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

TRG	Meaning
0b0	No Detected Trigger has been observed since this field was last cleared to zero.
0b1	A Detected Trigger has been observed since this field was last cleared to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

WRAP	Meaning
0b0	The current write pointer has not wrapped since this field was last cleared to zero.
0b1	The current write pointer has wrapped since this field was last cleared to zero.

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]

From Armv9.3:

Reserved, RES0.

When the PE sets this bit as the result of an External abort:

External Abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Trace Buffer Unit.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Stopped.

S	Meaning
0b0	Collection has not been stopped.
0b1	Collection is stopped.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

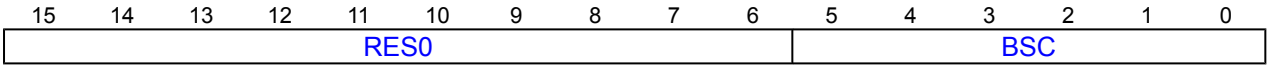
Reserved, RES0.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the trace buffer management event.

The syndrome contents for each trace buffer management event are described in the following sections.

MSS encoding for other trace buffer management events



Bits [15:6]

Reserved, RES0.

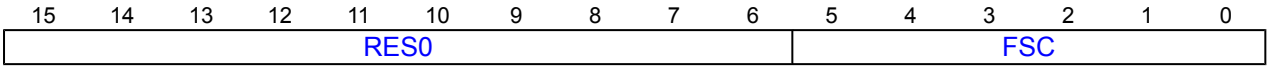
BSC, bits [5:0]

Trace buffer status code

BSC	Meaning	Applies when
0b000000	Collection not stopped, or access not allowed.	
0b000001	Trace buffer filled. Collection stopped because the current write pointer wrapped to the base pointer and the trace buffer mode is Fill mode.	
0b000010	Trigger Event. Collection stopped because of a Trigger Event. See TRBTRG_EL1 for more information.	
0b000011	Manual Stop. Collection stopped because of a Manual Stop event. See TRBCR.ManStop for more information.	When FEAT_TRBE_EXT is implemented
0b000100	Buffer size. The requested trace buffer size was too large.	

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer



Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented

0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to trace buffer

Bits [15:0]

Reserved, RES0.

MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing TRBSR_EL2

The PE might ignore a write to TRBSR_EL2 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TRBSR_EL2 or TRBSR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRBSR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1001	0b1011	0b011

```

TRBSR_EL3, Trace Buffer Syndrome Register (EL3)

The TRBSR_EL3 characteristics are:

Purpose

Provides syndrome information to software for a trace buffer management event.

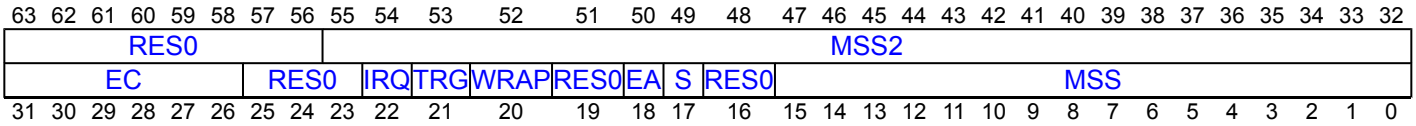
Configuration

This register is present only when FEAT_TRBE_EXC is implemented and EL3 is implemented. Otherwise, direct accesses to TRBSR_EL3 are UNDEFINED.

Attributes

TRBSR_EL3 is a 64-bit register.

Field descriptions



Bits [63:56]

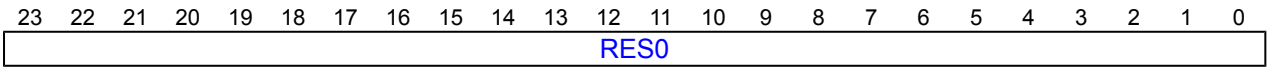
Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

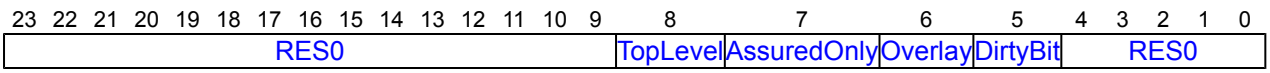
MSS2 encoding for other trace buffer management events



Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer



Bits [23:9]

Reserved, RES0.

TopLevel, bit [8]

When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]

When FEAT_THE is implemented, TRBSR_EL3.EC == 0b100101, and GetTRBSR_EL3_FSC() IN {0b0011xx}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]

When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetTRBSR_EL3_FSC() IN {0b0011xx}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]

When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetTRBSR_EL3_FSC() IN {0b0011xx}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

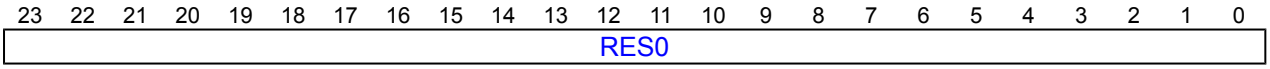
Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

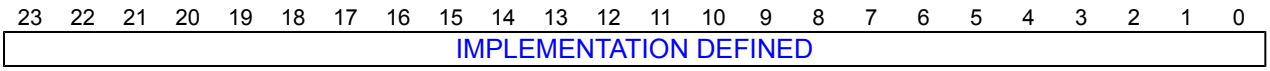
MSS2 encoding for Granule Protection Check faults on write to trace buffer



Bits [23:0]

Reserved, RES0.

MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason



IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the trace buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.	MSS encoding for other trace buffer management events	MSS2 encoding for other trace buffer management events	
0b011110	Granule Protection Check fault on write to trace buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • Synchronous External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to trace buffer	MSS2 encoding for Granule Protection Check faults on write to trace buffer	When FEAT_RME is implemented
0b011111	Trace buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	
0b100101	Stage 2 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:23]

Reserved, RES0.

IRQ, bit [22]

Maintenance status. Indicates that a trace buffer management event has been recorded.

IRQ	Meaning
0b0	No trace buffer management event for EL3 has been recorded.
0b1	A trace buffer management event for EL3 has been recorded.

When FEAT_TRBE_EXC is implemented, this field indicates a management event for EL3.

If the TRBE Profiling exception for EL3 is enabled, then when this field is 1, a TRBE Profiling exception for EL3 is pending

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

TRG	Meaning
0b0	No Detected Trigger has been observed since this field was last cleared to zero.
0b1	A Detected Trigger has been observed since this field was last cleared to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

WRAP	Meaning
0b0	The current write pointer has not wrapped since this field was last cleared to zero.
0b1	The current write pointer has wrapped since this field was last cleared to zero.

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]

From Armv9.3:

Reserved, RES0.

When the PE sets this bit as the result of an External abort:

External Abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Trace Buffer Unit.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Stopped.

S	Meaning
0b0	Collection has not been stopped.
0b1	Collection is stopped.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

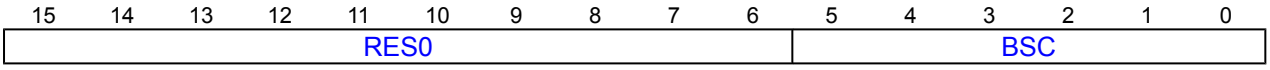
Reserved, RES0.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the trace buffer management event.

The syndrome contents for each trace buffer management event are described in the following sections.

MSS encoding for other trace buffer management events



Bits [15:6]

Reserved, RES0.

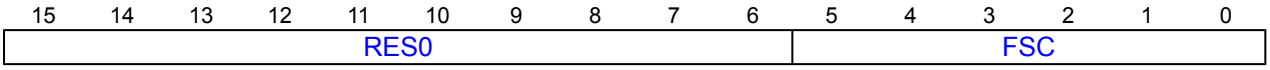
BSC, bits [5:0]

Trace buffer status code

BSC	Meaning	Applies when
0b000000	Collection not stopped, or access not allowed.	
0b000001	Trace buffer filled. Collection stopped because the current write pointer wrapped to the base pointer and the trace buffer mode is Fill mode.	
0b000010	Trigger Event. Collection stopped because of a Trigger Event. See TRBTRG_EL1 for more information.	
0b000011	Manual Stop. Collection stopped because of a Manual Stop event. See TRBCR.ManStop for more information.	When FEAT_TRBE_EXT is implemented
0b000100	Buffer size. The requested trace buffer size was too large.	

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer



Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented

0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to trace buffer

Bits [15:0]

Reserved, RES0.

MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing TRBSR_EL3

The PE might ignore a write to TRBSR_EL3 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRBSR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1001	0b1011	0b011

```

TRBTRG_EL1, Trace Buffer Trigger Counter Register

The TRBTRG_EL1 characteristics are:

Purpose

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

Configuration

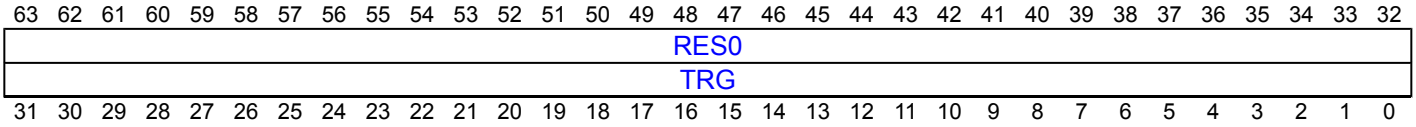
AArch64 System register TRBTRG_EL1 bits [63:0] are architecturally mapped to External register TRBTRG_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBTRG_EL1 are UNDEFINED.

Attributes

TRBTRG_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TRG, bits [31:0]

Trigger count.

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

TRBTRG_EL1 decrements by 1 for every byte of trace written to the trace buffer when all of the following are true:

- TRBTRG_EL1 is nonzero.
- TRBSR_EL1.TRG is 1.

The architecture places restrictions on the values that software can write to the counter.

Note

As a result of the restrictions an implementation might treat some of TRG[M:0] as RES0, where M is defined by TRBIDR_EL1.Align.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBTRG_EL1

The PE might ignore a write to TRBTRG_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBTRG_EL1

TRCACATR<n>, Trace Address Comparator Access Type Register <n>, n = 0 - 15

The TRCACATR<n> characteristics are:

Purpose

Defines the type of access for the corresponding TRCACVR<n> Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

Configuration

AArch64 System register TRCACATR<n> bits [63:0] are architecturally mapped to External register TRCACATR<n>[63:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMACPAIRS) * 2 > n. Otherwise, direct accesses to TRCACATR<n> are UNDEFINED.

Attributes

TRCACATR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45
RES0													EXLEVEL_RL_EL2	EXLEVEL_RL_EL1	EXLEVEL_RL_EL0	RES0	EXLEVEL_NS_EL2	EXLEVEL_NS_EL
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13

Bits [63:19]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [18]

When FEAT_RME is implemented:

Realm EL2 address comparison control. Controls whether a comparison can occur at EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator performs comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator does not perform comparisons in Realm EL2.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator does not perform comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator performs comparisons in Realm EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [17]

When FEAT_RME is implemented:

Realm EL1 address comparison control. Controls whether a comparison can occur at EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator performs comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator does not perform comparisons in Realm EL1.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator does not perform comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator performs comparisons in Realm EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [16]

When FEAT_RME is implemented:

Realm EL0 address comparison control. Controls whether a comparison can occur at EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator performs comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator does not perform comparisons in Realm EL0.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator does not perform comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator performs comparisons in Realm EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [14]

When Non-secure EL2 is implemented:

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL2.
0b1	The Address Comparator does not perform comparisons in Non-secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [13]

When Non-secure EL1 is implemented:

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL1.
0b1	The Address Comparator does not perform comparisons in Non-secure EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]

When Non-secure EL0 is implemented:

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

EXLEVEL_NS_EL0	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL0.
0b1	The Address Comparator does not perform comparisons in Non-secure EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [11]

When EL3 is implemented:

EL3 address comparison control. Controls whether a comparison can occur at EL3.

EXLEVEL_S_EL3	Meaning
0b0	The Address Comparator performs comparisons at EL3.
0b1	The Address Comparator does not perform comparisons at EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [10]
When Secure EL2 is implemented:

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The Address Comparator performs comparisons in Secure EL2.
0b1	The Address Comparator does not perform comparisons in Secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]
When Secure EL1 is implemented:

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The Address Comparator performs comparisons in Secure EL1.
0b1	The Address Comparator does not perform comparisons in Secure EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [8]
When Secure EL0 is implemented:

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

EXLEVEL_S_EL0	Meaning
0b0	The Address Comparator performs comparisons in Secure EL0.
0b1	The Address Comparator does not perform comparisons in Secure EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]

When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:

CONTEXT	Meaning	Applies when
0b000	Comparator 0.	
0b001	Comparator 1.	When UInt(TRCIDR4.NUMCIDC) > 1 or UInt(TRCIDR4.NUMVMIDC) > 1
0b010	Comparator 2.	When UInt(TRCIDR4.NUMCIDC) > 2 or UInt(TRCIDR4.NUMVMIDC) > 2
0b011	Comparator 3.	When UInt(TRCIDR4.NUMCIDC) > 3 or UInt(TRCIDR4.NUMVMIDC) > 3
0b100	Comparator 4.	When UInt(TRCIDR4.NUMCIDC) > 4 or UInt(TRCIDR4.NUMVMIDC) > 4
0b101	Comparator 5.	When UInt(TRCIDR4.NUMCIDC) > 5 or UInt(TRCIDR4.NUMVMIDC) > 5
0b110	Comparator 6.	When UInt(TRCIDR4.NUMCIDC) > 6 or UInt(TRCIDR4.NUMVMIDC) > 6
0b111	Comparator 7.	When UInt(TRCIDR4.NUMCIDC) > 7 or UInt(TRCIDR4.NUMVMIDC) > 7

The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CONTEXTTYPE, bits [3:2]

When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons.

CONTEXTTYPE	Meaning	Applies when
0b00	The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.	
0b01	The Address Comparator is dependent on the Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMCIDC != 0b0000
0b10	The Address Comparator is dependent on the Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Virtual Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMVMIDC != 0b0000
0b11	The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if the Context Identifier Comparator, the Virtual Context Identifier Comparator, and address comparison all match.	When TRCIDR4.NUMCIDC != 0b0000 and TRCIDR4.NUMVMIDC != 0b0000

If TRCIDR4.NUMCIDC == 0b0000, then bit [2] is RES0.

If TRCIDR4.NUMVMIDC == 0b0000, then bit [3] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing TRCACATR<n>

Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[n/2] == 1.
- TRCRSCTLR<a>.GROUP == 0b0100 and TRCRSCTLR<a>.SAC[n] == 1.
- TRCRSCTLR<a>.GROUP == 0b0101 and TRCRSCTLR<a>.ARC[n/2] == 1.
- TRCVIIECTLR.EXCLUDE[n/2] == 1.
- TRCVIIECTLR.INCLUDE[n/2] == 1.
- TRCVISSCTLR.START[n] == 1.
- TRCVISSCTLR.STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- TRCQCTLR.RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

TRCACVR<n>, Trace Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

Purpose

Contains the address value.

Configuration

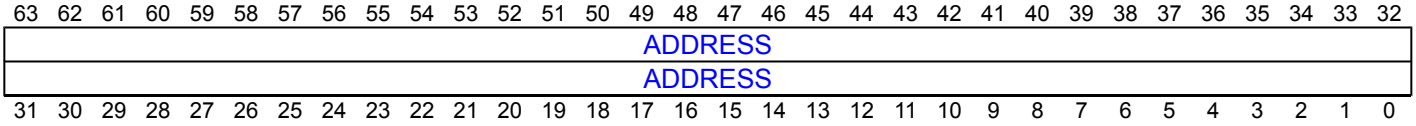
AArch64 System register TRCACVR<n> bits [63:0] are architecturally mapped to External register TRCACVR<n>[63:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMACPAIRS) * 2 > n. Otherwise, direct accesses to TRCACVR<n> are UNDEFINED.

Attributes

TRCACVR<n> is a 64-bit register.

Field descriptions



ADDRESS, bits [63:0]

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in TRCACVR<n>.ADDRESS. This requires that the trace analyzer always programs all implemented bits of TRCACVR<n>.ADDRESS.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as:

- 56, when FEAT_LVA3 is implemented.
- 52, when FEAT_LVA is implemented.
- 48, otherwise.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCACVR<n>

Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[n/2] == 1.
- TRCRSCTLR<a>.GROUP == 0b0100 and TRCRSCTLR<a>.SAC[n] == 1.
- TRCRSCTLR<a>.GROUP == 0b0101 and TRCRSCTLR<a>.ARC[n/2] == 1.
- TRCVIIECTLR.EXCLUDE[n/2] == 1.

- TRCVIIECTLR.INCLUDE[n/2] == 1.
- TRCVISSCTLR.START[n] == 1.
- TRCVISSCTLR.STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- TRCQCTLR.RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCACVR<m> ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0010	m[2:0]:0b0	0b00:m[3]

```

TRCAUTHSTATUS, Trace Authentication Status Register

The TRCAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configuration

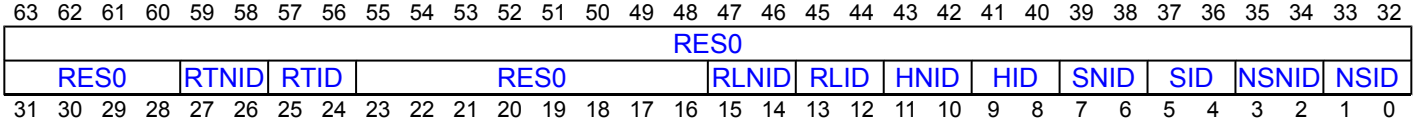
AArch64 System register TRCAUTHSTATUS bits [31:0] are architecturally mapped to External register TRCAUTHSTATUS[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are UNDEFINED.

Attributes

TRCAUTHSTATUS is a 64-bit register.

Field descriptions



Bits [63:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.

HNID, bits [11:10]

Hyp Non-invasive Debug. Indicates whether a separate enable control for EL2 non-invasive debug features is implemented and enabled.

HNID	Meaning
0b00	Separate Hyp non-invasive debug enable not implemented, or EL2 non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

HID, bits [9:8]

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.

HID	Meaning
0b00	Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

SNID, bits [7:6]

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

SNID	Meaning
0b00	Secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When Secure state is implemented, this field reads as 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When Secure state is not implemented, this field reads as 0b00.

SID, bits [5:4]

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

SID	Meaning
0b00	Secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

NSNID, bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

NSNID	Meaning
0b00	Non-secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When Non-secure state is implemented, this field reads as 0b11.

When Non-secure state is not implemented, this field reads as 0b00.

NSID, bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

NSID	Meaning
0b00	Non-secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

Accessing TRCAUTHSTATUS

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCAUTHSTATUS
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0111	0b1110	0b110

```

TRCAUXCTLR, Trace Auxiliary Control Register

The TRCAUXCTLR characteristics are:

Purpose

The function of this register is IMPLEMENTATION DEFINED.

Configuration

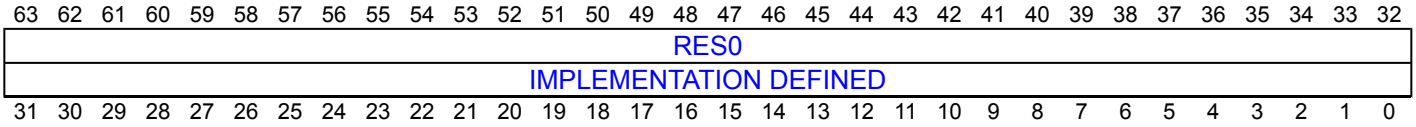
AArch64 System register TRCAUXCTLR bits [31:0] are architecturally mapped to External register TRCAUXCTLR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCAUXCTLR are UNDEFINED.

Attributes

TRCAUXCTLR is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '00000000000000000000000000000000'.

Accessing TRCAUXCTLR

If this register is nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCAUXCTLR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0110	0b000

TRCBBCTLR, Trace Branch Broadcast Control Register

The TRCBBCTLR characteristics are:

Purpose

Controls the regions in the memory map where branch broadcasting is active.

Configuration

AArch64 System register TRCBBCTLR bits [31:0] are architecturally mapped to External register TRCBBCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, TRCIDR0.TRCBB == 1, and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCBBCTLR are UNDEFINED.

Attributes

TRCBBCTLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33
RES0

RES0																								MODE	RANGE[7]	RANGE[6]	RANGE[5]	RANGE[4]	RANGE[3]	RANGE[2]	RANGE[1]	RANGE[0]

Bits [63:9]

Reserved, RES0.

MODE, bit [8]

Mode.

MODE	Meaning
0b0	Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then branch broadcasting is active for all instructions.
0b1	Include Mode. Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Selects whether Address Range Comparator <m> is used with branch broadcasting.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected.
0b1	The address range that Address Range Comparator <m> defines, is selected.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Accessing TRCBBCTLR

Must be programmed if TRCCONFIGR.BB == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCBBCTLR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1111	0b000

```

TRCCCCTLR, Trace Cycle Count Control Register

The TRCCCCTLR characteristics are:

Purpose

Set the threshold value for cycle counting.

Configuration

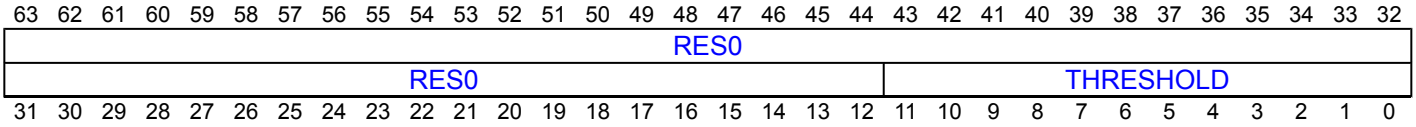
AArch64 System register TRCCCCTLR bits [31:0] are architecturally mapped to External register TRCCCCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR0.TRCCCI == 1. Otherwise, direct accesses to TRCCCCTLR are UNDEFINED.

Attributes

TRCCCCTLR is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

THRESHOLD, bits [11:0]

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in TRCIDR3.CCITMIN. If the THRESHOLD value is smaller than the value in TRCIDR3.CCITMIN then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when TRCCONFIGR.CCI enables instruction trace cycle counting results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCCCTLR

Must be programmed if TRCCONFIGR.CCI == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCCCCTLR
```

op0	op1	CRn	CRm	op2

0b10	0b001	0b0000	0b1110	0b000

TRCCIDCCTLR0, Trace Context Identifier Comparator Control Register 0

The TRCCIDCCTLR0 characteristics are:

Purpose

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 0 to 3.

Configuration

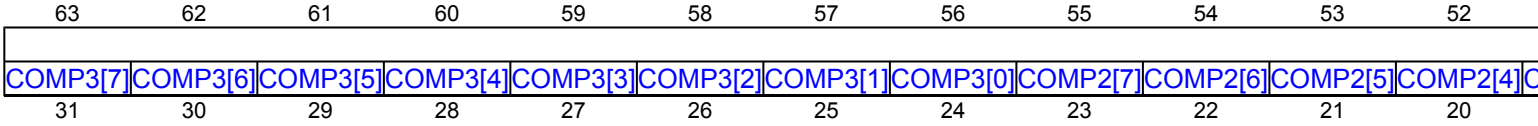
AArch64 System register TRCCIDCCTLR0 bits [31:0] are architecturally mapped to External register TRCCIDCCTLR0[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, UInt(TRCIDR4.NUMCIDC) > 0x0, and UInt(TRCIDR2.CIDSIZE) > 0. Otherwise, direct accesses to TRCCIDCCTLR0 are UNDEFINED.

Attributes

TRCCIDCCTLR0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

COMP3[<m>], bit [m+24], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 3:

TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 2:

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR0

If software uses the TRCCIDCVR<n> registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCCIDCVR<n> to `0x00`.

If any bit is 1 and the relevant byte in TRCCIDCVR<n> is not `0x00`, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCCIDCCTLR0
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	0b0000	0b010

TRCCIDCCTLR1, Trace Context Identifier Comparator Control Register 1

The TRCCIDCCTLR1 characteristics are:

Purpose

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 4 to 7.

Configuration

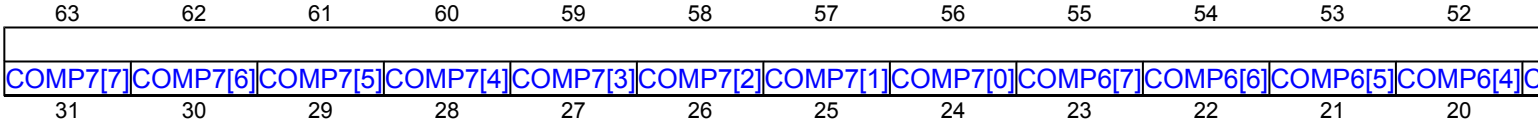
AArch64 System register TRCCIDCCTLR1 bits [31:0] are architecturally mapped to External register TRCCIDCCTLR1[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, UInt(TRCIDR4.NUMCIDC) > 0x4, and UInt(TRCIDR2.CIDSIZE) > 0. Otherwise, direct accesses to TRCCIDCCTLR1 are UNDEFINED.

Attributes

TRCCIDCCTLR1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

COMP7[<m>], bit [m+24], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 7:

TRCCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR7. Each bit in this field corresponds to a byte in TRCCIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 6:

TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 5:

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0

When UInt(TRCIDR4.NUMCIDC) > 4:

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR1

If software uses the TRCCIDCVR<n> registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCCIDCVR<n> to `0x00`.

If any bit is 1 and the relevant byte in TRCCIDCVR<n> is not `0x00`, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCCIDCCTLR1
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	0b0001	0b010

```

TRCCIDCVR<n>, Trace Context Identifier Comparator Value Registers <n>, n = 0 - 7

The TRCCIDCVR<n> characteristics are:

Purpose

Contains a Context identifier value.

Configuration

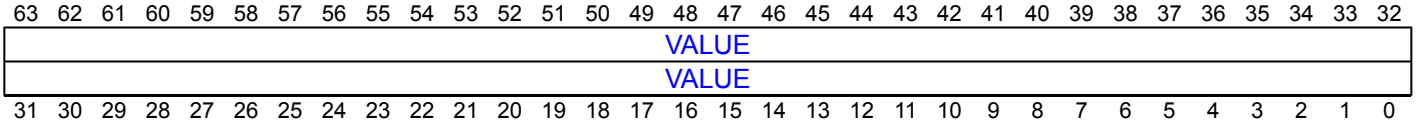
AArch64 System register TRCCIDCVR<n> bits [63:0] are architecturally mapped to External register TRCCIDCVR<n>[63:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMCIDC) > n. Otherwise, direct accesses to TRCCIDCVR<n> are UNDEFINED.

Attributes

TRCCIDCVR<n> is a 64-bit register.

Field descriptions



VALUE, bits [63:0]

Context identifier value. The width of this field is indicated by TRCIDR2.CIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCIDCVR<n>

Must be programmed if any of the following are true:

- TRCRSCTLR<a>.GROUP == 0b0110 and TRCRSCTLR<a>.CID[n] == 1.
- TRCACATR<a>.CONTEXTTYPE == 0b01 or 0b11 and TRCACATR<a>.CONTEXT == n.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCCIDCVR<m> ; Where m = 0-7
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	m[2:0]:0b0	0b000

```
integer m = UInt(CRm<3:1>);

TRCCLAIMCLR, Trace Claim Tag Clear Register

The TRCCLAIMCLR characteristics are:

Purpose

In conjunction with TRCCLAIMSET, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCCLAIMCLR bits [63:0] are architecturally mapped to AArch64 System register TRCCLAIMSET[63:0].

AArch64 System register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register TRCCLAIMCLR[31:0].

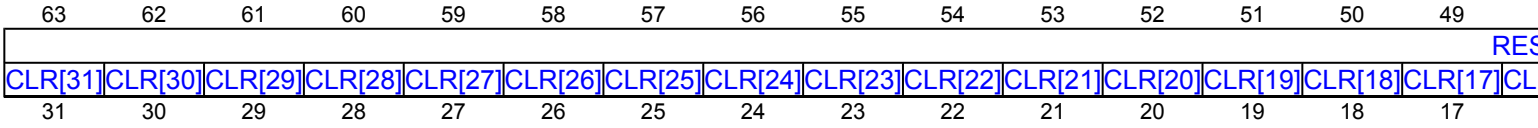
AArch64 System register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register TRCCLAIMSET[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCCLAIMCLR are UNDEFINED.

Attributes

TRCCLAIMCLR is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

CLR[<m>], bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLR[<m>]	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in TRCCLAIMSET.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0'.

Accessing this field has the following behavior:

- When m >= NUM_TRC_CLAIM_TAGS, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1C**.

Accessing TRCCLAIMCLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCCLAIMCLR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0111	0b1001	0b110

TRCCLAIMSET, Trace Claim Tag Set Register

The TRCCLAIMSET characteristics are:

Purpose

In conjunction with TRCCLAIMCLR, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCCLAIMSET bits [63:0] are architecturally mapped to AArch64 System register TRCCLAIMCLR[63:0].

AArch64 System register TRCCLAIMSET bits [31:0] are architecturally mapped to External register TRCCLAIMSET[31:0].

AArch64 System register TRCCLAIMSET bits [31:0] are architecturally mapped to External register TRCCLAIMCLR[31:0].

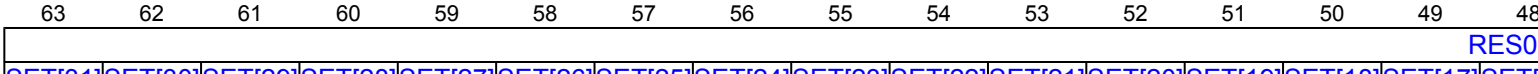
This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCCLAIMSET are UNDEFINED.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as `0b1111`.

Attributes

TRCCLAIMSET is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

SET[<m>], bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

SET[<m>]	Meaning
`0b0`	On a read: Claim Tag bit <m> is not implemented. On a write: Ignored.
`0b1`	On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1.

Accessing this field has the following behavior:

- When m >= NUM_TRC_CLAIM_TAGS, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RAO/W1S**.

Accessing TRCCLAIMSET

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCCLAIMSET
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0111	0b1000	0b110

```

TRCCNTCTLR<n>, Trace Counter Control Register <n>, n = 0 - 3

The TRCCNTCTLR<n> characteristics are:

Purpose

Controls the operation of Counter <n>.

Configuration

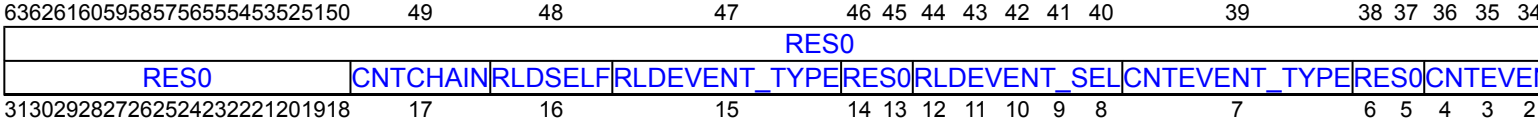
AArch64 System register TRCCNTCTLR<n> bits [31:0] are architecturally mapped to External register TRCCNTCTLR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTCTLR<n> are UNDEFINED.

Attributes

TRCCNTCTLR<n> is a 64-bit register.

Field descriptions



Bits [63:18]

Reserved, RES0.

CNTCHAIN, bit [17]

When n is odd:

For TRCCNTCTLR3 and TRCCNTCTLR1, this field controls whether the Counter decrements when a reload event occurs for Counter <n-1>.

CNTCHAIN	Meaning
0b0	The Counter does not decrement when a reload event for Counter <n-1> occurs.
0b1	Counter <n> decrements when a reload event for Counter <n-1> occurs. This concatenates Counter <n> and Counter <n-1>, to provide a larger count value.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLDSELF, bit [16]

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.

RLDSELF	Meaning
0b0	Normal mode. The Counter is in Normal mode.
0b1	Self-reload mode. The Counter is in Self-reload mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDEVENT_TYPE, bit [15]

Selects an event, that when it occurs causes a reload event for Counter <n>

Chooses the type of Resource Selector.

RLDEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.RLDEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

RLDEVENT_SEL, bits [12:8]

Selects an event, that when it occurs causes a reload event for Counter <n>

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.TYPE controls whether TRCCNTCTLR<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

CNTEVENT_TYPE, bit [7]

Selects an event, that when it occurs causes Counter <n> to decrement.

Chooses the type of Resource Selector.

CNTEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.CNTEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

CNTEVENT_SEL, bits [4:0]

Selects an event, that when it occurs causes Counter <n> to decrement.

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.TYPE controls whether TRCCNTCTLR<n>.CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTCTLR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCCNTCTLR<m> ; Where m = 0-3
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b01:m[1:0]	0b101

TRCCNTRLDVR<n>, Trace Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

Purpose

This sets or returns the reload count value for Counter <n>.

Configuration

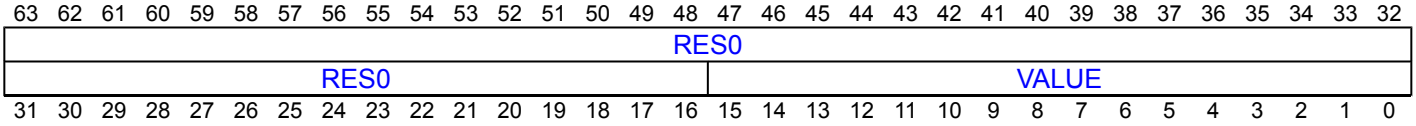
AArch64 System register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to External register TRCCNTRLDVR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTRLDVR<n> are UNDEFINED.

Attributes

TRCCNTRLDVR<n> is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTRLDVR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

TRCCNTVR<n>, Trace Counter Value Register <n>, n = 0 - 3

The TRCCNTVR<n> characteristics are:

Purpose

This sets or returns the value of Counter <n>.

Configuration

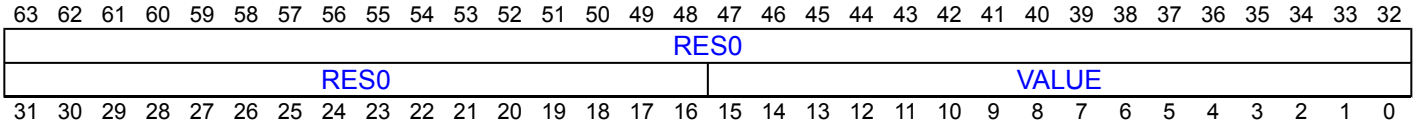
AArch64 System register TRCCNTVR<n> bits [31:0] are architecturally mapped to External register TRCCNTVR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTVR<n> are UNDEFINED.

Attributes

TRCCNTVR<n> is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the count value of Counter.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTVR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCCNTVR<m> ; Where m = 0-3
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b10:m[1:0]	0b101

```

TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

Purpose

Controls the tracing options.

Configuration

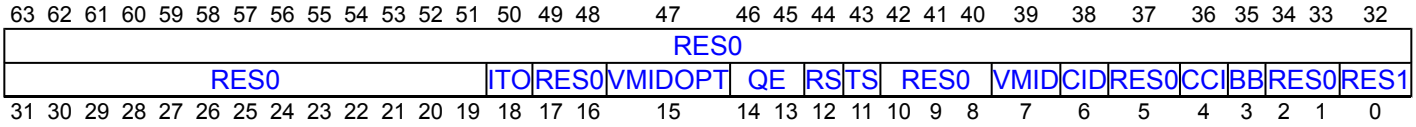
AArch64 System register TRCCONFIGR bits [31:0] are architecturally mapped to External register TRCCONFIGR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCCONFIGR are UNDEFINED.

Attributes

TRCCONFIGR is a 64-bit register.

Field descriptions



Bits [63:19]

Reserved, RES0.

ITO, bit [18]

When TRCIDR0.ITE == 1:

Instrumentation Trace Override.

ITO	Meaning
0b0	Instrumentation Trace Override disabled.
0b1	Instrumentation Trace Override enabled.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [17:16]

Reserved, RES0.

VMIDOPT, bit [15]

When TRCIDR2.VMIDOPT == 0b01:

Virtual context identifier selection control.

VMIDOPT	Meaning
0b0	VTTBR_EL2.VMID is used as the Virtual context identifier.
0b1	CONTEXTIDR_EL2.PROCID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b00:

Reserved, RES0.

Virtual context identifier selection control.

VTTBR_EL2.VMID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b10:

Reserved, RES1.

Virtual context identifier selection control.

CONTEXTIDR_EL2.PROCID is used as the Virtual context identifier.

Otherwise:

Reserved, RES0.

QE, bits [14:13]

When TRCIDR0.QSUPP == 0b01:

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled.
	Q elements without instruction counts are disabled.

All other values are reserved.

When TRCIDR0.QSUPP == 0b10:

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b11	Q elements with instruction counts are enabled.
	Q elements without instruction counts are enabled.

All other values are reserved.

When TRCIDR0.QSUPP == 0b11:

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled. Q elements without instruction counts are disabled.
0b11	Q elements with instruction counts are enabled. Q elements without instruction counts are enabled.

All other values are reserved.

Otherwise:

Reserved, RES0.

RS, bit [12]
When TRCIDR0.RETSTACK == 1:

Return stack control.

RS	Meaning
0b0	Return stack is disabled.
0b1	Return stack is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TS, bit [11]
When TRCIDR0.TSSIZE != 0b00000:

Global timestamp tracing control.

TS	Meaning
0b0	Global timestamp tracing is disabled.
0b1	Global timestamp tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

VMID, bit [7]
When TRCIDR2.VMIDSIZE != 0b00000:

Virtual context identifier tracing control.

VMID	Meaning
0b0	Virtual context identifier tracing is disabled.
0b1	Virtual context identifier tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CID, bit [6]
When TRCIDR2.CIDSIZE != 0b00000:

Context identifier tracing control.

CID	Meaning
0b0	Context identifier tracing is disabled.
0b1	Context identifier tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

CCI, bit [4]
When TRCIDR0.TRCCCI == 1:

Cycle counting instruction tracing control.

CCI	Meaning
0b0	Cycle counting instruction tracing is disabled.
0b1	Cycle counting instruction tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BB, bit [3]
When TRCIDR0.TRCBB == 1:

Branch broadcasting control.

BB	Meaning
0b0	Branch broadcasting is disabled.
0b1	Branch broadcasting is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [2:1]

Reserved, RES0.

Bit [0]

Reserved, RES1.

Accessing TRCCONFIGR

Must always be programmed.

TRCCONFIGR.QE must be set to `0b00` if TRCCONFIGR.BB is not 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCCONFIGR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0100	0b000

TRCDEVARCH, Trace Device Architecture Register

The TRCDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

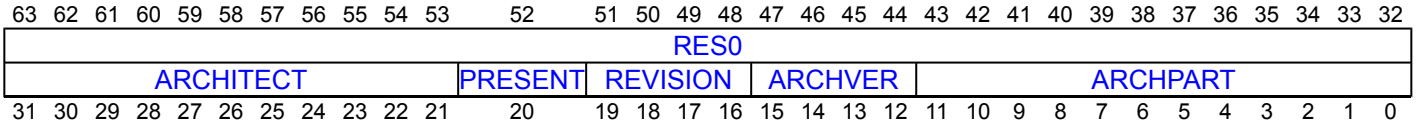
AArch64 System register TRCDEVARCH bits [31:0] are architecturally mapped to External register TRCDEVARCH[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCDEVARCH are UNDEFINED.

Attributes

TRCDEVARCH is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

ARCHITECT, bits [31:21]

Defines the architect of the component. For Trace, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0b0100`.

Bits [27:21] are the JEP106 identification code, `0b0111011`.

Reads as `0b01000111011`.

Access to this field is **RO**.

PRESENT, bit [20]

DEVARCH present. Indicates that the TRCDEVARCH register is present.

Reads as `0b1`.

Access to this field is **RO**.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

REVISION	Meaning
0b0000	ETEv1.0, FEAT_ETE.
0b0001	ETEv1.1, FEAT_ETEv1p1.
0b0010	ETEv1.2, FEAT_ETEv1p2.
0b0011	ETEv1.3, FEAT_ETEv1p3.

All other values are reserved.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0101	ETEv1.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0x5.

Access to this field is **RO**.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA13	Arm PE trace architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA13.

Access to this field is **RO**.

Accessing TRCDEVARCH

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCDEVARCH
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0111	0b1111	0b110

```

TRCEVENTCTL0R, Trace Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

Purpose

Controls the generation of ETEEvents.

Configuration

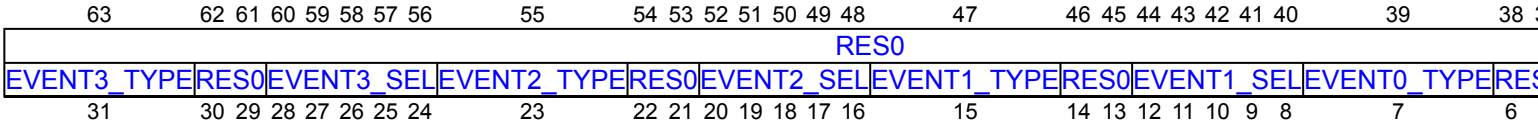
AArch64 System register TRCEVENTCTL0R bits [31:0] are architecturally mapped to External register TRCEVENTCTL0R[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR4.NUMRSPAIR != 0b0000. Otherwise, direct accesses to TRCEVENTCTL0R are UNDEFINED.

Attributes

TRCEVENTCTL0R is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

EVENT3_TYPE, bit [31]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 3:

Chooses the type of Resource Selector.

EVENT3_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT3.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:29]

Reserved, RES0.

EVENT3_SEL, bits [28:24]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 3:

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[3] == 1, then Event element 3 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT2_TYPE, bit [23]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 2:

Chooses the type of Resource Selector.

EVENT2_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT2.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT2.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:21]

Reserved, RES0.

EVENT2_SEL, bits [20:16]

When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 2:

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[2] == 1, then Event element 2 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.TYPE controls whether TRCEVENTCTL0R.EVENT2.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT1_TYPE, bit [15]
When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 1:

Chooses the type of Resource Selector.

EVENT1_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT1.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT1.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [14:13]

Reserved, RES0.

EVENT1_SEL, bits [12:8]
When TRCIDR4.NUMRSPAIR != 0b0000 and UInt(TRCIDR0.NUMEVENT) >= 1:

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[1] == 1, then Event element 1 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.TYPE controls whether TRCEVENTCTL0R.EVENT1.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT0_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT0_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT0.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT0_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[0] == 1, then Event element 0 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCEVENTCTL1R, Trace Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that TRCEVENTCTL0R selects.

Configuration

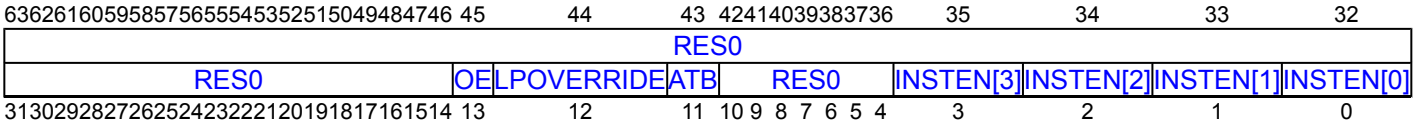
AArch64 System register TRCEVENTCTL1R bits [31:0] are architecturally mapped to External register TRCEVENTCTL1R[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are UNDEFINED.

Attributes

TRCEVENTCTL1R is a 64-bit register.

Field descriptions



Bits [63:14]

Reserved, RES0.

OE, bit [13]

When TRCIDR5.OE == 1:

ETE Trace Output Enable control.

OE	Meaning
0b0	Trace output to any IMPLEMENTATION DEFINED trace output interface is disabled.
0b1	Trace output to any IMPLEMENTATION DEFINED trace output interface is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

LPOVERRIDE, bit [12]

When TRCIDR5.LPOVERRIDE == 1:

Low-power Override Mode select.

LPOVERRIDE	Meaning
0b0	Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.
0b1	Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.

Otherwise:

Reserved, RES0.

ATB, bit [11]

When TRCIDR5.ATBTRIG == 1:

AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.
- ATDATA to the value of TRCTRACEIDR.

If the width of ATDATA is greater than the width of TRCTRACEIDR.TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

ATB	Meaning
0b0	ATB trigger is disabled.
0b1	ATB trigger is enabled.

Otherwise:

Reserved, RES0.

Bits [10:4]

Reserved, RES0.

INSTEN[<m>], bit [m], for m = 3 to 0

Event element control.

INSTEN[<m>]	Meaning
0b0	The trace unit does not generate an Event element <m>.
0b1	The trace unit generates an Event element <m> when ETEEvent <m> occurs.

Accessing this field has the following behavior:

- When TRCIDR4.NUMRSPAIR == 0b0000, access to this field is **RES0**.
- Access to this field is **RES0** if all the following are true:
  - TRCIDR4.NUMRSPAIR != 0b0000.
  - m > UInt(TRCIDR0.NUMEVENT).
- Otherwise, access to this field is **RW**.

Accessing TRCEVENTCTL1R

Must be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCEVENTCTL1R
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1001	0b000

```

TRCEXTINSELR<n>, Trace External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELR<n> characteristics are:

Purpose

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSELR is an alias of TRCEXTINSELR0.

Configuration

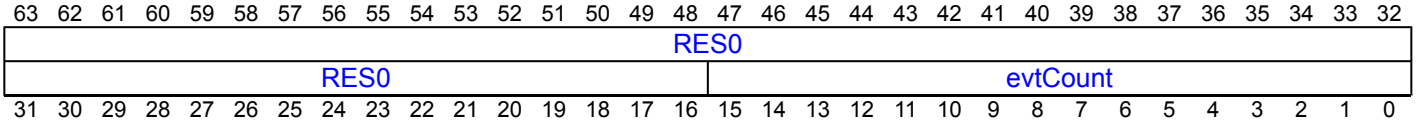
AArch64 System register TRCEXTINSELR<n> bits [31:0] are architecturally mapped to External register TRCEXTINSELR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR5.NUMEXTINSEL) > n. Otherwise, direct accesses to TRCEXTINSELR<n> are UNDEFINED.

Attributes

TRCEXTINSELR<n> is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range `0x0000` to `0x003F` are common architectural and microarchitectural events.
- PMU event numbers in the range `0x0040` to `0x00BF` are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range `0x00C0` to `0x03FF` are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range `0x0000` to `0x003F`, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCEXTINSELR<n>

Must be programmed if any of the following is true: TRCRSCTLR<a>.GROUP == 0b0000 and TRCRSCTLR<a>.EXTIN[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCEXTINSELR<m> ; Where m = 0-3
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b10:m[1:0]	0b100

TRCIDR0, Trace ID Register 0

The TRCIDR0 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

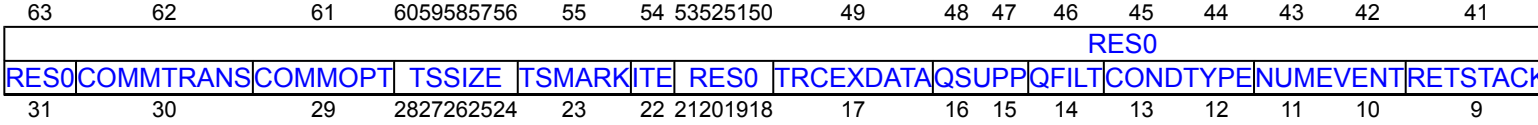
AArch64 System register TRCIDR0 bits [31:0] are architecturally mapped to External register TRCIDR0[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR0 are UNDEFINED.

Attributes

TRCIDR0 is a 64-bit register.

Field descriptions



Bits [63:31]

Reserved, RES0.

COMMTRANS, bit [30]

Transaction Start element behavior.

The value of this field is an IMPLEMENTATION DEFINED choice of:

COMMTRANS	Meaning
0b0	Transaction Start elements are P0 elements.
0b1	Transaction Start elements are not P0 elements.

Access to this field is **RO**.

COMMOPT, bit [29]

Indicates the contents and encodings of Cycle count packets.

The value of this field is an IMPLEMENTATION DEFINED choice of:

COMMOPT	Meaning
0b0	Commit mode 0.
0b1	Commit mode 1.

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- Access to this field is **RAO/WI** if all the following are true:

        - TRCIDR0.TRCCCI == 1.
        - UInt(TRCIDR8.MAXSPEC) == 0x0.
    - When TRCIDR0.TRCCCI == 0, access to this field is **RAZ/WI**.
    - Otherwise, access to this field is **RO**.

TSSIZE, bits [28:24]

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TSSIZE	Meaning
0b00000	Global timestamping not implemented.
0b01000	Global timestamping implemented with a 64-bit timestamp value.

All other values are reserved.

This field reads as 0b01000.

Access to this field is **RO**.

TSMARK, bit [23]

Indicates whether Timestamp Marker elements are generated.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TSMARK	Meaning
0b0	Timestamp Marker elements are not generated.
0b1	Timestamp Marker elements are generated.

Access to this field is **RO**.

ITE, bit [22]

Indicates whether Instrumentation Trace is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ITE	Meaning
0b0	Instrumentation Trace not implemented.
0b1	Instrumentation Trace implemented.

This field has the value 1 if FEAT_ITE is implemented.

Access to this field is **RO**.

Bits [21:18]

Reserved, RES0.

TRCEXDATA, bit [17]

When TRCIDR0.TRCDATA != 0b00:

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCEXDATA	Meaning
0b0	Tracing of data transfers for exceptions and exception returns not implemented.
0b1	Tracing of data transfers for exceptions and exception returns implemented.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

QSUPP	Meaning
0b00	Q element support is not implemented.
0b01	Q element support is implemented, and only supports Q elements with instruction counts.
0b10	Q element support is implemented, and only supports Q elements without instruction counts.
0b11	Q element support is implemented, and supports: • Q elements with instruction counts. • Q elements without instruction counts.

Access to this field is **RO**.

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.

The value of this field is an IMPLEMENTATION DEFINED choice of:

QFILT	Meaning
0b0	Q element filtering is not implemented.
0b1	Q element filtering is implemented.

If TRCIDR0.QSUPP == 0b00 then this field is 0.

Access to this field is **RO**.

CONDTYPE, bits [13:12]

When TRCIDR0.TRCCOND == 1:

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CONDTYPE	Meaning
0b00	Conditional instructions are traced with an indication of whether they pass or fail their condition code check.
0b01	Conditional instructions are traced with an indication of the APSR condition flags.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

NUMEVENT, bits [11:10]

When TRCIDR4.NUMRSPAIR == 0b0000:

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 0 ETEEvents.

All other values are reserved.

Access to this field is **RO**.

When TRCIDR4.NUMRSPAIR != 0b0000:

Indicates the number of ETEEvents implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMEVENT	Meaning
0b00	The trace unit supports 1 ETEEvent.
0b01	The trace unit supports 2 ETEEvents.
0b10	The trace unit supports 3 ETEEvents.
0b11	The trace unit supports 4 ETEEvents.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RETSTACK	Meaning
0b0	Return stack not implemented.
0b1	Return stack implemented.

Access to this field is **RO**.

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCCCI	Meaning
0b0	Cycle counting not implemented.
0b1	Cycle counting implemented.

This field reads as 1.

Access to this field is **RO**.

TRCCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCCOND	Meaning
0b0	Conditional instruction tracing not implemented.
0b1	Conditional instruction tracing implemented.

This field reads as 0.

Access to this field is **RO**.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCBB	Meaning
0b0	Branch broadcasting not implemented.
0b1	Branch broadcasting implemented.

This field reads as 1.

Access to this field is **RO**.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCDATA	Meaning
0b00	Data tracing not implemented.
0b11	Data tracing implemented.

All other values are reserved.

This field reads as 0b00.

Access to this field is **RO**.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INSTP0	Meaning
0b00	Load and store instructions are not P0 instructions.
0b11	Load and store instructions are P0 instructions.

All other values are reserved.

When FEAT_ETE is implemented, the only permitted value is 0b00.

Access to this field is **RO**.

Bit [0]

Reserved, RES1.

Accessing TRCIDR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCIDR0
```

op0	op1	CRn	CRm	op2

TRCIDR1, Trace ID Register 1

The TRCIDR1 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

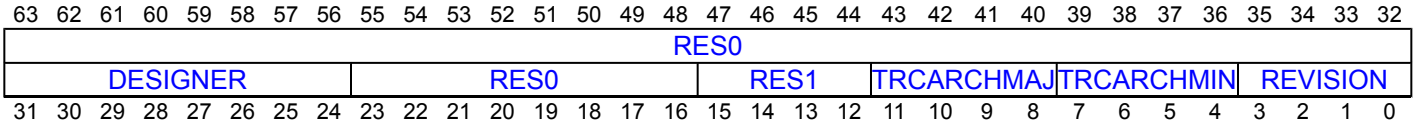
AArch64 System register TRCIDR1 bits [31:0] are architecturally mapped to External register TRCIDR1[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR1 are UNDEFINED.

Attributes

TRCIDR1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

DESIGNER, bits [31:24]

Indicates which company designed the trace unit. The permitted values of this field are the same as MIDR_EL1.Implementer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RES1.

TRCARCHMAJ, bits [11:8]

Major architecture version.

TRCARCHMAJ	Meaning
0b1111	If both TRCIDR1.TRCARCHMAJ and TRCIDR1.TRCARCHMIN == 0xF then refer to TRCDEVARCH.

All other values are reserved.

This field reads as `0b1111`.

Access to this field is **RO**.

TRCARCHMIN, bits [7:4]

Minor architecture version.

TRCARCHMIN	Meaning
`0b1111`	If both TRCIDR1.TRCARCHMAJ and TRCIDR1.TRCARCHMIN == `0xF` then refer to TRCDEVARCH.

All other values are reserved.

This field reads as `0b1111`.

Access to this field is **RO**.

REVISION, bits [3:0]

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of the trace unit.

Arm deprecates any use of this field and recommends that implementations set this field to zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCIDR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCIDR1
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1001	0b111

TRCIDR10, Trace ID Register 10

The TRCIDR10 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

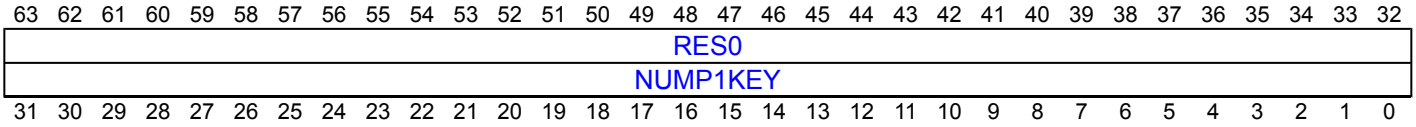
AArch64 System register TRCIDR10 bits [31:0] are architecturally mapped to External register TRCIDR10[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR10 are UNDEFINED.

Attributes

TRCIDR10 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

NUMP1KEY, bits [31:0]

When TRCIDR0.TRCDATA != 0b00:

Indicates the number of P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

TRCIDR2, Trace ID Register 2

The TRCIDR2 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

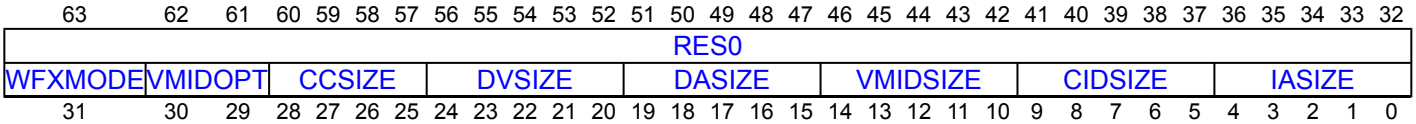
AArch64 System register TRCIDR2 bits [31:0] are architecturally mapped to External register TRCIDR2[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR2 are UNDEFINED.

Attributes

TRCIDR2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

WFXMODE, bit [31]

Indicates whether `WFI`, `WFIT`, `WFE`, and `WFET` instructions are classified as P0 instructions:

The value of this field is an IMPLEMENTATION DEFINED choice of:

WFXMODE	Meaning
`0b0`	`WFI`, `WFIT`, `WFE`, and `WFET` instructions are not classified as P0 instructions.
`0b1`	`WFI`, `WFIT`, `WFE`, and `WFET` instructions are classified as P0 instructions.

Access to this field is **RO**.

VMIDOPT, bits [30:29]

Indicates the options for Virtual context identifier selection.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMIDOPT	Meaning
`0b00`	Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES0.
`0b01`	Virtual context identifier selection supported. TRCCONFIGR.VMIDOPT is implemented.
`0b10`	Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES1.

All other values are reserved.

If TRCIDR2.VMIDSIZE == 0b00000 then this field is 0b00.

If TRCIDR2.VMIDSIZE != 0b00000 then this field is 0b10.

Access to this field is **RO**.

CCSIZE, bits [28:25]

When TRCIDR0.TRCCCI == 1:

Indicates the size of the cycle counter.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCSIZE	Meaning
0b0000	The cycle counter is 12 bits in length.
0b0001	The cycle counter is 13 bits in length.
0b0010	The cycle counter is 14 bits in length.
0b0011	The cycle counter is 15 bits in length.
0b0100	The cycle counter is 16 bits in length.
0b0101	The cycle counter is 17 bits in length.
0b0110	The cycle counter is 18 bits in length.
0b0111	The cycle counter is 19 bits in length.
0b1000	The cycle counter is 20 bits in length.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

DVSIZE, bits [24:20]

When TRCIDR0.TRCDATA != 0b00:

Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DVSIZE	Meaning
0b00000	Data value tracing not implemented.
0b00100	Data value tracing has a maximum of 32-bit data values.
0b01000	Data value tracing has a maximum of 64-bit data values.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

DASIZE, bits [19:15]

When TRCIDR0.TRCDATA != 0b00:

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DASIZE	Meaning
0b00000	Data address tracing not implemented.
0b00100	Data address tracing has a maximum of 32-bit data addresses.
0b01000	Data address tracing has a maximum of 64-bit data addresses.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

VMIDSIZE, bits [14:10]

Indicates the trace unit Virtual context identifier size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMIDSIZE	Meaning
0b00000	Virtual context identifier tracing is not supported.
0b00001	8-bit Virtual context identifier size.
0b00010	16-bit Virtual context identifier size.
0b00100	32-bit Virtual context identifier size.

All other values are reserved.

If the PE does not implement EL2 then this field is 0b00000.

If the PE implements EL2 then this field is 0b00100.

Access to this field is **RO**.

CIDSIZE, bits [9:5]

Indicates the Context identifier size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CIDSIZE	Meaning
0b00000	Context identifier tracing is not supported.
0b00100	32-bit Context identifier size.

All other values are reserved.

This field reads as 0b00100.

Access to this field is **RO**.

IASIZE, bits [4:0]

Virtual instruction address size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IASIZE	Meaning
0b00100	Maximum of 32-bit instruction address size.
0b01000	Maximum of 64-bit instruction address size.

All other values are reserved.

This field reads as 0b01000.

Access to this field is **RO**.

Accessing TRCIDR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCIDR2
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1010	0b111

```

TRCIDR3, Trace ID Register 3

The TRCIDR3 characteristics are:

Purpose

Returns the base architecture of the trace unit.

Configuration

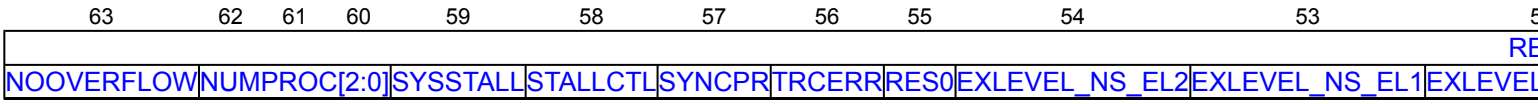
AArch64 System register TRCIDR3 bits [31:0] are architecturally mapped to External register TRCIDR3[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR3 are UNDEFINED.

Attributes

TRCIDR3 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

NOOVERFLOW, bit [31]

Indicates if overflow prevention is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NOOVERFLOW	Meaning
0b0	Overflow prevention is not implemented.
0b1	Overflow prevention is implemented.

If TRCIDR3.STALLCTL == 0 then this field is 0.

Access to this field is **RO**.

NUMPROC, bits [13:12, 30:28]

Indicates the number of PEs available for tracing.

NUMPROC	Meaning
0b00000	The trace unit can trace one PE.

This field reads as 0b00000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].

Access to this field is **RO**.

SYSSTALL, bit [27]

Indicates if stalling of the PE is permitted.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYSSTALL	Meaning
0b0	Stalling of the PE is not permitted.
0b1	Stalling of the PE is permitted.

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0 then this field is 0.

Access to this field is **RO**.

STALLCTL, bit [26]

Indicates if trace unit implements stalling of the PE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

STALLCTL	Meaning
0b0	Stalling of the PE is not implemented.
0b1	Stalling of the PE is implemented.

Access to this field is **RO**.

SYNCPR, bit [25]

Indicates if an implementation has a fixed synchronization period.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYNCPR	Meaning
0b0	TRCSYNCPR is read/write so software can change the synchronization period.
0b1	TRCSYNCPR is read-only so the synchronization period is fixed.

This field reads as 0.

Access to this field is **RO**.

TRCERR, bit [24]

Indicates forced tracing of System Error exceptions is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is not implemented.
0b1	Forced tracing of System Error exceptions is implemented.

This field reads as 1.

Access to this field is **RO**.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

Indicates if Non-secure EL2 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_NS_EL2	Meaning
0b0	Non-secure EL2 is not implemented.
0b1	Non-secure EL2 is implemented.

Access to this field is **RO**.

EXLEVEL_NS_EL1, bit [21]

Indicates if Non-secure EL1 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_NS_EL1	Meaning
0b0	Non-secure EL1 is not implemented.
0b1	Non-secure EL1 is implemented.

Access to this field is **RO**.

EXLEVEL_NS_EL0, bit [20]

Indicates if Non-secure EL0 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_NS_EL0	Meaning
0b0	Non-secure EL0 is not implemented.
0b1	Non-secure EL0 is implemented.

Access to this field is **RO**.

EXLEVEL_S_EL3, bit [19]

Indicates if EL3 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL3	Meaning
0b0	EL3 is not implemented.
0b1	EL3 is implemented.

Access to this field is **RO**.

EXLEVEL_S_EL2, bit [18]

Indicates if Secure EL2 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL2	Meaning
0b0	Secure EL2 is not implemented.
0b1	Secure EL2 is implemented.

Access to this field is **RO**.

EXLEVEL_S_EL1, bit [17]

Indicates if Secure EL1 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL1	Meaning
0b0	Secure EL1 is not implemented.
0b1	Secure EL1 is implemented.

Access to this field is **RO**.

EXLEVEL_S_EL0, bit [16]

Indicates if Secure EL0 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL0	Meaning
0b0	Secure EL0 is not implemented.
0b1	Secure EL0 is implemented.

Access to this field is **RO**.

Bits [15:14]

Reserved, RES0.

CCITMIN, bits [11:0]

When TRCIDR0.TRCCCI == 0:

Indicates the minimum value that can be programmed in TRCCCCTLR.THRESHOLD.

Reads as 0x000.

Access to this field is **RO**.

When TRCIDR0.TRCCCI == 1:

Indicates the minimum value that can be programmed in TRCCCCTLR.THRESHOLD.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCITMIN	Meaning
0x001..0xFFF	The minimum value that can be programmed in TRCCCCTLR.THRESHOLD.

The minimum value of this field is 0x001.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Accessing TRCIDR3

TRCIDR4, Trace ID Register 4

The TRCIDR4 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

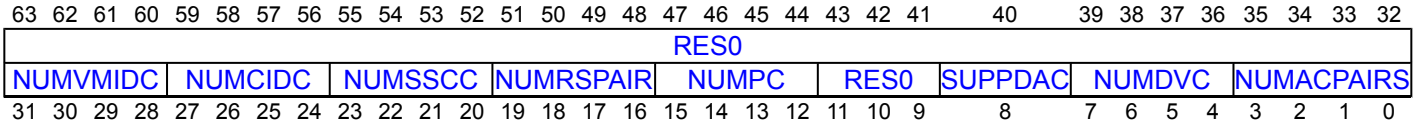
AArch64 System register TRCIDR4 bits [31:0] are architecturally mapped to External register TRCIDR4[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR4 are UNDEFINED.

Attributes

TRCIDR4 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

NUMVMIDC, bits [31:28]

Indicates the number of Virtual Context Identifier Comparators that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMVMIDC	Meaning
0b0000..0b1000	The number of Virtual Context Identifier Comparators in this implementation.

All other values are reserved.

If the PE does not implement EL2 then this field is 0b0000.

Access to this field is **RO**.

NUMCIDC, bits [27:24]

Indicates the number of Context Identifier Comparators that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMCIDC	Meaning
0b0000..0b1000	The number of Context Identifier Comparators in this implementation.

All other values are reserved.

Access to this field is **RO**.

NUMSSCC, bits [23:20]

Indicates the number of Single-shot Comparator Controls that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMSSCC	Meaning
0b0000..0b1000	The number of Single-shot Comparator Controls in this implementation.

All other values are reserved.

Access to this field is **RO**.

NUMRSPAIR, bits [19:16]

Indicates the number of resource selector pairs that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMRSPAIR	Meaning
0b0000	This implementation has zero resource selector pairs.
0b0001..0b1111	The number of resource selector pairs in this implementation, minus one.

All other values are reserved.

Access to this field is **RO**.

NUMPC, bits [15:12]

Indicates the number of PE Comparator Inputs that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMPC	Meaning
0b0000..0b1000	The number of PE Comparator Inputs in this implementation.

All other values are reserved.

Access to this field is **RO**.

Bits [11:9]

Reserved, RES0.

SUPPDAC, bit [8]

When TRCIDR4.NUMACPAIRS != 0b0000:

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SUPPDAC	Meaning
0b0	Data address comparisons not implemented.
0b1	Data address comparisons implemented.

This field reads as 0b0.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMDVC	Meaning
0b0000..0b1000	The number of data value comparators in this implementation.

All other values are reserved.

This field reads as 0b0000.

Access to this field is **RO**.

NUMACPAIRS, bits [3:0]

Indicates the number of Address Comparator pairs that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMACPAIRS	Meaning
0b0000..0b1000	The number of Address Comparator pairs in this implementation.

All other values are reserved.

Access to this field is **RO**.

TRCIDR5, Trace ID Register 5

The TRCIDR5 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

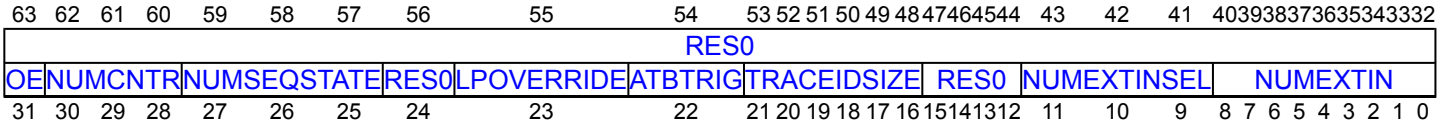
AArch64 System register TRCIDR5 bits [31:0] are architecturally mapped to External register TRCIDR5[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR5 are UNDEFINED.

Attributes

TRCIDR5 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

OE, bit [31]

Indicates support for the ETE Trace Output Enable.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OE	Meaning
0b0	ETE Trace Output Enable is not implemented.
0b1	ETE Trace Output Enable is implemented.

When FEAT_ETEv1p3 is implemented and when any IMPLEMENTATION DEFINED trace output interface is implemented, this field is 1.

Access to this field is **RO**.

NUMCNTR, bits [30:28]

Indicates the number of Counters that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMCNTR	Meaning
0b000..0b100	The number of Counters implemented.

All other values are reserved.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b000.

Access to this field is **RO**.

NUMSEQSTATE, bits [27:25]

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMSEQSTATE	Meaning
0b000	The Sequencer is not implemented.
0b100	Four Sequencer states are implemented.

All other values are reserved.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b000.

Access to this field is **RO**.

Bit [24]

Reserved, RES0.

LPOVERRIDE, bit [23]

Indicates support for Low-power Override Mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LPOVERRIDE	Meaning
0b0	The trace unit does not support Low-power Override Mode.
0b1	The trace unit supports Low-power Override Mode.

Access to this field is **RO**.

ATBTRIG, bit [22]

Indicates if the implementation can support ATB triggers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ATBTRIG	Meaning
0b0	The implementation does not support ATB triggers.
0b1	The implementation supports ATB triggers.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0.

Access to this field is **RO**.

TRACEIDSIZE, bits [21:16]

Indicates the trace ID width.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRACEIDSIZE	Meaning
0b000000	The external trace interface is not implemented.
0b000111	The implementation supports a 7-bit trace ID.

All other values are reserved.

Note

AMBA ATB requires a 7-bit trace ID width.

Access to this field is **RO**.

Bits [15:12]

Reserved, RES0.

NUMEXTINSEL, bits [11:9]

Indicates how many External Input Selector resources are implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMEXTINSEL	Meaning
0b000..0b100	The number of External Input Selector resources implemented.

All other values are reserved.

Access to this field is **RO**.

NUMEXTIN, bits [8:0]

Indicates how many External Inputs are implemented.

NUMEXTIN	Meaning
0b111111111	Unified PMU event selection.

All other values are reserved.

Access to this field is **RO**.

Accessing TRCIDR5

Accesses to this register use the following encodings in the System register encoding space:

TRCIDR6, Trace ID Register 6

The TRCIDR6 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

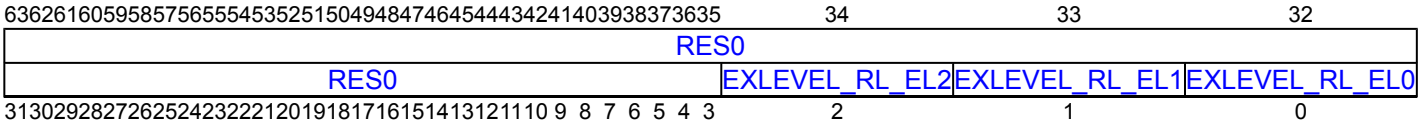
AArch64 System register TRCIDR6 bits [31:0] are architecturally mapped to External register TRCIDR6[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR6 are UNDEFINED.

Attributes

TRCIDR6 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [2]

Indicates if Realm EL2 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_RL_EL2	Meaning
0b0	Realm EL2 is not implemented.
0b1	Realm EL2 is implemented.

Access to this field is **RO**.

EXLEVEL_RL_EL1, bit [1]

Indicates if Realm EL1 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_RL_EL1	Meaning
0b0	Realm EL1 is not implemented.
0b1	Realm EL1 is implemented.

Access to this field is **RO**.

EXLEVEL_RL_EL0, bit [0]

Indicates if Realm EL0 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_RL_EL0	Meaning
0b0	Realm EL0 is not implemented.
0b1	Realm EL0 is implemented.

Access to this field is **RO**.

Accessing TRCIDR6

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCIDR6
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1110	0b111

```

TRCIDR8, Trace ID Register 8

The TRCIDR8 characteristics are:

Purpose

Returns the maximum speculation depth of the instruction trace element stream.

Configuration

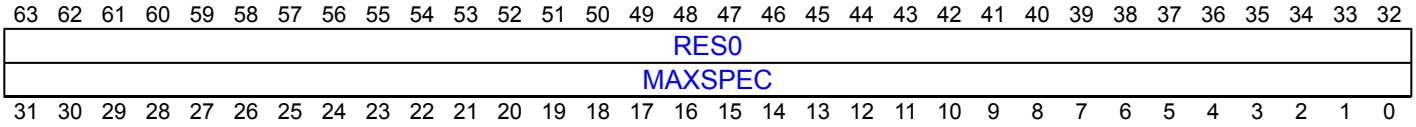
AArch64 System register TRCIDR8 bits [31:0] are architecturally mapped to External register TRCIDR8[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR8 are UNDEFINED.

Attributes

TRCIDR8 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

MAXSPEC, bits [31:0]

Indicates the maximum speculation depth of the instruction trace element stream. This is the maximum number of P0 elements in the trace element stream that can be speculative at any time.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCIDR8

Accesses to this register use the following encodings in the System register encoding space:

```

TRCIMSPEC0, Trace IMP DEF Register 0

The TRCIMSPEC0 characteristics are:

Purpose

TRCIMSPEC0 shows the presence of any IMPLEMENTATION DEFINED features, and provides an interface to enable the features that are provided.

Configuration

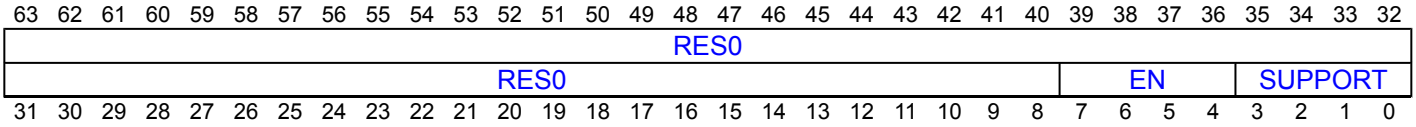
AArch64 System register TRCIMSPEC0 bits [31:0] are architecturally mapped to External register TRCIMSPEC0[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIMSPEC0 are UNDEFINED.

Attributes

TRCIMSPEC0 is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

EN, bits [7:4]

When TRCIMSPEC0.SUPPORT != 0b0000:

Enable. Controls whether the IMPLEMENTATION DEFINED features are enabled.

EN	Meaning
0b0000	The IMPLEMENTATION DEFINED features are not enabled. The trace unit must behave as if the IMPLEMENTATION DEFINED features are not supported.
0b0001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0111	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1000	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1111	The trace unit behavior is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0000'.

Otherwise:

Reserved, RES0.

SUPPORT, bits [3:0]

Indicates whether the implementation supports IMPLEMENTATION DEFINED features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SUPPORT	Meaning
0b0000	No IMPLEMENTATION DEFINED features are supported.
0b0001	IMPLEMENTATION DEFINED features are supported.
0b0010	IMPLEMENTATION DEFINED features are supported.
0b0011	IMPLEMENTATION DEFINED features are supported.
0b0100	IMPLEMENTATION DEFINED features are supported.
0b0101	IMPLEMENTATION DEFINED features are supported.
0b0110	IMPLEMENTATION DEFINED features are supported.
0b0111	IMPLEMENTATION DEFINED features are supported.
0b1000	IMPLEMENTATION DEFINED features are supported.
0b1001	IMPLEMENTATION DEFINED features are supported.
0b1010	IMPLEMENTATION DEFINED features are supported.
0b1011	IMPLEMENTATION DEFINED features are supported.
0b1100	IMPLEMENTATION DEFINED features are supported.
0b1101	IMPLEMENTATION DEFINED features are supported.
0b1110	IMPLEMENTATION DEFINED features are supported.
0b1111	IMPLEMENTATION DEFINED features are supported.

Use of nonzero values requires written permission from Arm.

Access to this field is **RO**.

TRCIMSPEC<n>, Trace IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

Purpose

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

Configuration

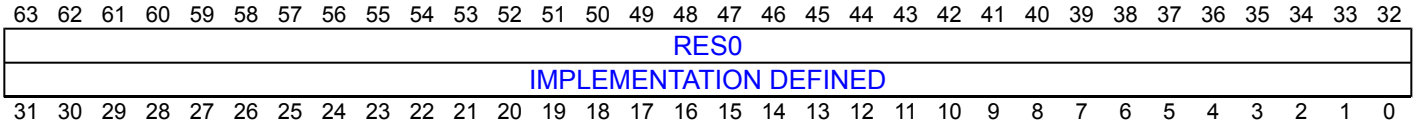
AArch64 System register TRCIMSPEC<n> bits [31:0] are architecturally mapped to External register TRCIMSPEC<n>[31:0].

This register is present only when an implementation implements TRCIMSPEC<n>, FEAT_ETE is implemented, and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are UNDEFINED.

Attributes

TRCIMSPEC<n> is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

Accessing TRCIMSPEC<n>

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCIMSPEC<m> ; Where m = 1-7
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0:m[2:0]	0b111

```
integer m = UInt(CRm<2:0>);

TRCIT, Trace Instrumentation

The TRCIT characteristics are:

Purpose

Generates an instrumentation packet in the trace.

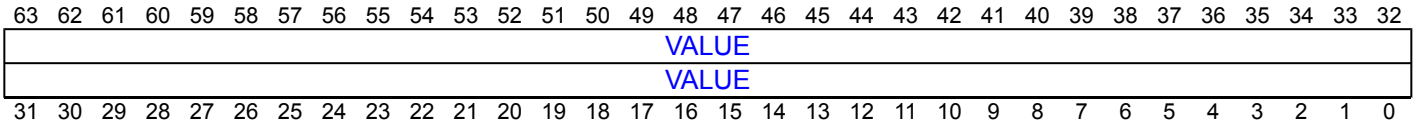
Configuration

This instruction is present only when FEAT_ITE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TRCIT are UNDEFINED.

Attributes

TRCIT is a 64-bit System instruction.

Field descriptions



VALUE, bits [63:0]

Value to be included in the Instrumentation packet.

Executing TRCIT

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TRCIT <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0010	0b111

```

TRCITECR_EL1, Instrumentation Trace Control Register (EL1)

The TRCITECR_EL1 characteristics are:

Purpose

Provides EL1 controls for Trace Instrumentation.

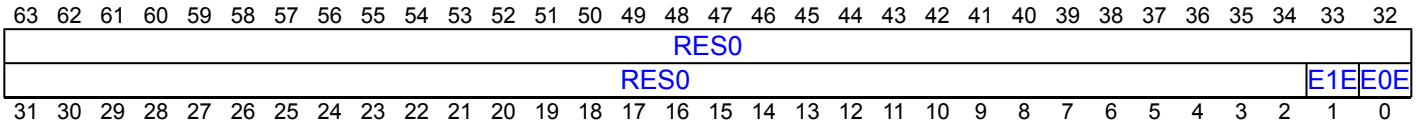
Configuration

This register is present only when FEAT_ITE is implemented, System register access to the trace unit registers is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TRCITECR_EL1 are UNDEFINED.

Attributes

TRCITECR_EL1 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

E1E, bit [1]

EL1 Instrumentation Trace Enable.

E1E	Meaning
0b0	Instrumentation trace prohibited at EL1.
0b1	Instrumentation trace not prohibited at EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0E, bit [0]

EL0 Instrumentation Trace Enable.

E0E	Meaning
0b0	Instrumentation trace prohibited at EL0.
0b1	Instrumentation trace not prohibited at EL0.

This field is ignored by the PE when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRCITECR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TRCITECR_EL1 or TRCITECR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

TRCITECR_EL2, Instrumentation Trace Control Register (EL2)

The TRCITECR_EL2 characteristics are:

Purpose

Provides EL2 controls for Trace Instrumentation.

Configuration

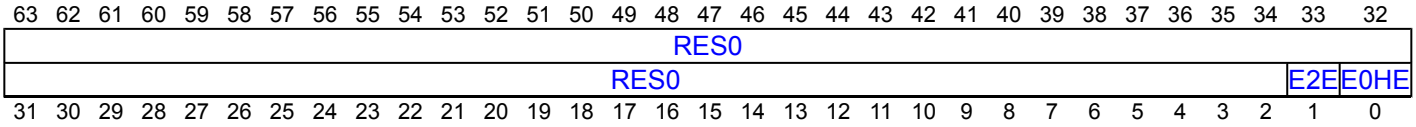
This register is present only when FEAT_ITE is implemented, System register access to the trace unit registers is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TRCITECR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TRCITECR_EL2 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

E2E, bit [1]

EL2 Instrumentation Trace Enable.

E2E	Meaning
0b0	Instrumentation trace prohibited at EL2.
0b1	Instrumentation trace not prohibited at EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0HE, bit [0]

EL0 Instrumentation Trace Enable.

E0HE	Meaning
0b0	Instrumentation trace prohibited at EL0 when HCR_EL2.TGE == 1.
0b1	Instrumentation trace not prohibited at EL0 when HCR_EL2.TGE == 1.

This field is ignored by the PE when any of the following are true:

- HCR_EL2.TGE == 0.
- EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRCITECR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TRCITECR_EL2 or TRCITECR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

TRCITEEDCR, Instrumentation Trace Extension External Debug Control Register

The TRCITEEDCR characteristics are:

Purpose

Controls instrumentation trace filtering.

Configuration

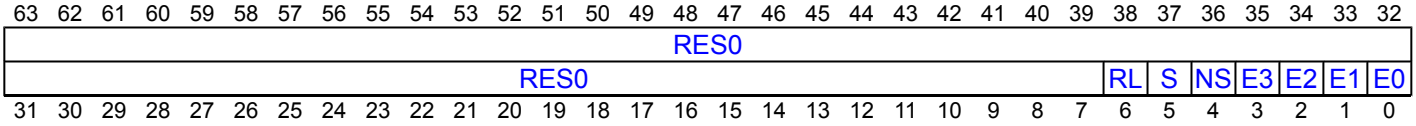
AArch64 System register TRCITEEDCR bits [31:0] are architecturally mapped to External register TRCITEEDCR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and FEAT_ITE is implemented. Otherwise, direct accesses to TRCITEEDCR are UNDEFINED.

Attributes

TRCITEEDCR is a 64-bit register.

Field descriptions



Bits [63:7]

Reserved, RES0.

RL, bit [6]

When FEAT_RME is implemented:

Instrumentation Trace in Realm state.

RL	Meaning
0b0	Instrumentation trace prohibited in Realm state.
0b1	Instrumentation trace permitted in Realm state.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

This field is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [5]

When Secure state is implemented:

Instrumentation Trace in Secure state.

S	Meaning
0b0	Instrumentation trace prohibited in Secure state.
0b1	Instrumentation trace permitted in Secure state.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

When FEAT_RME is not implemented, this field is used in conjunction with TRCCONFIGR.ITO, TRCITEEDCR.E3, and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Secure state.

When FEAT_RME is implemented, this field is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NS, bit [4]

When Any of Non-secure EL2, EL1, or EL0 are implemented:

Instrumentation Trace in Non-secure state.

NS	Meaning
0b0	Instrumentation trace prohibited in Non-secure state.
0b1	Instrumentation trace permitted in Non-secure state.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

This field is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [3]

When EL3 is implemented:

Instrumentation Trace Enable at EL3.

E3	Meaning
0b0	Instrumentation trace prohibited at EL3.
0b1	Instrumentation trace permitted at EL3.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

When FEAT_RME is not implemented, TRCITEEDCR.E3 is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.S to control whether Instrumentation trace is permitted or prohibited at EL3.

When FEAT_RME is implemented, TRCITEEDCR.E3 is used in conjunction with TRCCONFIGR.ITO to control whether Instrumentation trace is permitted or prohibited at EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E<m>, bit [m], for m = 2 to 0

Instrumentation Trace Enable at EL<m>.

E<m>	Meaning
0b0	Instrumentation trace prohibited at EL<m>.
0b1	Instrumentation trace permitted at EL<m>.

This field is ignored when `SelfHostedTraceEnabled()` returns TRUE.

This bit is used in conjunction with TRCCONFIGR.ITO, TRCITEEDCR.NS, TRCITEEDCR.S, and TRCITEEDCR.RL to control whether Instrumentation trace is permitted or prohibited at EL<m> in the specified Security states.

TRCITEEDCR.E<2> is RES0 if EL2 is not implemented in any Security states.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCITEEDCR

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCITEEDCR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0010	0b001

TRCOSLSR, Trace OS Lock Status Register

The TRCOSLSR characteristics are:

Purpose

Returns the status of the Trace OS Lock.

Configuration

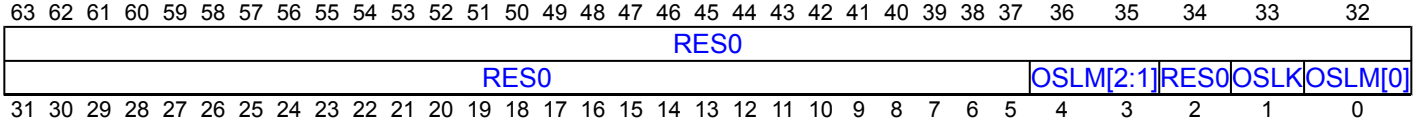
AArch64 System register TRCOSLSR bits [31:0] are architecturally mapped to External register TRCOSLSR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCOSLSR are UNDEFINED.

Attributes

TRCOSLSR is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

OSLM, bits [4:3, 0]

OS Lock model.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OSLM	Meaning
0b000	Trace OS Lock is not implemented.
0b010	Trace OS Lock is implemented.
0b100	Trace OS Lock is not implemented, and the trace unit is controlled by the PE OS Lock.

All other values are reserved.

When FEAT_ETE is implemented, the values 0b000 and 0b010 are not permitted.

The OSLM field is split as follows:

- OSLM[2:1] is TRCOSLSR[4:3].
- OSLM[0] is TRCOSLSR[0].

Access to this field is **RO**.

Bit [2]

Reserved, RES0.

OSLK, bit [1]

OS Lock status.

OSLK	Meaning
0b0	The OS Lock is unlocked.
0b1	The OS Lock is locked.

When FEAT_ETE is implemented, this field indicates the state of the PE OS Lock.

When FEAT_ETMv4 is implemented, this field indicates the state of the Trace OS Lock.

Accessing TRCOSLSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCOSLSR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0001	0b0001	0b100

TRCPRGCTLR, Trace Programming Control Register

The TRCPRGCTLR characteristics are:

Purpose

Enables the trace unit.

Configuration

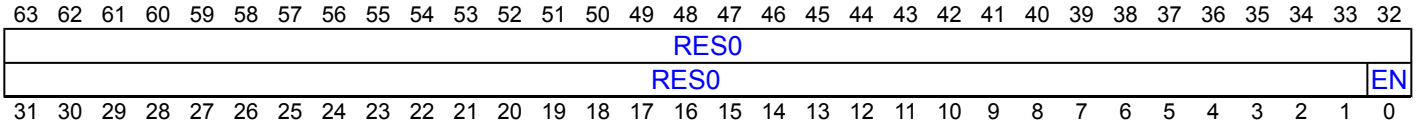
AArch64 System register TRCPRGCTLR bits [31:0] are architecturally mapped to External register TRCPRGCTLR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCPRGCTLR are UNDEFINED.

Attributes

TRCPRGCTLR is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

EN, bit [0]

Trace unit enable.

EN	Meaning
0b0	The trace unit is disabled.
0b1	The trace unit is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0'.

Accessing TRCPRGCTLR

Must be programmed.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCPRGCTLR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0001	0b000

TRCQCTLR, Trace Q Element Control Register

The TRCQCTLR characteristics are:

Purpose

Controls when Q elements are enabled.

Configuration

AArch64 System register TRCQCTLR bits [31:0] are architecturally mapped to External register TRCQCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR0.QFILT == 1. Otherwise, direct accesses to TRCQCTLR are UNDEFINED.

Attributes

TRCQCTLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33

RES0																								MODE	RANGE[7]	RANGE[6]	RANGE[5]	RANGE[4]	RANGE[3]	RANGE[2]	RANGE[1]	RANGE[0]

Bits [63:9]

Reserved, RES0.

MODE, bit [8]

Selects whether the Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

MODE	Meaning
0b0	Exclude mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.
0b1	Include Mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Specifies whether Address Range Comparator <m> controls Q elements.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines is not selected.
0b1	The address range that Address Range Comparator <m> defines is selected.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Accessing TRCQCTLR

Must be programmed if TRCCONFIGR.QE != `0b00`.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCQCTLR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0001	0b001

TRCRSCTLR<n>, Trace Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTLR<n> characteristics are:

Purpose

Controls the selection of the resources in the trace unit.

Configuration

AArch64 System register TRCRSCTLR<n> bits [31:0] are architecturally mapped to External register TRCRSCTLR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and (UInt(TRCIDR4.NUMRSPAIR) + 1) * 2 > n. Otherwise, direct accesses to TRCRSCTLR<n> are UNDEFINED.

Resource selector 0 always returns FALSE.

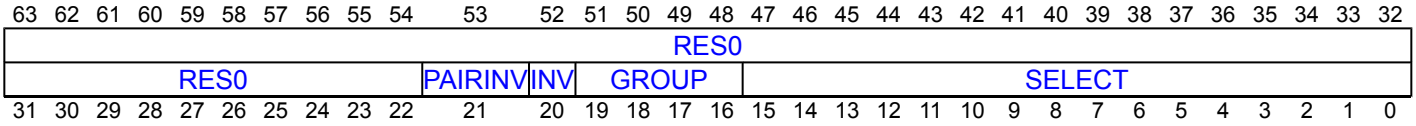
Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

Attributes

TRCRSCTLR<n> is a 64-bit register.

Field descriptions



Bits [63:22]

Reserved, RES0.

PAIRINV, bit [21]

When n is even:

Controls whether the combined result from a resource selector pair is inverted.

PAIRINV	Meaning
0b0	Do not invert the combined output of the 2 resource selectors.
0b1	Invert the combined output of the 2 resource selectors.

If:

- A is the register TRCRSCTLR<n>.
- B is the register TRCRSCTLR<n+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.
- 0b001 -> Reserved.
- 0b010 -> not(A) and B.

- 0b011 -> not(A) and not(B).
- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> Reserved.
- 0b111 -> A or B.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

INV, bit [20]

Controls whether the resource, that TRCRSCTLR<n>.GROUP and TRCRSCTLR<n>.SELECT selects, is inverted.

INV	Meaning
0b0	Do not invert the output of this selector.
0b1	Invert the output of this selector.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

GROUP, bits [19:16]

Selects a group of resources.

GROUP	Meaning	SELECT
0b0000	External Input Selectors.	SELECT encoding for External Input Selectors
0b0001	PE Comparator Inputs.	SELECT encoding for PE Comparator Inputs
0b0010	Counters and Sequencer.	SELECT encoding for Counters and Sequencer
0b0011	Single-shot Comparator Controls.	SELECT encoding for Single-shot Comparator Controls
0b0100	Single Address Comparators.	SELECT encoding for Single Address Comparators
0b0101	Address Range Comparators.	SELECT encoding for Address Range Comparators
0b0110	Context Identifier Comparators.	SELECT encoding for Context Identifier Comparators
0b0111	Virtual Context Identifier Comparators.	SELECT encoding for Virtual Context Identifier Comparators

All other values are reserved.

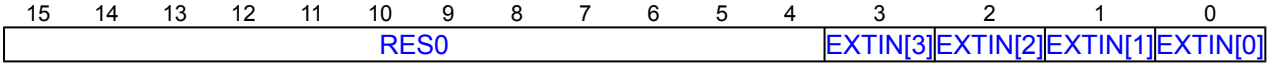
The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT, bits [15:0]

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

SELECT encoding for External Input Selectors



Bits [15:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

Selects one or more External Inputs.

EXTIN[<m>]	Meaning
0b0	Ignore EXTIN <m>.
0b1	Select EXTIN <m>.

This bit is RES0 if m >= TRCIDR5.NUMEXTINSEL.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for PE Comparator Inputs

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PECOMP[7]	PECOMP[6]	PECOMP[5]	PECOMP[4]	PECOMP[3]	PECOMP[2]	PECOMP[1]	PECOMP[0]

Bits [15:8]

Reserved, RES0.

PECOMP[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs.

PECOMP[<m>]	Meaning
0b0	Ignore PE Comparator Input <m>.
0b1	Select PE Comparator Input <m>.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Counters and Sequencer

15	14	13	12	11	10	9	8	7	6	5	4	3	2
RES0								SEQUENCER[3]	SEQUENCER[2]	SEQUENCER[1]	SEQUENCER[0]	COUNTERS[3]	COUNTERS[2]	COUN

Bits [15:8]

Reserved, RES0.

SEQUENCER[<m>], bit [m+4], for m = 3 to 0

Sequencer states.

SEQUENCER[<m>]	Meaning
0b0	Ignore Sequencer state <m>.
0b1	Select Sequencer state <m>.

This bit is RES0 if m >= TRCIDR5.NUMSEQSTATE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COUNTERS[<m>], bit [m], for m = 3 to 0

Counters resources at zero.

COUNTERS[<m>]	Meaning
0b0	Ignore Counter <m>.
0b1	Select Counter <m> is zero.

This bit is RES0 if m >= TRCIDR5.NUMCNTR.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single-shot Comparator Controls

15	14	13	12	11	10	9	8	7	6	5	4	3	2
RES0								SINGLE_SHOT[7]	SINGLE_SHOT[6]	SINGLE_SHOT[5]	SINGLE_SHOT[4]	SINGLE_SHOT[3]	SINGLE_SH

Bits [15:8]

Reserved, RES0.

SINGLE_SHOT[<m>], bit [m], for m = 7 to 0

Selects one or more Single-shot Comparator Controls.

SINGLE_SHOT[<m>]	Meaning
0b0	Ignore Single-shot Comparator Control <m>.
0b1	Select Single-shot Comparator Control <m>.

This bit is RES0 if m >= TRCIDR4.NUMSSCC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single Address Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
SAC[15]	SAC[14]	SAC[13]	SAC[12]	SAC[11]	SAC[10]	SAC[9]	SAC[8]	SAC[7]	SAC[6]	SAC[5]	SAC[4]	SAC[3]	SAC[2]	SAC[1]	SA

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators.

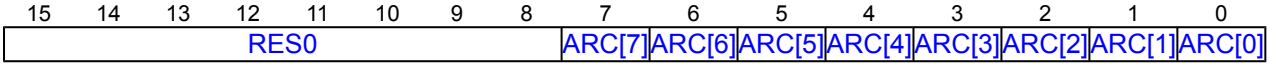
SAC[<m>]	Meaning
0b0	Ignore Single Address Comparator <m>.
0b1	Select Single Address Comparator <m>.

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Address Range Comparators



Bits [15:8]

Reserved, RES0.

ARC[<m>], bit [m], for m = 7 to 0

Selects one or more Address Range Comparators.

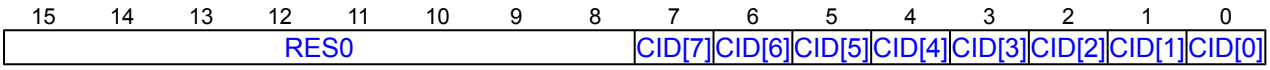
ARC[<m>]	Meaning
0b0	Ignore Address Range Comparator <m>.
0b1	Select Address Range Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Context Identifier Comparators



Bits [15:8]

Reserved, RES0.

CID[<m>], bit [m], for m = 7 to 0

Selects one or more Context Identifier Comparators.

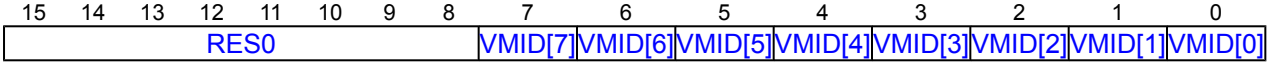
CID[<m>]	Meaning
0b0	Ignore Context Identifier Comparator <m>.
0b1	Select Context Identifier Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMCIDC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Virtual Context Identifier Comparators



Bits [15:8]

Reserved, RES0.

VMID[<m>], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

VMID[<m>]	Meaning
0b0	Ignore Virtual Context Identifier Comparator <m>.
0b1	Select Virtual Context Identifier Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMVMIDC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSCTLR<n>

Must be programmed if any of the following are true:

- TRCCNTCTLR<a>.RLDEVENT.TYPE == 0 and TRCCNTCTLR<a>.RLDEVENT.SEL == n.
- TRCCNTCTLR<a>.RLDEVENT.TYPE == 1 and TRCCNTCTLR<a>.RLDEVENT.SEL == n/2.
- TRCCNTCTLR<a>.CNTEVENT.TYPE == 0 and TRCCNTCTLR<a>.CNTEVENT.SEL == n.
- TRCCNTCTLR<a>.CNTEVENT.TYPE == 1 and TRCCNTCTLR<a>.CNTEVENT.SEL == n/2.
- TRCEVENTCTL0R.EVENT0.TYPE == 0 and TRCEVENTCTL0R.EVENT0.SEL == n.
- TRCEVENTCTL0R.EVENT0.TYPE == 1 and TRCEVENTCTL0R.EVENT0.SEL == n/2.
- TRCEVENTCTL0R.EVENT1.TYPE == 0 and TRCEVENTCTL0R.EVENT1.SEL == n.
- TRCEVENTCTL0R.EVENT1.TYPE == 1 and TRCEVENTCTL0R.EVENT1.SEL == n/2.
- TRCEVENTCTL0R.EVENT2.TYPE == 0 and TRCEVENTCTL0R.EVENT2.SEL == n.
- TRCEVENTCTL0R.EVENT2.TYPE == 1 and TRCEVENTCTL0R.EVENT2.SEL == n/2.
- TRCEVENTCTL0R.EVENT3.TYPE == 0 and TRCEVENTCTL0R.EVENT3.SEL == n.
- TRCEVENTCTL0R.EVENT3.TYPE == 1 and TRCEVENTCTL0R.EVENT3.SEL == n/2.
- TRCSEQEVR<a>.B.TYPE == 0 and TRCSEQEVR<a>.B.SEL = n.
- TRCSEQEVR<a>.B.TYPE == 1 and TRCSEQEVR<a>.B.SEL = n/2.
- TRCSEQEVR<a>.F.TYPE == 0 and TRCSEQEVR<a>.F.SEL = n.
- TRCSEQEVR<a>.F.TYPE == 1 and TRCSEQEVR<a>.F.SEL = n/2.
- TRCSEQRSTEVR.RST.TYPE == 0 and TRCSEQRSTEVR.RST.SEL == n.
- TRCSEQRSTEVR.RST.TYPE == 1 and TRCSEQRSTEVR.RST.SEL == n/2.
- TRCTSCTLR.EVENT.TYPE == 0 and TRCTSCTLR.EVENT.SEL == n.
- TRCTSCTLR.EVENT.TYPE == 1 and TRCTSCTLR.EVENT.SEL == n/2.
- TRCVICTLR.EVENT.TYPE == 0 and TRCVICTLR.EVENT.SEL == n.
- TRCVICTLR.EVENT.TYPE == 1 and TRCVICTLR.EVENT.SEL == n/2.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCRSR, Trace Resources Status Register

The TRCRSR characteristics are:

Purpose

Use this to set, or read, the status of the resources.

Configuration

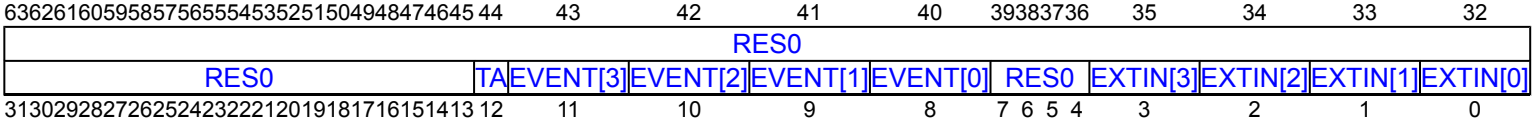
AArch64 System register TRCRSR bits [31:0] are architecturally mapped to External register TRCRSR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCRSR are UNDEFINED.

Attributes

TRCRSR is a 64-bit register.

Field descriptions



Bits [63:13]

Reserved, RES0.

TA, bit [12]

Tracing active.

TA	Meaning
0b0	Tracing is not active.
0b1	Tracing is active.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

EVENT[<m>], bit [m+8], for m = 3 to 0

Untraced status of ETEEvents.

EVENT[<m>]	Meaning
0b0	An ETEEvent <m> has not occurred.
0b1	An ETEEvent <m> has occurred while the resources were in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When TRCIDR4.NUMRSPAIR == 0b0000, access to this field is **RES0**.

- Access to this field is **RES0** if all the following are true:
    - TRCIDR4.NUMRSPAIR != 0b0000.
    - m > UInt(TRCIDR0.NUMEVENT).
- Otherwise, access to this field is **RW**.

Bits [7:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

The sticky status of the External Input Selectors.

EXTIN[<m>]	Meaning
0b0	An event selected by External Input Selector <m> has not occurred.
0b1	At least one event selected by External Input Selector <m> has occurred while the resources were in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR5.NUMEXTINSEL), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Accessing TRCRSR

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCRSR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1010	0b000

```

TRCSEQEVR<n>, Trace Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

Purpose

Moves the Sequencer state:

- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

Configuration

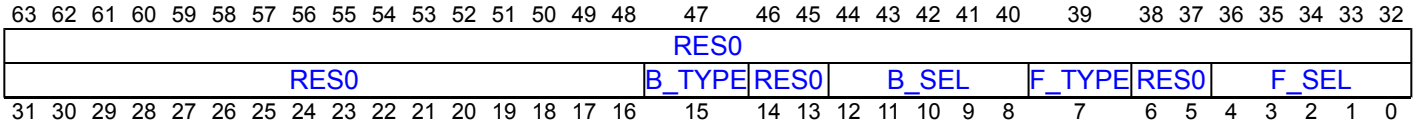
AArch64 System register TRCSEQEVR<n> bits [31:0] are architecturally mapped to External register TRCSEQEVR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQEVR<n> are UNDEFINED.

Attributes

TRCSEQEVR<n> is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

B_TYPE, bit [15]

Backward field. Selects an event that causes the Sequencer to move from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == `0x14` then when event `0x14` occurs, the Sequencer moves from state 3 to state 2.

Chooses the type of Resource Selector.

B_TYPE	Meaning
`0b0`	A single Resource Selector. TRCSEQEVR<n>.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
`0b1`	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.B.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

B_SEL, bits [12:8]

Backward field. Selects an event that causes the Sequencer to move from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == `0x14` then when event `0x14` occurs, the Sequencer moves from state 3 to state 2.

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]

Forward field. Selects an event that causes the Sequencer to move from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == `0x12` then when event `0x12` occurs, the Sequencer moves from state 1 to state 2.

Chooses the type of Resource Selector.

F_TYPE	Meaning
`0b0`	A single Resource Selector. TRCSEQEVR<n>.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
`0b1`	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.F.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

F_SEL, bits [4:0]

Forward field. Selects an event that causes the Sequencer to move from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == `0x12` then when event `0x12` occurs, the Sequencer moves from state 1 to state 2.

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQEVR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCSEQEVR<m> ; Where m = 0-2
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b00:m[1:0]	0b100

TRCSEQRSTEVR, Trace Sequencer Reset Control Register

The TRCSEQRSTEVR characteristics are:

Purpose

Moves the Sequencer to state 0 when a programmed resource event occurs.

Configuration

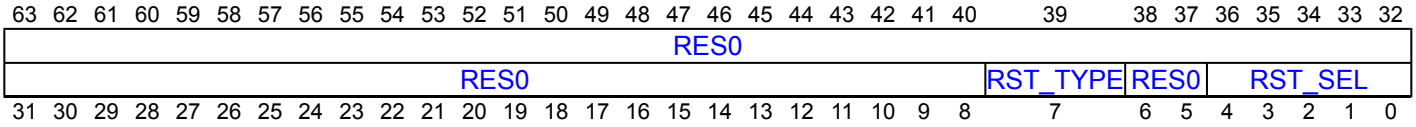
AArch64 System register TRCSEQRSTEVR bits [31:0] are architecturally mapped to External register TRCSEQRSTEVR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQRSTEVR are UNDEFINED.

Attributes

TRCSEQRSTEVR is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

RST_TYPE, bit [7]

Reset field. Selects an event that causes the Sequencer to move to state 0.

Chooses the type of Resource Selector.

RST_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQRSTEVR.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQRSTEVR.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEVR.RST.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

RST_SEL, bits [4:0]

Reset field. Selects an event that causes the Sequencer to move to state 0.

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQRSTEVR.RST.TYPE controls whether TRCSEQRSTEVR.RST.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQRSTEVR

Must be programmed if TRCRSCTLR<a>.GROUP == `0b0010` and TRCRSCTLR<a>.SEQUENCER != `0b0000`.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQSTR, Trace Sequencer State Register

The TRCSEQSTR characteristics are:

Purpose

Use this to set, or read, the Sequencer state.

Configuration

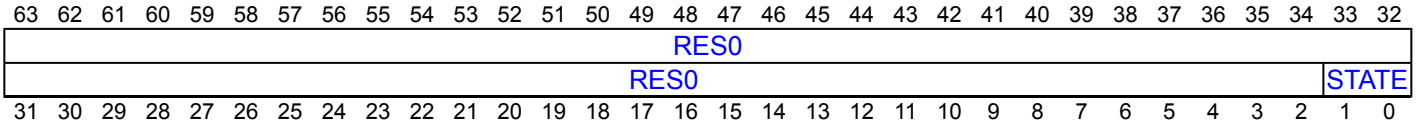
AArch64 System register TRCSEQSTR bits [31:0] are architecturally mapped to External register TRCSEQSTR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQSTR are UNDEFINED.

Attributes

TRCSEQSTR is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

STATE, bits [1:0]

Set or returns the state of the Sequencer.

STATE	Meaning
0b00	State 0.
0b01	State 1.
0b10	State 2.
0b11	State 3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQSTR

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSEQSTR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0111	0b100

TRCSSCCR<n>, Trace Single-shot Comparator Control Register <n>, n = 0 - 7

The TRCSSCCR<n> characteristics are:

Purpose

Controls the corresponding Single-shot Comparator Control resource.

Configuration

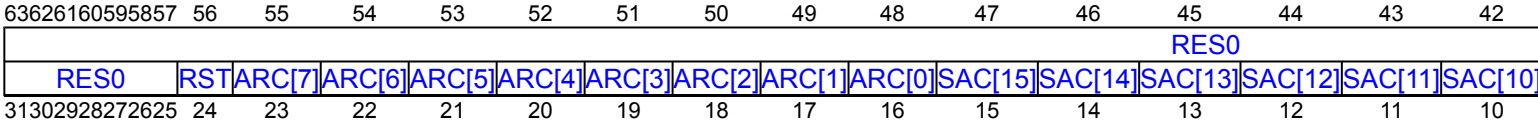
AArch64 System register TRCSSCCR<n> bits [31:0] are architecturally mapped to External register TRCSSCCR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMSSCC) > n. Otherwise, direct accesses to TRCSSCCR<n> are UNDEFINED.

Attributes

TRCSSCCR<n> is a 64-bit register.

Field descriptions



Bits [63:25]

Reserved, RES0.

RST, bit [24]

Selects the Single-shot Comparator Control mode.

RST	Meaning
0b0	The Single-shot Comparator Control is in single-shot mode.
0b1	The Single-shot Comparator Control is in multi-shot mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

ARC[<m>], bit [m+16], for m = 7 to 0

Selects one or more Address Range Comparators for Single-shot control.

ARC[<m>]	Meaning
0b0	The Address Range Comparator <m>, is not selected for Single-shot control.
0b1	The Address Range Comparator <m>, is selected for Single-shot control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators for Single-shot control.

SAC[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected for Single-shot control.
0b1	The Single Address Comparator <m>, is selected for Single-shot control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS) * 2, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Accessing TRCSSCCR<n>

Must be programmed if any TRCRSCTLR<a>.GROUP == 0b0011 and TRCRSCTLR<a>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCSSCCR<m> ; Where m = 0-7
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0001	0b0:m[2:0]	0b010

TRCSSCSR<n>, Trace Single-shot Comparator Control Status Register <n>, n = 0 - 7

The TRCSSCSR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

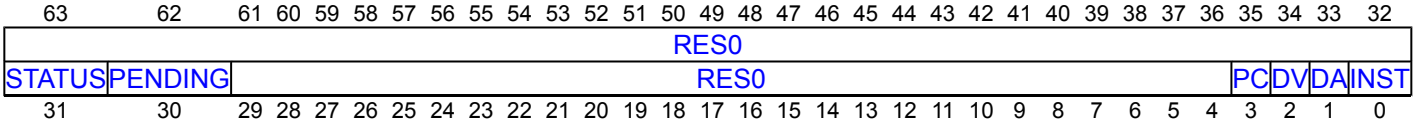
AArch64 System register TRCSSCSR<n> bits [31:0] are architecturally mapped to External register TRCSSCSR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMSSCC) > n. Otherwise, direct accesses to TRCSSCSR<n> are UNDEFINED.

Attributes

TRCSSCSR<n> is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

STATUS, bit [31]

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by TRCSSCCR<n>.ARC, TRCSSCCR<n>.SAC, and TRCSSPCICR<n>.PC.

STATUS	Meaning
0b0	No match has occurred. When the first match occurs, this field takes a value of 1. It remains at 1 until explicitly modified by a write to this register.
0b1	One or more matches has occurred. If TRCSSCCR<n>.RST == 0 then: • There is only one match and no more matches are possible. • Software must reset this field to 0 to re-enable the Single-shot Comparator Control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

PENDING, bit [30]

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.

PENDING	Meaning
0b0	No match has occurred.
0b1	One or more matches has occurred.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [29:4]

Reserved, RES0.

PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

PC	Meaning
0b0	This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR<n> results in CONSTRAINED UNPREDICTABLE behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match.
0b1	This Single-shot Comparator Control supports PE Comparator Inputs.

Access to this field is **RO**.

DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DV	Meaning
0b0	This Single-shot Comparator Control does not support data value comparisons.
0b1	This Single-shot Comparator Control supports data value comparisons.

This field reads as 0.

Access to this field is **RO**.

DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DA	Meaning
0b0	This Single-shot Comparator Control does not support data address comparisons.
0b1	This Single-shot Comparator Control supports data address comparisons.

This field reads as 0.

Access to this field is **RO**.

INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.

INST	Meaning
0b0	This Single-shot Comparator Control does not support instruction address comparisons.
0b1	This Single-shot Comparator Control supports instruction address comparisons.

This field reads as 1.

Access to this field is **RO**.

Accessing TRCSSCSR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0011 and TRCRSCTLR<a>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCSSCSR<m> ; Where m = 0-7
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0001	0b1:m[2:0]	0b010

TRCSSPCICR<n>, Trace Single-shot Processing Element Comparator Input Control Register <n>, n = 0 - 7

The TRCSSPCICR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

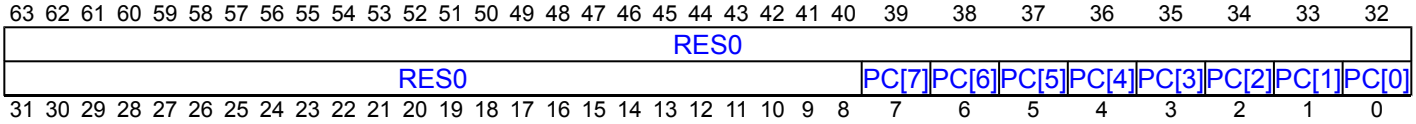
AArch64 System register TRCSSPCICR<n> bits [31:0] are architecturally mapped to External register TRCSSPCICR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, UInt(TRCIDR4.NUMSSCC) > n, UInt(TRCIDR4.NUMPC) > 0, and TRCSSCSR<n>.PC == 1. Otherwise, direct accesses to TRCSSPCICR<n> are UNDEFINED.

Attributes

TRCSSPCICR<n> is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

PC[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs for Single-shot control.

PC[<m>]	Meaning
0b0	The single PE Comparator Input <m>, is not selected as for Single-shot control.
0b1	The single PE Comparator Input <m>, is selected as for Single-shot control.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSPCICR<n>

Must be programmed if implemented and any TRCRSCTLR<a>.GROUP == 0b0011 and TRCRSCTLR<a>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCSSPCICR<m> ; Where m = 0-7
```

TRCSTALLCTLR, Trace Stall Control Register

The TRCSTALLCTLR characteristics are:

Purpose

Enables trace unit functionality that prevents trace unit buffer overflows.

Configuration

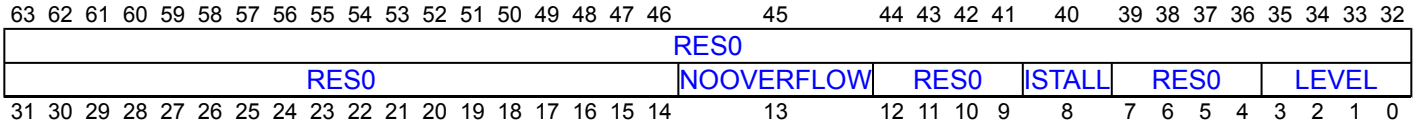
AArch64 System register TRCSTALLCTLR bits [31:0] are architecturally mapped to External register TRCSTALLCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR3.STALLCTL == 1. Otherwise, direct accesses to TRCSTALLCTLR are UNDEFINED.

Attributes

TRCSTALLCTLR is a 64-bit register.

Field descriptions



Bits [63:14]

Reserved, RES0.

NOOVERFLOW, bit [13]

When TRCIDR3.NOOVERFLOW == 1:

Trace overflow prevention.

NOOVERFLOW	Meaning
0b0	Trace unit buffer overflow prevention is disabled.
0b1	Trace unit buffer overflow prevention is enabled.

Note

Enabling this feature might cause a significant performance impact.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

ISTALL	Meaning
0b0	The trace unit must not stall the PE.
0b1	The trace unit can stall the PE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

LEVEL, bits [3:0]

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

The value 0b0000 defines the Minimal invasion level. This setting has a greater risk of a trace unit buffer overflow.

The value 0b1111 defines the Maximum invasion level. This setting has a reduced risk of a trace unit buffer overflow.

Note

For some implementations, invasion might occur at the minimal invasion level.

One or more of the least significant bits of LEVEL are permitted to be RES0. Arm recommends that LEVEL[3:2] are fully implemented. Arm strongly recommends that LEVEL[3] is always implemented. If one or more bits are RES0 and are written with a nonzero value, the effective value of LEVEL is rounded down to the nearest power of 2 value which has the RES0 bits as zero. For example, if LEVEL[1:0] are RES0 and a value of 0b1110 is written to LEVEL, the effective value of LEVEL is 0b1100.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSTALLCTLR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCSTALLCTLR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1011	0b000

TRCSTATR, Trace Status Register

The TRCSTATR characteristics are:

Purpose

Returns the trace unit status.

Configuration

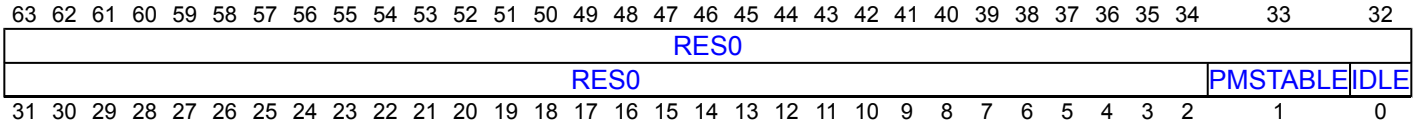
AArch64 System register TRCSTATR bits [31:0] are architecturally mapped to External register TRCSTATR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCSTATR are UNDEFINED.

Attributes

TRCSTATR is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

PMSTABLE, bit [1]

Programmers' model stable.

PMSTABLE	Meaning
0b0	The programmers' model is not stable.
0b1	The programmers' model is stable.

Accessing this field has the following behavior:

- When the trace unit is enabled, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

IDLE, bit [0]

Idle status.

IDLE	Meaning
0b0	The trace unit is not idle.
0b1	The trace unit is idle.

Accessing TRCSTATR

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCSTATR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0011	0b000

```
if !(IsFeatureImplemented(FEAT_ETE) && IsFeatureImplemented(FEAT_TRC_SR)) then

TRCSYNCPR, Trace Synchronization Period Register

The TRCSYNCPR characteristics are:

Purpose

Controls how often trace protocol synchronization requests occur.

Configuration

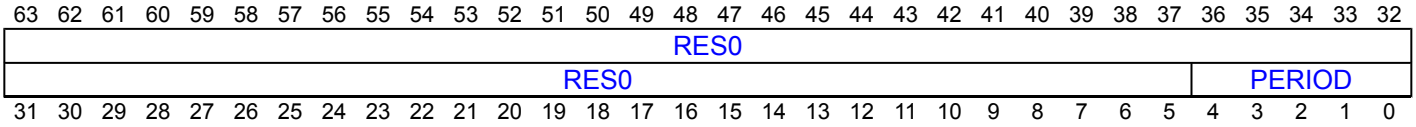
AArch64 System register TRCSYNCPR bits [31:0] are architecturally mapped to External register TRCSYNCPR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCSYNCPR are UNDEFINED.

Attributes

TRCSYNCPR is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

PERIOD, bits [4:0]

Defines the number of bytes of trace between each periodic trace protocol synchronization request.

PERIOD	Meaning
0b00000	Trace protocol synchronization is disabled.
0b01000	Trace protocol synchronization request occurs after 2^8 bytes of trace.
0b01001	Trace protocol synchronization request occurs after 2^9 bytes of trace.
0b01010	Trace protocol synchronization request occurs after 2^{10} bytes of trace.
0b01011	Trace protocol synchronization request occurs after 2^{11} bytes of trace.
0b01100	Trace protocol synchronization request occurs after 2^{12} bytes of trace.
0b01101	Trace protocol synchronization request occurs after 2^{13} bytes of trace.
0b01110	Trace protocol synchronization request occurs after 2^{14} bytes of trace.
0b01111	Trace protocol synchronization request occurs after 2^{15} bytes of trace.
0b10000	Trace protocol synchronization request occurs after 2^{16} bytes of trace.
0b10001	Trace protocol synchronization request occurs after 2^{17} bytes of trace.
0b10010	Trace protocol synchronization request occurs after 2^{18} bytes of trace.
0b10011	Trace protocol synchronization request occurs after 2^{19} bytes of trace.
0b10100	Trace protocol synchronization request occurs after 2^{20} bytes of trace.

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.

- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSYNCPR

Must be programmed if TRCIDR3.SYNCPR == 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCSYNCPR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1101	0b000

```

TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR characteristics are:

Purpose

Sets the trace ID for instruction trace.

Configuration

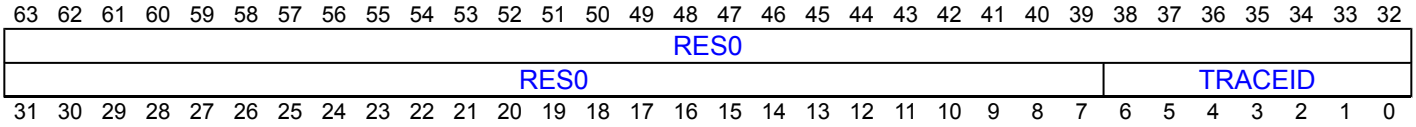
AArch64 System register TRCTRACEIDR bits [31:0] are architecturally mapped to External register TRCTRACEIDR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCTRACEIDR are UNDEFINED.

Attributes

TRCTRACEIDR is a 64-bit register.

Field descriptions



Bits [63:7]

Reserved, RES0.

TRACEID, bits [6:0]

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of TRCIDR5.TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCTRACEIDR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCTRACEIDR

op0	op1	CRn	CRm	op2

TRCTSCTLR, Trace Timestamp Control Register

The TRCTSCTLR characteristics are:

Purpose

Controls the insertion of global timestamps in the trace stream.

Configuration

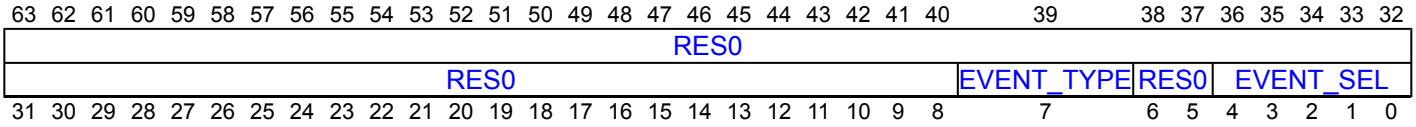
AArch64 System register TRCTSCTLR bits [31:0] are architecturally mapped to External register TRCTSCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR0.TSSIZE != 0b00000. Otherwise, direct accesses to TRCTSCTLR are UNDEFINED.

Attributes

TRCTSCTLR is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

EVENT_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCTSCTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCTSCTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTLR.EVENT.TYPE controls whether TRCTSCTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCTSCTLR

Must be programmed if TRCCONFIGR.TS == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

TRCVICTLR, Trace ViewInst Main Control Register

The TRCVICTLR characteristics are:

Purpose

Controls instruction trace filtering.

Configuration

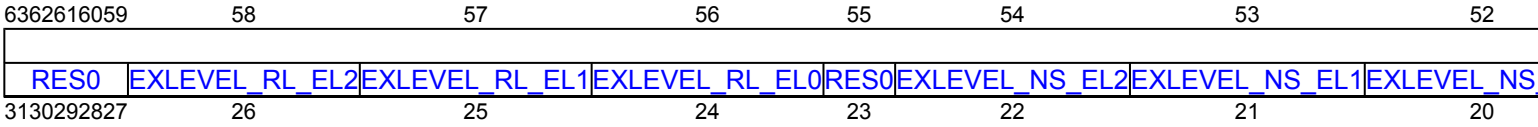
AArch64 System register TRCVICTLR bits [31:0] are architecturally mapped to External register TRCVICTLR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCVICTLR are UNDEFINED.

Attributes

TRCVICTLR is a 64-bit register.

Field descriptions



Bits [63:27]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [26]

When FEAT_RME is implemented:

Filter instruction trace for EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit does not generate instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit generates instruction trace for EL2 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [25]

When FEAT_RME is implemented:

Filter instruction trace for EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [24]

When FEAT_RME is implemented:

Filter instruction trace for EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit generates instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit does not generate instruction trace for EL0 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit does not generate instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit generates instruction trace for EL0 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

When Non-secure EL2 is implemented:

Filter instruction trace for EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]

When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [20]

When Non-secure EL0 is implemented:

Filter instruction trace for EL0 in Non-secure state.

EXLEVEL_NS_EL0	Meaning
0b0	The trace unit generates instruction trace for EL0 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL0 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]

When EL3 is implemented:

Filter instruction trace for EL3.

EXLEVEL_S_EL3	Meaning
0b0	The trace unit generates instruction trace for EL3.
0b1	The trace unit does not generate instruction trace for EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]
When Secure EL2 is implemented:

Filter instruction trace for EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [17]
When Secure EL1 is implemented:

Filter instruction trace for EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [16]
When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

EXLEVEL_S_EL0	Meaning
0b0	The trace unit generates instruction trace for EL0 in Secure state.
0b1	The trace unit does not generate instruction trace for EL0 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:12]

Reserved, RES0.

TRCERR, bit [11]

When TRCIDR3.TRCERR == 1:

Controls the forced tracing of System Error exceptions.

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is disabled.
0b1	Forced tracing of System Error exceptions is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

TRCRESET	Meaning
0b0	Forced tracing of PE Resets is disabled.
0b1	Forced tracing of PE Resets is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

SSSTATUS	Meaning
0b0	Stopped State. The ViewInst start/stop function is in the stopped state.
0b1	Started State. The ViewInst start/stop function is in the started state.

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing TRCPRGCTLR.EN or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RES1** if all the following are true:
  - TRCIDR4.NUMACPAIRS == 0b0000.
  - TRCIDR4.NUMPC == 0b0000.

- Otherwise, access to this field is **RW**.

Bit [8]

Reserved, RES0.

EVENT_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

Bits[4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

EVENT_SEL, bits [4:0] of bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == 0b0000:

Reserved, bits [4:0] of bits [4:0]

This field is reserved:

- Bits [4:1] are RES0.

- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

Accessing TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCVICTLR
```

TRCVIIECTLR, Trace ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

Purpose

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

Configuration

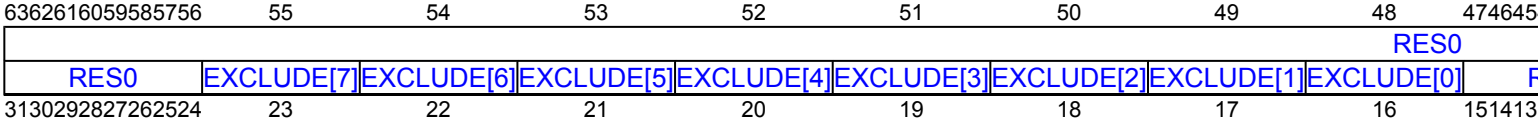
AArch64 System register TRCVIIECTLR bits [31:0] are architecturally mapped to External register TRCVIIECTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCVIIECTLR are UNDEFINED.

Attributes

TRCVIIECTLR is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

EXCLUDE[<m>], bit [m+16], for m = 7 to 0

Exclude Address Range Comparator <m>. Selects whether Address Range Comparator <m> is in use with the ViewInst exclude function.

EXCLUDE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected for the ViewInst exclude function.
0b1	The address range that Address Range Comparator <m> defines, is selected for the ViewInst exclude function.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Bits [15:8]

Reserved, RES0.

INCLUDE[<m>], bit [m], for m = 7 to 0

Include Address Range Comparator <m>.

Selects whether Address Range Comparator <m> is in use with the ViewInst include function.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

INCLUDE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected for the ViewInst include function.
0b1	The address range that Address Range Comparator <m> defines, is selected for the ViewInst include function.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Accessing TRCVIIECTLR

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCVIIECTLR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0001	0b010

```

TRCVIPCSSCTLR, Trace ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTLR characteristics are:

Purpose

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

Configuration

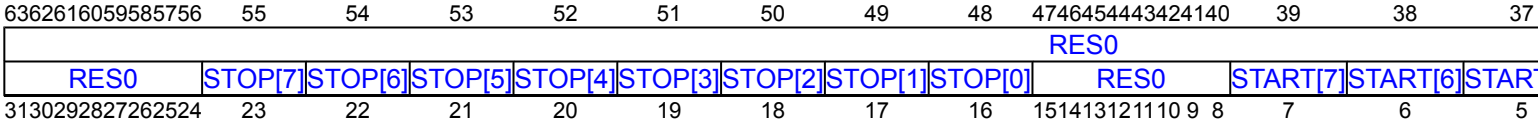
AArch64 System register TRCVIPCSSCTLR bits [31:0] are architecturally mapped to External register TRCVIPCSSCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMPC) > 0. Otherwise, direct accesses to TRCVIPCSSCTLR are UNDEFINED.

Attributes

TRCVIPCSSCTLR is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

STOP[<m>], bit [m+16], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with the ViewInst start/stop function for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The PE Comparator Input <m> is not selected as a stop resource.
0b1	The PE Comparator Input <m> is selected as a stop resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMPC), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Bits [15:8]

Reserved, RES0.

START[<m>], bit [m], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with the ViewInst start/stop function for the purpose of starting trace.

START[<m>]	Meaning
0b0	The PE Comparator Input <m> is not selected as a start resource.
0b1	The PE Comparator Input <m> is selected as a start resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMPC), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Accessing TRCVIPCSSCTLR

Must be programmed if TRCIDR4.NUMPC != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCVIPCSSCTLR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0011	0b010

TRCVISSCTLR, Trace ViewInst Start/Stop Control Register

The TRCVISSCTLR characteristics are:

Purpose

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

Configuration

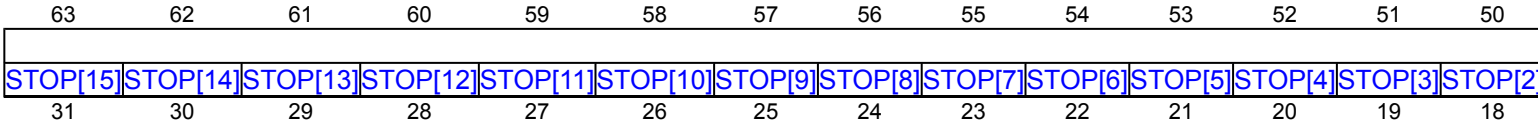
AArch64 System register TRCVISSCTLR bits [31:0] are architecturally mapped to External register TRCVISSCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCVISSCTLR are UNDEFINED.

Attributes

TRCVISSCTLR is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

STOP[<m>], bit [m+16], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The Single Address Comparator <m> is not selected as a stop resource.
0b1	The Single Address Comparator <m> is selected as a stop resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS) * 2, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

START[<m>], bit [m], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function for the purpose of starting trace.

START[<m>]	Meaning
0b0	The Single Address Comparator <m> is not selected as a start resource.
0b1	The Single Address Comparator <m> is selected as a start resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS) * 2, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Accessing TRCVISSCTLR

Must be programmed if TRCIDR4.NUMACPAIRS > `0b0000`.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCVISSCTLR
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0010	0b010

TRCVMIDCCTLR0, Trace Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCCTLR0 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<n> registers, where n=0-3.

Configuration

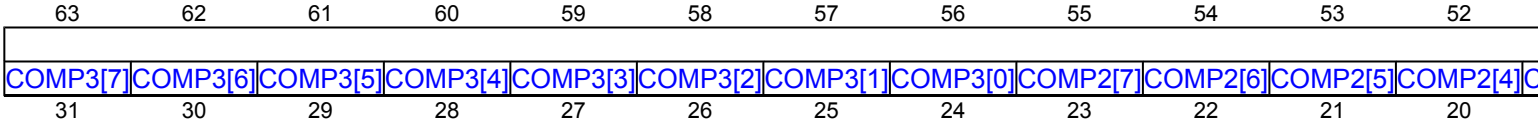
AArch64 System register TRCVMIDCCTLR0 bits [31:0] are architecturally mapped to External register TRCVMIDCCTLR0[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, UInt(TRCIDR4.NUMVMIDC) > 0x0, and UInt(TRCIDR2.VMIDSIZE) > 0. Otherwise, direct accesses to TRCVMIDCCTLR0 are UNDEFINED.

Attributes

TRCVMIDCCTLR0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

COMP3[<m>], bit [m+24], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 3:

TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 2:

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLR0

If software uses the TRCVMIDCVR<n> registers, where n=0-3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCVMIDCVR<n> to `0x00`.

If any bit is 1 and the relevant byte in TRCVMIDCVR<n> is not `0x00`, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCVMIDCCTLR0
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	0b0010	0b010

```

TRCVMIDCCTLR1, Trace Virtual Context Identifier Comparator Control Register 1

The TRCVMIDCCTLR1 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<n> registers, where n=4-7.

Configuration

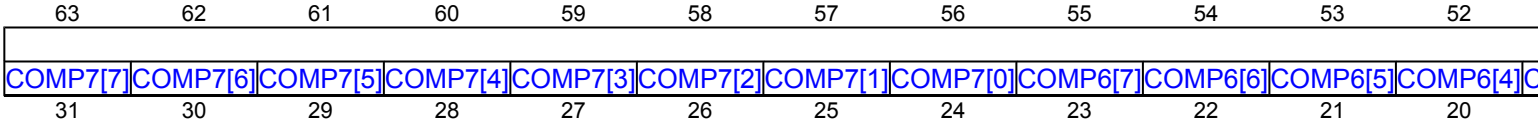
AArch64 System register TRCVMIDCCTLR1 bits [31:0] are architecturally mapped to External register TRCVMIDCCTLR1[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, UInt(TRCIDR4.NUMVMIDC) > 0x4, and UInt(TRCIDR2.VMIDSIZE) > 0. Otherwise, direct accesses to TRCVMIDCCTLR1 are UNDEFINED.

Attributes

TRCVMIDCCTLR1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

COMP7[<m>], bit [m+24], for m = 7 to 0

When UInt(TRCIDR4.NUMVMIDC) > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 6:

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLR1

If software uses the TRCVMIDCVR<n> registers, where n=4-7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCVMIDCVR<n> to `0x00`.

If any bit is 1 and the relevant byte in TRCVMIDCVR<n> is not `0x00`, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCVMIDCCTLR1
```

TRCVMIDCVR<n>, Trace Virtual Context Identifier Comparator Value Register <n>, n = 0 - 7

The TRCVMIDCVR<n> characteristics are:

Purpose

Contains the Virtual Context Identifier Comparator value.

Configuration

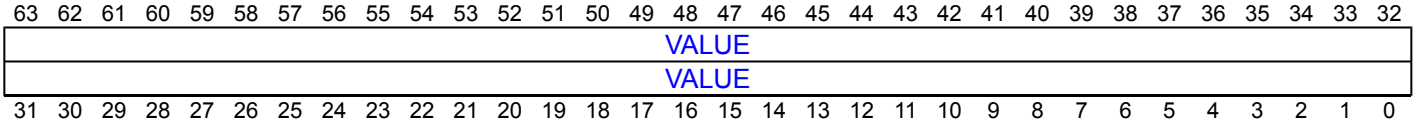
AArch64 System register TRCVMIDCVR<n> bits [63:0] are architecturally mapped to External register TRCVMIDCVR<n>[63:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMVMIDC) > n. Otherwise, direct accesses to TRCVMIDCVR<n> are UNDEFINED.

Attributes

TRCVMIDCVR<n> is a 64-bit register.

Field descriptions



VALUE, bits [63:0]

Virtual context identifier value. The width of this field is indicated by TRCIDR2.VMIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier .

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVMIDCVR<n>

Must be programmed if any of the following are true:

- TRCRSCTLR<a>.GROUP == 0b0111 and TRCRSCTLR<a>.VMID[n] == 1.
- TRCACATR<a>.CONTEXTTYPE == 0b10 or 0b11 and TRCACATR<a>.CONTEXT == n.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRCVMIDCVR<m> ; Where m = 0-7
```

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	m[2:0]:0b0	0b001

```
integer m = UInt(CRm<3:1>);

TRFCR_EL1, Trace Filter Control Register (EL1)

The TRFCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Trace.

Configuration

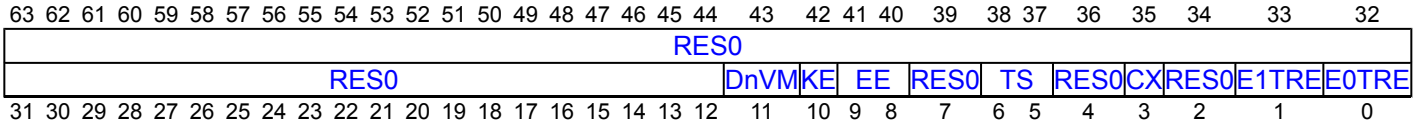
AArch64 System register TRFCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TRFCR[31:0].

This register is present only when FEAT_TRF is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TRFCR_EL1 are UNDEFINED.

Attributes

TRFCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

DnVM, bit [11]

When FEAT_TRBEv1p1 is implemented and FEAT_NV is implemented:

Reserved for software use in nested virtualization. See also TRFCR_EL2.DnVM.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

KE, bit [10]

When FEAT_TRBE_EXC is implemented:

Kernel exception enable for TRBE Profiling exceptions taken to EL1.

KE	Meaning
0b0	TRBE Profiling exceptions taken to EL1 are always masked at EL1.
0b1	Enabled TRBE Profiling exceptions taken to EL1 are masked at EL1 when PSTATE.PM is 1 and unmasked when PSTATE.PM is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bits [9:8]

When FEAT_TRBE_EXC is implemented:

Exception Enable.

EE	Meaning	Applies when
0b00	Disabled. TRBE Profiling exceptions for EL1 are disabled. All of the following apply: • Unless enabled by a higher Exception level, TRBE Profiling exceptions are not generated. • TRBSR_EL1.IRQ drives the interrupt request signal **TRBIRQ**. • Accesses to TRBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1.	
0b01	Reserved for software use in nested virtualization. Behaves as 0b00 for the purpose of controlling the TRBE Profiling exception and interrupt request signal **TRBIRQ**, and as 0b11 for the purpose of accesses to TRBSR_EL1.	When FEAT_NV is implemented
0b10	Reserved for software use in nested virtualization. Behaves as 0b11 for the purposes of controlling the TRBE Profiling exception and interrupt request signal **TRBIRQ**, and accesses to TRBSR_EL1.	When FEAT_NV is implemented
0b11	Enabled. TRBE Profiling exceptions for EL1 are enabled, as follows: • All trace buffer management events are recorded in TRBSR_EL1, unless they are configured to be recorded in TRBSR_EL3 by MDCR_EL3.TRBEE or TRBSR_EL2 by TRFCR_EL2.EE. • TRBE Profiling exceptions are generated and taken to EL1 when unmasked and TRBSR_EL1.IRQ is 1, unless the Effective value of HCR_EL2.TGE is 1, in which case the exception is taken to EL2. • The interrupt request signal **TRBIRQ** is not asserted.	

For more information on the values reserved for software use in nested virtualization, see TRFCR_EL2.EE.

If the Effective value of TRFCR_EL2.EE is 0b00, then the Effective value of TRFCR_EL1.EE is 0b00.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b00	Reserved for software use in nested virtualization. Behaves as 0b01. See also TRFCR_EL2.TS,	When FEAT_NV2p1 is implemented
0b01	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF_EL2.	
0b10	Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, then the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • SCR_EL3.ECVEn == 0. • CNTHCTL_EL2.ECV == 0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved.

If any of the following are true, then this field is ignored by the PE:

- EL2 is implemented and TRFCR_EL2.TS is not 0b00.
- SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RES0.

CX, bit [3]

When FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization. See also TRFCR_EL2.CX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

E1TRE	Meaning
0b0	Trace is prohibited at EL1.
0b1	Trace is allowed at EL1.

If any of the following are true, then this field is ignored by the PE:

- SelfHostedTraceEnabled() == FALSE.
- The Effective value of HCR_EL2.TGE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0TRE, bit [0]

EL0 Trace Enable.

E0TRE	Meaning
0b0	Trace is prohibited at EL0.
0b1	Trace is allowed at EL0.

If any of the following are true, then this field is ignored by the PE:

- SelfHostedTraceEnabled() == FALSE.
- The Effective value of HCR_EL2.TGE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRFCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TRFCR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0010	0b001

TRFCR_EL2, Trace Filter Control Register (EL2)

The TRFCR_EL2 characteristics are:

Purpose

Provides EL2 controls for Trace.

Configuration

AArch64 System register TRFCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTRFCR[31:0].

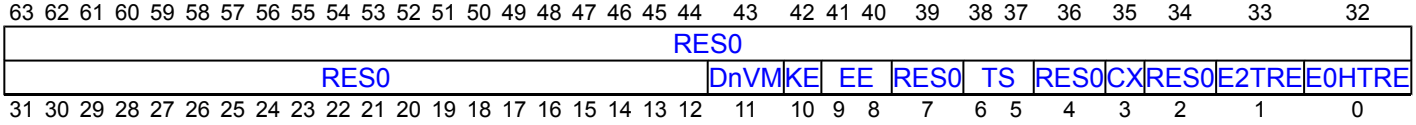
This register is present only when FEAT_TRF is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TRFCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TRFCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

DnVM, bit [11]

When FEAT_TRBEv1p1 is implemented:

Disable use of physical address trace buffer pointers.

DnVM	Meaning
0b0	Use of physical address trace buffer pointers is permitted.
0b1	Use of physical address trace buffer pointers is disabled. The PE behaves as if TRBLIMITR_EL1.nVM is 0.

If EL2 is disabled in the owning Security state, or the trace buffer owning Exception level is EL2, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

KE, bit [10]

When FEAT_TRBE_EXC is implemented:

Kernel exception enable for TRBE Profiling exceptions taken to EL2.

KE	Meaning
0b0	TRBE Profiling exceptions taken to EL2 are always masked at EL2.
0b1	Enabled TRBE Profiling exceptions taken to EL2 are masked at EL2 when PSTATE.PM is 1 and unmasked when PSTATE.PM is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bits [9:8]

When FEAT_TRBE_EXC is implemented:

Exception Enable.

EE	Meaning
0b00	Disabled. TRBE Profiling exceptions for EL2 and EL1 are disabled. All of the following apply: • No trace buffer management events are recorded in TRBSR_EL2. • Unless enabled by a higher Exception level, TRBE Profiling exceptions are not generated. • TRBSR_EL1.IRQ drives the interrupt request signal **TRBIRQ**. • Accesses to TRBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1 and accesses to TRBSR_EL1 at EL2 ignore the value of HCR_EL2.E2H.
0b01	Delegated. TRBE Profiling exceptions for EL2 are disabled, but might be enabled for EL1 by TRFCR_EL1.EE. All of the following apply: • No trace buffer management events are recorded in TRBSR_EL2. • TRBSR_EL2.IRQ is ignored and TRBE Profiling exceptions are not taken to EL2, other than for the case when the Effective value of HCR_EL2.TGE is 1.
0b10	Enabled. TRBE Profiling exceptions for EL2 are enabled for trace buffer management events targeting EL2, as follows: • Trace buffer management events due to a fault on a write to the trace buffer that would generate a Data Abort exception taken to EL2 if generated by a store instruction executed at the owning Exception level are recorded in TRBSR_EL2, unless they are configured to be recorded in TRBSR_EL3 by MDCR_EL3.TRBEE. If the trace buffer owning Exception level is EL2, then this means any fault on a write to the trace buffer. If the trace buffer owning Exception level is EL1, then this means any of the following faults on a write to the trace buffer: ◦ Stage 2 faults. ◦ If HCR_EL2.TEA is 1, synchronous External aborts. ◦ If HCR_EL2.GPF is 1, Granule Protection Faults (GPFs). • Trace buffer management events due to Granule Protection Check faults other than GPFs on a write to the trace buffer are recorded in TRBSR_EL2, unless they are configured to be recorded in TRBSR_EL3 by MDCR_EL3.TRBEE. • TRBE Profiling exceptions are generated and taken to EL2 when unmasked and TRBSR_EL2.IRQ is 1.
0b11	Trap all. TRBE Profiling exceptions for EL2 are enabled for all trace buffer management events, as follows: • All trace buffer management events are recorded in TRBSR_EL2, unless they are configured to be recorded in TRBSR_EL3 by MDCR_EL3.TRBEE. • TRBE Profiling exceptions are generated and taken to EL2 when unmasked and TRBSR_EL2.IRQ is 1.

If the Effective value of MDCR_EL3.TRBEE is 0b00, then the Effective value of TRFCR_EL2.EE is 0b00. Otherwise, if EL2 is not implemented or the Effective value of SCR_EL3.{NS, EEL2} is {0, 0}, then the Effective value of TRFCR_EL2.EE is 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b00	Timestamp controlled by TRFCR_EL1.TS or TRFCR.TS.	
0b01	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF_EL2.	
0b10	Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • SCR_EL3.ECVEn == 0. • CNTHCTL_EL2.ECV == 0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

If SelfHostedTraceEnabled() == FALSE, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

Bit [4]

Reserved, RES0.

CX, bit [3]

CONTEXTIDR_EL2 and VMID trace enable.

CX	Meaning
0b0	CONTEXTIDR_EL2 and VMID trace prohibited.
0b1	CONTEXTIDR_EL2 and VMID trace allowed.

If SelfHostedTraceEnabled() == FALSE, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.

E2TRE	Meaning
0b0	Trace is prohibited at EL2.
0b1	Trace is allowed at EL2.

If SelfHostedTraceEnabled() == FALSE, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0HTRE, bit [0]

EL0 Trace Enable.

E0HTRE	Meaning
0b0	Trace is prohibited at EL0.
0b1	Trace is allowed at EL0.

If any of the following are true, then this field is ignored by the PE:

- SelfHostedTraceEnabled() == FALSE.
- The Effective value of HCR_EL2.TGE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRFCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR0[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TTBR0_EL1 are UNDEFINED.

TTBR0_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

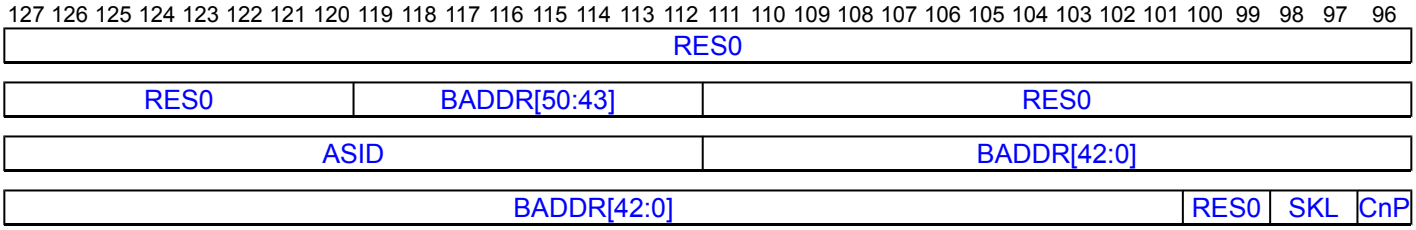
Attributes

TTBR0_EL1 is a:

- 128-bit register when FEAT_D128 is implemented and TCR2_EL1.D128 == 1
- 64-bit register when FEAT_D128 is not implemented or TCR2_EL1.D128 == 0

Field descriptions

When FEAT_D128 is implemented and TCR2_EL1.D128 == 1:



Bits [127:88]

Reserved, RES0.

BADDR, bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is TTBR0_EL1[87:80].
- BADDR[42:0] is TTBR0_EL1[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR0_EL1.

This determines the number of levels to be skipped from the regular start level of the stage 1 EL1&0 translation table walks using TTBR0_EL1.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR0_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

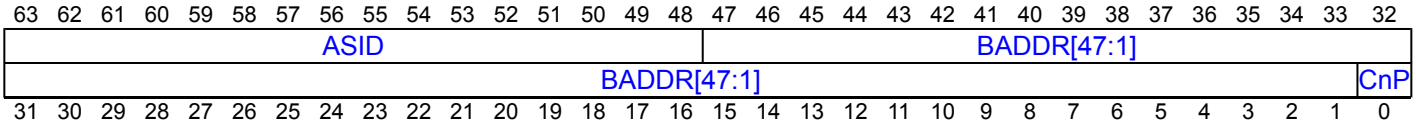
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL1.D128 == 0:



ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T0SZ, the translation stage, and the translation granule size.

If the value of TCR_EL1.IPS is not `0b110`, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are `0b0000`.

The BADDR field represents a 52-bit address if one of the following applies:

- FEAT_LPA is implemented, the 64KB granule size is in use, and the value of TCR_EL1.IPS is `0b110`.
- FEAT_LPA2 is implemented, the 4KB or 16KB granule size is in use, and the Effective value of TCR_EL1.DS is 1.
- FEAT_D128 is implemented, 56-bit PAs are supported, the 64KB granule size is in use, and the value of TCR2_EL1.D128 is 0.

When TTBR0_EL1.BADDR represents a 52-bit addresses, all of the following apply:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- The smallest permitted value of x is 6.
- When x>6, register bits[(x-1):6] are RES0.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

For the 64KB granule, if FEAT_LPA is not implemented, and the value of TCR_EL1.IPS is `0b110`, one the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

CnP	Meaning
`0b0`	The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
`0b1`	The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR0_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TTBR0_EL1

TTBR0_EL2, Translation Table Base Register 0 (EL2)

The TTBR0_EL2 characteristics are:

Purpose

When the Effective value of HCR_EL2.E2H is not 1, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When the Effective value of HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL2 bits [47:0] are architecturally mapped to AArch32 System register HTTBR[47:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TTBR0_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

TTBR0_EL2 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

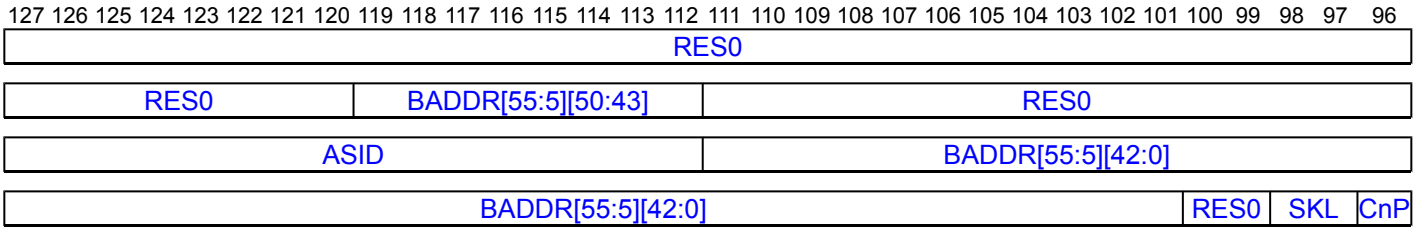
Attributes

TTBR0_EL2 is a:

- 128-bit register when FEAT_D128 is implemented, TCR2_EL2.D128 == 1, and ELIsInHost(EL2)
- 64-bit register when FEAT_D128 is not implemented or TCR2_EL2.D128 == 0

Field descriptions

When FEAT_D128 is implemented, TCR2_EL2.D128 == 1, and ELIsInHost(EL2):



Bits [127:88]

Reserved, RES0.

BADDR[55:5], bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR[55:5] field is split as follows:

- BADDR[55:5][50:43] is TTBR0_EL2[87:80].
- BADDR[55:5][42:0] is TTBR0_EL2[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

When FEAT_VHE is implemented:

When the Effective value of HCR_EL2.E2H is 1, it holds an ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR0_EL2.

This determines the number of levels to be skipped from the regular start level of the stage 1 EL2&0 translation table walks using TTBR0_EL2.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0_EL2.CnP on those other PEs. • When the current translation regime is the EL2&0 regime, the value of the current ASID.
0b1	The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR0_EL2. • The translation tables relate to the same translation regime. • If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

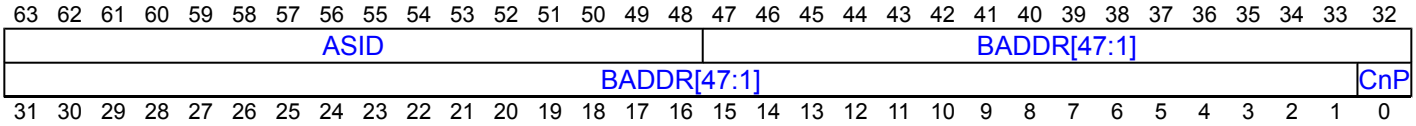
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL2.D128 == 0:



ASID, bits [63:48]

When FEAT_VHE is implemented:

When the Effective value of HCR_EL2.E2H is not 1, this field is RES0.

When the Effective value of HCR_EL2.E2H is 1, it holds an ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T0SZ, the translation stage, and the translation granule size.

If the value of TCR_EL2.{I}PS is not `0b110`, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are `0b0000`.

The BADDR field represents a 52-bit address if one of the following applies:

- FEAT_LPA is implemented, the 64KB granule size is in use, and the value of TCR_EL2.{I}PS is `0b110`.
- FEAT_LPA2 is implemented, the 4KB or 16KB granule size is in use, and the Effective value of TCR_EL2.DS is 1.
- FEAT_D128 is implemented, 56-bit PAs are supported, the 64KB granule size is in use, and the value of TCR2_EL2.D128 is 0.

When TTBR0_EL2.BADDR represents a 52-bit addresses, all of the following apply:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- The smallest permitted value of x is 6.
- When x>6, register bits[(x-1):6] are RES0.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

The OA size specified by TCR_EL2.{I}PS is determined as follows:

- The value of TCR_EL2.PS when the Effective value of HCR_EL2.E2H is not 1.
- The value of TCR_EL2.IPS when the Effective value of HCR_EL2.E2H is 1.

For the 64KB granule, if FEAT_LPA is not implemented, and the value of TCR_EL2.{I}PS is `0b110`, one the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0_EL2.CnP on those other PEs. • When the current translation regime is the EL2&0 regime, the value of the current ASID.
0b1	The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR0_EL2. • The translation tables relate to the same translation regime. • If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TTBR0_EL2 or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

Configuration

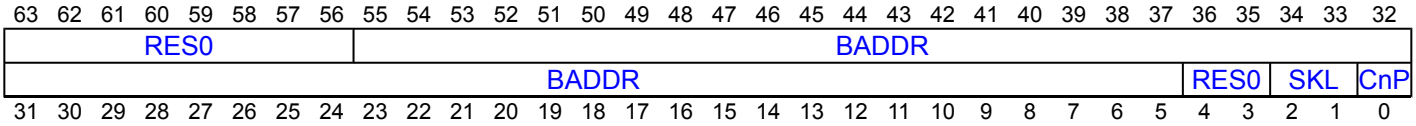
This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TTBR0_EL3 are UNDEFINED.

Attributes

TTBR0_EL3 is a 64-bit register.

Field descriptions

When FEAT_D128 is implemented and TCR_EL3.D128 == 1:



Bits [63:56]

Reserved, RES0.

BADDR, bits [55:5]

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[55:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR0_EL3.

This determines the number of levels to be skipped from the regular start level of the stage 1 EL3 translation table walks using TTBR0_EL3.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.
0b1	The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.

This bit is permitted to be cached in a TLB.

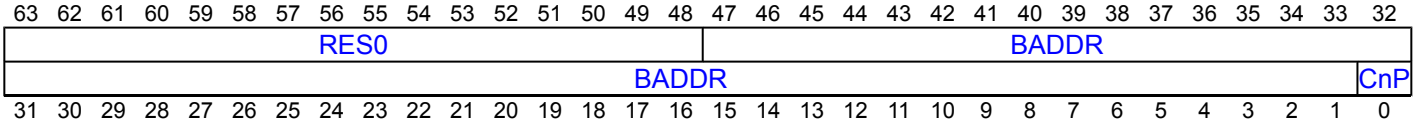
Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is not implemented or TCR_EL3.D128 == 0:



Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL3.T0SZ, the translation stage, and the translation granule size.

If the value of TCR_EL3.PS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

The BADDR field represents a 52-bit address if one of the following applies:

- FEAT_LPA is implemented, the 64KB granule size is in use, and the value of TCR_EL3.PS is 0b110.
- FEAT_LPA2 is implemented, the 4KB or 16KB granule size is in use, and the Effective value of TCR_EL3.DS is 1.
- FEAT_D128 is implemented, 56-bit PAs are supported, the 64KB granule size is in use, and the value of TCR_EL3.D128 is 0.

When TTBR0_EL3.BADDR represents a 52-bit addresses, all of the following apply:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- The smallest permitted value of x is 6.
- When x>6, register bits[(x-1):6] are RES0.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

For the 64KB granule, if FEAT_LPA is not implemented, and the value of TCR_EL3.PS is 0b110, one the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.
0b1	The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TTBR0_EL3

TTBR1_EL1, Translation Table Base Register 1 (EL1)

The TTBR1_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR1[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TTBR1_EL1 are UNDEFINED.

TTBR1_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

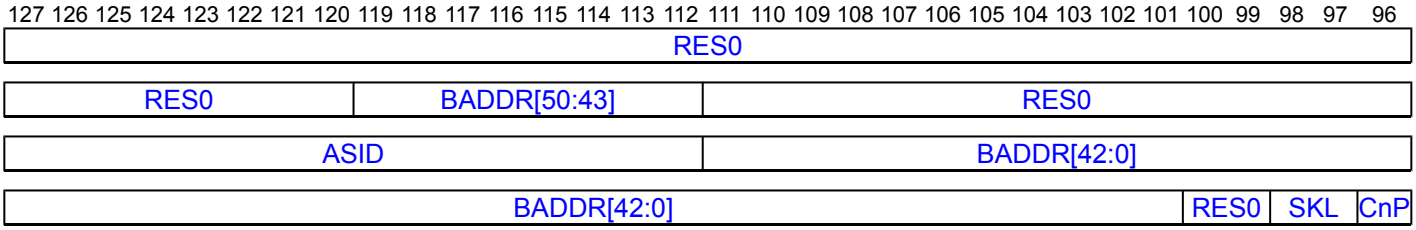
Attributes

TTBR1_EL1 is a:

- 128-bit register when FEAT_D128 is implemented and TCR2_EL1.D128 == 1
- 64-bit register when FEAT_D128 is not implemented or TCR2_EL1.D128 == 0

Field descriptions

When FEAT_D128 is implemented and TCR2_EL1.D128 == 1:



Bits [127:88]

Reserved, RES0.

BADDR, bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is TTBR1_EL1[87:80].
- BADDR[42:0] is TTBR1_EL1[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR1_EL1.

This determines the number of levels to be skipped from the regular start level of the stage 1 EL1&0 translation table walks using TTBR1_EL1.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR1_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

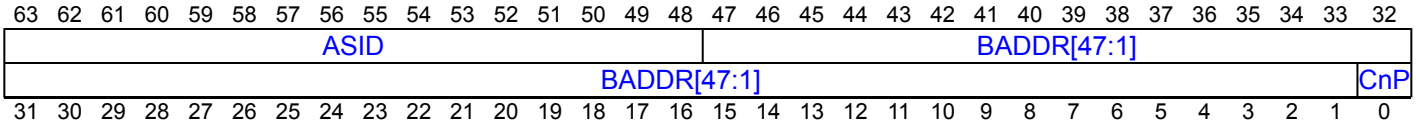
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL1.D128 == 0:



ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T1SZ, the translation stage, and the translation granule size.

If the value of TCR_EL1.IPS is not `0b110`, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are `0b0000`.

The BADDR field represents a 52-bit address if one of the following applies:

- FEAT_LPA is implemented, the 64KB granule size is in use, and the value of TCR_EL1.IPS is `0b110`.
- FEAT_LPA2 is implemented, the 4KB or 16KB granule size is in use, and the Effective value of TCR_EL1.DS is 1.
- FEAT_D128 is implemented, 56-bit PAs are supported, the 64KB granule size is in use, and the value of TCR2_EL1.D128 is 0.

When TTBR1_EL1.BADDR represents a 52-bit addresses, all of the following apply:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- The smallest permitted value of x is 6.
- When x>6, register bits[(x-1):6] are RES0.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

For the 64KB granule, if FEAT_LPA is not implemented, and the value of TCR_EL1.IPS is `0b110`, one the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

CnP	Meaning
`0b0`	The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
`0b1`	The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR1_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```

TTBR1_EL2, Translation Table Base Register 1 (EL2)

The TTBR1_EL2 characteristics are:

Purpose

When the Effective value of HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

Note

When the Effective value of HCR_EL2.E2H is not 1, the contents of this register are ignored by the PE, except for a direct read or write of the register.

Configuration

This register is present only when FEAT_VHE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TTBR1_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

TTBR1_EL2 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

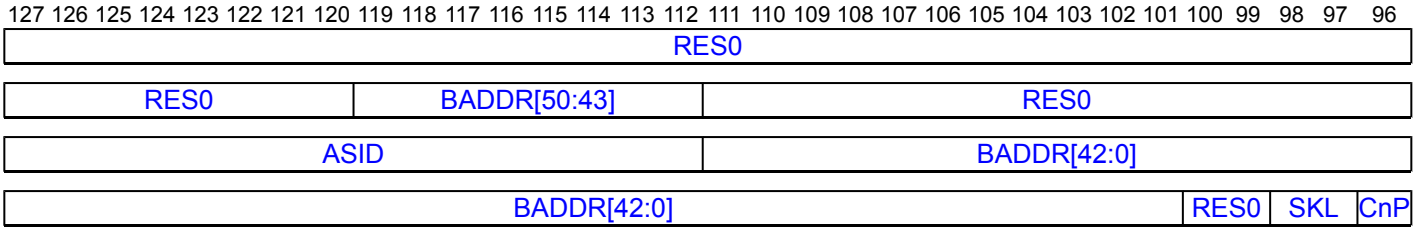
Attributes

TTBR1_EL2 is a:

- 128-bit register when FEAT_D128 is implemented, TCR2_EL2.D128 == 1, and ELIsInHost(EL2)
- 64-bit register when FEAT_D128 is not implemented or TCR2_EL2.D128 == 0

Field descriptions

When FEAT_D128 is implemented, TCR2_EL2.D128 == 1, and ELIsInHost(EL2):



Bits [127:88]

Reserved, RES0.

BADDR, bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is TTBR1_EL2[87:80].
- BADDR[42:0] is TTBR1_EL2[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR1_EL2.

This determines the number of levels to be skipped from the regular start level of the stage 1 EL2&0 translation table walks using TTBR1_EL2.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1_EL2.CnP on those other PEs. • The value of the current ASID.
0b1	The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR1_EL2. • The ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

- TTBR1_EL2 is accessible only when the Effective value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

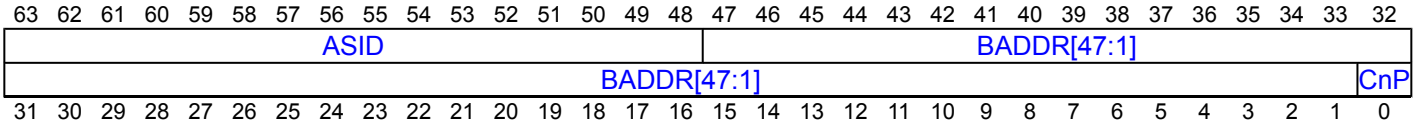
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL2.D128 == 0:



ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T1SZ, the translation stage, and the translation granule size.

If the value of TCR_EL2.{I}PS is not `0b110`, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are `0b0000`.

The BADDR field represents a 52-bit address if one of the following applies:

- FEAT_LPA is implemented, the 64KB granule size is in use, and the value of TCR_EL2.{I}PS is `0b110`.
- FEAT_LPA2 is implemented, the 4KB or 16KB granule size is in use, and the Effective value of TCR_EL2.DS is 1.
- FEAT_D128 is implemented, 56-bit PAs are supported, the 64KB granule size is in use, and the value of TCR2_EL2.D128 is 0.

When TTBR1_EL2.BADDR represents a 52-bit addresses, all of the following apply:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- The smallest permitted value of x is 6.
- When x>6, register bits[(x-1):6] are RES0.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

The OA size specified by TCR_EL2.{I}PS is determined as follows:

- The value of TCR_EL2.PS when the Effective value of HCR_EL2.E2H is not 1.
- The value of TCR_EL2.IPS when the Effective value of HCR_EL2.E2H is 1.

For the 64KB granule, if FEAT_LPA is not implemented, and the value of TCR_EL2.{I}PS is `0b110`, one the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

CnP	Meaning
`0b0`	The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1_EL2.CnP on those other PEs. • The value of the current ASID.
`0b1`	The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR1_EL2. • The ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

- TTBR1_EL2 is accessible only when the Effective value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TTBR1_EL2 or TTBR1_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

UAO, User Access Override

The UAO characteristics are:

Purpose

Allows access to the User Access Override bit.

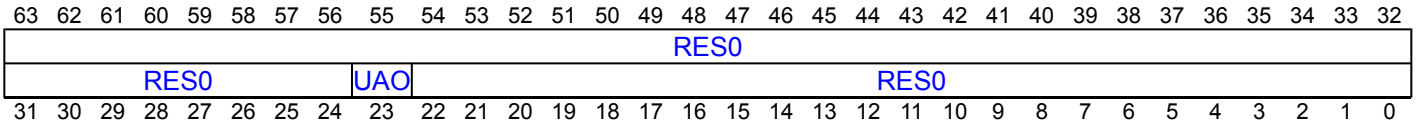
Configuration

This register is present only when FEAT_UAO is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to UAO are UNDEFINED.

Attributes

UAO is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

UAO, bit [23]

User Access Override.

UAO	Meaning
0b0	The behavior of LDTR* and STTR* instructions is as defined in the base Armv8 architecture.
0b1	When executed at the following Exception levels, LDTR* and STTR* instructions behave as the equivalent LDR* and STR* instructions: • EL1. • EL2 when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

When executed at EL3, or at EL2 when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the LDTR* and STTR* instructions behave as the equivalent LDR* and STR* instructions, regardless of the setting of the PSTATE.UAO bit.

Bits [22:0]

Reserved, RES0.

Accessing UAO

For more information about the operation of the MSR (immediate) accessor, see 'MSR (immediate)'.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, UAO

VBAR_EL1, Vector Base Address Register (EL1)

The VBAR_EL1 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL1.

Configuration

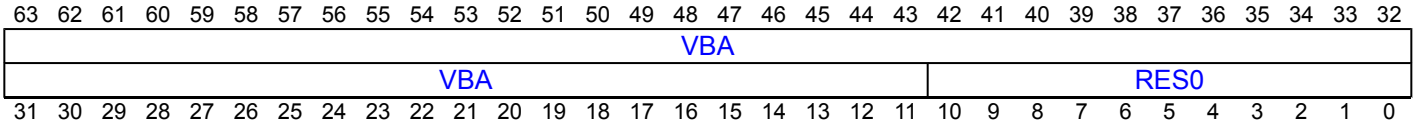
AArch64 System register VBAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register VBAR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to VBAR_EL1 are UNDEFINED.

Attributes

VBAR_EL1 is a 64-bit register.

Field descriptions



VBA, bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL1.

Note

If the implementation supports FEAT_LVA3, then:

- If tagged addresses are not being used, bits [63:56] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

Otherwise:

If the implementation supports FEAT_LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

If the implementation does not support FEAT_LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing VBAR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name VBAR_EL1 or VBAR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, VBAR_EL1
```

op0	op1	CRn	CRm	op2

VBAR_EL2, Vector Base Address Register (EL2)

The VBAR_EL2 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL2.

Configuration

AArch64 System register VBAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HVBAR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to VBAR_EL2 are UNDEFINED.

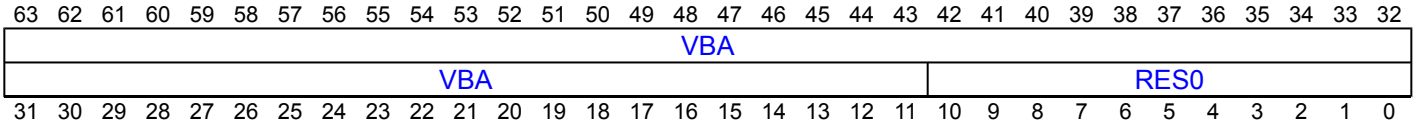
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VBAR_EL2 is a 64-bit register.

Field descriptions



VBA, bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL2.

Note

If FEAT_LVA3 is implemented:

- If the Effective value of HCR_EL2.E2H is 1:
  - If tagged addresses are not being used, bits [63:56] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If the Effective value of HCR_EL2.E2H is not 1:
  - If tagged addresses are not being used, bits [63:56] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

Otherwise :

If FEAT_LVA is implemented:

- If the Effective value of HCR_EL2.E2H is 1:
  - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If the Effective value of HCR_EL2.E2H is not 1:
  - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

If FEAT_LVA is not implemented:

- If the Effective value of HCR_EL2.E2H is 1:
  - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If the Effective value of HCR_EL2.E2H is not 1:
  - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing VBAR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name VBAR_EL2 or VBAR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

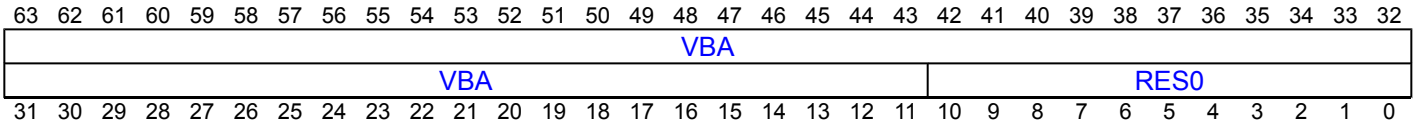
Field descriptions



VBA, bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL3.

Note

If the implementation supports FEAT_LVA3, then:

- If tagged addresses are not being used, bits [63:56] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

Otherwise:

If the implementation supports FEAT_LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation does not support FEAT_LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing VBAR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```

VDISR_EL2, Virtual Deferred Interrupt Status Register (EL2)

The VDISR_EL2 characteristics are:

Purpose

Records that a virtual SError exception has been consumed by an ESB instruction executed at EL1.

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of one of the following registers occurring in program order after the ESB instruction:

- DISR_EL1.
- DISR.

Configuration

AArch64 System register VDISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDISR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

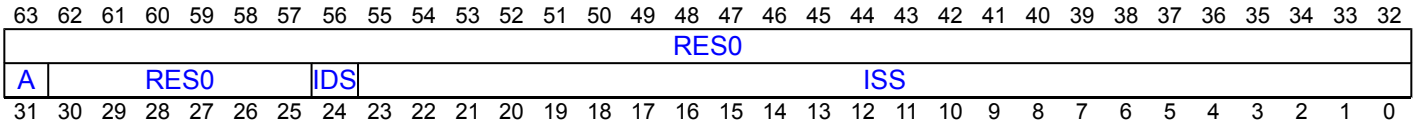
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VDISR_EL2 is a 64-bit register.

Field descriptions

When EL1 is using AArch64:



Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

The value copied from VSESR_EL2.IDS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

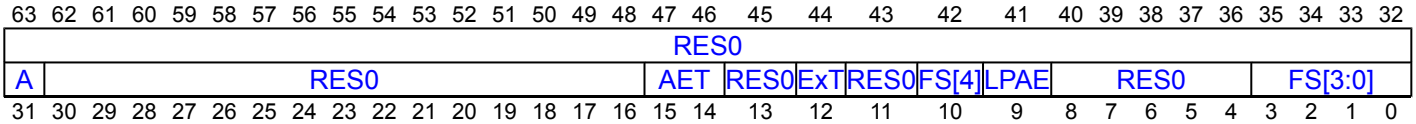
ISS, bits [23:0]

The value copied from VSESR_EL2.ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When EL1 is using AArch32 and VDISR_EL2.LPAE == 0:



Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VSESR_EL2.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VSESR_EL2.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to `0b10110` when an `ESB` instruction defers a virtual SError exception.

FS	Meaning
`0b10110`	Asynchronous SError exception.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR_EL2[10].
- FS[3:0] is VDISR_EL2[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an `ESB` instruction defers a virtual SError exception.

LPAE	Meaning
`0b0`	Using the Short-descriptor translation table format.

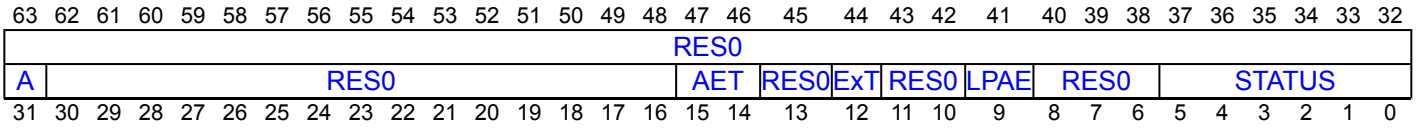
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When EL1 is using AArch32 and VDISR_EL2.LPAE == 1:



Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an `ESB` instruction defers a virtual SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VSESR_EL2.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VSESR_EL2.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError exception.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError exception.

STATUS	Meaning
0b010001	Asynchronous SError exception.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR_EL2

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of one of the following registers occurring in program order after the ESB instruction:

- DISR_EL1.
- DISR.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, VDISR_EL2

VDISR_EL3, Virtual Deferred Interrupt Status Register (EL3)

The VDISR_EL3 characteristics are:

Purpose

Records that a delegated SError exception has been consumed by an ESB instruction executed at EL2 or EL1 when the Effective value of SCR_EL3.DSE is 1.

An indirect write to VDISR_EL3 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of DISR_EL1 occurring in program order after the ESB instruction.

Configuration

This register is present only when FEAT_E3DSE is implemented. Otherwise, direct accesses to VDISR_EL3 are UNDEFINED.

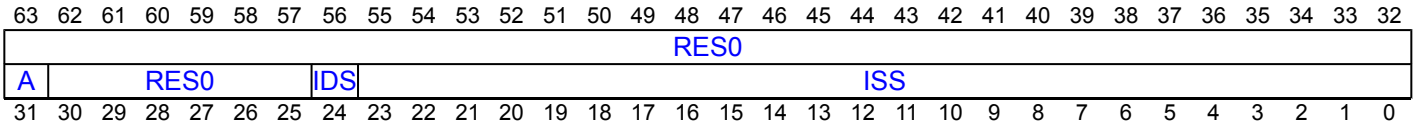
Note

The encoding for this register is subject to change.

Attributes

VDISR_EL3 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a delegated SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

The value copied from VSESR_EL3.IDS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

The value copied from VSESR_EL3.ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR_EL3

An indirect write to VDISR_EL3 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR_EL1 occurring in program order after the ESB instruction.

Note

The accessibility pseudocode for DISR_EL1 has not been updated to show the effect of VDISR_EL3.

Accesses to this register use the following encodings in the System register encoding space:

```

VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of MPIDR_EL1, which in a multiprocessor system, provides an additional PE identification system.

Configuration

AArch64 System register VMPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VMPIDR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to VMPIDR_EL2 are UNDEFINED.

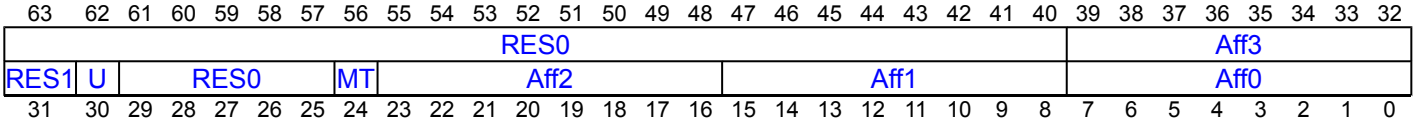
If EL2 is not implemented, reads of this register return the value of the MPIDR_EL1 and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VMPIDR_EL2 is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of VMPIDR_EL2.Aff0 for more information.

Aff3 is not supported in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of VMPIDR_EL2.Aff0 for more information about affinity levels.

MT	Meaning
0b0	Performance of PEs at the lowest affinity level is largely independent.
0b1	Performance of PEs at the lowest affinity level is very interdependent.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff2, bits [23:16]

Affinity level 2. See the description of VMPIDR_EL2.Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1. See the description of VMPIDR_EL2.Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0.

The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VNCR_EL2, Virtual Nested Control Register

The VNCR_EL2 characteristics are:

Purpose

When FEAT_NV2 is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

Configuration

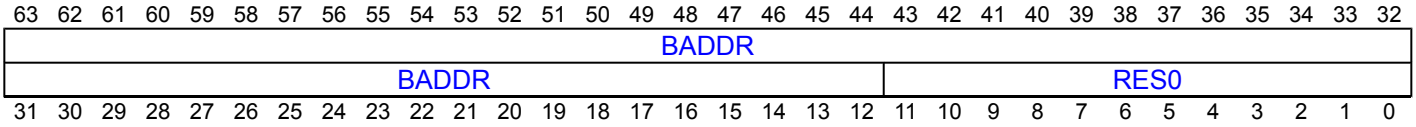
This register is present only when FEAT_NV2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VNCR_EL2 is a 64-bit register.

Field descriptions



BADDR, bits [63:12]

Base Address. When a register read/write is transformed to be a Load or Store, the address of the load/store is to VNCR_EL2.BADDR:Offset<11:0>.

Bits[63:n] are RESS where n is one of the following:

- If FEAT_LVA3 is implemented, n is 57.
- Otherwise, if FEAT_LVA is implemented, n is 53.
- If FEAT_LVA is not implemented, n is 49.

If the bits marked as RESS do not all have the same value as bit[n-1], then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating a Translation fault when translating the transformed register read/write.
- The bits behave as the same value as bit[n-1] for all purposes other than reading back the register.
- The bits are treated as the same value as bit[n-1] for all purposes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing VNCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

VPIDR_EL2, Virtualization Processor ID Register

The VPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by EL1 reads of MIDR_EL1.

Configuration

AArch64 System register VPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VPIDR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to VPIDR_EL2 are UNDEFINED.

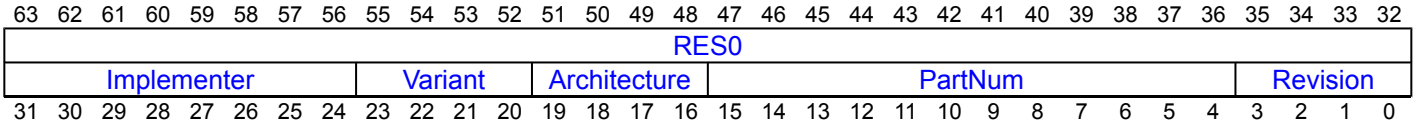
If EL2 is not implemented, reads of this register return the value of the MIDR_EL1 and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VPIDR_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Architecture, bits [19:16]

Architecture version.

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VPIDR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```

VSESR_EL2, Virtual SError Exception Syndrome Register (EL2)

The VSESR_EL2 characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError exception injected using HCR_EL2.VSE is taken to EL1 using AArch64, then the syndrome value is reported in ESR_EL1.

When the virtual SError exception injected using HCR_EL2.VSE is taken to EL1 using AArch32, then the syndrome value is reported in DFSR.{AET, ExT} and the remainder of DFSR is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

When the virtual SError exception injected using HCR_EL2.VSE is deferred by an ESB instruction, then the syndrome value is written to VDISR_EL2.

Configuration

AArch64 System register VSESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDFSR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VSESR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

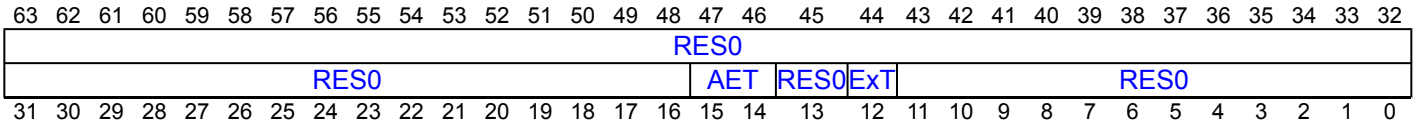
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VSESR_EL2 is a 64-bit register.

Field descriptions

When EL1 is using AArch32:



Bits [63:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError exception is taken to EL1 using AArch32, DFSR[15:14] is set to VSESR_EL2.AET.

When a virtual SError exception is deferred by an ESB instruction, VDISR_EL2[15:14] is set to VSESR_EL2.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError exception is taken to EL1 using AArch32, DFSR[12] is set to VSESR_EL2.ExT.

When a virtual SError exception is deferred by an `ESB` instruction, VDISR_EL2[12] is set to VSESR_EL2.ExT.

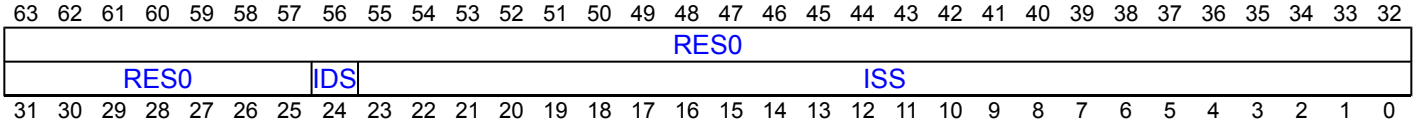
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

When EL1 is using AArch64:



Bits [63:25]

Reserved, RES0.

IDS, bit [24]

When a virtual SError exception is taken to EL1 using AArch64, ESR_EL1[24] is set to VSESR_EL2.IDS.

When a virtual SError exception is deferred by an `ESB` instruction, VDISR_EL2[24] is set to VSESR_EL2.IDS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

When a virtual SError exception is taken to EL1 using AArch64, ESR_EL1[23:0] is set to VSESR_EL2.ISS.

When a virtual SError exception is deferred by an `ESB` instruction, VDISR_EL2[23:0] is set to VSESR_EL2.ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSESR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, VSESR_EL2
```

op0	op1	CRn	CRm	op2

VSESR_EL3, Virtual SError Exception Syndrome Register (EL3)

The VSESR_EL3 characteristics are:

Purpose

Provides the syndrome value reported to software when the Effective value of SCR_EL3.DSE is 1 on taking a delegated SError exception to EL2 or EL1, or on executing an `ESB` instruction at EL2 or EL1.

When the delegated SError exception injected using SCR_EL3.DSE is taken to EL2 using AArch64, then the syndrome value is reported in ESR_EL2.

When the delegated SError exception injected using SCR_EL3.DSE is taken to EL1 using AArch64, then the syndrome value is reported in ESR_EL1.

When the delegated SError exception injected using SCR_EL3.DSE is deferred by an `ESB` instruction, then the syndrome value is written to VDISR_EL3.

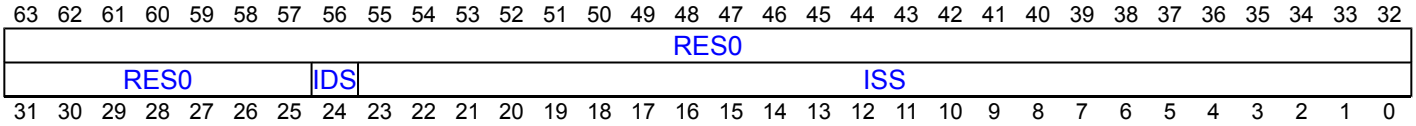
Configuration

This register is present only when FEAT_E3DSE is implemented. Otherwise, direct accesses to VSESR_EL3 are UNDEFINED.

Attributes

VSESR_EL3 is a 64-bit register.

Field descriptions



Bits [63:25]

Reserved, RES0.

IDS, bit [24]

When a delegated SError exception triggered by SCR_EL3.DSE is taken to EL2 or EL1 using AArch64, ESR_ELx[24] is set to VSESR_EL3.IDS.

When a delegated SError exception triggered by SCR_EL3.DSE is deferred by an `ESB` instruction, VDISR_EL3[24] is set to VSESR_EL3.IDS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

When a delegated SError exception triggered by SCR_EL3.DSE is taken to EL2 or EL1 using AArch64, ESR_ELx[23:0] is set to VSESR_EL3.ISS.

When a delegated SError exception triggered by SCR_EL3.DSE is deferred by an `ESB` instruction, VDISR_EL3[23:0] is set to VSESR_EL3.ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSESR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, VSESR_EL3
```

VSTCR_EL2, Virtualization Secure Translation Control Register

The VSTCR_EL2 characteristics are:

Purpose

The control register for stage 2 of the Secure EL1&0 translation regime.

Configuration

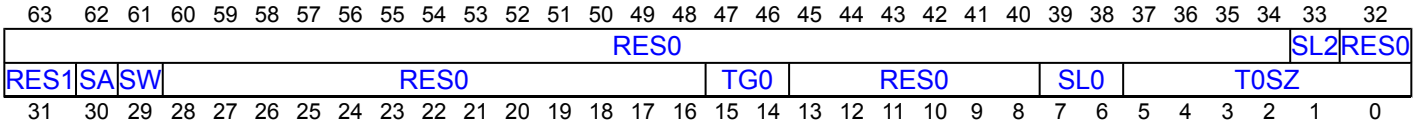
This register is present only when FEAT_SEL2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to VSTCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VSTCR_EL2 is a 64-bit register.

Field descriptions



Any of the bits in VSTCR_EL2 are permitted to be cached in a TLB.

Bits [63:34]

Reserved, RES0.

SL2, bit [33]

When FEAT_LPA2 is implemented and (FEAT_D128 is not implemented or VTCR_EL2.D128 == 0):

Starting level of the Secure stage 2 translation lookup controlled by VSTCR_EL2.

If VTCR_EL2.DS == 1, then VSTCR_EL2.SL2, in combination with VSTCR_EL2.SL0, gives encodings for the Secure stage 2 translation table walk initial lookup level.

If VTCR_EL2.DS == 0, then VSTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

SA, bit [30]

Secure stage 2 translation output address space.

SA	Meaning
0b0	All stage 2 translations for the Secure IPA space access the Secure PA space.
0b1	All stage 2 translations for the Secure IPA space access the Non-secure PA space.

When the value of VSTCR_EL2.SW is 1, this bit behaves as 1 for all purposes other than reading back the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [29]

Secure stage 2 translation address space.

SW	Meaning
0b0	All stage 2 translation table walks for the Secure IPA space are to the Secure PA space.
0b1	All stage 2 translation table walks for the Secure IPA space are to the Non-secure PA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [28:16]

Reserved, RES0.

TG0, bits [15:14]

Secure stage 2 granule size for VSTTBR_EL2.

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If FEAT_GTG is implemented, ID_AA64MMFR0_EL1.{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for stage 2 translation.

If FEAT_GTG is not implemented, ID_AA64MMFR0_EL1.{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [13:8]

Reserved, RES0.

SL0, bits [7:6]

When FEAT_TTST is implemented and (FEAT_D128 is not implemented or VTCR_EL2.D128 == 0):

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

SL0	Meaning
0b00	If VSTCR_EL2.TG0 is 0b00 (4KB granule): • If FEAT_LPA2 is not implemented, start at level 2. • If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 2. • If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b1, start at level -1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01	If VSTCR_EL2.TG0 is 0b00 (4KB granule): • If FEAT_LPA2 is not implemented, start at level 1. • If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 1. • If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 01 and VSTCR_EL2.SL2 == 1 is reserved. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10	If VSTCR_EL2.TG0 is 0b00 (4KB granule): • If FEAT_LPA2 is not implemented, start at level 0. • If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 0. • If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 10 and VSTCR_EL2.SL2 == 1 is reserved. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.
0b11	If VSTCR_EL2.TG0 is 0b00 (4KB granule): • If FEAT_LPA2 is not implemented, start at level 3. • If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 3. • If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 11 and VSTCR_EL2.SL2 == 1 is reserved. If VSTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.

If this field is programmed to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_TTST is not implemented and (FEAT_D128 is not implemented or VTCR_EL2.D128 == 0):

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

SL0	Meaning
0b00	If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01	If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10	If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by VSTTBR_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSTCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, VSTCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0110	0b010

```
if !(IsFeatureImplemented(FEAT_SEL2) && IsFeatureImplemented(FEAT_AA64)) then

VSTTBR_EL2, Virtualization Secure Translation Table Base Register

The VSTTBR_EL2 characteristics are:

Purpose

The base register for stage 2 translation tables to translate Secure IPAs in the Secure EL1&0 translation regime. Holds the base address of the translation table for the initial lookup for stage 2 of an address translation for a Secure IPA in the Secure EL1&0 translation regime, and other information for this translation stage.

Configuration

This register is present only when FEAT_SEL2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to VSTTBR_EL2 are UNDEFINED.

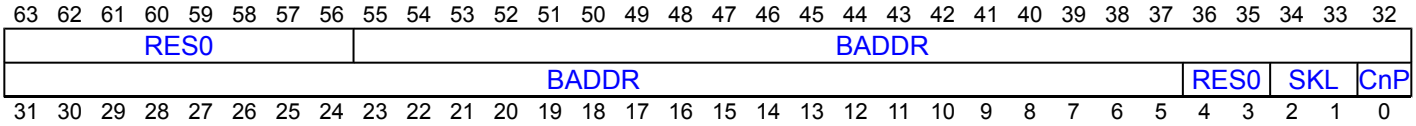
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VSTTBR_EL2 is a 64-bit register.

Field descriptions

When FEAT_D128 is implemented and VTCR_EL2.D128 == 1:



Bits [63:56]

Reserved, RES0.

BADDR, bits [55:5]

- Bits A[55:x] of the stage 2 translation table base address bits are in register bits[55:x].
- Bits A[(x-1):0] of the stage 2 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level. Skip Level determines the number of levels to be skipped from the regular start level of the Secure stage 2 translation table walk.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes FEAT_TTCNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

Note

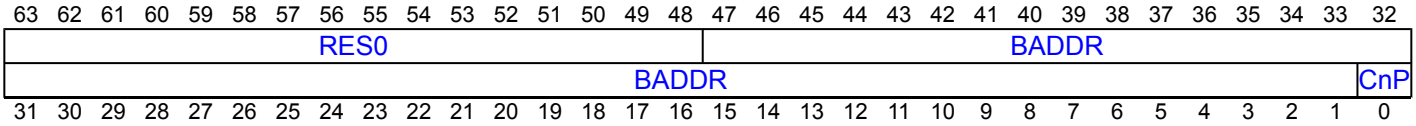
If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is not implemented or VTCR_EL2.D128 == 0:



Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

The BADDR field represents a 52-bit address if one of the following applies:

- FEAT_LPA is implemented, the 64KB granule size is in use, and the value of VTCR_EL2.PS is 0b110.
- FEAT_LPA2 is implemented, the 4KB or 16KB granule size is in use, and the Effective value of VTCR_EL2.DS is 1.
- FEAT_D128 is implemented, 56-bit PAs are supported, the 64KB granule size is in use, and the value of VTCR_EL2.D128 is 0.

When VSTTBR_EL2.BADDR represents a 52-bit addresses, all of the following apply:

- Register bits[47:x] hold bits[47:x] of the stage 2 translation table base address, where x is determined by the size of the translation table at the start level.

- The smallest permitted value of x is 6.
- Register bits[5:2] hold bits[51:48] of the stage 2 translation table base address.
- Bits[x:0] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

For the 64KB granule, if FEAT_LPA is not implemented, and the value of VTCR_EL2.PS is `0b110`, one the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits [55:52] of the stage 2 translation table base address are zero.

If the Effective value of VTCR_EL2.PS is not `0b110`, then:

- Register bits[47:x] hold bits[47:x] of the stage 2 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are `0b0000`.

If any VSTTBR_EL2[47:1] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VSTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of VSTCR_EL2.T0SZ, the stage of translation, and the translation granule size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes FEAT_TTCNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

CnP	Meaning
`0b0`	The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
`0b1`	The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

Note

If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSTTBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, VSTTBR_EL2

VTCR_EL2, Virtualization Translation Control Register

The VTCR_EL2 characteristics are:

Purpose

The control register for stage 2 of the EL1&0 translation regime.

Configuration

AArch64 System register VTCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VTCR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to VTCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VTCR_EL2 is a 64-bit register.

Field descriptions

Unless stated otherwise, any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Bits [63:46]

Reserved, RES0.

HDBSS, bit [45]

When FEAT_HDBSS is implemented:

Enable use of HDBSS.

HDBSS	Meaning
0b0	Hardware tracking of Dirty state Structure is disabled.
0b1	Hardware tracking of Dirty state Structure is enabled.

If VTCR_EL2.{HA, HD} is not {1, 1}, the Effective value of this field is 0.

If SCR_EL3.HDBSSEn is 0, then this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HAFT, bit [44]

When FEAT_HAFT is implemented:

Hardware managed Access Flag for Table descriptors.

Enables the Hardware managed Access Flag for Table descriptors.

HAFT	Meaning
0b0	Hardware managed Access Flag for Table descriptors is disabled.
0b1	Hardware managed Access Flag for Table descriptors is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [43:42]

Reserved, RES0.

TL0, bit [41]

When FEAT_THE is implemented:

Control bit to check for presence of MMU TopLevel0 permission attribute.

TL0	Meaning
0b0	This bit does not have any effect on stage 2 translations.
0b1	Enables MMU TopLevel0 permission attribute check for TTBR0_EL1 and TTBR1_EL1 translations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GCSH, bit [40]

When FEAT_THE is implemented and FEAT_GCS is implemented:

Assured stage 1 translations for Guarded Control Stacks. Enforces use of the AssuredOnly attribute in stage 2 for the memory accessed by privileged Guarded Control Stack data accesses.

GCSH	Meaning
0b0	For the memory accessed by privileged Guarded Control Stack data accesses, the AssuredOnly attribute in stage 2 is not required to be set.
0b1	For the memory accessed by privileged Guarded Control Stack data accesses, the AssuredOnly attribute in stage 2 is required to be set.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

D128, bit [38]

When FEAT_D128 is implemented:

Enables VMSAv9-128 translation system for stage 2 translation.

D128	Meaning
0b0	Translation system follows VMSAv8-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S2POE, bit [37]

When FEAT_S2POE is implemented:

Enable Permission Overlay. Enables permission overlay in stage 2 Permission model.

S2POE	Meaning
0b0	Overlay disabled.
0b1	Overaly enabled.

This bit is not permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S2PIE, bit [36]

When FEAT_S2PIE is implemented:

Select Permission Model. Enables usage of permission indirection in stage 2 Permission model.

S2PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when VTCR_EL2.D128 is set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TL1, bit [35]
When FEAT_THE is implemented:

Control bit to check for presence of MMU TopLevel1 permission attribute.

TL1	Meaning
0b0	This bit does not have any effect on stage 2 translations.
0b1	Enables MMU TopLevel1 permission attribute check for TTBR0_EL1 and TTBR1_EL1 translations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [34]
When FEAT_THE is implemented:

AssuredOnly attribute enable for VMSAv8-64. Configures use of bit[58] of the stage 2 translation table Block or Page descriptor.

AssuredOnly	Meaning
0b0	Bit[58] of each stage 2 translation Block or Page descriptor does not indicate AssuredOnly attribute.
0b1	Bit[58] of each stage 2 translation Block or Page descriptor indicates AssuredOnly attribute.

This field is RES0 when VTCR_EL2.D128 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SL2, bit [33]
When FEAT_LPA2 is implemented and (FEAT_D128 is not implemented or VTCR_EL2.D128 == 0):

Starting level of the stage 2 translation lookup controlled by VTCR_EL2.

If VTCR_EL2.DS == 1, then VTCR_EL2.SL2, in combination with VTCR_EL2.SL0, gives encodings for the stage 2 translation table walk initial lookup level.

If VTCR_EL2.DS == 0, then VTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented and (FEAT_D128 is not implemented or VTCR_EL2.D128 == 0):

This field affects:

- Whether a 52-bit output address can be described by the translation tables of the 4KB or 16KB translation granules.
- The minimum value of VTCR_EL2.T0SZ and VSTCR_EL2.T0SZ.
- How and where shareability for Block and Page descriptors are encoded.

DS	Meaning
0b0	Bits[49:48] of translation descriptors are RES0. Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in Table descriptors are ignored by hardware. The minimum value of VTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault. The minimum value of VSTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault. Output address[51:48] is 0000.
0b1	Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] in translation descriptors hold output address[51:50]. The shareability information of Block and Page descriptors for cacheable locations is determined by VTCR_EL2.SH0. The minimum value of VTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault. The minimum value of VSTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault. **Note** As FEAT_LPA must be implemented if VTCR_EL2.DS == 1, the minimum values of VTCR_EL2.T0SZ and VSTCR_EL2.T0SZ are 12, as determined by that extension. For the TLBI range instructions affecting IPA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 00. **Note** This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

NSA, bit [30]

When FEAT_SEL2 is implemented:

Non-secure stage 2 translation output address space for the Secure EL1&0 translation regime.

NSA	Meaning
0b0	All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Secure PA space.
0b1	All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Non-secure PA space.

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The value of VTCR_EL2.NSW is 1.
- The value of VSTCR_EL2.SA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSW, bit [29]

When FEAT_SEL2 is implemented:

Non-secure stage 2 translation table address space for the Secure EL1&0 translation regime.

NSW	Meaning
0b0	All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Secure PA space.
0b1	All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Non-secure PA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:23]

Reserved, RES0.

HD, bit [22]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 2 translations when EL2 is enabled in the current Security state.

HD	Meaning
0b0	Stage 2 hardware management of dirty state disabled.
0b1	Stage 2 hardware management of dirty state enabled.

When the Effective value of VTCR_EL2.HA is 0, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 2 translations when EL2 is enabled in the current Security state.

HA	Meaning
0b0	Stage 2 Access flag update disabled.
0b1	Stage 2 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

VS, bit [19]

When FEAT_VMID16 is implemented:

VMID Size.

VS	Meaning
0b0	8-bit VMID. The upper 8 bits of VTTBR_EL2 are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.
0b1	16-bit VMID. The upper 8 bits of VTTBR_EL2 are used for allocation and matching in the TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PS, bits [18:16]

Physical address Size for the second stage of translation.

PS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.
0b111	56 bits, 64PB.

The value 0b110 represents the following output address sizes:

- For the 64KB translation granule size, if FEAT_LPA is implemented, the value 0b110 represents 52 bits.
- For the 4KB and 16KB translation granule sizes, if FEAT_LPA is implemented and the Effective value of VTCR_EL2.DS is 0b1, then the value 0b110 represents 52 bits.
- Otherwise, the value 0b110 behaves as the 0b101 value and represents 48 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the VTTBR_EL2.

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If FEAT_GTG is implemented, ID_AA64MMFR0_EL1.{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for stage 2 translation.

If FEAT_GTG is not implemented, ID_AA64MMFR0_EL1.{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

When FEAT_TTST is implemented and (FEAT_D128 is not implemented or VTCR_EL2.D128 == 0):

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

SL0	Meaning
0b00	If VTCR_EL2.TG0 is 0b00 (4KB granule): • If FEAT_LPA2 is not implemented, start at level 2. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 2. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b1, start at level -1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01	If VTCR_EL2.TG0 is 0b00 (4KB granule): • If FEAT_LPA2 is not implemented, start at level 1. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 1. • If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 01 and VTCR_EL2.SL2 == 1 is reserved. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10	If VTCR_EL2.TG0 is 0b00 (4KB granule): • If FEAT_LPA2 is not implemented, start at level 0. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 0. • If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 10 and VTCR_EL2.SL2 == 1 is reserved. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.
0b11	If VTCR_EL2.TG0 is 0b00 (4KB granule): • If FEAT_LPA2 is not implemented, start at level 3. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 3. • If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 11 and VTCR_EL2.SL2 == 1 is reserved. If VTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.

If this field is programmed to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_TTST is not implemented and (FEAT_D128 is not implemented or VTCR_EL2.D128 == 0):

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

SL0	Meaning
0b00	If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01	If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10	If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by VTTBR_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in 'The AArch64 Virtual Memory System Architecture'.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, VTCR_EL2.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, VTCR_EL2.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR_EL2

Unless stated otherwise, any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, VTCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then
        X[t, 64] = NVMem[0x040];
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = VTCR_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = VTCR_EL2;
```

```
MSR VTCR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then
        NVMem[0x040] = X[t, 64];
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    VTCR_EL2 = X[t, 64];
elsif PSTATE.EL == EL3 then
    VTCR_EL2 = X[t, 64];
```

VTTBR_EL2, Virtualization Translation Table Base Register

The VTTBR_EL2 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register VTTBR_EL2 bits [63:0] are architecturally mapped to AArch32 System register VTTBR[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to VTTBR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

VTTBR_EL2 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

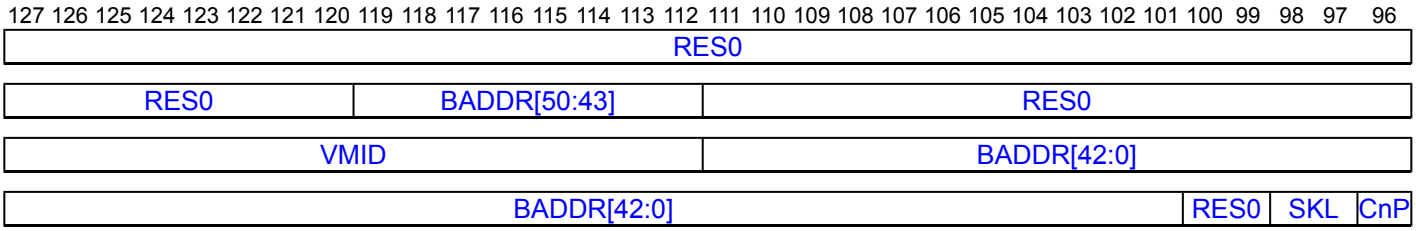
Attributes

VTTBR_EL2 is a:

- 128-bit register when FEAT_D128 is implemented and VTCR_EL2.D128 == 1
- 64-bit register when FEAT_D128 is not implemented or VTCR_EL2.D128 == 0

Field descriptions

When FEAT_D128 is implemented and VTCR_EL2.D128 == 1:



Bits [127:88]

Reserved, RES0.

BADDR, bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 2 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 2 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is VTTBR_EL2[87:80].
- BADDR[42:0] is VTTBR_EL2[47:5].

The reset behavior of this field is:

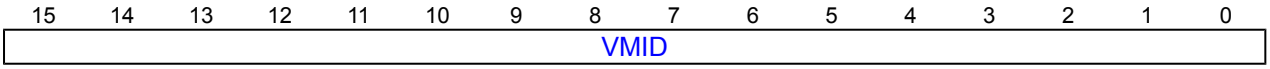
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

VMID, bits [63:48]

VMID encoding when FEAT_VMID16 is implemented and VTCR_EL2.VS == 1



VMID, bits [15:0]

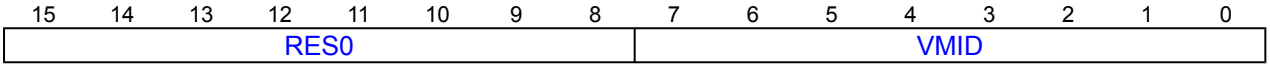
The VMID for the translation table.

If the implementation has an 8-bit VMID, bits [15:8] of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VMID encoding when FEAT_VMID16 is not implemented or VTCR_EL2.VS == 0



Bits [15:8]

Reserved, RES0.

VMID, bits [7:0]

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level. Skip Level determines the number of levels to be skipped from the regular start level of the Non-Secure stage 2 translation table walk.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

Note

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

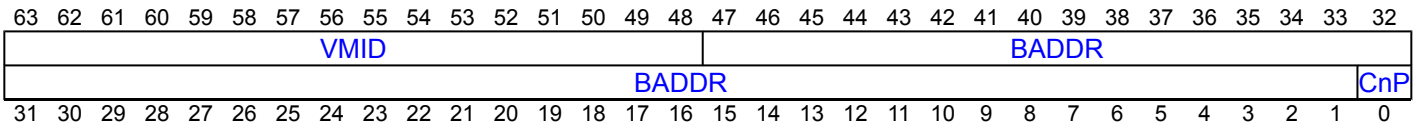
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or VTCR_EL2.D128 == 0:



VMID, bits [63:48]

VMID encoding when FEAT_VMID16 is implemented and VTCR_EL2.VS == 1

VMID, bits [15:0]

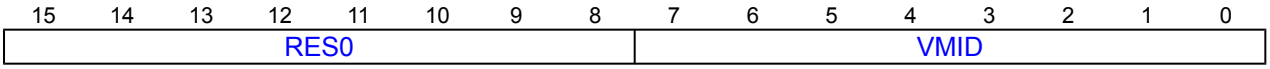
The VMID for the translation table.

If the implementation has an 8-bit VMID, bits [15:8] of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VMID encoding when FEAT_VMID16 is not implemented or VTCR_EL2.VS == 0



Bits [15:8]

Reserved, RES0.

VMID, bits [7:0]

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

The BADDR field represents a 52-bit address if one of the following applies:

- FEAT_LPA is implemented, the 64KB granule size is in use, and the value of VTCR_EL2.PS is `0b110`.
- FEAT_LPA2 is implemented, the 4KB or 16KB granule size is in use, and the Effective value of VTCR_EL2.DS is 1.
- FEAT_D128 is implemented, 56-bit PAs are supported, the 64KB granule size is in use, and the value of VTCR_EL2.D128 is 0.

When VTTBR_EL2.BADDR represents a 52-bit addresses, all of the following apply:

- Register bits[47:x] hold bits[47:x] of the stage 2 translation table base address, where x is determined by the size of the translation table at the start level.
- The smallest permitted value of x is 6.
- Register bits[5:2] hold bits[51:48] of the stage 2 translation table base address.
- Bits[x:0] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

For the 64KB granule, if FEAT_LPA is not implemented, and the value of VTCR_EL2.PS is `0b110`, one the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits [55:52] of the stage 2 translation table base address are zero.

If the Effective value of VTCR_EL2.PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 2 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any VTTBR_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of VTCR_EL2.T0SZ, the stage of translation, and the translation granule size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This bit is permitted to be cached in a TLB.

Note

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ZCR_EL1, SVE Control Register (EL1)

The ZCR_EL1 characteristics are:

Purpose

This register controls aspects of SVE visible at Exception levels EL1 and EL0.

Configuration

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL1 are UNDEFINED.

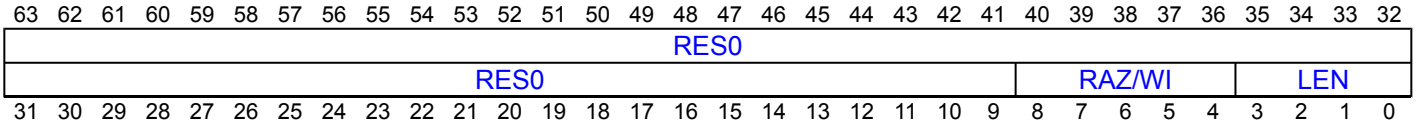
This register has no effect when FEAT_SME is implemented and the PE is in Streaming SVE mode.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this register has no effect on execution at EL0.

Attributes

ZCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Non-streaming SVE vector length at EL1 of (LEN+1)*128 bits. This field also defines the Effective Non-streaming SVE vector length at EL0 when EL2 is not implemented, or EL2 is not enabled in the current Security state, or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

The Non-streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support a subset of the architecturally permitted lengths. An implementation is required to support all lengths that are powers of two, from 128 bits up to its maximum implemented Non-streaming SVE vector length.

When FEAT_SME is not implemented, or the PE is not in Streaming SVE mode, the Effective SVE vector length (VL) is equal to the Effective Non-streaming SVE vector length.

When FEAT_SME is implemented and the PE is in Streaming SVE mode, VL is equal to the Effective Streaming SVE vector length. See SMCR_EL1.

For all purposes other than returning the result of a direct read of ZCR_EL1, the PE selects the Effective Non-streaming SVE vector length by performing checks in the following order:

1. If EL2 is implemented and enabled in the current Security state, and the requested length is greater than the Effective length at EL2, then the Effective length at EL2 is used.
2. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.

3. Otherwise, the Effective length is the highest supported Non-streaming SVE vector length that is less than or equal to the requested length.

An indirect read of ZCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ZCR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name ZCR_EL1 or ZCR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```

ZCR_EL2, SVE Control Register (EL2)

The ZCR_EL2 characteristics are:

Purpose

This register controls aspects of SVE visible at Exception levels EL2, EL1, and EL0.

Configuration

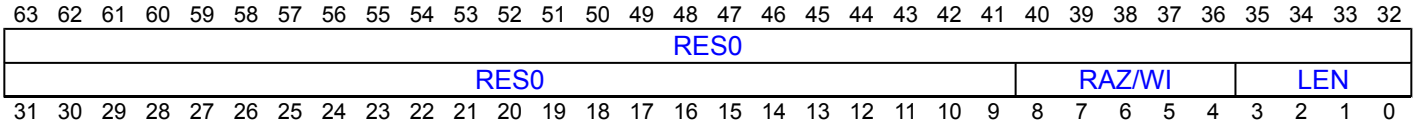
This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL2 are UNDEFINED.

This register has no effect when EL2 is not enabled in the current Security state, or when FEAT_SME is implemented and the PE is in Streaming SVE mode.

Attributes

ZCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Non-streaming SVE vector length at EL2 of (LEN+1)*128 bits. This field also defines the Effective Non-streaming SVE vector length at EL0 when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Non-streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support a subset of the architecturally permitted lengths. An implementation is required to support all lengths that are powers of two, from 128 bits up to its maximum implemented Non-streaming SVE vector length.

When FEAT_SME is not implemented, or the PE is not in Streaming SVE mode, the Effective SVE vector length (VL) is equal to the Effective Non-streaming SVE vector length.

When FEAT_SME is implemented and the PE is in Streaming SVE mode, VL is equal to the Effective Streaming SVE vector length. See SMCR_EL2.

For all purposes other than returning the result of a direct read of ZCR_EL2, the PE selects the Effective Non-streaming SVE vector length by performing checks in the following order:

1. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
2. Otherwise, the Effective length is the highest supported Non-streaming SVE vector length that is less than or equal to the requested length.

An indirect read of ZCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ZCR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name ZCR_EL2 or ZCR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

ZCR_EL3, SVE Control Register (EL3)

The ZCR_EL3 characteristics are:

Purpose

This register controls aspects of SVE visible at all Exception levels.

Configuration

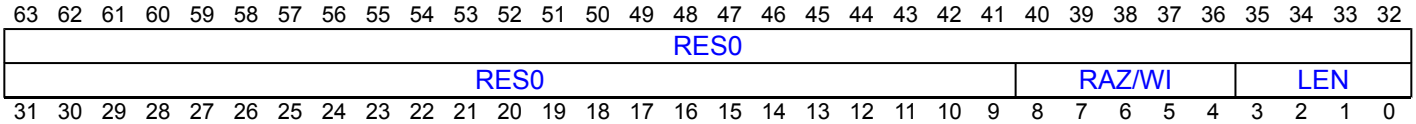
This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL3 are UNDEFINED.

This register has no effect when FEAT_SME is implemented and the PE is in Streaming SVE mode.

Attributes

ZCR_EL3 is a 64-bit register.

Field descriptions



Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Non-streaming SVE vector length at EL3 of (LEN+1)*128 bits.

The Non-streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support a subset of the architecturally permitted lengths. An implementation is required to support all lengths that are powers of two, from 128 bits up to its maximum implemented Non-streaming SVE vector length.

When FEAT_SME is not implemented, or the PE is not in Streaming SVE mode, the Effective SVE vector length (VL) is equal to the Effective Non-streaming SVE vector length.

When FEAT_SME is implemented and the PE is in Streaming SVE mode, VL is equal to the Effective Streaming SVE vector length. See SMCR_EL3.

For all purposes other than returning the result of a direct read of ZCR_EL3, the PE selects the highest supported Non-streaming SVE vector length that is less than or equal to the requested length.

An indirect read of ZCR_EL3.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ZCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ZCR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0010	0b000

```

ACTLR, Auxiliary Control Register

The ACTLR characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

Configuration

This register is banked between ACTLR and ACTLR_S and ACTLR_NS.

AArch32 System register ACTLR bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ACTLR are UNDEFINED.

Some bits might define global configuration settings, and be common to the Secure and Non-secure instances of the register.

Attributes

ACTLR is a 32-bit register.

This register has the following instances:

- ACTLR, when EL3 is not implemented or FEAT_AA64 is implemented.
- ACTLR_S, when FEAT_AA32EL3 is implemented.
- ACTLR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

ACTLR2, Auxiliary Control Register 2

The ACTLR2 characteristics are:

Purpose

Provides additional space to the ACTLR register to hold IMPLEMENTATION DEFINED trap functionality for execution at EL1 and EL0.

Configuration

This register is banked between ACTLR2 and ACTLR2_S and ACTLR2_NS.

AArch32 System register ACTLR2 bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL1[63:32].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ACTLR2 are UNDEFINED.

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining ID_MMFR4.AC2.

From Armv8.2 this register must be implemented.

Attributes

ACTLR2 is a 32-bit register.

This register has the following instances:

- ACTLR2, when EL3 is not implemented or FEAT_AA64 is implemented.
- ACTLR2_S, when FEAT_AA32EL3 is implemented.
- ACTLR2_NS, when FEAT_AA32EL3 is implemented.

AMAIR0, Auxiliary Memory Attribute Indirection Register 0

The AMAIR0 characteristics are:

Purpose

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR0.

Configuration

This register is banked between AMAIR0 and AMAIR0_S and AMAIR0_NS.

AArch32 System register AMAIR0 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to AMAIR0 are UNDEFINED.

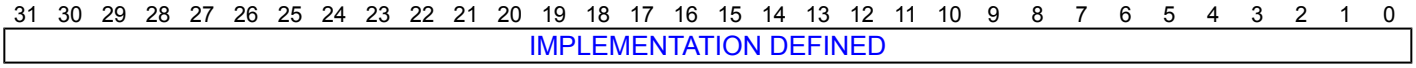
Attributes

AMAIR0 is a 32-bit register.

This register has the following instances:

- AMAIR0, when EL3 is not implemented or FEAT_AA64 is implemented.
- AMAIR0_S, when FEAT_AA32EL3 is implemented.
- AMAIR0_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR0(S) gives the value for memory accesses from Secure state.
- AMAIR0(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMAIR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

AMAIR1, Auxiliary Memory Attribute Indirection Register 1

The AMAIR1 characteristics are:

Purpose

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR1.

Configuration

This register is banked between AMAIR1 and AMAIR1_S and AMAIR1_NS.

AArch32 System register AMAIR1 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL1[63:32].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to AMAIR1 are UNDEFINED.

When EL3 is using AArch32, write access to AMAIR1(S) is disabled when the **CP15SDISABLE** signal is asserted HIGH.

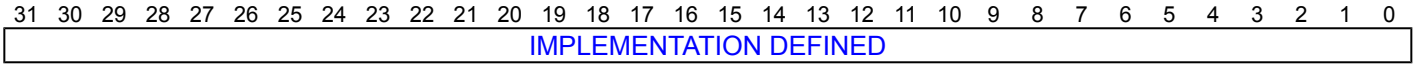
Attributes

AMAIR1 is a 32-bit register.

This register has the following instances:

- AMAIR1, when EL3 is not implemented or FEAT_AA64 is implemented.
- AMAIR1_S, when FEAT_AA32EL3 is implemented.
- AMAIR1_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR1(S) gives the value for memory accesses from Secure state.
- AMAIR1(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

IMPLEMENTATION DEFINED, bits [31:0]

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register AMCFGR_EL0[31:0].

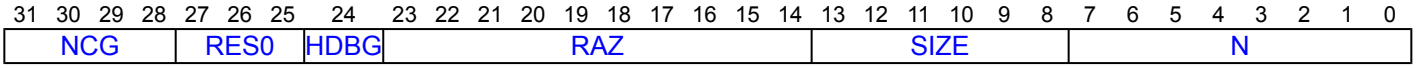
AArch32 System register AMCFGR bits [31:0] are architecturally mapped to External register AMCFGR[31:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMCFGR are UNDEFINED.

Attributes

AMCFGR is a 32-bit register.

Field descriptions



NCG, bits [31:28]

Defines the number of counter groups implemented, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NCG	Meaning
0b0000	One counter group implemented.
0b0001	Two counter groups implemented.

All other values are reserved.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is 0b1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HDBG	Meaning
0b0	AMCR.HDBG is RES0.
0b1	AMCR.HDBG is read/write.

Access to this field is **RO**.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of the activity monitor event counters, minus one.

The counters are 64-bit, so the value of this field is `0b111111`.

This field is used by software to determine the spacing of the counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as `0b111111`.

Access to this field is **RO**.

N, bits [7:0]

Defines the number of activity monitor event counters implemented in all groups, minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMCFGR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b001

```

AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configuration

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register AMCGCR_EL0[31:0].

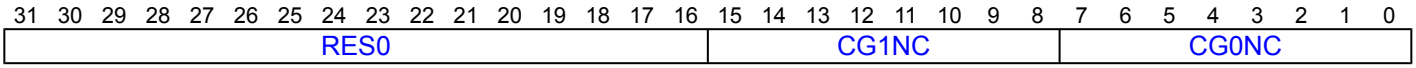
AArch32 System register AMCGCR bits [31:0] are architecturally mapped to External register AMCGCR[31:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMCGCR are UNDEFINED.

Attributes

AMCGCR is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as `0x04`.

Access to this field is **RO**.

Accessing AMCGCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b010

```

AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, AMEVCNTR0<n>.

Configuration

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to External register AMCNTENCLR0[31:0].

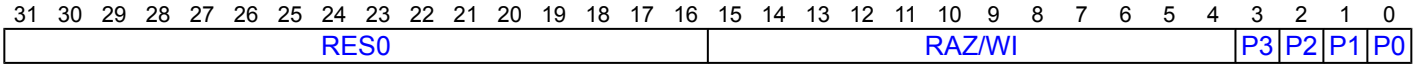
AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to External register AMCNTENSET0[31:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are UNDEFINED.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for AMEVCNTR0<n>.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR0<n> is enabled. When written, disables AMEVCNTR0<n>.

The reset behavior of this field is:

- On an AMU reset, this field resets to '0'.

Accessing this field has the following behavior:

- When n >= 4, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1C**.

Accessing AMCNTENCLR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b100

```

AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

Configuration

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to External register AMCNTENCLR1[31:0].

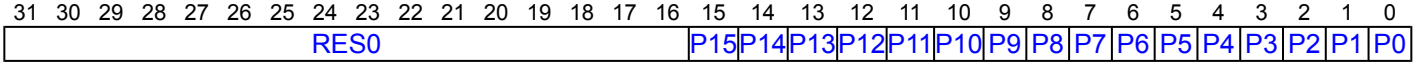
AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to External register AMCNTENSET1[31:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are UNDEFINED.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for AMEVCNTR1<n>.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR1<n> is enabled. When written, disables AMEVCNTR1<n>.

The reset behavior of this field is:

- On an AMU reset, this field resets to '0'.

Accessing this field has the following behavior:

- When n >= UInt(AMCGCR.CG1NC), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1C**.

Accessing AMCNTENCLR1

If there are no auxiliary monitor event counters implemented, reads and writes of AMCNTENCLR1 are UNDEFINED.

Note

There are no implemented auxiliary activity monitor event counters when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0011	0b000

AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

Configuration

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to External register AMCNTENSET1[31:0].

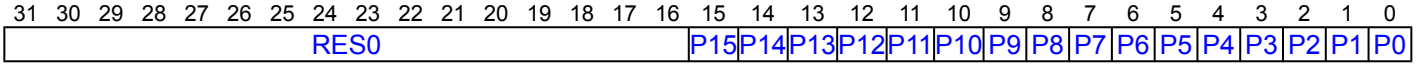
AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to External register AMCNTENCLR1[31:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMCNTENSET1 are UNDEFINED.

Attributes

AMCNTENSET1 is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter enable bit for AMEVCNTR1<n>.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR1<n> is enabled. When written, enables AMEVCNTR1<n>.

The reset behavior of this field is:

- On an AMU reset, this field resets to '0'.

Accessing this field has the following behavior:

- When n >= UInt(AMCGCR.CG1NC), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1S**.

Accessing AMCNTENSET1

If there are no auxiliary monitor event counters implemented, reads and writes of AMCNTENSET1 are UNDEFINED.

Note

There are no implemented auxiliary activity monitor event counters when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0011	0b001

```

AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch32 System register AMCR bits [31:0] are architecturally mapped to AArch64 System register AMCR_EL0[31:0].

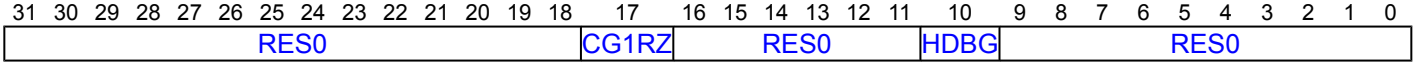
AArch32 System register AMCR bits [31:0] are architecturally mapped to External register AMCR[31:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMCR are UNDEFINED.

Attributes

AMCR is a 32-bit register.

Field descriptions



Bits [31:18]

Reserved, RES0.

CG1RZ, bit [17]

When FEAT_AMUv1p1 is implemented:

Counter Group 1 Read Zero.

CG1RZ	Meaning
0b0	System register reads of AMEVCNTR1<n> return the event count at all implemented and enabled Exception levels.
0b1	If the current Exception level is the highest implemented Exception level, System register reads of AMEVCNTR1<n> return the event count. Otherwise, reads of AMEVCNTR1<n> return a zero value.

Note

Reads from the memory-mapped view are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

HDBG	Meaning
0b0	Activity monitors do not halt counting when the PE is halted in Debug state.
0b1	Activity monitors halt counting when the PE is halted in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing AMCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b000

```

AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 3

The AMEVCNTR0<n> characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configuration

AArch32 System register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR0<n>_EL0[63:0].

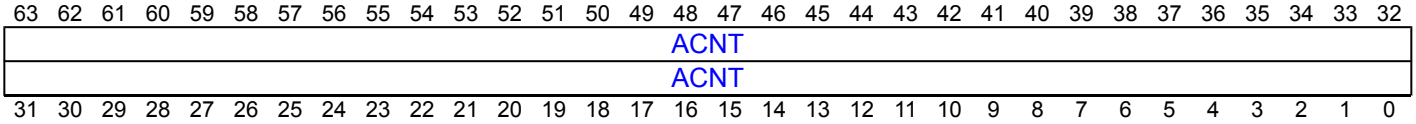
AArch32 System register AMEVCNTR0<n> bits [63:0] are architecturally mapped to External register AMEVCNTR0<n>[63:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are UNDEFINED.

Attributes

AMEVCNTR0<n> is a 64-bit register.

Field descriptions



ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

If FEAT_AMUv1p1 is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and EL2 is using AArch64 and is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF0<n>_EL2<63:0>).

PCount is the physical count returned when AMEVCNTR0<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to '0000000000000000000000000000000000000000000000000000000000000000'.

Accessing AMEVCNTR0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n> are UNDEFINED.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configuration

AArch32 System register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR1<n>_EL0[63:0].

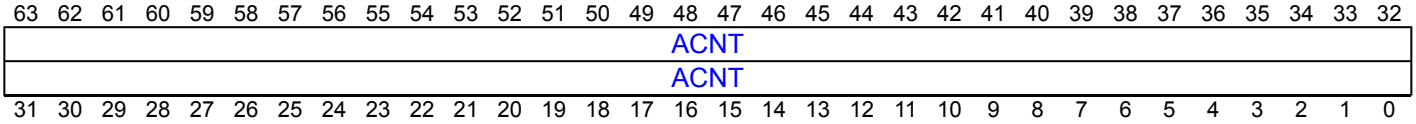
AArch32 System register AMEVCNTR1<n> bits [63:0] are architecturally mapped to External register AMEVCNTR1<n>[63:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are UNDEFINED.

Attributes

AMEVCNTR1<n> is a 64-bit register.

Field descriptions



ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If FEAT_AMUv1p1 is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL2 is using AArch64 and is implemented in the current Security state, and AMCR_EL0.CG1RZ is 0, reads to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF1<n>_EL2<63:0>).

PCount is the physical count returned when AMEVCNTR1<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to '0000000000000000000000000000000000000000000000000000000000000000'.

Accessing AMEVCNTR1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n> are UNDEFINED.

Note

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm> ; Where m = 0-15
```

AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n> characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n> counts.

Configuration

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER0<n>_EL0[31:0].

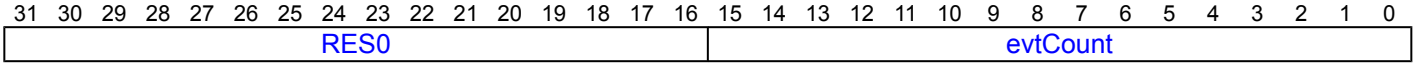
AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to External register AMEVTYPER0<n>[31:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are UNDEFINED.

Attributes

AMEVTYPER0<n> is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

evtCount	Meaning	Applies when
0x0011	Processor frequency cycles.	When n == 0
0x4004	Constant frequency cycles.	When n == 1
0x0008	Instructions retired.	When n == 2
0x4005	Memory stall cycles.	When n == 3

Access to this field is **RO**.

Accessing AMEVTYPER0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n> are UNDEFINED.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-3
```

coproc	opc1	CRn	CRm	opc2

AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter AMEVCNTR1<n> counts.

Configuration

AArch32 System register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER1<n>_EL0[31:0].

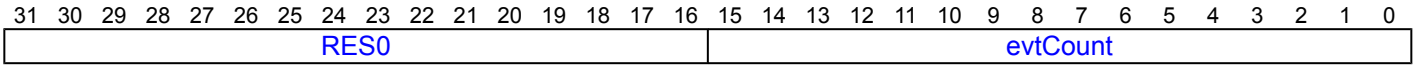
AArch32 System register AMEVTYPER1<n> bits [31:0] are architecturally mapped to External register AMEVTYPER1<n>[31:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are UNDEFINED.

Attributes

AMEVTYPER1<n> is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1<n>, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by AMEVCNTR1<n> might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter AMEVCNTR1<n> is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n> are UNDEFINED.

Note

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15
```

coproc	opc1	CRn	CRm	opc2

AMUSERENR, Activity Monitors User Enable Register

The AMUSERENR characteristics are:

Purpose

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR is applicable to both the architected and the auxiliary counter groups.

Configuration

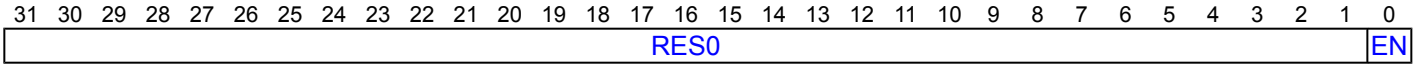
AArch32 System register AMUSERENR bits [31:0] are architecturally mapped to AArch64 System register AMUSERENR_EL0[31:0].

This register is present only when FEAT_AMUv1 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to AMUSERENR are UNDEFINED.

Attributes

AMUSERENR is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

EN, bit [0]

Traps EL0 accesses to the activity monitors registers to EL1.

EN	Meaning
0b0	EL0 accesses to the activity monitors registers are trapped to EL1.
0b1	This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

Note

- AMUSERENR can always be read at EL0 and is not governed by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMUSERENR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b011

APSR, Application Program Status Register

The APSR characteristics are:

Purpose

Hold program status and control information.

Note

Some of the fields in this register are permitted to return the value of the PSTATE field on a read. This is an exception to the general rule that an UNKNOWN field must not return information that cannot be obtained, at the current Privilege level, by an architected mechanism.

For more information see 'The Application Program Status Register, APSR'.

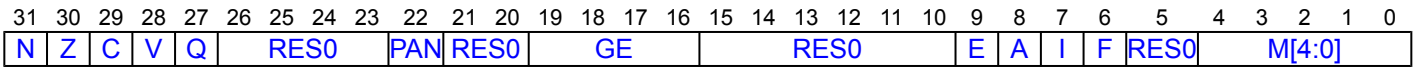
Configuration

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to APSR are UNDEFINED.

Attributes

APSR is a 32-bit register.

Field descriptions



N, bit [31]

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

Q, bit [27]

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Bits [26:23]

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. This field is UNKNOWN, but is permitted to return the value of PSTATE.PAN field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [21:20]

Reserved, RES0.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

Bits [15:10]

Reserved, RES0.

E, bit [9]

Endianness. This field is UNKNOWN, but is permitted to return the value of PSTATE.E field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. This field is UNKNOWN, but is permitted to return the value of PSTATE.A field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. This field is UNKNOWN, but is permitted to return the value of PSTATE.I field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. This field is UNKNOWN, but is permitted to return the value of PSTATE.F field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4:0], bits [4:0]

Mode. This field is UNKNOWN, but is permitted to return the value of PSTATE.M[4:0] field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APSR

APSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

ATS12NSOPR, Address Translate Stages 1 and 2 Non-secure Only PL1 Read

The ATS12NSOPR characteristics are:

Purpose

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if reading from the given virtual address.

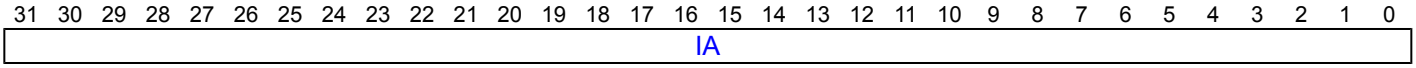
Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to ATS12NSOPR are UNDEFINED.

Attributes

ATS12NSOPR is a 32-bit System instruction.

Field descriptions



IA, bits [31:0]

Input address for translation. The resulting address can be read from the PAR.

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

Executing ATS12NSOPR

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1000	0b100

ATS1HR, Address Translate Stage 1 Hyp mode Read

The ATS1HR characteristics are:

Purpose

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if reading from the given virtual address.

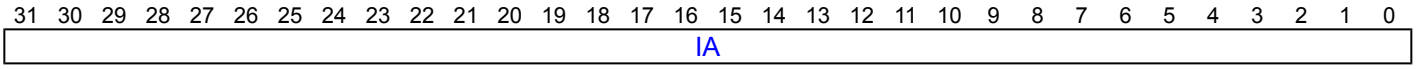
Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to ATS1HR are UNDEFINED.

Attributes

ATS1HR is a 32-bit System instruction.

Field descriptions



IA, bits [31:0]

Input address for translation. The resulting address can be read from the PAR.

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

Executing ATS1HR

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0111	0b1000	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T7

ATS1HW, Address Translate Stage 1 Hyp mode Write

The ATS1HW characteristics are:

Purpose

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if writing to the given virtual address.

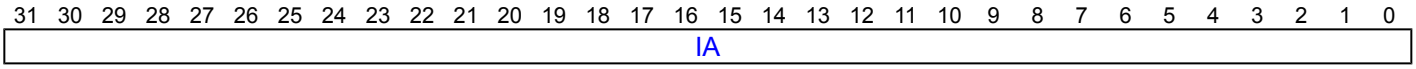
Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to ATS1HW are UNDEFINED.

Attributes

ATS1HW is a 32-bit System instruction.

Field descriptions



IA, bits [31:0]

Input address for translation. The resulting address can be read from the PAR.

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

Executing ATS1HW

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0111	0b1000	0b001

BPIALL, Branch Predictor Invalidate All

The BPIALL characteristics are:

Purpose

Invalidate all entries from branch predictors.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to BPIALL are UNDEFINED.

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

Attributes

BPIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing BPIALL

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

When HCR.FB is 1, at Non-secure EL1 this instruction executes as a BPIALLIS.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0101	0b110

```

BPIALLIS, Branch Predictor Invalidate All, Inner Shareable

The BPIALLIS characteristics are:

Purpose

Invalidate all entries from branch predictors Inner Shareable.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to BPIALLIS are UNDEFINED.

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

Attributes

BPIALLIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing BPIALLIS

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

BPIMVA, Branch Predictor Invalidate by VA

The BPIMVA characteristics are:

Purpose

Invalidate virtual address from branch predictors.

Configuration

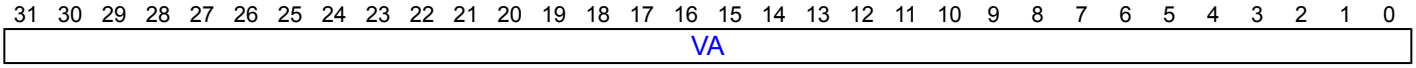
This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to BPIMVA are UNDEFINED.

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

Attributes

BPIMVA is a 32-bit System instruction.

Field descriptions



VA, bits [31:0]

Virtual address to use.

Executing BPIMVA

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

CCSIDR, Current Cache Size ID Register

The CCSIDR characteristics are:

Purpose

Provides information about the architecture of the currently selected cache.

When FEAT_CCIDX is implemented, this register is used in conjunction with CCSIDR2.

Configuration

AArch32 System register CCSIDR bits [31:0] are architecturally mapped to AArch64 System register CCSIDR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to CCSIDR are UNDEFINED.

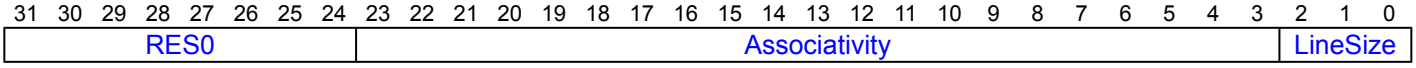
The implementation includes one CCSIDR for each cache that it can access. CSSELR and the Security state select which Cache Size ID Register is accessible.

Attributes

CCSIDR is a 32-bit register.

Field descriptions

When FEAT_CCIDX is implemented:



Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [31:24]

Reserved, RES0.

Associativity, bits [23:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log_2(Number of bytes in cache line)) - 4. For example:

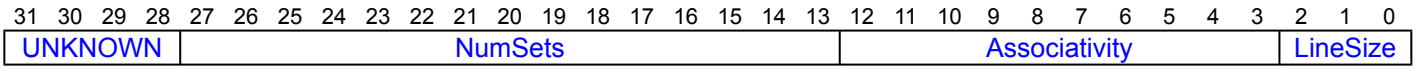
For a line length of 16 bytes: $Log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: $Log_2(32) = 5$, LineSize entry = 1.

Note

The C++ 17 specification has two defined parameters relating to the granularity of memory that does not interfere. For generic software and tools, Arm will set the hardware_destructive_interference_size parameter to 256 bytes and the hardware_constructive_interference_size parameter to 64 bytes.

Otherwise:



Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [31:28]

Reserved, UNKNOWN.

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log_2(Number of bytes in cache line)) - 4. For example:

For a line length of 16 bytes: $Log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: $Log_2(32) = 5$, LineSize entry = 1.

Note

The C++ 17 specification has two defined parameters relating to the granularity of memory that does not interfere. For generic software and tools, Arm will set the hardware_destructive_interference_size parameter to 256 bytes and the hardware_constructive_interference_size parameter to 64 bytes.

Accessing CCSIDR

If CSSELR.{Level, InD} is programmed to a cache level that is not implemented, then on a read of the CCSIDR the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR read is treated as NOP.
- The CCSIDR read is UNDEFINED.
- The CCSIDR read returns an UNKNOWN value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

0b1111	0b001	0b0000	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T0

CCSIDR2, Current Cache Size ID Register 2

The CCSIDR2 characteristics are:

Purpose

Provides information about the architecture of the currently selected cache.

Configuration

AArch32 System register CCSIDR2 bits [31:0] are architecturally mapped to AArch64 System register CCSIDR2_EL1[31:0].

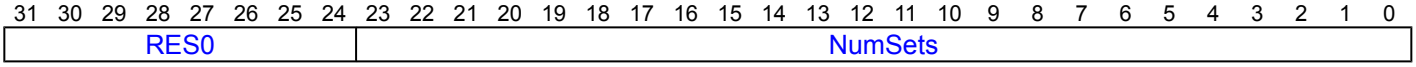
This register is present only when FEAT_AA32EL1 is implemented and FEAT_CCIDX is implemented. Otherwise, direct accesses to CCSIDR2 are UNDEFINED.

The implementation includes one CCSIDR2 for each cache that it can access. CSSELR and the Security state select which Cache Size ID Register is accessible.

Attributes

CCSIDR2 is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

NumSets, bits [23:0]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Accessing CCSIDR2

If CSSELR.{Level, InD} is programmed to a cache level that is not implemented, then on a read of the CCSIDR2 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR2 read is treated as NOP.
- The CCSIDR2 read is UNDEFINED.
- The CCSIDR2 read returns an UNKNOWN value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

CFPRCTX, Control Flow Prediction Restriction by Context

The CFPRCTX characteristics are:

Purpose

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Control flow predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

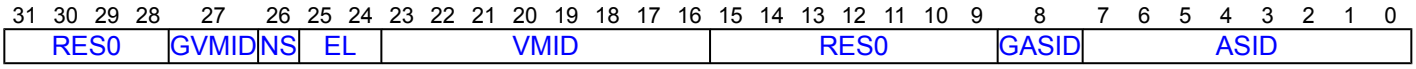
Configuration

This instruction is present only when FEAT_AA32 is implemented and FEAT_SPECRES is implemented. Otherwise, direct accesses to CFPRCTX are UNDEFINED.

Attributes

CFPRCTX is a 32-bit System instruction.

Field descriptions



Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, or is specified to apply to a combination of Exception level and Security state that is not implemented, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when EL2 is using AArch32 or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0, this field is treated as the current VMID if any of the following are true:

- EL2 is using AArch32.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field is treated as 0.

ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing CFPRCTX

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0011	0b100

CLIDR, Cache Level ID Register

The CLIDR characteristics are:

Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

Configuration

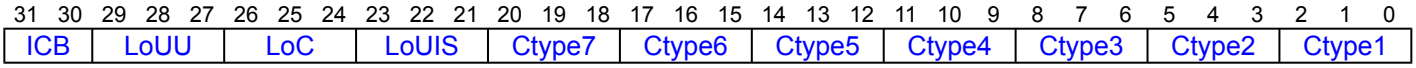
AArch32 System register CLIDR bits [31:0] are architecturally mapped to AArch64 System register CLIDR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to CLIDR are UNDEFINED.

Attributes

CLIDR is a 32-bit register.

Field descriptions



ICB, bits [31:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ICB	Meaning
0b00	Not disclosed by this mechanism.
0b01	L1 cache is the highest Inner Cacheable level.
0b10	L2 cache is the highest Inner Cacheable level.
0b11	L3 cache is the highest Inner Cacheable level.

Access to this field is **RO**.

LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

Note

This field does not describe the requirements for instruction cache invalidation. See CTR.DIC.

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

For a description of the values of this field, see Terminology for Clean, Invalidate, and Clean and Invalidate instructions.

Note

This field does not describe the requirements for instruction cache invalidation. See CTR.DIC.

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 7 to 1

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy.

Ctype<n>	Meaning
0b000	No cache.
0b001	Instruction cache only.
0b010	Data cache only.
0b011	Separate instruction and data caches.
0b100	Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 0b000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 0b000, the values of Ctype4 to Ctype7 must be ignored.

Accessing CLIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

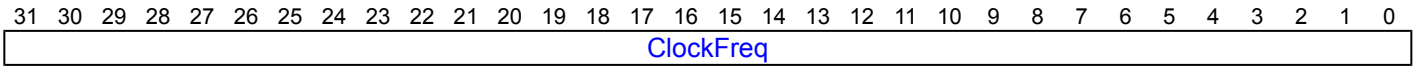
AArch32 System register CNTFRQ bits [31:0] are architecturally mapped to AArch64 System register CNTFRQ_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTFRQ are UNDEFINED.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions



ClockFreq, bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

CNTHCTL, Counter-timer Hyp Control register

The CNTHCTL characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

Configuration

AArch32 System register CNTHCTL bits [31:0] are architecturally mapped to AArch64 System register CNTHCTL_EL2[31:0].

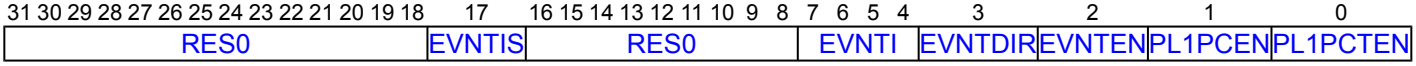
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to CNTHCTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHCTL is a 32-bit register.

Field descriptions



Bits [31:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL.EVNTI field applies to CNTPCT[15:0].
0b1	The CNTHCTL.EVNTI field applies to CNTPCT[23:8].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit of CNTPCT, as seen from EL2, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of CNTPCT.

Otherwise, this field selects a trigger bit in the range 0 to 15 of CNTPCT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the CNTPCT trigger bit, as seen from EL2 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from CNTPCT as seen from EL2.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL1PCEN, bit [1]

Traps Non-secure EL0 and EL1 MRC or MCR accesses, reported using EC syndrome value 0x03, and MRRC or MCRR accesses, reported using EC syndrome value 0x04, to the physical timer registers to Hyp mode.

PL1PCEN	Meaning
0b0	Non-secure EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to Hyp mode, unless trapped by CNTKCTL.PL0PTEN.
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL1PCTEN, bit [0]

Traps Non-secure EL0 and EL1 MRRC or MCRR accesses, reported using EC syndrome value 0x04, to the physical counter register to Hyp mode.

PL1PCTEN	Meaning
0b0	Non-secure EL0 and EL1 accesses to the CNTPCT are trapped to Hyp mode, unless it is trapped by CNTKCTL.PL0PCTEN.
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHCTL

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1110	0b0001	0b000

CNTHP_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP_CTL characteristics are:

Purpose

Control register for the Hyp mode physical timer.

Configuration

This register is banked between CNTHP_CTL and CNTHP_CTL_S and CNTHP_CTL_NS.

AArch32 System register CNTHP_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHP_CTL_EL2[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTHP_CTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

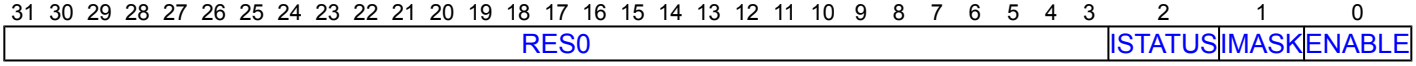
Attributes

CNTHP_CTL is a 32-bit register.

This register has the following instances:

- CNTHP_CTL, when EL3 is not implemented or FEAT_AA64 is implemented.
- CNTHP_CTL_S, when FEAT_AA32EL3 is implemented.
- CNTHP_CTL_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHP_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_CTL

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP_CVAL characteristics are:

Purpose

Holds the compare value for the Hyp mode physical timer.

Configuration

This register is banked between CNTHP_CVAL and CNTHP_CVAL_S and CNTHP_CVAL_NS.

AArch32 System register CNTHP_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHP_CVAL_EL2[63:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTHP_CVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

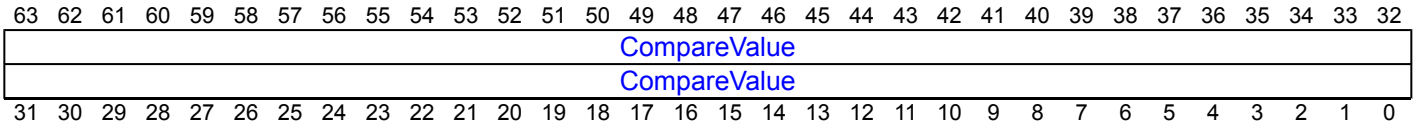
Attributes

CNTHP_CVAL is a 64-bit register.

This register has the following instances:

- CNTHP_CVAL, when EL3 is not implemented or FEAT_AA64 is implemented.
- CNTHP_CVAL_S, when FEAT_AA32EL3 is implemented.
- CNTHP_CVAL_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CNTHP_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP_TVAL characteristics are:

Purpose

Holds the timer value for the Hyp mode physical timer.

Configuration

This register is banked between CNTHP_TVAL and CNTHP_TVAL_S and CNTHP_TVAL_NS.

AArch32 System register CNTHP_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHP_TVAL_EL2[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTHP_TVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

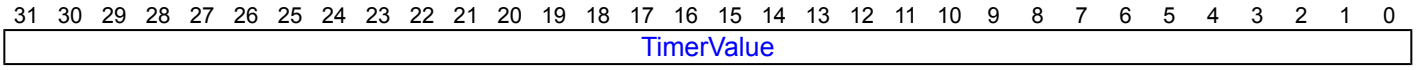
Attributes

CNTHP_TVAL is a 32-bit register.

This register has the following instances:

- CNTHP_TVAL, when EL3 is not implemented or FEAT_AA64 is implemented.
- CNTHP_TVAL_S, when FEAT_AA32EL3 is implemented.
- CNTHP_TVAL_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL.ENABLE is 1, the value returned is (CNTHP_CVAL - CNTPCT).

On a write of this register, CNTHP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTHP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CNTHPS_CTL, Counter-timer Secure Physical Timer Control Register (EL2)

The CNTHPS_CTL characteristics are:

Purpose

Provides AArch32 access from EL0 to the Secure EL2 physical timer.

Configuration

This register is banked between CNTHPS_CTL and CNTHPS_CTL_S and CNTHPS_CTL_NS.

AArch32 System register CNTHPS_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHPS_CTL_EL2[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL are UNDEFINED.

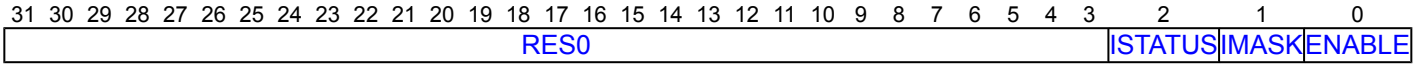
Attributes

CNTHPS_CTL is a 32-bit register.

This register has the following instances:

- CNTHPS_CTL, when EL3 is not implemented or FEAT_AA64 is implemented.
- CNTHPS_CTL_S, when FEAT_AA32EL3 is implemented.
- CNTHPS_CTL_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHPS_CTL.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHPS_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_CTL

This register is accessed using the encoding for CNTP_CTL.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b001

```

CNTHPS_CVAL, Counter-timer Secure Physical Timer CompareValue Register (EL2)

The CNTHPS_CVAL characteristics are:

Purpose

Provides AArch32 access from EL0 to the compare value for the Secure EL2 physical timer.

Configuration

This register is banked between CNTHPS_CVAL and CNTHPS_CVAL_S and CNTHPS_CVAL_NS.

AArch32 System register CNTHPS_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHPS_CVAL_EL2[63:0].

This register is present only when FEAT_AA32 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL are UNDEFINED.

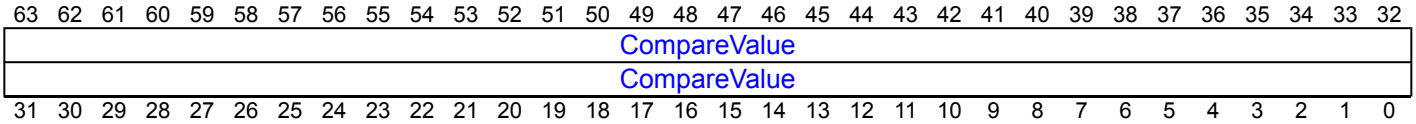
Attributes

CNTHPS_CVAL is a 64-bit register.

This register has the following instances:

- CNTHPS_CVAL, when EL3 is not implemented or FEAT_AA64 is implemented.
- CNTHPS_CVAL_S, when FEAT_AA32EL3 is implemented.
- CNTHPS_CVAL_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS_CTL.ISTATUS is set to 1.
- If CNTHPS_CTL.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_CVAL

This register is accessed using the encoding for CNTP_CVAL.

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1110	0b0010

```

CNTHPS_TVAL, Counter-timer Secure Physical Timer TimerValue Register (EL2)

The CNTHPS_TVAL characteristics are:

Purpose

Provides AArch32 access from EL0 to the timer value for the Secure EL2 physical timer.

Configuration

This register is banked between CNTHPS_TVAL and CNTHPS_TVAL_S and CNTHPS_TVAL_NS.

AArch32 System register CNTHPS_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHPS_TVAL_EL2[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL are UNDEFINED.

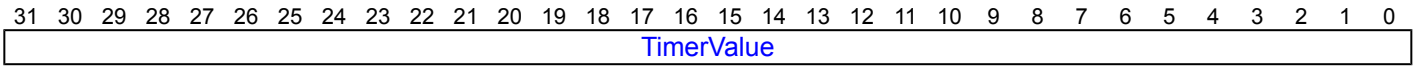
Attributes

CNTHPS_TVAL is a 32-bit register.

This register has the following instances:

- CNTHPS_TVAL, when EL3 is not implemented or FEAT_AA64 is implemented.
- CNTHPS_TVAL_S, when FEAT_AA32EL3 is implemented.
- CNTHPS_TVAL_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHPS_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHPS_CTL.ENABLE is 1, the value returned is (CNTHPS_CVAL - CNTPCT).

On a write of this register, CNTHPS_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHPS_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTHPS_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHPS_CTL.ISTATUS is set to 1.
- If CNTHPS_CTL.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_TVAL

This register is accessed using the encoding for CNTP_TVAL.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

CNTHV_CTL, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL characteristics are:

Purpose

Provides AArch32 access to the control register for the EL2 virtual timer.

Configuration

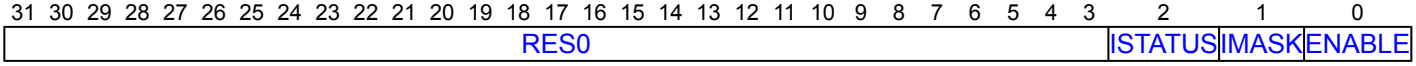
AArch32 System register CNTHV_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHV_CTL_EL2[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CTL are UNDEFINED.

Attributes

CNTHV_CTL is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHV_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_CTL

This register is accessed using the encoding for CNTV_CTL.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b001

```

CNTHV_CVAL, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL characteristics are:

Purpose

Provides AArch32 access to the compare value for the EL2 virtual timer.

Configuration

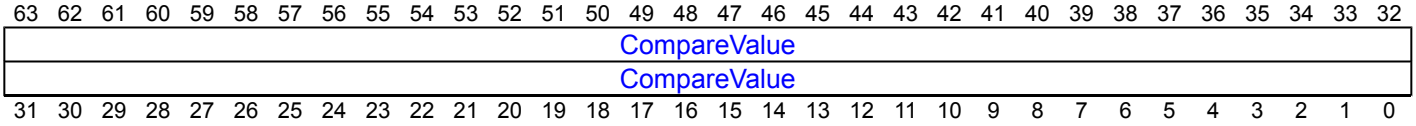
AArch32 System register CNTHV_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHV_CVAL_EL2[63:0].

This register is present only when FEAT_AA32 is implemented and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CVAL are UNDEFINED.

Attributes

CNTHV_CVAL is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHV_CTL.ISTATUS is set to 1.
- If CNTHV_CTL.IMASK is 0, an interrupt is generated.

When CNTHV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

Accessing CNTHV_CVAL

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

CNTHV_TVAL, Counter-timer Virtual Timer TimerValue register (EL2)

The CNTHV_TVAL characteristics are:

Purpose

Provides AArch32 access to the timer value for the EL2 virtual timer.

Configuration

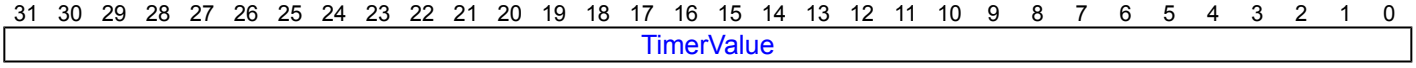
AArch32 System register CNTHV_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHV_TVAL_EL2[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL are UNDEFINED.

Attributes

CNTHV_TVAL is a 32-bit register.

Field descriptions



TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHV_CTL.ENABLE is 1, the value returned is (CNTHV_CVAL - CNTVCT).

On a write of this register, CNTHV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTHV_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHV_CTL.ISTATUS is set to 1.
- If CNTHV_CTL.IMASK is 0, an interrupt is generated.

When CNTHV_CTL.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

Accessing CNTHV_TVAL

This register is accessed using the encoding for CNTV_TVAL.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b000

```

CNTHVS_CTL, Counter-timer Secure Virtual Timer Control Register (EL2)

The CNTHVS_CTL characteristics are:

Purpose

Provides AArch32 access from EL0 to the Secure EL2 virtual timer.

Configuration

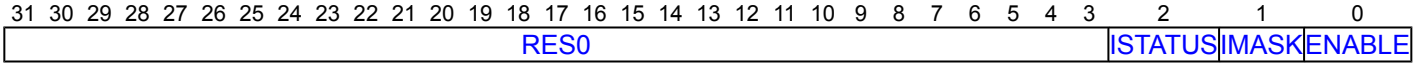
AArch32 System register CNTHVS_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHVS_CTL_EL2[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL are UNDEFINED.

Attributes

CNTHVS_CTL is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHVS_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHVS_CTL

This register is accessed using the encoding for CNTV_CTL.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b001

```

CNTHVS_CVAL, Counter-timer Secure Virtual Timer CompareValue Register (EL2)

The CNTHVS_CVAL characteristics are:

Purpose

Provides AArch32 access to the compare value for the Secure EL2 virtual timer.

Configuration

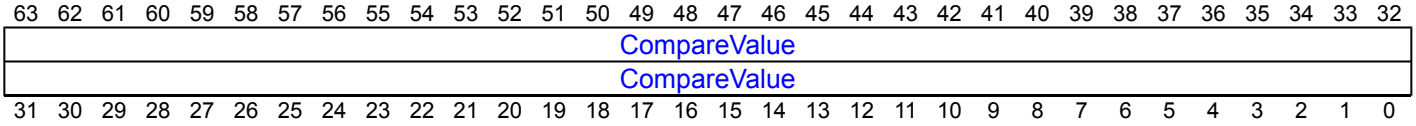
AArch32 System register CNTHVS_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHVS_CVAL_EL2[63:0].

This register is present only when FEAT_AA32 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CVAL are UNDEFINED.

Attributes

CNTHVS_CVAL is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When CNTHVS_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHVS_CTL.ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

Accessing CNTHVS_CVAL

This register is accessed using the encoding for CNTV_CVAL.

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1

CNTHVS_TVAL, Counter-timer Secure Virtual Timer TimerValue Register (EL2)

The CNTHVS_TVAL characteristics are:

Purpose

Provides AArch32 access to the timer value for the Secure EL2 virtual timer.

Configuration

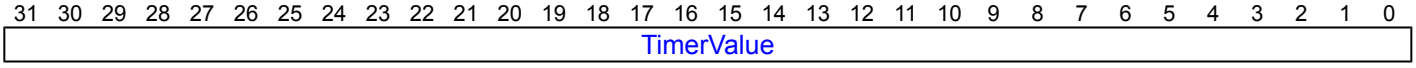
AArch32 System register CNTHVS_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHVS_TVAL_EL2[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL are UNDEFINED.

Attributes

CNTHVS_TVAL is a 32-bit register.

Field descriptions



TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHVS_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHVS_CTL.ENABLE is 1, the value returned is (CNTHVS_CVAL - CNTVCT).

On a write of this register, CNTHVS_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHVS_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTHVS_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHVS_CTL.ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

Accessing CNTHVS_TVAL

This register is accessed using the encoding for CNTV_TVAL.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b000

```

CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

Purpose

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

Configuration

AArch32 System register CNTKCTL bits [31:0] are architecturally mapped to AArch64 System register CNTKCTL_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to CNTKCTL are UNDEFINED.

Attributes

CNTKCTL is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTKCTL.EVNTI field applies to CNTVCT[15:0].
0b1	The CNTKCTL.EVNTI field applies to CNTVCT[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:10]

Reserved, RES0.

PL0PTEN, bit [9]

Traps PL0 accesses to the physical timer registers to Undefined mode.

PL0PTEN	Meaning
0b0	PL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to Undefined mode.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0VTEN, bit [8]

Traps PL0 accesses to the virtual timer registers to Undefined mode.

PL0VTEN	Meaning
0b0	PL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to Undefined mode.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of CNTVCT, as seen from EL1, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTKCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of CNTVCT.

Otherwise, this field selects a trigger bit in the range 0 to 15 of CNTVCT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the CNTVCT trigger bit, as seen from EL1 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from CNTVCT as seen from EL1.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0VCTEN, bit [1]

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

PL0VCTEN	Meaning
0b0	PL0 accesses to the CNTVCT are trapped to Undefined mode. PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PL0PCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0PCTEN, bit [0]

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

PL0PCTEN	Meaning
0b0	PL0 accesses to the CNTPCT are trapped to Undefined mode. PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PL0VCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTKCTL

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    R[t] = CNTKCTL;
elsif PSTATE.EL == EL2 then
    R[t] = CNTKCTL;
elsif PSTATE.EL == EL3 then
    R[t] = CNTKCTL;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    CNTKCTL = R[t];
elsif PSTATE.EL == EL2 then
    CNTKCTL = R[t];
elsif PSTATE.EL == EL3 then
    CNTKCTL = R[t];
```

CNTP_CTL, Counter-timer Physical Timer Control register

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

This register is banked between CNTP_CTL and CNTP_CTL_S and CNTP_CTL_NS.

AArch32 System register CNTP_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTP_CTL_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTP_CTL are UNDEFINED.

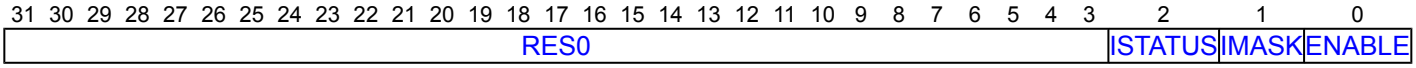
Attributes

CNTP_CTL is a 32-bit register.

This register has the following instances:

- CNTP_CTL, when EL3 is not implemented or FEAT_AA64 is implemented.
- CNTP_CTL_S, when FEAT_AA32EL3 is implemented.
- CNTP_CTL_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing CNTP_CTL

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b001

CNTP_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configuration

This register is banked between CNTP_CVAL and CNTP_CVAL_S and CNTP_CVAL_NS.

AArch32 System register CNTP_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTP_CVAL_EL0[63:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTP_CVAL are UNDEFINED.

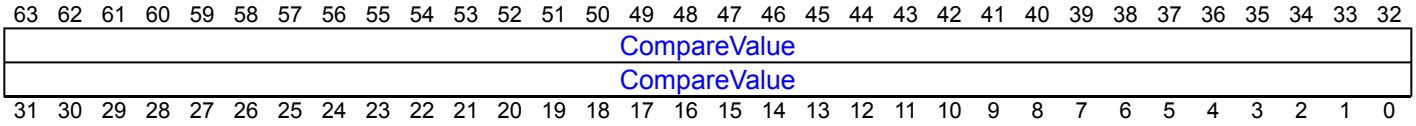
Attributes

CNTP_CVAL is a 64-bit register.

This register has the following instances:

- CNTP_CVAL, when EL3 is not implemented or FEAT_AA64 is implemented.
- CNTP_CVAL_S, when FEAT_AA32EL3 is implemented.
- CNTP_CVAL_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1110	0b0010

CNTP_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

This register is banked between CNTP_TVAL and CNTP_TVAL_S and CNTP_TVAL_NS.

AArch32 System register CNTP_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTP_TVAL_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTP_TVAL are UNDEFINED.

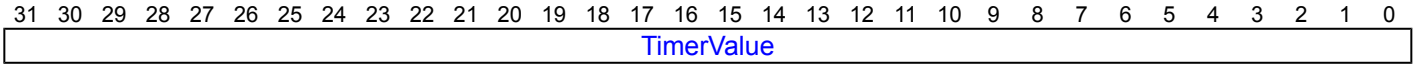
Attributes

CNTP_TVAL is a 32-bit register.

This register has the following instances:

- CNTP_TVAL, when EL3 is not implemented or FEAT_AA64 is implemented.
- CNTP_TVAL_S, when FEAT_AA32EL3 is implemented.
- CNTP_TVAL_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CNTP_CVAL - CNTPCT).

On a write of this register, CNTP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

CNTPCT, Counter-timer Physical Count register

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

AArch32 System register CNTPCT bits [63:0] are architecturally mapped to AArch64 System register CNTPCT_EL0[63:0].

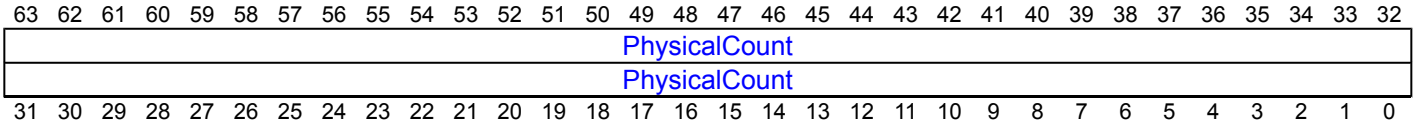
This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTPCT are UNDEFINED.

All reads to the CNTPCT occur in program order relative to reads to CNTPCTSS or CNTPCT.

Attributes

CNTPCT is a 64-bit register.

Field descriptions



PhysicalCount, bits [63:0]

Physical count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1110	0b0000

CNTPCTSS, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

AArch32 System register CNTPCTSS bits [63:0] are architecturally mapped to AArch64 System register CNTPCTSS_EL0[63:0].

This register is present only when FEAT_AA32 is implemented and FEAT_ECV is implemented. Otherwise, direct accesses to CNTPCTSS are UNDEFINED.

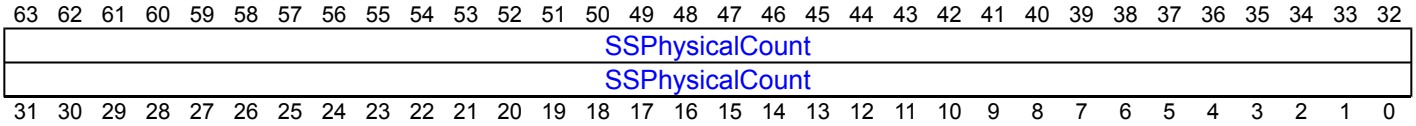
All reads to the CNTPCTSS occur in program order relative to reads to CNTPCT or CNTPCTSS.

This register is a view of the CNTPCT register for which reads appear to occur in program order relative to other instructions, without the need for any explicit synchronization. Reads of this register return a value consistent with the counter not being read until the read instruction is known to be non-speculative.

Attributes

CNTPCTSS is a 64-bit register.

Field descriptions



SSPhysicalCount, bits [63:0]

Self-Synchronized Physical count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCTSS

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

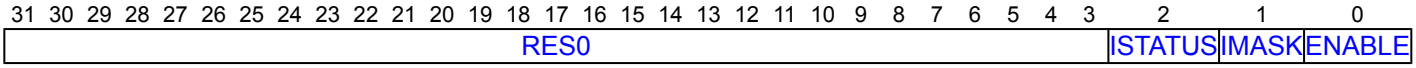
AArch32 System register CNTV_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTV_CTL_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTV_CTL are UNDEFINED.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing CNTV_CTL

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b001

CNTV_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configuration

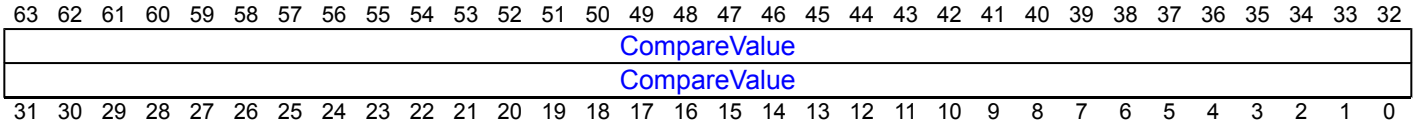
AArch32 System register CNTV_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTV_CVAL_EL0[63:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTV_CVAL are UNDEFINED.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1110	0b0011

CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

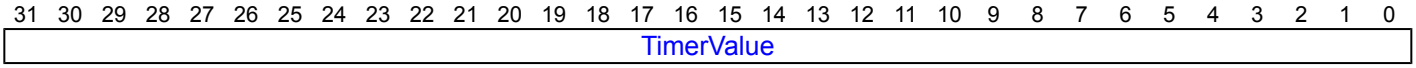
AArch32 System register CNTV_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTV_TVAL_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTV_TVAL are UNDEFINED.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions



TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CNTV_CVAL - CNTVCT).

On a write of this register, CNTV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the TimerValue cannot be read but continues to decrement. When the timer is enabled, the TimerValue represents the elapsed time whether that time was spent enabled or disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in CNTVOFF.

Configuration

AArch32 System register CNTVCT bits [63:0] are architecturally mapped to AArch64 System register CNTVCT_EL0[63:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CNTVCT are UNDEFINED.

The value of this register is the same as the value of CNTPCT in the following conditions:

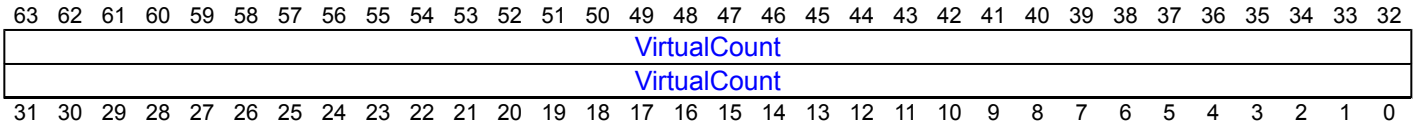
- When EL2 is not implemented.
- When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, and this register is read from Non-secure EL0.

All reads to the CNTVCT occur in program order relative to reads to CNTVCTSS or CNTVCT.

Attributes

CNTVCT is a 64-bit register.

Field descriptions



VirtualCount, bits [63:0]

Virtual count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1110	0b0001

```

CNTVCTSS, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in CNTPCT minus the virtual offset visible in CNTVOFF.

Configuration

AArch32 System register CNTVCTSS bits [63:0] are architecturally mapped to AArch64 System register CNTVCTSS_EL0[63:0].

This register is present only when FEAT_AA32 is implemented and FEAT_ECV is implemented. Otherwise, direct accesses to CNTVCTSS are UNDEFINED.

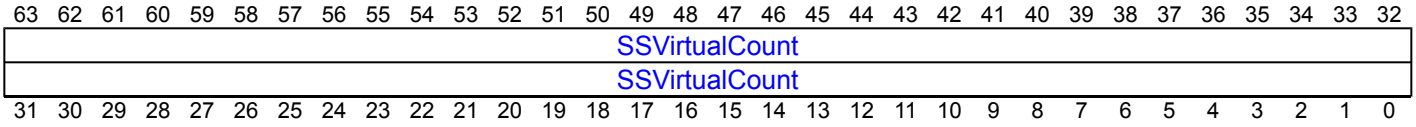
All reads to the CNTVCTSS occur in program order relative to reads to CNTVCT or CNTVCTSS.

This register is a view of the CNTVCT register for which reads appear to occur in program order relative to other instructions, without the need for any explicit synchronization. Reads of this register return a value consistent with the counter not being read until the read instruction is known to be non-speculative.

Attributes

CNTVCTSS is a 64-bit register.

Field descriptions



SSVirtualCount, bits [63:0]

Self-Synchronized Virtual count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCTSS

CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT and the virtual count value visible in CNTVCT.

Configuration

AArch32 System register CNTVOFF bits [63:0] are architecturally mapped to AArch64 System register CNTVOFF_EL2[63:0].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to CNTVOFF are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

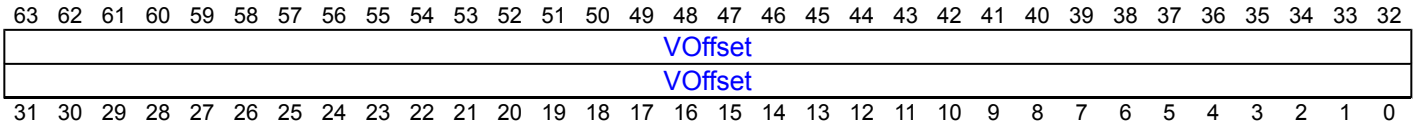
Note

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the virtual counter uses a fixed virtual offset of zero when CNTVCT is read from Non-secure EL0.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions



VOffset, bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1110	0b0100

CONTEXTIDR, Context ID Register

The CONTEXTIDR characteristics are:

Purpose

Identifies the current Process Identifier and, when using the Short-descriptor translation table format, the Address Space Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

Configuration

This register is banked between CONTEXTIDR and CONTEXTIDR_S and CONTEXTIDR_NS.

AArch32 System register CONTEXTIDR bits [31:0] are architecturally mapped to AArch64 System register CONTEXTIDR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to CONTEXTIDR are UNDEFINED.

The register format depends on whether address translation is using the Long-descriptor or the Short-descriptor translation table format.

Attributes

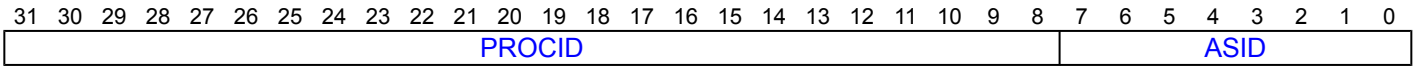
CONTEXTIDR is a 32-bit register.

This register has the following instances:

- CONTEXTIDR, when EL3 is not implemented or FEAT_AA64 is implemented.
- CONTEXTIDR_S, when FEAT_AA32EL3 is implemented.
- CONTEXTIDR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == 0:



PROCID, bits [31:8]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

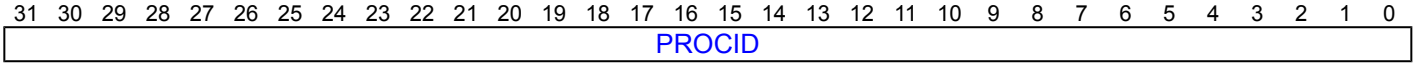
ASID, bits [7:0]

Address Space Identifier. This field is programmed with the value of the current ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:



PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CONTEXTIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

COSPRCTX, Clear Other Speculative Prediction Restriction by Context

The COSPRCTX characteristics are:

Purpose

Clear Other Speculative Prediction Restriction by Context applies to prediction resources not managed by other speculation restriction System instructions.

The actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control any predictions occurring after the instruction is complete and synchronized.

This instruction applies to all speculative access except:

- Cache Prefetch predictions.
- Control Flow predictions.
- Data Value predictions.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the PE that executed the original restriction instruction, and a subsequent Context Synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations, the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

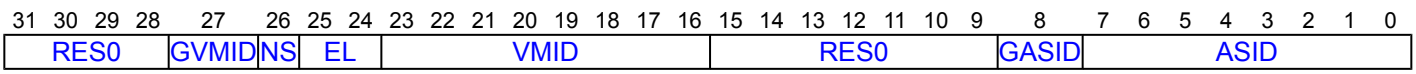
Configuration

This instruction is present only when FEAT_AA32 is implemented and FEAT_SPECRES2 is implemented. Otherwise, direct accesses to COSPRCTX are UNDEFINED.

Attributes

COSPRCTX is a 32-bit System instruction.

Field descriptions



Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

If the instruction is executed in Non-secure state, this field is treated as 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, or is specified to apply to a combination of Exception level and Security state that is not implemented, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when EL2 is using AArch32 or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0, this field is treated as the current VMID if any of the following are true:

- EL2 is using AArch32.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs, or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [7:0]

Only applies to an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing COSPRCTX

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

CPACR, Architectural Feature Access Control Register

The CPACR characteristics are:

Purpose

Controls access to trace, and to Advanced SIMD and floating-point functionality from EL0, EL1, and EL3.

In an implementation that includes EL2, the CPACR has no effect on instructions executed at EL2.

Configuration

AArch32 System register CPACR bits [31:0] are architecturally mapped to AArch64 System register CPACR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to CPACR are UNDEFINED.

Bits in the NSACR control Non-secure access to the CPACR fields. See the field descriptions for more information.

Note

In the register field descriptions, controls are described as applying at specified Privilege levels. This is because, in Secure state, a PL1 control:

- Applies to execution in a Secure EL3 mode when EL3 is using AArch32.
- Applies to execution in a Secure EL1 mode when EL3 is using AArch64.

See 'Security state, Exception levels, and AArch32 execution privilege'.

Attributes

CPACR is a 32-bit register.

Field descriptions

31	30 29	28	27 26 25 24	23 22	21 20	19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
ASEDIS	RES0	TRCDIS	RES0	cp11	cp10	RES0

ASEDIS, bit [31]

Disables PL0 and PL1 execution of Advanced SIMD instructions.

ASEDIS	Meaning
0b0	This control permits execution of Advanced SIMD instructions at PL0 and PL1.
0b1	All instruction encodings that are Advanced SIMD instruction encodings, but are not also floating-point instruction encodings, are UNDEFINED at PL0 and PL1.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

See the description of CPACR.cp10 for a list of other controls that can disable or trap execution of Advanced SIMD instructions in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

Bits [30:29]

Reserved, RES0.

TRCDIS, bit [28]

Traps PL0 and PL1 System register accesses to all implemented trace registers to Undefined mode.

TRCDIS	Meaning
`0b0`	This control has no effect on PL0 and PL1 System register accesses to trace registers.
`0b1`	PL0 and PL1 System register accesses to all implemented trace registers are trapped to Undefined mode.

If the implementation does not include a trace unit, or does not include a System register interface to the trace unit registers, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

Note

- The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED.
- The Arm architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:24]

Reserved, RES0.

cp11, bits [23:22]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the CPACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'00'`.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - EL3 is using AArch32.
  - !IsCurrentSecurityState(SS_Secure).
  - NSACR.cp10 == 0.

cp10, bits [21:20]

Defines the access rights for the Advanced SIMD and floating-point functionality. Possible values of the field are:

cp10	Meaning
0b00	PL0 and PL1 accesses to Advanced SIMD and floating-point registers or instructions are UNDEFINED.
0b01	PL0 accesses to Advanced SIMD and floating-point registers or instructions are UNDEFINED.
0b10	Reserved. The effect of programming this field to this value is CONSTRAINED UNPREDICTABLE choice between: • The value of this field is treated as 0b00, 0b01, or 0b11 for all purposes other than reading the value of the field. • PL1 accesses to floating-point and Advanced SIMD regsiters or instructions are UNDEFINED.
0b11	This control permits full access to the Advanced SIMD and floating-point functionality from PL0 and PL1.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

Note

The CPACR has no effect on Advanced SIMD and floating-point accesses from PL2. These can be disabled by the HCPTR.TCP10 field.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, HCPTR.TASE and NSACR.NSASEDIS.

See the descriptions of the controls for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if all the following are true:
  - EL3 is implemented.
  - EL3 is using AArch32.
  - !IsCurrentSecurityState(SS_Secure).
  - NSACR.cp10 == 0.

Bits [19:0]

Reserved, RES0.

Accessing CPACR

CPPRCTX, Cache Prefetch Prediction Restriction by Context

The CPPRCTX characteristics are:

Purpose

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

The actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control cache prefetch predictions occurring after the instruction is complete and synchronized.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

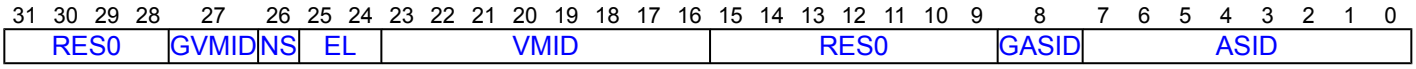
Configuration

This instruction is present only when FEAT_AA32 is implemented and FEAT_SPECRES is implemented. Otherwise, direct accesses to CPPRCTX are UNDEFINED.

Attributes

CPPRCTX is a 32-bit System instruction.

Field descriptions



Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

If the instruction is executed in Non-secure state, this field is treated as 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, or is specified to apply to a combination of Exception level and Security state that is not implemented, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when EL2 is using AArch32 or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0, this field is treated as the current VMID if any of the following are true:

- EL2 is using AArch32.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing CPPRCTX

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0011	0b111

```

CPSR, Current Program Status Register

The CPSR characteristics are:

Purpose

Holds PE status and control information.

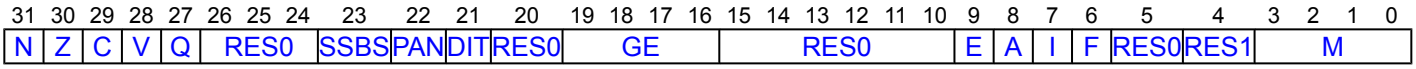
Configuration

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to CPSR are UNDEFINED.

Attributes

CPSR is a 32-bit register.

Field descriptions



N, bit [31]

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

Q, bit [27]

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Bits [26:24]

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass Safe.

Prohibits speculative loads or stores that might practically allow a cache timing side channel.

A speculative value in a register is used in a potentially speculatively exploitable manner if it is used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence or if the execution timing of any other instructions in the speculative sequence is a function of the data loaded under speculation.

SSBS	Meaning
0b0	Hardware is not permitted to use speculative register values in a potentially speculatively exploitable manner if the speculative read that loads the register is from earlier in the coherence order than the entry generated by the latest store to that location using the same virtual address as the load instruction.
0b1	When the value of PSTATE.SSBS is 1, hardware is permitted to use speculative register values in a potentially speculatively exploitable manner if the speculative read that loads the register is from earlier in the coherence order than the entry generated by the latest store to that location using the same virtual address as the load instruction.

The value of this bit is usually set to the value described by the SCTLR.DSSBS bit on exceptions to any mode except Hyp mode, and the value described by HSCTLR.DSSBS on exceptions to Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never.

PAN	Meaning
0b0	The translation system is the same as Armv8.0.
0b1	Disables privileged read and write accesses to addresses accessible at EL0.

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the SCTLR.SPAN bit for the current Security state is 0, this bit is set to 1.
- When the target of the exception is EL3, from Secure state, and the value of the Secure SCTLR.SPAN is 0, this bit is set to 1.
- When the target of the exception is EL3, from Non-secure state, this bit is set to 0 regardless of the value of the Secure SCTLR.SPAN bit.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing.

DIT	Meaning
0b0	The architecture makes no statement about the timing properties of any instructions.
0b1	The architecture requires that: • The timing of every load and store instruction is insensitive to the value of the data being loaded or stored. • For certain data processing instructions, the instruction takes a time that is independent of: ◦ The values of the data supplied in any of its registers. ◦ The values of the NZCV flags. • For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on: ◦ The values of the data supplied in any of its registers. ◦ The values of the NZCV flags.

The Operational Information section of a data processing instruction description indicates if that instruction is affected by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

Bits [15:10]

Reserved, RES0.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

E	Meaning
0b0	Little-endian operation
0b1	Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError exception mask bit.

A	Meaning
0b0	Exception not masked.
0b1	Exception masked.

I, bit [7]

IRQ mask bit.

I	Meaning
0b0	Exception not masked.
0b1	Exception masked.

F, bit [6]

FIQ mask bit.

F	Meaning
0b0	Exception not masked.
0b1	Exception masked.

Bit [5]

Reserved, RES0.

Bit [4]

Reserved, RES1.

M, bits [3:0]

Current PE mode.

M	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Accessing CPSR

CPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

2025-06-23 17:47:32, 2025-06_rel

Copyright © 2010-2025 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CSSELR, Cache Size Selection Register

The CSSELR characteristics are:

Purpose

Selects the current Cache Size ID Register, CCSIDR, by specifying the required cache level and the cache type, which is either instruction cache or data cache.

If FEAT_CCIDX is implemented, CSSELR also selects the current CCSIDR2.

Configuration

This register is banked between CSSELR and CSSELR_S and CSSELR_NS.

AArch32 System register CSSELR bits [31:0] are architecturally mapped to AArch64 System register CSSELR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to CSSELR are UNDEFINED.

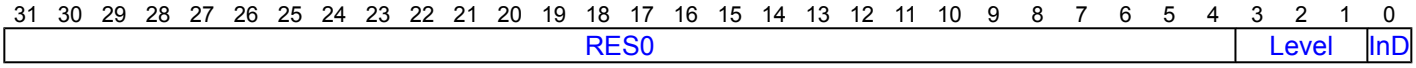
Attributes

CSSELR is a 32-bit register.

This register has the following instances:

- CSSELR, when EL3 is not implemented or FEAT_AA64 is implemented.
- CSSELR_S, when FEAT_AA32EL3 is implemented.
- CSSELR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



Bits [31:4]

Reserved, RES0.

Level, bits [3:1]

Cache level of required cache. Permitted values are:

Level	Meaning
0b000	Level 1 cache.
0b001	Level 2 cache.
0b010	Level 3 cache.
0b011	Level 4 cache.
0b100	Level 5 cache.
0b101	Level 6 cache.
0b110	Level 7 cache.

All other values are reserved.

If CSSELR.{Level, InD} is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [0]

Instruction not Data bit. Permitted values are:

InD	Meaning
0b0	Data or unified cache.
0b1	Instruction cache.

If CSSELR.{Level, InD} is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CSSELR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

CTR, Cache Type Register

The CTR characteristics are:

Purpose

Provides information about the architecture of the caches.

Configuration

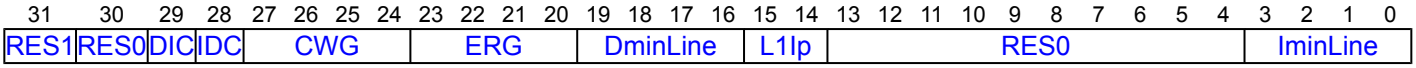
AArch32 System register CTR bits [31:0] are architecturally mapped to AArch64 System register CTR_EL0[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to CTR are UNDEFINED.

Attributes

CTR is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.

DIC, bit [29]

Instruction cache invalidation requirements for data to instruction coherence.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DIC	Meaning
0b0	Instruction cache invalidation to the Point of Unification is required for data to instruction coherence.
0b1	Instruction cache invalidation to the Point of Unification is not required for data to instruction coherence.

All PEs in the same Inner Shareable shareability domain must have a common value of this field.

Access to this field is **RO**.

IDC, bit [28]

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDC	Meaning
0b0	Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR.LoC == 0b000 or (CLIDR.LoUIS == 0b000 and CLIDR.LoUU == 0b000).
0b1	Data cache clean to the Point of Unification is not required for instruction to data coherence.

If CTR.DIC is 1, then the value reported in this field must be 1.

The Effective value of IDC is 1 if any of the following are true:

- CTR.IDC == 1.
- CLIDR.LoC == 0b000.
- CLIDR.LoUIS == 0b000 and CLIDR.LoUU == 0b000.

All PEs in the same Inner Shareable shareability domain must have a common Effective value of IDC.

Access to this field is **RO**.

CWG, bits [27:24]

Cache writeback granule. Log_2 of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ERG, bits [23:20]

Exclusives reservation granule. Log_2 of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

The use of the value 0b0000 is deprecated.

The value 0b0001 and values greater than 0b1001 are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

DminLine, bits [19:16]

Log_2 of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Ip	Meaning
0b00	Reserved.
0b01	ASID-tagged Virtual Index, Virtual Tag (AIVIVT).
0b10	Virtual Index, Physical Tag (VIPT).
0b11	Physical Index, Physical Tag (PIPT).

From Armv8.0, the value 0b01 is not permitted.

Access to this field is **RO**.

Bits [13:4]

Reserved, RES0.

IminLine, bits [3:0]

Log_2 of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTR

DACR, Domain Access Control Register

The DACR characteristics are:

Purpose

Defines the access permission for each of the sixteen memory domains.

Configuration

This register is banked between DACR and DACR_S and DACR_NS.

AArch32 System register DACR bits [31:0] are architecturally mapped to AArch64 System register DACR32_EL2[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DACR are UNDEFINED.

This register has no function when TTBCR.EAE is set to 1, to select the Long-descriptor translation table format.

Attributes

DACR is a 32-bit register.

This register has the following instances:

- DACR, when EL3 is not implemented or FEAT_AA64 is implemented.
- DACR_S, when FEAT_AA32EL3 is implemented.
- DACR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

31 30	29 28	27 26	25 24	23 22	21 20	19 18	17 16	15 14	13 12	11 10	9 8	7 6	5 4	3 2	1 0
D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

D<n>, bits [2n+1:2n], for n = 15 to 0

Domain n access permission, where n = 0 to 15. Permitted values are:

D<n>	Meaning
0b00	No access. Any access to the domain generates a Domain fault.
0b01	Client. Accesses are checked against the permission bits in the translation tables.
0b11	Manager. Accesses are not checked against the permission bits in the translation tables.

The value 0b10 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DACR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0].

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to External register DBGAUTHSTATUS_EL1[31:0].

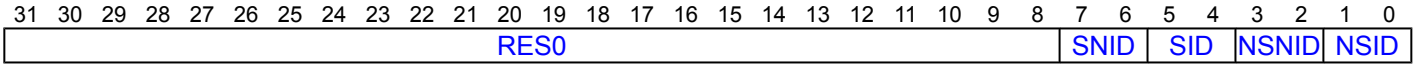
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGAUTHSTATUS are UNDEFINED.

This register is required in all implementations.

Attributes

DBGAUTHSTATUS is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

Secure Non-Invasive Debug.

This field has the same value as DBGAUTHSTATUS.SID.

Otherwise:

Secure Non-Invasive Debug.

SNID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure Invasive Debug.

SID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

Non-secure Non-invasive debug.

NSNID	Meaning
0b00	Non-secure state is not implemented.
0b11	Implemented and enabled. EL3 is implemented or the Effective value of SCR.NS is 1.

All other values are reserved.

Otherwise:

Non-secure Non-Invasive Debug.

NSNID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure Invasive Debug.

NSID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing DBGAUTHSTATUS

DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

Configuration

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to External register DBGBCR<n>_EL1[31:0].

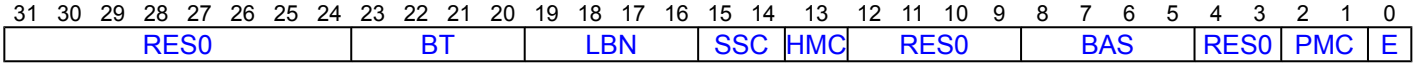
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGBCR<n> are UNDEFINED.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBCR<n> is a 32-bit register.

Field descriptions



When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. DBGBVR<n> is the address of an instruction.
0b0001	As 0b0000, but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. If the Effective value of HCR_EL2.E2H is 1, and either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>.ContextID is compared against CONTEXTIDR_EL2. Otherwise, DBGBVR<n>.ContextID is compared against CONTEXTIDR.
0b0011	As 0b0010 with linking enabled.
0b0100	Unlinked instruction address mismatch. DBGBVR<n> is the address of an instruction to be stepped.
0b0101	As 0b0100, but linked to a Context matching breakpoint.
0b0110	Unlinked CONTEXTIDR match. DBGBVR<n>.ContextID is a Context ID compared against CONTEXTIDR.
0b0111	As 0b0110 with linking enabled.
0b1000	Unlinked VMID match. DBGBXVR<n>.VMID is a VMID compared against VTTBR.VMID.
0b1001	As 0b1000 with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>.ContextID is a Context ID compared against CONTEXTIDR, and DBGBXVR<n>.VMID is a VMID compared against VTTBR.VMID.
0b1011	As 0b1010 with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBXVR<n>.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.
0b1101	As 0b1100 with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>.ContextID is compared against CONTEXTIDR, and DBGBXVR<n>.ContextID2 is compared against CONTEXTIDR_EL2.
0b1111	As 0b1110 with linking enabled.

For more information on Breakpoints and their constraints, see 'Breakpoint exceptions' and 'Reserved DBGBCR<n>.BT values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>.E is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>.{SSC, HMC, PMC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>	Use for T32 instructions
0b1100	DBGBVR<n>+2	Use for T32 instructions
0b1111	DBGBVR<n>	Use for A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values'.

For more information on using the BAS field in Address Match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Step instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>	Use for T32 instructions
0b1100	DBGBVR<n>+2	Use for T32 instructions
0b1111	DBGBVR<n>	Use for A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values'.

For more information on using the BAS field in address mismatch breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint DBGBVR<n>. Possible values are:

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DBGBVR<n>, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n> characteristics are:

Purpose

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register DBGBCR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

Configuration

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[31:0].

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to External register DBGBVR<n>_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGBVR<n> are UNDEFINED.

How this register is interpreted depends on the value of DBGBCR<n>.BT.

- When DBGBCR<n>.BT is `0b0x0x`, this register holds a virtual address.
- When DBGBCR<n>.BT is `0bxx1x`, this register holds a Context ID.

For other values of DBGBCR<n>.BT, this register is RES0.

Some breakpoints might not support Context ID comparison. For more information, see the description of the DBGDIDR.CTX_CMPs field.

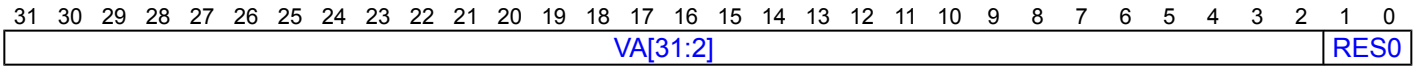
If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBVR<n> is a 32-bit register.

Field descriptions

When DBGBCR<n>.BT IN {0b0x0x}:



VA[31:2], bits [31:2]

Bits[31:2] of the address value for comparison.

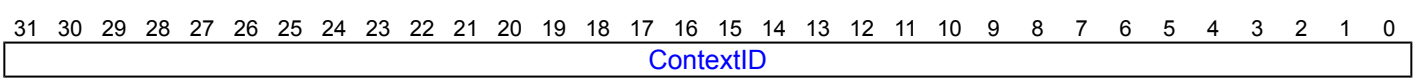
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>.BT IN {0b001x}:



ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when all of the following are true:

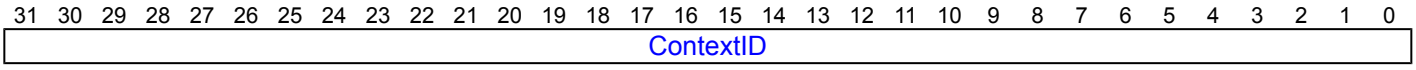
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- The PE is executing at EL0.

Otherwise, the value is compared against CONTEXTIDR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>.BT IN {0b101x} and EL2 is implemented:



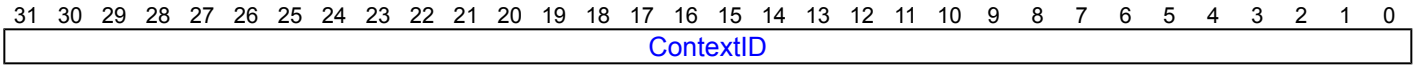
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>.BT IN {0bx11x}, EL2 is implemented, and FEAT_Debugv8p1 is implemented:



ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15
```

DBGBXVR<n>, Debug Breakpoint Extended Value Registers, n = 0 - 15

The DBGBXVR<n> characteristics are:

Purpose

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register DBGBCR<n> and a value register DBGBVR<n>, where EL2 is implemented and breakpoint n supports Context matching.

Configuration

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:32].

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to External register DBGBVR<n>_EL1[63:32].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGBXVR<n> are UNDEFINED.

How this register is interpreted depends on the value of DBGBCR<n>.BT.

- When DBGBCR<n>.BT is `0b10xx`, this register holds a VMID.
- When DBGBCR<n>.BT is `0b11xx`, this register holds a Context ID.

For other values of DBGBCR<n>.BT, this register is RES0.

Accesses to this register are UNDEFINED in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.
- EL2 is not implemented.

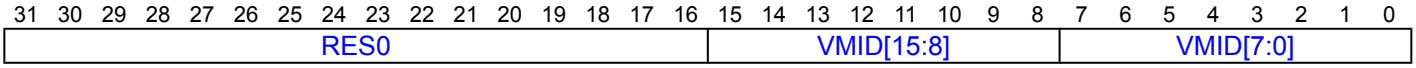
For more information, see the description of the DBGDIDR.CTX_CMPs field.

Attributes

DBGBXVR<n> is a 32-bit register.

Field descriptions

When DBGBCR<n>.BT IN {0b10xx} and EL2 is implemented:



Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [7:0]

VMID value for comparison. The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>.BT IN {0b11xx} and EL2 is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ContextID2																															

ContextID2, bits [31:0]

When FEAT_Debugv8p1 is implemented:

Context ID value for comparison against CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing DBGBXVR<n>

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15
```

DBGCLAIMCLR, Debug CLAIM Tag Clear register

The DBGCLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET register.

Configuration

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

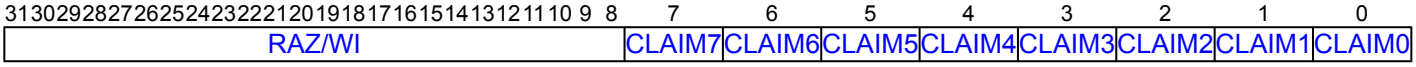
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGCLAIMCLR are UNDEFINED.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m>, bit [m], for m = 7 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is **W1C**.

Accessing DBGCLAIMCLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b1001	0b110

```

DBGCLAIMSET, Debug CLAIM Tag Set register

The DBGCLAIMSET characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR register.

Configuration

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

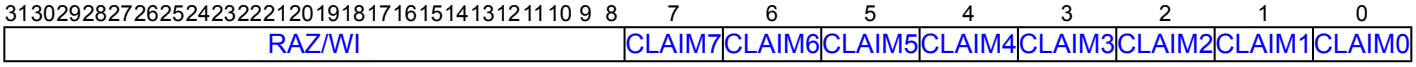
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGCLAIMSET are UNDEFINED.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET is a 32-bit register.

Field descriptions



Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m>, bit [m], for m = 7 to 0

Claim Tag Set. Used to set Claim Tag bit <m> to 1.

CLAIM<m>	Meaning
0b0	On a write: Ignored.
0b1	On a write: Set Claim Tag bit <m> to 1.

Access to this field is **RAO/W1S**.

Accessing DBGCLAIMSET

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

DBGDCCINT, DCC Interrupt Enable Register

The DBGDCCINT characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

Configuration

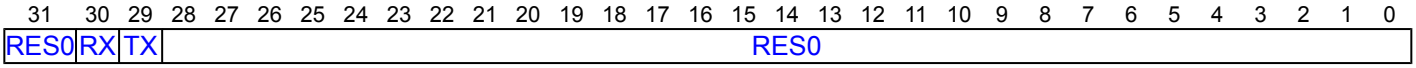
AArch32 System register DBGDCCINT bits [31:0] are architecturally mapped to AArch64 System register MDCCINT_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGDCCINT are UNDEFINED.

Attributes

DBGDCCINT is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

RX	Meaning
0b0	No interrupt request generated by DTRRX.
0b1	Interrupt request will be generated on RXfull == 1.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

TX	Meaning
0b0	No interrupt request generated by DTRTX.
0b1	Interrupt request will be generated on TXfull == 0.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [28:0]

Reserved, RES0.

DBGDEVID, Debug Device ID register 0

The DBGDEVID characteristics are:

Purpose

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

Configuration

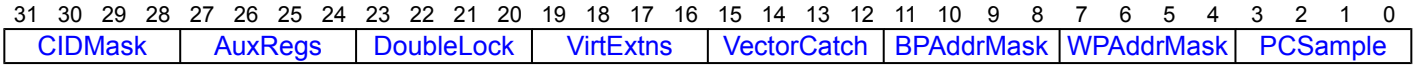
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGDEVID are UNDEFINED.

This register is required in all implementations.

Attributes

DBGDEVID is a 32-bit register.

Field descriptions



CIDMask, bits [31:28]

Indicates the level of support for the Context ID matching breakpoint masking capability.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CIDMask	Meaning
0b0000	Context ID masking is not implemented.
0b0001	Context ID masking is implemented.

All other values are reserved. The value of this for Armv8 is 0b0000.

Access to this field is **RO**.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AuxRegs	Meaning
0b0000	None supported.
0b0001	Support for External Debug Auxiliary Control Register, EDACR.

All other values are reserved.

Access to this field is **RO**.

DoubleLock, bits [23:20]

OS Double Lock implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DoubleLock	Meaning
0b0000	OS Double Lock is not implemented. DBGOSDLR is RAZ/WI.
0b0001	OS Double Lock is implemented. DBGOSDLR is RW.

FEAT_DoubleLock implements the functionality identified by the value 0b0001.

All other values are reserved.

Access to this field is **RO**.

VirtExtns, bits [19:16]

Indicates whether EL2 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VirtExtns	Meaning
0b0000	EL2 is not implemented.
0b0001	EL2 is implemented.

All other values are reserved.

Access to this field is **RO**.

VectorCatch, bits [15:12]

Defines the form of Vector Catch exception implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VectorCatch	Meaning
0b0000	Address matching Vector Catch exception implemented.
0b0001	Exception matching Vector Catch exception implemented.

All other values are reserved.

Access to this field is **RO**.

BPAddrMask, bits [11:8]

Indicates the level of support for the instruction address matching breakpoint masking capability.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BPAddrMask	Meaning
0b0000	Breakpoint address masking might be implemented. If not implemented, DBGBCR<n>[28:24] is RAZ/WI.
0b0001	Breakpoint address masking is implemented.
0b1111	Breakpoint address masking is not implemented. DBGBCR<n>[28:24] is RES0.

All other values are reserved. The value of this for Armv8 is 0b1111.

Access to this field is **RO**.

WPAddrMask, bits [7:4]

Indicates the level of support for the data address matching watchpoint masking capability.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WPAddrMask	Meaning
0b0000	Watchpoint address masking might be implemented. If not implemented, DBGWCR<n>.MASK (Address mask) is RAZ/WI.
0b0001	Watchpoint address masking is implemented.
0b1111	Watchpoint address masking is not implemented. DBGWCR<n>.MASK (Address mask) is RES0.

All other values are reserved. The value of this for Armv8 is 0b0001.

Access to this field is **RO**.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010	Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011	EDPCSR, EDCIDSR, and EDVIDSR are implemented.

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Access to this field is **RO**.

Accessing DBGDEVID

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b0010	0b111

```

DBGDEVID1, Debug Device ID register 1

The DBGDEVID1 characteristics are:

Purpose

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

Configuration

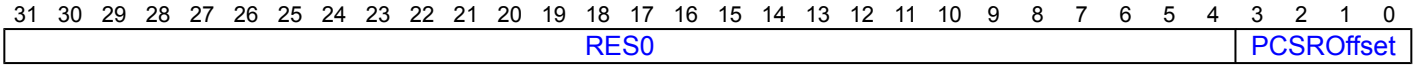
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGDEVID1 are UNDEFINED.

This register is required in all implementations.

Attributes

DBGDEVID1 is a 32-bit register.

Field descriptions



Bits [31:4]

Reserved, RES0.

PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of EDPCSR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSROffset	Meaning
0b0000	EDPCSR is not implemented.
0b0010	EDPCSR implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Access to this field is **RO**.

DBGDIDR, Debug ID Register

The DBGDIDR characteristics are:

Purpose

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

Configuration

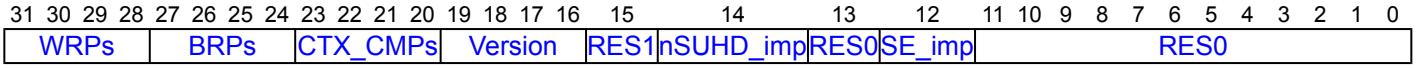
This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to DBGDIDR are UNDEFINED.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDIDR is a 32-bit register.

Field descriptions



WRPs, bits [31:28]

Number of watchpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WRPs	Meaning
0b0001..0b1111	The number of watchpoints, minus 1.

If FEAT_Debugv8p9 is implemented and 16 or more watchpoints are implemented, this field reads as 0b1111.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 watchpoints.

The value 0b0000 is reserved.

Access to this field is **RO**.

BRPs, bits [27:24]

Number of breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRPs	Meaning
0b0001..0b1111	The number of breakpoints, minus 1.

If FEAT_Debugv8p9 is implemented and 16 or more breakpoints are implemented, this field reads as 0b1111.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 breakpoints.

The value 0b0000 is reserved.

Access to this field is **RO**.

CTX_CMPs, bits [23:20]

Number of context-aware breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPs	Meaning
0b0000..0b1111	The number of context-aware breakpoints, minus 1.

The value of this field is never greater than DBGDIDR.BRPs.

If FEAT_Debugv8p9 is implemented and 16 or more context-aware breakpoints are implemented, this field reads as 0b1111.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 breakpoints.

Access to this field is **RO**.

Version, bits [19:16]

Debug architecture version. Indicates presence of Armv8 debug architecture.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Version	Meaning
0b0000	Not supported.
0b0001	Armv6, v6 Debug architecture, with System registers access.
0b0010	Armv6, v6.1 Debug architecture, with System registers access.
0b0011	Armv7, v7 Debug architecture, with only baseline System registers.
0b0100	Armv7, v7 Debug architecture, with all System registers implemented.
0b0101	Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Armv8.0 debug architecture.
0b0111	Armv8.1 debug architecture, FEAT_Debugv8p1.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

All other values are reserved.

From Armv8.0, the values 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

FEAT_Debugv8p1 implements the functionality identified by the value 0b0111.

FEAT_Debugv8p2 implements the functionality identified by the value 0b1000.

FEAT_Debugv8p4 implements the functionality identified by the value 0b1001.

FEAT_Debugv8p8 implements the functionality identified by the value 0b1010.

FEAT_Debugv8p9 implements the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_Debugv8p1 is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Access to this field is **RO**.

Bit [15]

Reserved, RES1.

nSUHD_imp, bit [14]

Previously indicated that Secure User Halting Debug is not implemented.

The value of this field must match the value of the SE_imp field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [13]

Reserved, RES0.

SE_imp, bit [12]

EL3 implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SE_imp	Meaning
0b0	EL3 not implemented.
0b1	EL3 implemented.

The value of this field must match the value of the nSUHD_imp field.

Access to this field is **RO**.

Bits [11:0]

Reserved, RES0.

Accessing DBGDIDR

Arm deprecates any access to this register from EL0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Use of this register is deprecated.

Configuration

AArch32 System register DBGDRAR bits [63:0] are architecturally mapped to AArch64 System register MDRAR_EL1[63:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to DBGDRAR are UNDEFINED.

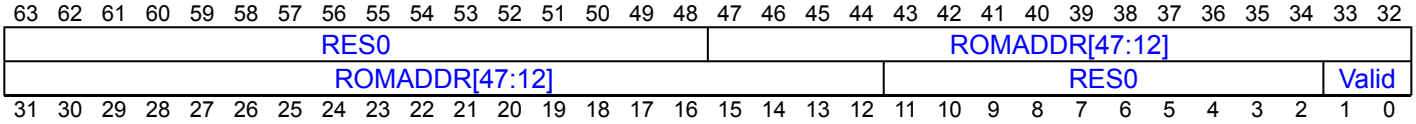
DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDRAR is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

If DBGDRAR.Valid == `0b00`, then this field is UNKNOWN.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

Valid	Meaning
0b00	ROM Table address is not valid. Software must ignore ROMADDR.
0b11	ROM Table address is valid.

Other values are reserved.

Arm recommends implementations set this field to zero.

Accessing DBGDRAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA32) then

DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

Purpose

In earlier versions of the Arm Architecture, this register defines the offset from the base address defined in DBGDRAR of the physical base address of the debug registers for the PE. Use of this register is deprecated.

Configuration

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to DBGDSAR are UNDEFINED.

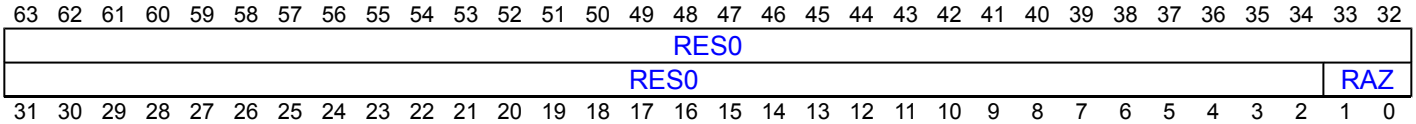
DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDSAR is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

Bits [1:0]

Reserved, RAZ.

This field indicates whether the debug self address offset is valid. For ARMv8, this field is always `0b00`, the offset is not valid.

Accessing DBGDSAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0010	0b0000	0b000

```

DBGDSCRext, Debug Status and Control Register, External View

The DBGDSCRext characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

AArch32 System register DBGDSCRext bits [31:0] are architecturally mapped to AArch64 System register MDSCR_EL1[31:0].

AArch32 System register DBGDSCRext bits [31:29, 27:26, 23:21, 19, 14, 6] are architecturally mapped to External register EDSCR[31:29, 27:26, 23:21, 19, 14, 6].

AArch32 System register DBGDSCRext bit [15] is architecturally mapped to AArch32 System register DBGDSCRint[15].

AArch32 System register DBGDSCRext bit [12] is architecturally mapped to AArch32 System register DBGDSCRint[12].

AArch32 System register DBGDSCRext bits [5:2] are architecturally mapped to AArch32 System register DBGDSCRint[5:2].

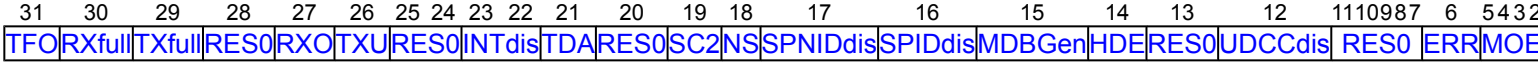
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGDSCRext are UNDEFINED.

This register is required in all implementations.

Attributes

DBGDSCRext is a 32-bit register.

Field descriptions



TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter override. Used for save/restore of EDSCR.TFO.

When the OS Lock is unlocked, DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When the OS Lock is locked, DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Used for save/restore of EDSCR.RXfull.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.RXfull. Reads and writes of this bit are indirect accesses to EDSCR.RXfull.

Arm deprecates use of this bit other than for save/restore. Use DBGDSCRint to access the DTRRX full status.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

TXfull, bit [29]

DTRTX full. Used for save/restore of EDSCR.TXfull.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.TXfull. Reads and writes of this bit are indirect accesses to EDSCR.TXfull.

Arm deprecates use of this bit other than for save/restore. Use DBGDSCRint to access the DTRTX full status.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of EDSCR.RXO.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.RXO. Reads and writes of this bit are indirect accesses to EDSCR.RXO.

When DBGOSLSR.OSLK == 1, if bits [27,6] of the value written to DBGDSCRext are {1,0}, that is, the RXO bit is 1 and the ERR bit is 0, the PE sets EDSCR.{RXO,ERR} to UNKNOWN values.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

TXU, bit [26]

Used for save/restore of EDSCR.TXU.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.TXU. Reads and writes of this bit are indirect accesses to EDSCR.TXU.

When DBGOSLSR.OSLK == 1, if bits [26,6] of the value written to DBGDSCRext are {1,0}, that is, the TXU bit is 1 and the ERR bit is 0, the PE sets EDSCR.{TXU,ERR} to UNKNOWN values.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of EDSCR.INTdis.

When DBGOSLSR.OSLK == 0, software must treat it as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this field holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'00'`.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

TDA, bit [21]

Used for save/restore of EDSCR.TDA.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented, and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of EDSCR.SC2.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

NS, bit [18]

Non-secure status.

Arm deprecates use of this field.

NS	Meaning
`0b0`	Secure state.
`0b1`	Non-secure state.

Access to this field is **RO**.

SPNIDdis, bit [17]

When EL3 is implemented:

Secure privileged profiling disabled status bit.

SPNIDdis	Meaning
`0b0`	Profiling allowed in Secure privileged modes.
`0b1`	Profiling prohibited in Secure privileged modes.

This field reads as 0 if any of the following applies, and reads as 1 otherwise:

- FEAT_Debugv8p2 is not implemented and `ExternalSecureNoninvasiveDebugEnabled()` returns TRUE.
- EL3 is using AArch32 and the value of SDCR.SPME is 1.
- EL3 is using AArch64 and the value of MDCR_EL3.SPME is 1.

Arm deprecates use of this field.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

SPIDdis, bit [16]

When EL3 is implemented:

Secure privileged AArch32 invasive self-hosted debug disabled status bit. The value of this bit depends on the value of SDCR.SPD and the pseudocode function `AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()`.

SPIDdis	Meaning
`0b0`	Self-hosted debug enabled in Secure privileged AArch32 modes.
`0b1`	Self-hosted debug disabled in Secure privileged AArch32 modes.

This bit reads as 1 if any of the following is true and reads as 0 otherwise:

- EL3 is using AArch32 and SDCR.SPD has the value `0b10`.
- EL3 is using AArch64 and MDCR_EL3.SPD32 has the value `0b10`.

- EL3 is using AArch32, SDCR.SPD has the value `0b00`, and `AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()` returns FALSE.
- EL3 is using AArch64, MDCR_EL3.SPD32 has the value `0b00`, and `AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()` returns FALSE.

Arm deprecates use of this field.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

MDBGen, bit [15]

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

MDBGen	Meaning
`0b0`	Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
`0b1`	Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

HDE, bit [14]

Used for save/restore of EDSCR.HDE.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'0'`.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

Bit [13]

Reserved, RES0.

UDCCdis, bit [12]

Traps EL0 accesses to the DCC registers to Undefined mode.

UDCCdis	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIDR, DBGDSAR, and DBGDRAR are trapped to Undefined mode.

Note

All accesses to these registers are trapped, including LDC and STC accesses to DBGDTRTXint and DBGDTRRXint, and MRRC accesses to DBGDSAR and DBGDRAR.

Traps of EL0 accesses to the DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of EDSCR.ERR.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

MOE	Meaning
0b0001	Breakpoint.
0b0011	Software breakpoint (BKPT) instruction.
0b0101	Vector catch.
0b1010	Watchpoint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGDSCRext

Individual fields within this register might have restricted accessibility when the OS Lock is unlocked, DBGOSLSR.OSLK == 0. See the field descriptions for more detail.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

DBGDSCRint, Debug Status and Control Register, Internal View

The DBGDSCRint characteristics are:

Purpose

Main control register for the debug implementation. This is an internal, read-only view.

Configuration

AArch32 System register DBGDSCRint bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

AArch32 System register DBGDSCRint bits [30:29] are architecturally mapped to External register EDSCR[30:29].

AArch32 System register DBGDSCRint bit [15] is architecturally mapped to AArch64 System register MDSCR_EL1[15].

AArch32 System register DBGDSCRint bit [12] is architecturally mapped to AArch64 System register MDSCR_EL1[12].

AArch32 System register DBGDSCRint bits [5:2] are architecturally mapped to AArch64 System register MDSCR_EL1[5:2].

AArch32 System register DBGDSCRint bit [15] is architecturally mapped to AArch32 System register DBGDSCRext[15].

AArch32 System register DBGDSCRint bit [12] is architecturally mapped to AArch32 System register DBGDSCRext[12].

AArch32 System register DBGDSCRint bits [5:2] are architecturally mapped to AArch32 System register DBGDSCRext[5:2].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to DBGDSCRint are UNDEFINED.

This register is required in all implementations.

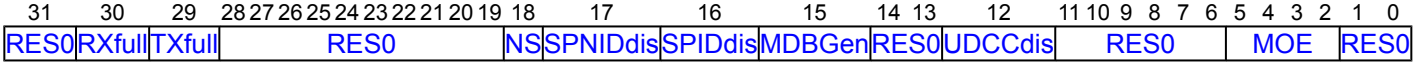
DBGDSCRint.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} are UNKNOWN when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither UNPREDICTABLE nor return UNKNOWN values, it is permissible for an implementation to return the values of DBGDSCRext.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)

Attributes

DBGDSCRint is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the EDSCR.

TXfull, bit [29]

DTRTX full. Read-only view of the equivalent bit in the EDSCR.

Bits [28:19]

Reserved, RES0.

NS, bit [18]

Non-secure status.

Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

SPNIDdis, bit [17]

Secure privileged non-invasive debug disable.

Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

SPIDdis, bit [16]

Secure privileged invasive debug disable.

Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

MDBGen, bit [15]

Monitor debug events enable.

Read-only view of the equivalent bit in the DBGDSCRext.

Bits [14:13]

Reserved, RES0.

UDCCdis, bit [12]

User mode access to Debug Communications Channel disable.

Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

Bits [11:6]

Reserved, RES0.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

MOE	Meaning
0b0001	Breakpoint
0b0011	Software breakpoint (BKPT) instruction
0b0101	Vector catch
0b1010	Watchpoint

Read-only view of the equivalent bit in the DBGDSCRext.

Bits [1:0]

Reserved, RES0.

Accessing DBGDSCRint

When <Rt> is APSR_nzcv, encoded as R15, then instead of reading the entire register, the access copies DBGDSCRint[31:28] into the PSTATE NZCV flags.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0001	0b000

```

DBGDTRRXext, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRXext characteristics are:

Purpose

Used for save/restore of DBGDTRRXint. It is a component of the Debug Communications Channel.

Configuration

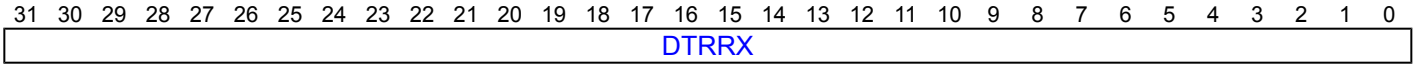
AArch32 System register DBGDTRRXext bits [31:0] are architecturally mapped to AArch64 System register OSDTRRX_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGDTRRXext are UNDEFINED.

Attributes

DBGDTRRXext is a 32-bit register.

Field descriptions



DTRRX, bits [31:0]

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRXext

Arm deprecates reads and writes of DBGDTRRXext through the System register interface when the OS Lock is unlocked, DBGOSLSR.OSLK == 0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0000	0b010

```

DBGDTRRXint, Debug Data Transfer Register, Receive

The DBGDTRRXint characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

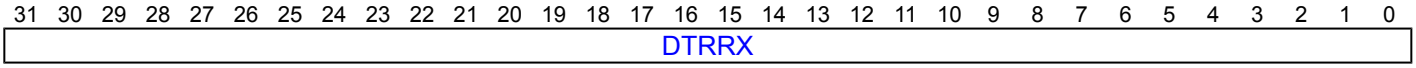
AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to DBGDTRRXint are UNDEFINED.

Attributes

DBGDTRRXint is a 32-bit register.

Field descriptions



DTRRX, bits [31:0]

Update DTRRX.

Reads of this register:

- If RXfull is 1, return the last value written to DTRRX.
- If RXfull is 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRXint

Data can be stored to memory from this register using STC.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0101	0b000

```

DBGDTRTXext, Debug OS Lock Data Transfer Register, Transmit

The DBGDTRTXext characteristics are:

Purpose

Used for save/restore of DBGDTRTXint. It is a component of the Debug Communication Channel.

Configuration

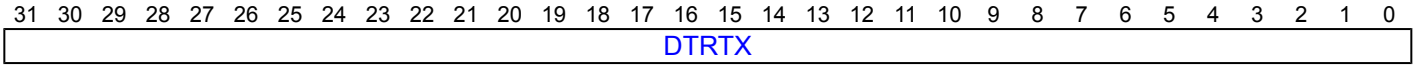
AArch32 System register DBGDTRTXext bits [31:0] are architecturally mapped to AArch64 System register OSDTRTX_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGDTRTXext are UNDEFINED.

Attributes

DBGDTRTXext is a 32-bit register.

Field descriptions



DTRTX, bits [31:0]

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTXext

Arm deprecates reads and writes of DBGDTRTXext through the System register interface when the OS Lock is unlocked, DBGOSLSR.OSLK == 0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0011	0b010

```

DBGDTRTXint, Debug Data Transfer Register, Transmit

The DBGDTRTXint characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

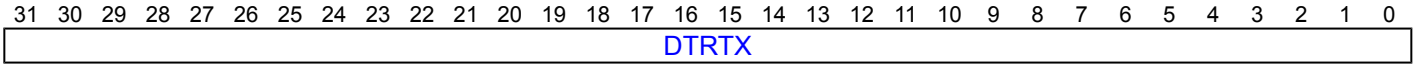
AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to DBGDTRTXint are UNDEFINED.

Attributes

DBGDTRTXint is a 32-bit register.

Field descriptions



DTRTX, bits [31:0]

DTRTX. Writes to this register:

- If TXfull is 1, DTRTX is set to an UNKNOWN value.
- If TXfull is 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTXint

Data can be loaded from memory into this register using 'LDC (immediate)' and 'LDC (literal)'.

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0101	0b000

DBGOSDLR, Debug OS Double Lock Register

The DBGOSDLR characteristics are:

Purpose

Locks out the external debug interface.

Configuration

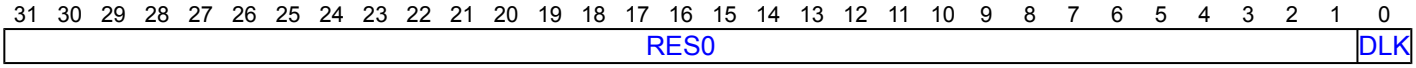
AArch32 System register DBGOSDLR bits [31:0] are architecturally mapped to AArch64 System register OSDLR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGOSDLR are UNDEFINED.

Attributes

DBGOSDLR is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

DLK, bit [0]

When FEAT_DoubleLock is implemented:

OS Double Lock control bit.

DLK	Meaning
0b0	OS Double Lock unlocked.
0b1	OS Double Lock locked, if DBGPRCR.CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RAZ/WI.

Accessing DBGOSDLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0011	0b100

```

DBGOSECCR, Debug OS Lock Exception Catch Control Register

The DBGOSECCR characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

Configuration

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to AArch64 System register OSECCR_EL1[31:0].

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to External register EDECCR[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGOSECCR are UNDEFINED.

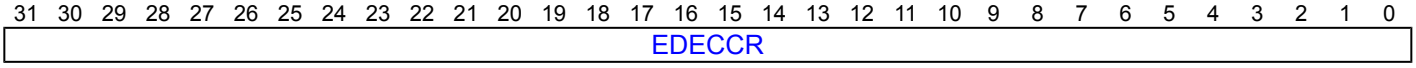
If DBGOSLSR.OSLK == 0 then DBGOSECCR returns an UNKNOWN value on reads and ignores writes.

Attributes

DBGOSECCR is a 32-bit register.

Field descriptions

When DBGOSLSR.OSLK == 1:



EDECCR, bits [31:0]

Used for save/restore to EDECCR over powerdown.

Reads or writes to this field are indirect accesses to EDECCR.

The reset behavior of this field is:

- On a Cold reset, this field resets to `'00000000000000000000000000000000'`.

Accessing DBGOSECCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

DBGOSLAR, Debug OS Lock Access Register

The DBGOSLAR characteristics are:

Purpose

Provides a lock for the debug registers. The OS Lock also disables some debug exceptions and debug events.

Configuration

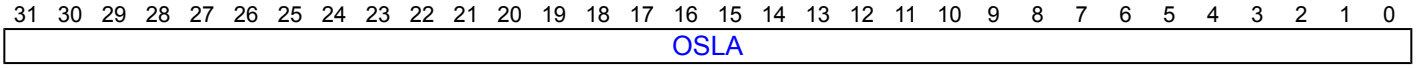
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGOSLAR are UNDEFINED.

The OS Lock can also be locked or unlocked using the AArch64 System register OSLAR_EL1 and External register OSLAR_EL1.

Attributes

DBGOSLAR is a 32-bit register.

Field descriptions



OSLA, bits [31:0]

OS Lock Access. Writing the value `0xC5ACCE55` to the DBGOSLAR sets the OS Lock to 1. Writing any other value sets the OS Lock to 0.

Use DBGOSLSR.OSLK to check the current status of the lock.

Accessing DBGOSLAR

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0000	0b100

```

DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

Purpose

Provides status information for the OS Lock.

Configuration

AArch32 System register DBGOSLSR bits [31:0] are architecturally mapped to AArch64 System register OSLSR_EL1[31:0].

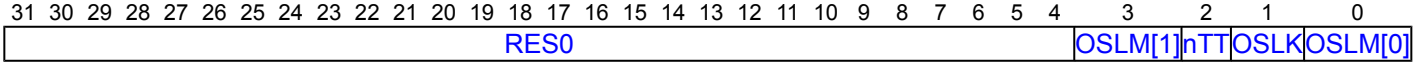
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGOSLSR are UNDEFINED.

The OS Lock status is also visible in the external debug interface through EDPRSR.

Attributes

DBGOSLSR is a 32-bit register.

Field descriptions



Bits [31:4]

Reserved, RES0.

OSLM, bits [3, 0]

OS Lock model implemented. Identifies the form of OS save and restore mechanism implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OSLM	Meaning
0b00	OS Lock not implemented.
0b10	OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is DBGOSLSR[3].
- OSLM[0] is DBGOSLSR[0].

Access to this field is **RO**.

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

OSLK, bit [1]

OS Lock Status.

OSLK	Meaning
0b0	OS Lock unlocked.
0b1	OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Accessing DBGOSLSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0001	0b100

```

DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

Purpose

Controls behavior of the PE on powerdown request.

Configuration

AArch32 System register DBGPRCR bits [31:0] are architecturally mapped to AArch64 System register DBGPRCR_EL1[31:0].

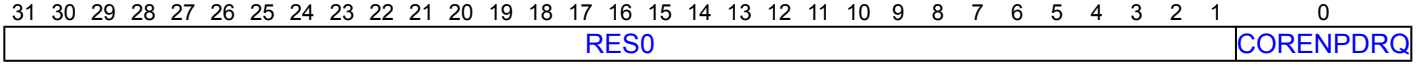
AArch32 System register DBGPRCR bit [0] is architecturally mapped to External register EDPRCR[0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGPRCR are UNDEFINED.

Attributes

DBGPRCR is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

CORENPDRQ, bit [0]

When FEAT_DoPD is implemented:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGNOPWRDWN** signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the **DBGNOPWRDWN** signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.

Accessing DBGPRCR

DBGVCR, Debug Vector Catch Register

The DBGVCR characteristics are:

Purpose

Controls Vector Catch debug events.

Configuration

AArch32 System register DBGVCR bits [31:0] are architecturally mapped to AArch64 System register DBGVCR32_EL2[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGVCR are UNDEFINED.

This register is required in all implementations.

Attributes

DBGVCR is a 32-bit register.

Field descriptions

When EL3 is implemented and EL3 is using AArch32:

31	30	29	28	27	26	25	24 23 22 21 20 19 18 17 16	15	14	13	12	11	10	9 8	7	6	5	4	3	2	1	0
NSF	NSI	RES0	NSD	NSP	NSS	NSU	RES0	MF	MI	RES0	MD	MP	MS	RES0	SF	SI	RES0	SD	SP	SS	SU	RES0

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort exception vector catch enable in Non-secure state.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is `0x04`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:16]

Reserved, RES0.

MF, bit [15]

FIQ vector catch enable in Monitor mode.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MI, bit [14]

IRQ vector catch enable in Monitor mode.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

MD, bit [12]

Data Abort exception vector catch enable in Monitor mode.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MP, bit [11]

Prefetch Abort vector catch enable in Monitor mode.

The exception vector offset is `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MS, bit [10]

Secure Monitor Call (SMC) vector catch enable in Monitor mode.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort exception vector catch enable in Secure state.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is `0x04`.

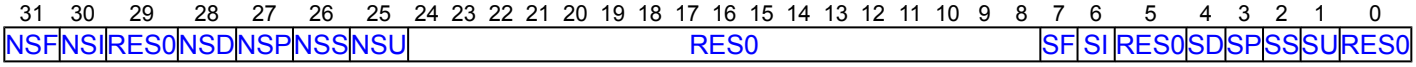
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When EL3 is implemented and EL3 is using AArch64:



NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort exception vector catch enable in Non-secure state.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is `0x04`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort exception vector catch enable in Secure state.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is `0x04`.

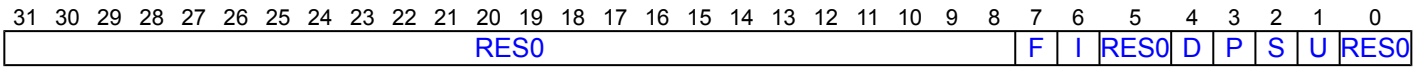
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When EL3 is not implemented:



Bits [31:8]

Reserved, RES0.

F, bit [7]

FIQ vector catch enable.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]

IRQ vector catch enable.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

D, bit [4]

Data Abort exception vector catch enable.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]

Prefetch Abort vector catch enable.

The exception vector offset `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is `0x04`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>.

Configuration

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to External register DBGWCR<n>_EL1[31:0].

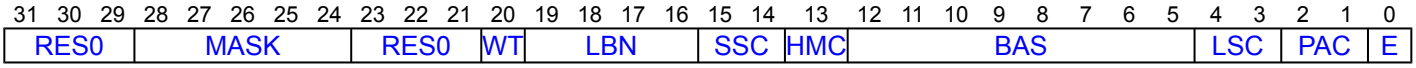
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGWCR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWCR<n> is a 32-bit register.

Field descriptions



When the E field is zero, all the other fields in the register are ignored.

Bits [31:29]

Reserved, RES0.

MASK, bits [28:24]

Address Mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00011..0b11111	Number of address bits masked.

All other values are reserved.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

If programmed with a reserved value, the watchpoint behaves as if either:

- DBGWCR<n>.MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCR<n>.
- The watchpoint is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions', and 'Reserved DBGWCR<n>.{SSC, HMC, PAC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n> is being watched.

BAS	Description
0bxxxxxxx1	Match byte at DBGWVR<n>
0bxxxxxx1x	Match byte at DBGWVR<n>+1
0bxxxxx1xx	Match byte at DBGWVR<n>+2
0bxxxx1xxx	Match byte at DBGWVR<n>+3

In cases where DBGWVR<n> addresses a double-word:

BAS	Description, if DBGWVR<n>[2] == 0
0bxxx1xxxx	Match byte at DBGWVR<n>+4
0bxx1xxxxx	Match byte at DBGWVR<n>+5
0bx1xxxxxx	Match byte at DBGWVR<n>+6
0b1xxxxxxx	Match byte at DBGWVR<n>+7

If DBGWVR<n>[2] == 1, only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting DBGWVR<n>[2] == 1.

The valid values for BAS are nonzero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

E	Meaning
0b0	Watchpoint disabled.
0b1	Watchpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>.

Configuration

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGWVR<n>_EL1[31:0].

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to External register DBGWVR<n>_EL1[31:0].

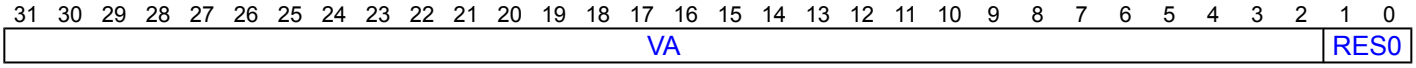
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DBGWVR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWVR<n> is a 32-bit register.

Field descriptions



VA, bits [31:2]

Bits[31:2] of the address value for comparison.

Arm deprecates setting DBGWVR<n>[2] == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-15

DCCIMVAC, Data Cache line Clean and Invalidate by VA to PoC

The DCCIMVAC characteristics are:

Purpose

Clean and Invalidate data or unified cache line by virtual address to PoC.

Configuration

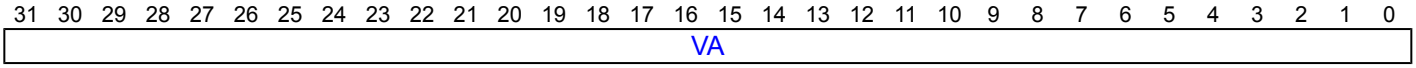
AArch32 System instruction DCCIMVAC performs the same function as AArch64 System instruction DC CIVAC.

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DCCIMVAC are UNDEFINED.

Attributes

DCCIMVAC is a 32-bit System instruction.

Field descriptions



VA, bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DCCIMVAC

Execution of this instruction might require an address translation from VA to PA, and that translation might fault.

For more information about faults, see 'Permission fault'.

For more information about data cache maintenance instructions, see 'AArch32 data cache maintenance instructions (DC*)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b1110	0b001

```

DCCISW, Data Cache line Clean and Invalidate by Set/Way

The DCCISW characteristics are:

Purpose

Clean and Invalidate data or unified cache line by set/way.

Configuration

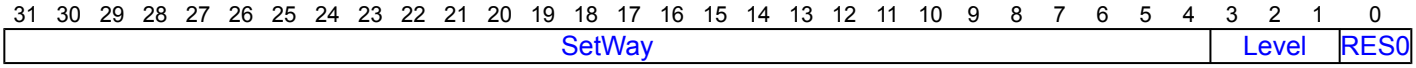
AArch32 System instruction DCCISW performs the same function as AArch64 System instruction DC CISW.

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DCCISW are UNDEFINED.

Attributes

DCCISW is a 32-bit System instruction.

Field descriptions



SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing DCCISW

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

DCIMVAC, Data Cache line Invalidate by VA to PoC

The DCIMVAC characteristics are:

Purpose

Invalidate data or unified cache line by virtual address to PoC.

Configuration

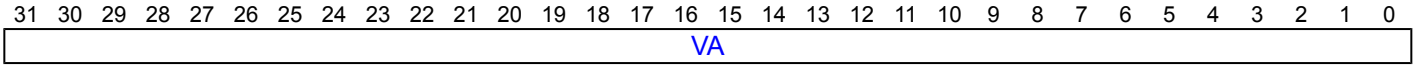
AArch32 System instruction DCIMVAC performs the same function as AArch64 System instruction DC IVAC.

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DCIMVAC are UNDEFINED.

Attributes

DCIMVAC is a 32-bit System instruction.

Field descriptions



VA, bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing DCIMVAC

It is IMPLEMENTATION DEFINED whether, when this instruction is executed, it can generate a watchpoint. If this instruction can generate a watchpoint this is prioritized in the same way as other watchpoints.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'AArch32 data cache maintenance instructions (DC*)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

DFAR, Data Fault Address Register

The DFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception.

Configuration

This register is banked between DFAR and DFAR_S and DFAR_NS.

AArch32 System register DFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL1[31:0].

AArch32 System register DFAR bits [31:0] (DFAR_S) are architecturally mapped to AArch32 System register HDFAR[31:0] when FEAT_AA32EL2 is implemented and FEAT_AA32EL3 is implemented.

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DFAR are UNDEFINED.

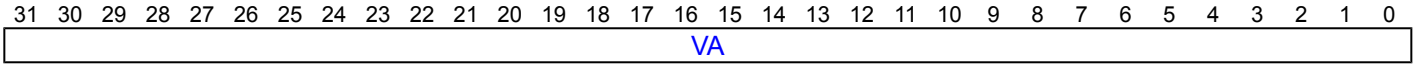
Attributes

DFAR is a 32-bit register.

This register has the following instances:

- DFAR, when EL3 is not implemented or FEAT_AA64 is implemented.
- DFAR_S, when FEAT_AA32EL3 is implemented.
- DFAR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



VA, bits [31:0]

VA of faulting address of synchronous Data Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DFAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0110	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then

DFSR, Data Fault Status Register

The DFSR characteristics are:

Purpose

Holds status information about the last data fault.

Configuration

This register is banked between DFSR and DFSR_S and DFSR_NS.

AArch32 System register DFSR bits [31:0] are architecturally mapped to AArch64 System register ESR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DFSR are UNDEFINED.

The current translation table format determines which format of the register is used.

Attributes

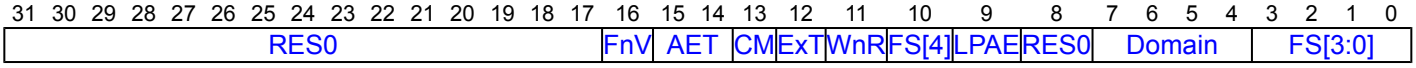
DFSR is a 32-bit register.

This register has the following instances:

- DFSR, when EL3 is not implemented or FEAT_AA64 is implemented.
- DFSR_S, when FEAT_AA32EL3 is implemented.
- DFSR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == 0:



Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	DFAR is valid.
0b1	DFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AET, bits [15:14]

When FEAT_RAS is implemented:

Asynchronous Error Type. When DFSC is `0b010001`, describes the PE error state after taking the SError exception. Possible values are:

AET	Meaning
`0b00`	Uncontainable (UC).
`0b01`	Unrecoverable state (UEU).
`0b10`	Restartable state (UEO).
`0b11`	Recoverable state (UER).

This field is valid only if the DFSC code is `0b010001`. It is RES0 for all other aborts.

In the event of multiple errors taken as a single SError exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault.

CM	Meaning
`0b0`	Abort not caused by execution of a cache maintenance instruction.
`0b1`	Abort caused by execution of a cache maintenance instruction, or on an address translation.

On a synchronous Data Abort exception on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ExT, bit [12]

External abort type.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [11]

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction.

WnR	Meaning
0b0	Abort caused by a read instruction.
0b1	Abort caused by a write instruction.

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FS, bits [10, 3:0]

Fault status bits. Possible values of FS[4:0] are:

FS	Meaning	Applies when
0b00001	Alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00100	Fault on instruction cache maintenance.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b10101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault).	
0b10110	SError exception.	
0b11000	SError exception, from a parity or ECC error on memory access.	When FEAT_RAS is not implemented
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is DFSR[10].
- FS[3:0] is DFSR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

Domain, bits [7:4]

The domain of the fault address.

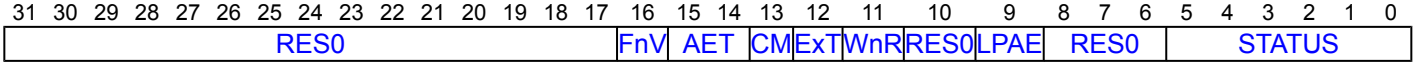
Arm deprecates any use of this field, see 'The Domain field in the DFSR'.

This field is UNKNOWN for certain faults where the DFSR is updated and reported using the Short-descriptor FSR encodings, see 'Validity of Domain field on faults that update the DFSR when using the Short-descriptor encodings'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:



Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	DFAR is valid.
0b1	DFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AET, bits [15:14]

When FEAT_RAS is implemented:

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError exception. Possible values are:

AET	Meaning
0b00	Uncontainable (UC).
0b01	Unrecoverable state (UEU).
0b10	Restartable state (UEO).
0b11	Recoverable state (UER).

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other aborts.

In the event of multiple errors taken as a single SError exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault.

CM	Meaning
0b0	Abort not caused by execution of a cache maintenance instruction.
0b1	Abort caused by execution of a cache maintenance instruction.

On a synchronous Data Abort exception on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ExT, bit [12]

External abort type.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [11]

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction.

WnR	Meaning
0b0	Abort caused by a read instruction.
0b1	Abort caused by a write instruction.

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010001	Asynchronous SError exception.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011001	Asynchronous SError exception, from a parity or ECC error on memory access.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DFSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0000	0b000

```

DISR, Deferred Interrupt Status Register

The DISR characteristics are:

Purpose

Records that an SError exception has been consumed by an `ESB` instruction.

Configuration

AArch32 System register DISR bits [31:0] are architecturally mapped to AArch64 System register DISR_EL1[31:0].

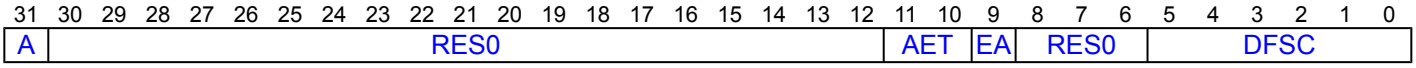
This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DISR are UNDEFINED.

Attributes

DISR is a 32-bit register.

Field descriptions

When the ESB instruction is executed at EL2:



A, bit [31]

Set to 1 when an `ESB` instruction defers an asynchronous SError exception. If the implementation does not include any sources of SError exception that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:12]

Reserved, RES0.

AET, bits [11:10]

Asynchronous Error Type. See the description of HSR.AET for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort Type. See the description of HSR.EA for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

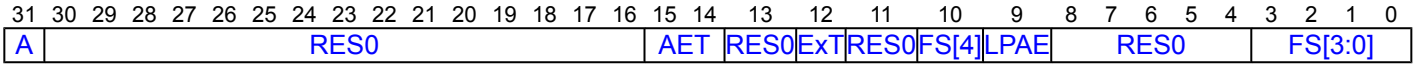
DFSC, bits [5:0]

Fault Status Code. See the description of HSR.DFSC for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 0:



A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError exception. If the implementation does not include any sources of SError exception that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

Asynchronous Error Type. See the description of DFSR.AET for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

External abort Type. See the description of DFSR.ExT for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status Code. See the description of DFSR.FS for an SError exception.

The FS field is split as follows:

- FS[4] is DISR[10].

- FS[3:0] is DISR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

LPAE	Meaning
0b0	Using the Short-descriptor translation table format.

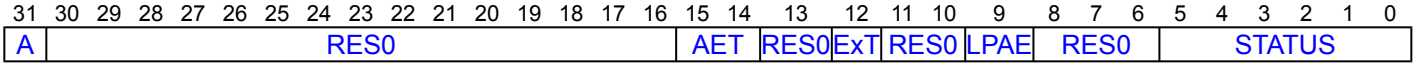
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 1:



A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError exception. If the implementation does not include any sources of SError exception that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

Asynchronous Error Type. See the description of DFSR.AET for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

External abort Type. See the description of DFSR.ExT for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault Status Code. See the description of DFSR.FS for an SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DISR

An indirect write to DISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0001	0b001

```

DLR, Debug Link Register

The DLR characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configuration

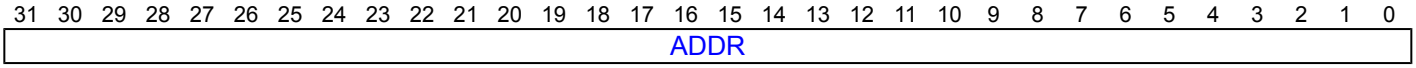
AArch32 System register DLR bits [31:0] are architecturally mapped to AArch64 System register DLR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to DLR are UNDEFINED.

Attributes

DLR is a 32-bit register.

Field descriptions



ADDR, bits [31:0]

Restart address.

Accessing DLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b001

```
if !IsFeatureImplemented(FEAT_AA32) then

DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configuration

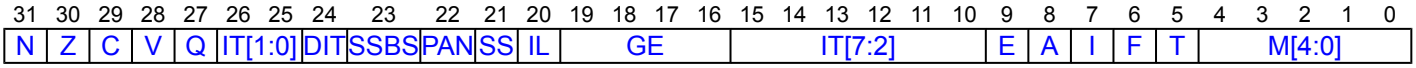
AArch32 System register DSPSR bits [31:0] are architecturally mapped to AArch64 System register DSPSR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to DSPSR are UNDEFINED.

Attributes

DSPSR is a 32-bit register.

Field descriptions



N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on entering Debug state, and copied to PSTATE.Q on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on entering Debug state, and copied to PSTATE.IT on exiting Debug state.

On exiting Debug state, DSPSR.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is DSPSR[26:25].
- IT[7:2] is DSPSR[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on entering Debug state, and copied to PSTATE.GE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on entering Debug state, and copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR.E is RES0. If the implementation does not support little-endian operation, DSPSR.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on entering Debug state, and copied to PSTATE.T on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on entering Debug state, and copied to PSTATE.M[4:0] on exiting Debug state.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If DSPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DSPSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

DSPSR2, Debug Saved Process State Register 2

The DSPSR2 characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configuration

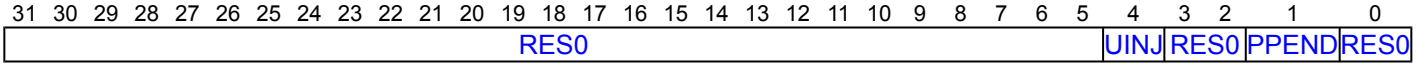
AArch32 System register DSPSR2 bits [31:0] are architecturally mapped to AArch64 System register DSPSR_EL0[63:32] when FEAT_Debugv8p9 is implemented.

This register is present only when FEAT_Debugv8p9 is implemented and FEAT_AA32 is implemented. Otherwise, direct accesses to DSPSR2 are UNDEFINED.

Attributes

DSPSR2 is a 32-bit register.

Field descriptions



Bits [31:5]

Reserved, RES0.

UINJ, bit [4]

When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to the value of PSTATE.UINJ on entering Debug state, and copied to PSTATE.UINJ on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [3:2]

Reserved, RES0.

PPEND, bit [1]

When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on entering Debug state, and conditionally copied to PSTATE.PPEND on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing DSPSR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

DTLBIALL, Data TLB Invalidate All

The DTLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from data TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DTLBIALL are UNDEFINED.

Attributes

DTLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing DTLBIALL

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0110	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

DTLBIASID, Data TLB Invalidate by ASID match

The DTLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

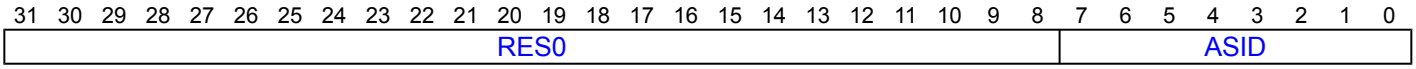
Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DTLBIASID are UNDEFINED.

Attributes

DTLBIASID is a 32-bit System instruction.

Field descriptions



Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing DTLBIASID

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

DTLBIMVA, Data TLB Invalidate by VA

The DTLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

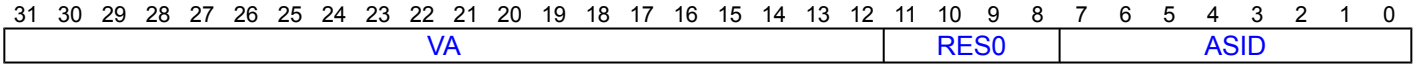
Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to DTLBIMVA are UNDEFINED.

Attributes

DTLBIMVA is a 32-bit System instruction.

Field descriptions



VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing DTLBIMVA

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0110	0b001

```

DVPRCTX, Data Value Prediction Restriction by Context

The DVPRCTX characteristics are:

Purpose

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Note

The prediction of the PSTATE.{N,Z,C,V} values is not considered a data value for this purpose.

Data value predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

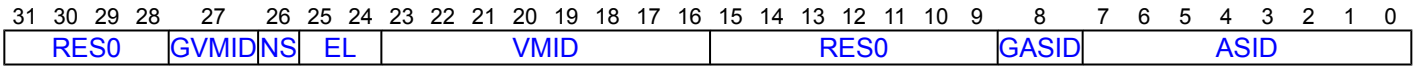
Configuration

This instruction is present only when FEAT_AA32 is implemented and FEAT_SPECRES is implemented. Otherwise, direct accesses to DVPRCTX are UNDEFINED.

Attributes

DVPRCTX is a 32-bit System instruction.

Field descriptions



Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, or is specified to apply to a combination of Exception level and Security state that is not implemented, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1} or EL2 is using AArch32.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and (the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1} or ELUsingAArch32(EL2)), this field is treated as the current VMID.

When the instruction is executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASIDs for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing DVPRCTX

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0011	0b101

ELR_hyp, Exception Link Register (Hyp mode)

The ELR_hyp characteristics are:

Purpose

When taking an exception to Hyp mode, holds the address to return to.

Configuration

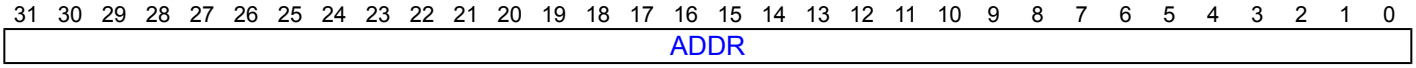
AArch32 System register ELR_hyp bits [31:0] are architecturally mapped to AArch64 System register ELR_EL2[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to ELR_hyp are UNDEFINED.

Attributes

ELR_hyp is a 32-bit register.

Field descriptions



ADDR, bits [31:0]

Return address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ELR_hyp

ELR_hyp is accessible only at Hyp mode and Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, ELR_hyp
```

R	M	M1
0b0	0b1	0b1110

```
MSR{<c>}{<q>} ELR_hyp, <Rn>
```

R	M	M1
0b0	0b1	0b1110

ERRIDR, Error Record ID Register

The ERRIDR characteristics are:

Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

Configuration

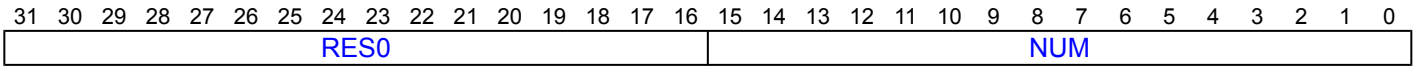
AArch32 System register ERRIDR bits [31:0] are architecturally mapped to AArch64 System register ERRIDR_EL1[31:0].

This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERRIDR are UNDEFINED.

Attributes

ERRIDR is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates that no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ERRSELR, Error Record Select Register

The ERRSELR characteristics are:

Purpose

Selects an error record to be accessed through the Error Record System registers.

Configuration

AArch32 System register ERRSELR bits [31:0] are architecturally mapped to AArch64 System register ERRSELR_EL1[31:0].

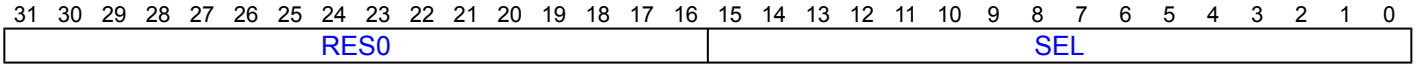
This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERRSELR are UNDEFINED.

If ERRIDR indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR is UNDEFINED or RES0.

Attributes

ERRSELR is a 32-bit register.

Field descriptions



Bits [31:16]

Reserved, RES0.

SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR.SEL is `0x0004`, then direct reads and writes of ERXSTATUS access ERR4STATUS.

If ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then all of the following apply:

- The value read back from ERRSELR.SEL is UNKNOWN.
- One of the following occurs:
  - An UNKNOWN error record is selected.
  - The ERX* registers are RAZ/WI.
  - ERX* register reads and writes are NOPs.
  - ERX* register reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ERRSELR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ERXADDR, Selected Error Record Address Register

The ERXADDR characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>ADDR for the error record <n> selected by ERRSELR.SEL.

Configuration

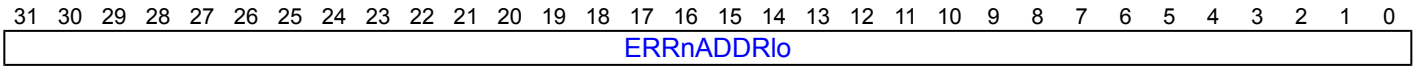
AArch32 System register ERXADDR bits [31:0] are architecturally mapped to AArch64 System register ERXADDR_EL1[31:0].

This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERXADDR are UNDEFINED.

Attributes

ERXADDR is a 32-bit register.

Field descriptions



ERRnADDRlo, bits [31:0]

ERXADDR accesses bits [31:0] of ERR<n>ADDR, where <n> is the value in ERRSELR.SEL.

Accessing ERXADDR

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR is RAZ/WI.
- Direct reads and writes of ERXADDR are NOPs.
- Direct reads and writes of ERXADDR are UNDEFINED.

ERR<n>ADDR describes additional constraints that also apply when ERR<n>ADDR is accessed through ERXADDR.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0100	0b011

```

ERXCTLR, Selected Error Record Control Register

The ERXCTLR characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>CTLR for the error record <n> selected by ERRSELR.SEL.

Configuration

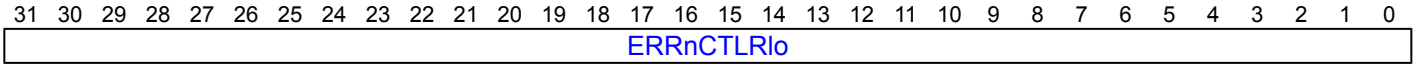
AArch32 System register ERXCTLR bits [31:0] are architecturally mapped to AArch64 System register ERXCTLR_EL1[31:0].

This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERXCTLR are UNDEFINED.

Attributes

ERXCTLR is a 32-bit register.

Field descriptions



ERRnCTLRIo, bits [31:0]

ERXCTLR accesses bits [31:0] of ERR<n>CTLR, where <n> is the value in ERRSELR.SEL.

Accessing ERXCTLR

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR is RAZ/WI.
- Direct reads and writes of ERXCTLR are NOPs.
- Direct reads and writes of ERXCTLR are UNDEFINED.

If ERRSELR.SEL is not the index of the first error record owned by a node, then ERR<n>CTLR[31:0] is not present, meaning reads and writes of ERXCTLR are RES0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0100	0b001

```

ERXCTLR2, Selected Error Record Control Register 2

The ERXCTLR2 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>CTLR for the error record <n> selected by ERRSELR.SEL.

Configuration

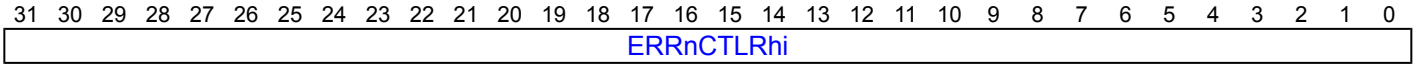
AArch32 System register ERXCTLR2 bits [31:0] are architecturally mapped to AArch64 System register ERXCTLR_EL1[63:32].

This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERXCTLR2 are UNDEFINED.

Attributes

ERXCTLR2 is a 32-bit register.

Field descriptions



ERRnCTLRhi, bits [31:0]

ERXCTLR2 accesses bits [63:32] of ERR<n>CTLR, where <n> is the value in ERRSELR.SEL.

Accessing ERXCTLR2

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR2 is RAZ/WI.
- Direct reads and writes of ERXCTLR2 are NOPs.
- Direct reads and writes of ERXCTLR2 are UNDEFINED.

If ERRSELR.SEL is not the index of the first error record owned by a node, then ERR<n>CTLR[63:32] is not present, meaning reads and writes of ERXCTLR2 are RES0.

Accesses to this register use the following encodings in the System register encoding space:

```

ERXFR, Selected Error Record Feature Register

The ERXFR characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>FR for the error record <n> selected by ERRSELR.SEL.

Configuration

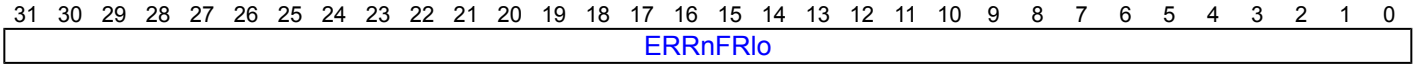
AArch32 System register ERXFR bits [31:0] are architecturally mapped to AArch64 System register ERXFR_EL1[31:0].

This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERXFR are UNDEFINED.

Attributes

ERXFR is a 32-bit register.

Field descriptions



ERRnFRIo, bits [31:0]

ERXFR accesses bits [31:0] of ERR<n>FR, where <n> is the value in ERRSELR.SEL.

Accessing ERXFR

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXFR is RAZ.
- Direct reads of ERXFR are NOPs.
- Direct reads of ERXFR are UNDEFINED.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0100	0b000

```

ERXMISC1, Selected Error Record Miscellaneous Register 1

The ERXMISC1 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>MISC0 for the error record <n> selected by ERRSELR.SEL.

Configuration

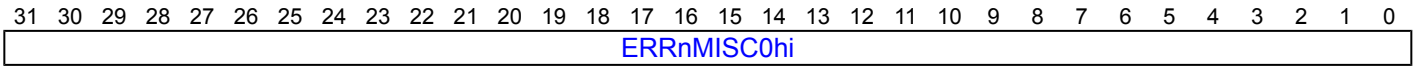
AArch32 System register ERXMISC1 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC0_EL1[63:32].

This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERXMISC1 are UNDEFINED.

Attributes

ERXMISC1 is a 32-bit register.

Field descriptions



ERRnMISC0hi, bits [31:0]

ERXMISC1 accesses bits [63:32] of ERR<n>MISC0, where <n> is the value in ERRSELR.SEL.

Accessing ERXMISC1

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC1 is RAZ/WI.
- Direct reads and writes of ERXMISC1 are NOPs.
- Direct reads and writes of ERXMISC1 are UNDEFINED.

ERR<n>MISC0 describes additional constraints that also apply when ERR<n>MISC0 is accessed through ERXMISC1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ERXMISC2, Selected Error Record Miscellaneous Register 2

The ERXMISC2 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC1 for the error record <n> selected by ERRSELR.SEL.

Configuration

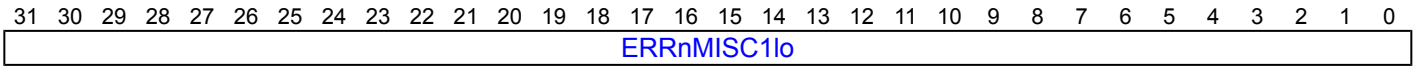
AArch32 System register ERXMISC2 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC1_EL1[31:0].

This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERXMISC2 are UNDEFINED.

Attributes

ERXMISC2 is a 32-bit register.

Field descriptions



ERRnMISC1lo, bits [31:0]

ERXMISC2 accesses bits [31:0] of ERR<n>MISC1, where <n> is the value in ERRSELR.SEL.

Accessing ERXMISC2

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC2 is RAZ/WI.
- Direct reads and writes of ERXMISC2 are NOPs.
- Direct reads and writes of ERXMISC2 are UNDEFINED.

ERR<n>MISC1 describes additional constraints that also apply when ERR<n>MISC1 is accessed through ERXMISC2.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0101	0b100

```

ERXMISC4, Selected Error Record Miscellaneous Register 4

The ERXMISC4 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC2 for the error record <n> selected by ERRSELR.SEL.

Configuration

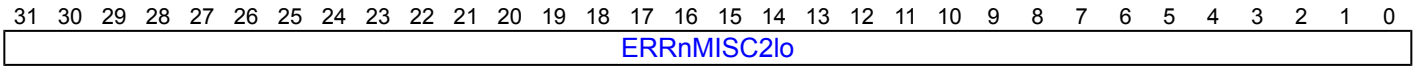
AArch32 System register ERXMISC4 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC2_EL1[31:0].

This register is present only when FEAT_RASv1p1 is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERXMISC4 are UNDEFINED.

Attributes

ERXMISC4 is a 32-bit register.

Field descriptions



ERRnMISC2lo, bits [31:0]

ERXMISC4 accesses bits [31:0] of ERR<n>MISC2, where <n> is the value in ERRSELR.SEL.

Accessing ERXMISC4

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC4 is RAZ/WI.
- Direct reads and writes of ERXMISC4 are NOPs.
- Direct reads and writes of ERXMISC4 are UNDEFINED.

ERR<n>MISC2 describes additional constraints that also apply when ERR<n>MISC2 is accessed through ERXMISC4.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0101	0b010

```

ERXMISC6, Selected Error Record Miscellaneous Register 6

The ERXMISC6 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC3 for the error record <n> selected by ERRSELR.SEL.

Configuration

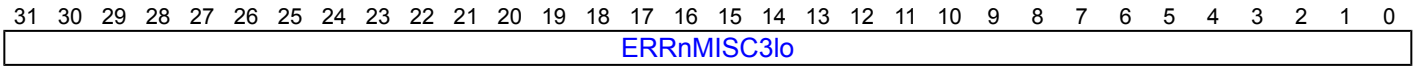
AArch32 System register ERXMISC6 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC3_EL1[31:0].

This register is present only when FEAT_RASv1p1 is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERXMISC6 are UNDEFINED.

Attributes

ERXMISC6 is a 32-bit register.

Field descriptions



ERRnMISC3lo, bits [31:0]

ERXMISC6 accesses bits [31:0] of ERR<n>MISC3, where <n> is the value in ERRSELR.SEL.

Accessing ERXMISC6

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC6 is RAZ/WI.
- Direct reads and writes of ERXMISC6 are NOPs.
- Direct reads and writes of ERXMISC6 are UNDEFINED.

ERR<n>MISC3 describes additional constraints that also apply when ERR<n>MISC3 is accessed through ERXMISC6.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0101	0b110

```

ERXSTATUS, Selected Error Record Primary Status Register

The ERXSTATUS characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>STATUS for the error record selected by ERRSELR.SEL.

Configuration

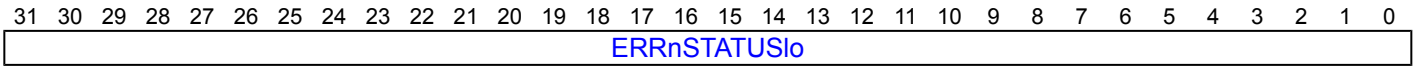
AArch32 System register ERXSTATUS bits [31:0] are architecturally mapped to AArch64 System register ERXSTATUS_EL1[31:0].

This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to ERXSTATUS are UNDEFINED.

Attributes

ERXSTATUS is a 32-bit register.

Field descriptions



ERRnSTATUSIo, bits [31:0]

ERXSTATUS accesses bits [31:0] of ERR<n>STATUS, where n is the value in ERRSELR.SEL.

Accessing ERXSTATUS

If ERRIDR.NUM == 0 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN record is selected.
- ERXSTATUS is RAZ/WI.
- Direct reads and writes of ERXSTATUS are NOPs.
- Direct reads and writes of ERXSTATUS are UNDEFINED.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0100	0b010

```

FCSEIDR, FCSE Process ID register

The FCSEIDR characteristics are:

Purpose

Identifies whether the Fast Context Switch Extension (FCSE) is implemented.

From Armv8.0, the FCSE is not implemented, so this register is RAZ/WI. Software can access this register to determine that the implementation does not include the FCSE.

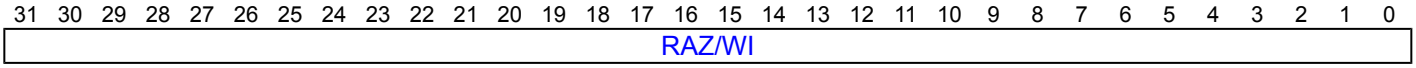
Configuration

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to FCSEIDR are UNDEFINED.

Attributes

FCSEIDR is a 32-bit register.

Field descriptions



Bits [31:0]

Reserved, RAZ/WI.

Accessing FCSEIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

FPEXC, Floating-Point Exception Control register

The FPEXC characteristics are:

Purpose

Provides a global enable for the implemented Advanced SIMD and floating-point functionality, and reports floating-point status information.

Configuration

AArch32 System register FPEXC bits [31:0] are architecturally mapped to AArch64 System register FPEXC32_EL2[31:0].

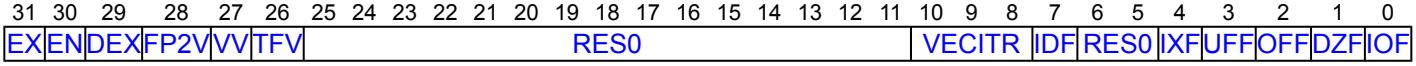
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to FPEXC are UNDEFINED.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPEXC is a 32-bit register.

Field descriptions



EX, bit [31]

Exception bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RAZ/WI**.

EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

EN	Meaning
0b0	Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.
0b1	This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, HCPTR.TASE and NSACR.NSASEDIS.

See the descriptions of the controls for more information.

Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64, then the Effective value of FPEXC.EN is 1. This includes when EL2 is using AArch64 and is enabled in the current Security state, HCR_EL2.TGE is 1, and the Effective value of HCR_EL2.RW is 1.
- If EL2 is using AArch64 and is enabled in the current Security state, HCR_EL2.TGE is 1, and the Effective value of HCR_EL2.RW is 0, then it is IMPLEMENTATION DEFINED whether the Effective value of FPEXC.EN is 1 or the value written to FPEXC.EN. However, Arm deprecates using the value of FPEXC.EN to determine behavior.

The reset behavior of this field is:

- On a Warm reset, this field resets to `'0'`.

DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC.TFV field is valid.

The meaning of this bit is:

DEX	Meaning
`0b0`	The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC.TFV is RW then it is invalid and UNKNOWN. If FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
`0b1`	The exception was generated during the execution of an allocated encoding. FPEXC.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the FPSCR.{Stride, Len} fields as RAZ, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FP2V, bit [28]

FPINST2 instruction Valid bit. From Armv8.0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RES0**.

VV, bit [27]

VECITR Valid bit. From Armv8.0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RES0**.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are valid.

TFV	Meaning
0b0	The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR.{Stride, Len} was nonzero. If FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When an implementation does not implement trapping of floating-point exceptions, access to this field is **RAZ/WI**.
- When an implementation implements FPSCR.LEN,STRIDE as RAZ, access to this field is **RAO/WI**.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector Iteration count. From Armv8.0, this field is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RES1**.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

IDF	Meaning
0b0	Input Denormal exception has not occurred.
0b1	Input Denormal exception has occurred.

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of FPSCR.FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Input Denormal floating-point exceptions, access to this field is **RAZ/WI**.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

IXF	Meaning
0b0	Inexact exception has not occurred.
0b1	Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Inexact floating-point exceptions, access to this field is **RAZ/WI**.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

UFF	Meaning
0b0	Underflow exception has not occurred.
0b1	Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when FPSCR.FZ16 is 0.
- Otherwise only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Underflow floating-point exceptions, access to this field is **RAZ/WI**.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

OFF	Meaning
0b0	Overflow exception has not occurred.
0b1	Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Overflow floating-point exceptions, access to this field is **RAZ/WI**.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

DZF	Meaning
0b0	Divide by Zero exception has not occurred.
0b1	Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Divide by Zero floating-point exceptions, access to this field is **RAZ/WI**.

IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

IOF	Meaning
0b0	Invalid Operation exception has not occurred.
0b1	Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Invalid Operation floating-point exceptions, access to this field is **RAZ/WI**.

Accessing FPEXC

Accesses to this register use the following encodings in the System register encoding space:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>

FPSCR, Floating-Point Status and Control Register

The FPSCR characteristics are:

Purpose

Provides floating-point system status information and control.

Configuration

AArch32 System register FPSCR bits [31:27] are architecturally mapped to AArch64 System register FPSR[31:27].

AArch32 System register FPSCR bit [7] is architecturally mapped to AArch64 System register FPSR[7].

AArch32 System register FPSCR bits [4:0] are architecturally mapped to AArch64 System register FPSR[4:0].

AArch32 System register FPSCR bits [26:15] are architecturally mapped to AArch64 System register FPCR[26:15].

AArch32 System register FPSCR bits [12:8] are architecturally mapped to AArch64 System register FPCR[12:8].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to FPSCR are UNDEFINED.

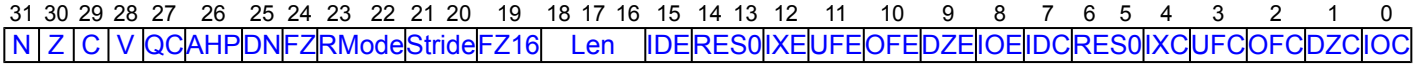
It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to nonzero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPSCR is a 32-bit register.

Field descriptions



N, bit [31]

Negative condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AHP, bit [26]

Alternative half-precision control bit:

AHP	Meaning
0b0	IEEE half-precision format selected.
0b1	Alternative half-precision format selected.

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DN, bit [25]

Default NaN mode control bit:

DN	Meaning
0b0	NaN operands propagate through to the output of a floating-point operation.
0b1	Any operation involving one or more NaNs returns the Default NaN.

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Default NaN setting, regardless of the value of the DN bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flush-to-zero mode control bit:

FZ	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled.

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

This bit has no effect on half-precision calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field. The encoding of this field is:

RMode	Meaning
0b00	Round to Nearest (RN) mode.
0b01	Round towards Plus Infinity (RP) mode.
0b10	Round towards Minus Infinity (RM) mode.
0b11	Round towards Zero (RZ) mode.

The specified rounding mode is used by almost all scalar floating-point instructions. Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Stride, bits [21:20]

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation implements FPSCR.LEN,STRIDE as RAZ, access to this field is **RAZ/WI**.

FZ16, bit [19]

When FEAT_FP16 is implemented:

Flush-to-zero mode control bit on half-precision data-processing instructions:

FZ16	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled.

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Len, bits [18:16]

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation implements FPSCR.LEN,STRIDE as RAZ, access to this field is **RAZ/WI**.

IDE, bit [15]

Input Denormal floating-point exception trap enable.

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IDC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Input Denormal floating-point exceptions, access to this field is **RAZ/WI**.

Bits [14:13]

Reserved, RES0.

IXE, bit [12]

Inexact floating-point exception trap enable.

IXE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the IXC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IXC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Inexact floating-point exceptions, access to this field is **RAZ/WI**.

UFE, bit [11]

Underflow floating-point exception trap enable.

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the UFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the UFC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Underflow floating-point exceptions, access to this field is **RAZ/WI**.

OFE, bit [10]

Overflow floating-point exception trap enable.

OFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the OFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the OFC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Overflow floating-point exceptions, access to this field is **RAZ/WI**.

DZE, bit [9]

Divide by Zero floating-point exception trap enable.

DZE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the DZC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the DZC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Divide by Zero floating-point exceptions, access to this field is **RAZ/WI**.

IOE, bit [8]

Invalid Operation floating-point exception trap enable.

IOE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the IOC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IOC bit.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement trapping of Invalid Operation floating-point exceptions, access to this field is **RAZ/WI**.

IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IDE bit.

Advanced SIMD instructions set this bit if the Input Denormal floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IDE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IXE bit.

Advanced SIMD instructions set this bit if the Inexact floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IXE bit.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For more information, see 'Flush-to-zero'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the UFE bit.

Advanced SIMD instructions set this bit if the Underflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, if FPSCR.UFE is 0 or if Flush-to-zero is enabled.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For more information, see 'Flush-to-zero'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the OFE bit.

Advanced SIMD instructions set this bit if the Overflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the OFE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the DZE bit.

Advanced SIMD instructions set this bit if the Divide by Zero floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the DZE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IOE bit.

Advanced SIMD instructions set this bit if the Invalid Operation floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IOE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FPSCR

Accesses to this register use the following encodings in the System register encoding space:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

FPSID, Floating-Point System ID register

The FPSID characteristics are:

Purpose

Provides top-level information about the floating-point implementation.

This register largely duplicates information held in the MIDR. Arm deprecates use of it.

Configuration

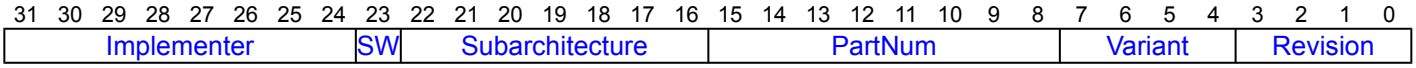
This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to FPSID are UNDEFINED.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPSID is a 32-bit register.

Field descriptions



Implementer, bits [31:24]

Implementer codes are the same as those used for the MIDR.

For an implementation by Arm this field is `0x41`, the ASCII code for A.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SW, bit [23]

Software bit.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SW	Meaning
`0b0`	The implementation provides a hardware implementation of the floating-point instructions.
`0b1`	The implementation supports only software emulation of the floating-point instructions.

In Armv8-A, the only permitted value is `0b0`.

Access to this field is **RO**.

Subarchitecture, bits [22:16]

Subarchitecture version number.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Subarchitecture	Meaning
0b0000000	VFPv1 architecture with an IMPLEMENTATION DEFINED subarchitecture.
0b0000001	VFPv2 architecture with Common VFP subarchitecture v1.
0b0000010	VFPv3 architecture, or later, with Common VFP subarchitecture v2. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.
0b0000011	VFPv3 architecture, or later, with Null subarchitecture. The entire floating-point implementation is in hardware, and no software support code is required. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers. This value can be used only by an implementation that does not support the trap enable bits in the FPSCR.
0b0000100	VFPv3 architecture, or later, with Common VFP subarchitecture v3, and support for trap enable bits in FPSCR. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.

For a subarchitecture designed by Arm the most significant bit of this field, register bit[22], is 0. Values with a most significant bit of 0 that are not listed here are reserved.

When the subarchitecture designer is not Arm, the most significant bit of this field, register bit[22], must be 1. Each implementer must maintain its own list of subarchitectures it has designed, starting at subarchitecture version number 0x40.

In Armv8-A, the permitted values are 0b0000011 and 0b0000100.

Access to this field is **RO**.

PartNum, bits [15:8]

Part Number for the floating-point implementation, assigned by the implementer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [7:4]

Variant number. Typically, this field distinguishes between different production variants of a single product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the floating-point implementation.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing FPSID

Accesses to this register use the following encodings in the System register encoding space:

HACR, Hyp Auxiliary Configuration Register

The HACR characteristics are:

Purpose

Controls trapping to Hyp mode of IMPLEMENTATION DEFINED aspects of Non-secure EL1 or EL0 operation.

Configuration

AArch32 System register HACR bits [31:0] are architecturally mapped to AArch64 System register HACR_EL2[31:0].

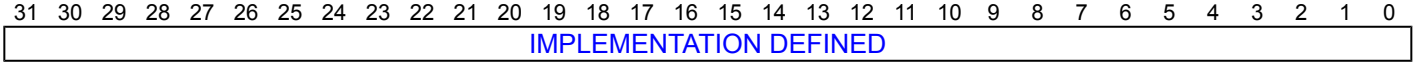
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HACR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HACR is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HACR

Accesses to this register use the following encodings in the System register encoding space:

HACTLR2, Hyp Auxiliary Control Register 2

The HACTLR2 characteristics are:

Purpose

Provides additional space to the HACTLR register to hold IMPLEMENTATION DEFINED trap functionality.

Configuration

AArch32 System register HACTLR2 bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL2[63:32].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HACTLR2 are UNDEFINED.

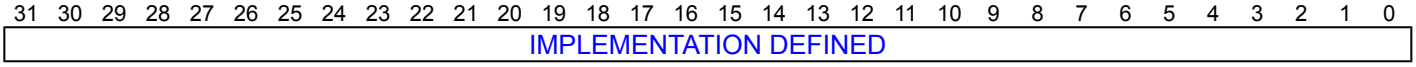
In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining ID_MMFR4.AC2.

From Armv8.2 this register must be implemented.

Attributes

HACTLR2 is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

HADFSR, Hyp Auxiliary Data Fault Status Register

The HADFSR characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED syndrome information for Data Abort exceptions taken to Hyp mode.

Configuration

AArch32 System register HADFSR bits [31:0] are architecturally mapped to AArch64 System register AFSR0_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HADFSR are UNDEFINED.

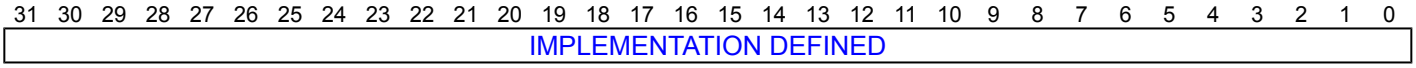
This is an optional register. An implementation that does not require this register can implement it as RES0.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HADFSR is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HADFSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0001	0b000

```

HCPTR, Hyp Architectural Feature Trap Register

The HCPTR characteristics are:

Purpose

Controls:

- Trapping to Hyp mode of Non-secure access, at EL1 or EL0, to trace, and to Advanced SIMD and floating-point functionality.
- Hyp mode access to trace, and to Advanced SIMD and floating-point functionality.

Note

Accesses to this functionality:

- From Non-secure modes other than Hyp mode are also affected by settings in the CPACR and NSACR.
- From Hyp mode are also affected by settings in the NSACR.

Exceptions generated by the CPACR and NSACR controls are higher priority than those generated by the HCPTR controls.

Configuration

AArch32 System register HCPTR bits [31:0] are architecturally mapped to AArch64 System register CPTR_EL2[31:0].

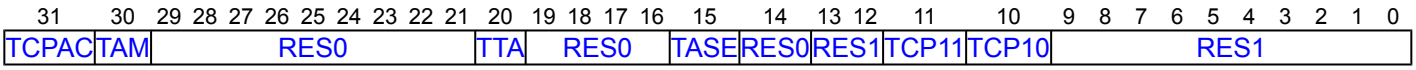
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HCPTR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCPTR is a 32-bit register.

Field descriptions



TCPAC, bit [31]

Traps Non-secure EL1 MRC and MCR accesses to the CPACR to Hyp mode, reported using EC syndrome value `0x03`.

TCPAC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 accesses to the CPACR are trapped to Hyp mode.

Note

The CPACR is not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps Non-secure EL1 and EL0 MRC, MCR, MRRC, and MCRR accesses to all Activity Monitor registers to EL2, reported using EC syndrome values `0x03` and `0x04`.

TAM	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are trapped to Hyp mode.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps Non-secure System register MRC, MCR, MRRC, and MCRR accesses to all implemented trace registers to Hyp mode, reported using EC syndrome values `0x05` and `0x0C`.

TTA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any Non-secure System register access to an implemented trace register is trapped to Hyp mode, unless the access is trapped to EL1 by a CPACR or NSACR control, or the access is from Non-secure EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates: • A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1. • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

If the implementation does not include a trace unit, or does not include a System register interface to the trace unit registers, it is IMPLEMENTATION DEFINED whether this bit:

- Is RES0.
- Is RES1.
- Can be written from Hyp mode, and from Secure Monitor mode when SCR.NS is 1.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

Note

- The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPTR.TTA Hyp Trap exception.
- The Arm architecture does not provide traps on trace register accesses through the optional memory-mapped debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [19:16]

Reserved, RES0.

TASE, bit [15]

Traps Non-secure execution of Advanced SIMD instructions to Hyp mode, reported using EC syndrome value 0x07, when the value of HCPTR.TCP10 is 0.

TASE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	When the value of HCPTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates: • A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1. • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

When the value of HCPTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [14]

Reserved, RES0.

Bits [13:12]

Reserved, RES1.

TCP11, bit [11]

When FEAT_FP is implemented and FEAT_AdvSIMD is implemented:

The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HCPTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

The reset behavior of this field is:

- On a Warm reset:
    - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
    - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAO/WI** if all the following are true:
    - EL3 is implemented.
    - EL3 is using AArch32.
    - !IsCurrentSecurityState(SS_Secure).
    - NSACR.cp10 == 0.

Otherwise:

Reserved, RES1.

TCP10, bit [10]

When FEAT_FP is implemented and FEAT_AdvSIMD is implemented:

Trap Non-secure accesses to Advanced SIMD and floating-point functionality to Hyp mode, reported using EC syndrome value `0x07`:

TCP10	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempted access to Advanced SIMD and floating-point functionality from Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates: • A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1. • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

The reset behavior of this field is:

- On a Warm reset:
    - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
    - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAO/WI** if all the following are true:
    - EL3 is implemented.
    - EL3 is using AArch32.
    - !IsCurrentSecurityState(SS_Secure).
    - NSACR.cp10 == 0.

Otherwise:

Reserved, RES1.

Bits [9:0]

Reserved, RES1.

Accessing HCPTR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

HCR, Hyp Configuration Register

The HCR characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various Non-secure operations are trapped to Hyp mode.

Configuration

AArch32 System register HCR bits [31:0] are architecturally mapped to AArch64 System register HCR_EL2[31:0].

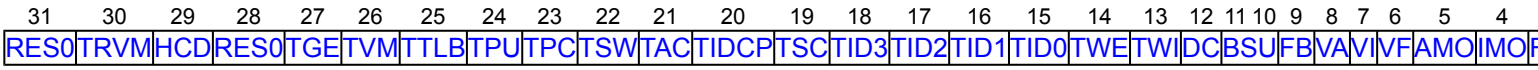
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCR is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RES0.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

MRC reads of the following registers are trapped and reported using EC syndrome value `0x03` and MRRC reads are trapped and reported using EC syndrome value `0x04`:

SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

TRVM	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

HCD, bit [29]

When EL3 is not implemented:

HVC instruction disable. Disables Non-secure EL1 and EL2 execution of HVC instructions, when EL2 is enabled in the current Security state, reported using EC syndrome value `0x00`.

HCD	Meaning
0b0	HVC instruction execution is enabled at EL2 and EL1.
0b1	HVC instructions are UNDEFINED at EL2 and Non-secure EL1. The Undefined Instruction exception is taken to the Exception level at which the HVC instruction is executed.

Note

HVC instructions are always UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

TGE, bit [27]

Trap General Exceptions, from Non-secure EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, then: • All exceptions that would be routed to EL1 are routed to EL2. • The SCTLR.M bit is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR. • The HCR.{FMO, IMO, AMO} bits are treated as being 1 for all purposes other than returning the result of a direct read of HCR. • All virtual interrupts are disabled. • Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled. • An exception return to EL1 is treated as an illegal exception return. • Monitor mode execution of an MSR or CPS instruction that changes PSTATE.M to a Non-secure EL1 mode is an illegal change to PSTATE.M. For more information see 'Illegal changes to PSTATE.M'.

Also, when HCR.TGE is 1:

- If EL3 is using AArch32, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing SCR.NS from 0 to 1 results in SCR.NS remaining as 0.
- The HDCR.{TDRA, TDOSA, TDA, TDE} bits are ignored and treated as being 1 other than for the purpose of a direct read of HDCR.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Trap Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

MCR writes of the following registers are trapped and reported using EC syndrome value `0x03` and MCRR writes are trapped and reported using EC syndrome value `0x04`:

SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

TVM	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 write accesses to the specified virtual memory control registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of a TLBI instruction to EL2, when EL2 is enabled in the current Security state.

MCR and MRC accesses to the following system instructions are trapped and reported using EC syndrome value `0x03`:

TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS, ITLBIALL, ITLBIMVA, ITLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, TLBIMVAAL

TTLB	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 accesses to the specified TLB maintenance instructions are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

MRC and MCR accesses of the following system instructions are trapped and reported using EC syndrome value `0x03`:

- ICIMVAU, ICIALLU, ICIALLUIS, DCCMVAU.

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TPU	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

TPC, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

MRC and MCR accesses of the following system instructions are trapped and reported using EC syndrome value 0x03:

- DCIMVAC, DCCIMVAC, DCCMVAC.

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TPC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps Non-secure EL1 execution of those cache maintenance instructions by set/way to EL2, when EL2 is enabled in the current Security state.

MRC and MCR accesses of the following system instructions are trapped and reported using EC syndrome value 0x03:

- DCISW, DCCSW, DCCISW.

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TAC, bit [21]

Trap Auxiliary Control Registers. Traps Non-secure EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, from both Execution states.

MRC and MCR accesses of the following registers are trapped and reported using EC syndrome value 0x03:

ACTLR and, if implemented, ACTLR2.

TAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 accesses to the specified registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps Non-secure EL1 accesses to the encodings for IMPLEMENTATION DEFINED System Registers to EL2, when EL2 is enabled in the current Security state.

MRC and MCR accesses of the following encodings are trapped and reported using EC syndrome value 0x03:

- All coproc==p15, CRn==c9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c10, Opcode1 =={0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

TIDCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 accesses to the specified System register encodings for IMPLEMENTATION DEFINED functionality are trapped to EL2.

When HCR.TIDCP is set to 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from Non-secure EL0 is trapped to EL2. Otherwise, it is UNDEFINED and the PE takes an Undefined Instruction exception to Non-secure Undefined mode.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TSC, bit [19]

Trap SMC instructions. Traps Non-secure EL1 execution of SMC instructions to Hyp mode.

TSC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute an SMC instruction at Non-secure EL1 is trapped to Hyp mode, regardless of the value of SCR.SCD.

The Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

Note

- This trap is implemented only if the implementation includes EL3.
- SMC instructions are always UNDEFINED at PL0.
- This bit traps execution of the SMC instruction, reported using EC syndrome value 0x13. It is not a routing control for the SMC exception. Hyp Trap exceptions and SMC exceptions have different preferred return addresses.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TID3, bit [18]

Trap ID group 3. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- VMRS access to MVFR0, MVFR1, and MVFR2, reported using EC syndrome value `0x08`, unless access is also trapped by HCPTR which takes priority.
- MRC access to the following registers are reported using EC syndrome value `0x03`:
  - ID_PFR0, ID_PFR1, ID_PFR2, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.
  - If FEAT_FGT is implemented:
    - ID_MMFR4 and ID_MMFR5 are trapped to EL2.
    - ID_ISAR6 is trapped to EL2.
    - ID_DFR1 is trapped to EL2.
    - This field traps all MRC accesses to registers in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
  - If FEAT_FGT is not implemented:
    - ID_MMFR4 and ID_MMFR5 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or ID_MMFR5 are trapped.
    - ID_ISAR6 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_ISAR6 are trapped to EL2.
    - ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped to EL2.
    - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to registers not already mentioned, with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TID2, bit [17]

Trap ID group 2. Traps the following register MRC and MCR accesses to EL2, reported using EC syndrome value `0x03`, when EL2 is enabled in the current Security state:

- Non-secure EL1 and EL0 reads of the CTR, CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- Non-secure EL1 and EL0 writes to the CSSELR.

TID2	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Trap ID group 1. Traps Non-secure EL1 MRC reads of the following registers to EL2, reported using EC syndrome value `0x03`, when EL2 is enabled in the current Security state:

TCMTR, TLBTR, REVIDR, AIDR.

TID1	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TID0, bit [15]

Trap ID group 0. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 VMRS reads of FPSID reported using EC syndrome value `0x08`.
- Non-secure EL0 and EL1 MCR and MRC accesses of JIDR reported using EC syndrome value `0x05`.

Note

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The FPSID is not accessible at EL0.
- Writes to the FPSID are ignored, and not trapped by this control.

TID0	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TWE, bit [14]

Traps Non-secure EL0 and EL1 execution of WFE instructions to EL2, reported using EC syndrome value `0x01`, when EL2 is enabled in the current Security state.

TWE	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TWI, bit [13]

Traps Non-secure EL0 and EL1 execution of WFI instructions to EL2, reported using EC syndrome value 0x01, when EL2 is enabled in the current Security state.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DC, bit [12]

Default Cacheability.

DC	Meaning
0b0	This control has no effect on the Non-secure EL1&0 translation regime.
0b1	In Non-secure state: • The SCTLR.M field behaves as 0 for all purposes other than a direct read of the value of the field. • The HCR.VM field behaves as 1 for all purposes other than a direct read of the value of the field. • The memory type produced by the first stage of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2 and EL3 translation regimes.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBIMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVAL, TLBIMVAAL.

FB	Meaning
0b0	This field has no effect on the operation of the specified instructions.
0b1	When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

VA, bit [8]

Virtual SError exception.

VA	Meaning
0b0	This mechanism is not making a virtual SError exception pending.
0b1	A virtual SError exception is pending because of this mechanism.

The virtual SError exception is enabled only when the value of HCR.{TGE, AMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

VI, bit [7]

Virtual IRQ exception.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR.{TGE, IMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

VF, bit [6]

Virtual FIQ exception.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR.{TGE, FMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AMO, bit [5]

SError exception Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.A, and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 0, then virtual SError exceptions are enabled in Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

IMO, bit [4]

IRQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 0, then Virtual IRQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

FMO, bit [3]

FIQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 0, then Virtual FIQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

PTW, bit [2]

Protected Table Walk. In the Non-secure PL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

PTW	Meaning
0b0	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
0b1	The memory access generates a stage 2 Permission fault.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SWIO, bit [1]

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way.

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When this bit is set to 1, DCISW performs the same invalidation as a DCCISW instruction.

As a result of changes to the behavior of DCISW, this bit is redundant in Armv8. This bit can be implemented as RES1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime.

VM	Meaning
0b0	Non-secure EL1&0 stage 2 address translation disabled.
0b1	Non-secure EL1&0 stage 2 address translation enabled.

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T1
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T1 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    R[t] = HCR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        R[t] = HCR;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T1
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T1 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HCR = R[t];
```

HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

Purpose

Provides additional configuration controls for virtualization.

Configuration

AArch32 System register HCR2 bits [31:0] are architecturally mapped to AArch64 System register HCR_EL2[63:32].

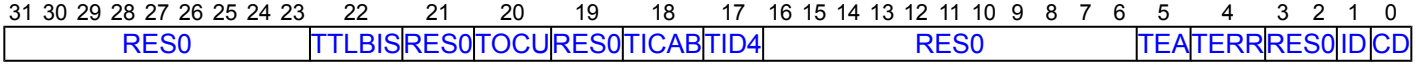
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HCR2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCR2 is a 32-bit register.

Field descriptions



Bits [31:23]

Reserved, RES0.

TTLBIS, bit [22]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of the following TLB maintenance instructions at EL1 to EL2:

TLBIALLIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVAALIS, TLBIMVAIS, and TLBIMVALIS

TTLBIS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified TLB maintenance instructions is trapped to EL2.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

TOCU, bit [20]

When FEAT_EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of DCCMVAU, ICIALLU, and ICIMVAU at EL1 to EL2.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

TICAB, bit [18]

When FEAT_EVT is implemented:

Trap ICIALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2.

This applies to the following instructions:

ICIALLUIS.

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID4, bit [17]

When FEAT_EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2:

- EL1 reads of CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- EL1 writes to CSSELR.

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:6]

Reserved, RES0.

TEA, bit [5]

When FEAT_RAS is implemented:

Route synchronous External abort exceptions from EL0 and EL1 to EL2.

TEA	Meaning
0b0	Does not route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2.
0b1	Route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2, if not routed to EL3.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [4]

When FEAT_RAS is implemented:

Trap Error record accesses from EL1 to EL2. Traps MRC or MCR accesses, reported using EC syndrome value `0x03`, and MRRC or MCRR accesses, reported using EC syndrome value `0x04`, to the following registers from EL1 to EL2:

ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.

When FEAT_RASv1p1 is implemented, ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

TERR	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Accesses to the specified registers from EL1 generate a Trap exception to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [3:2]

Reserved, RES0.

ID, bit [1]

Stage 2 Instruction access cacheability disable. For the Non-secure PL1&0 translation regime, when HCR.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
`0b0`	This control has no effect on stage 2 of the Non-secure PL1&0 translation regime.
`0b1`	For the Non-secure PL1&0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CD, bit [0]

Stage 2 Data access cacheability disable. When HCR.VM==1, this forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable for the Non-secure PL1&0 translation regime.

CD	Meaning
`0b0`	This control has no effect on stage 2 of the Non-secure PL1&0 translation regime for data accesses and translation table walks.
`0b1`	For the Non-secure PL1&0 translation regime, forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

The reset behavior of this field is:

- On a Warm reset:
    - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
    - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HCR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b100

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T1
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T1 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    R[t] = HCR2;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        R[t] = HCR2;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b100

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T1
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T1 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR2 = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HCR2 = R[t];
```

HDCR, Hyp Debug Control Register

The HDCR characteristics are:

Purpose

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

Configuration

AArch32 System register HDCR bits [31:0] are architecturally mapped to AArch64 System register MDCR_EL2[31:0].

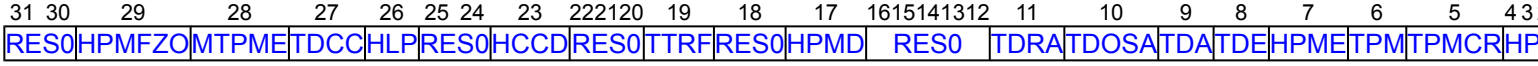
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HDCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3, and other than for a direct read of the register, the PE behaves as if HDCR.HPMN == PMCR.N.

Attributes

HDCR is a 32-bit register.

Field descriptions



Bits [31:30]

Reserved, RES0.

HPMFZO, bit [29]

When FEAT_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

HPMFZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when PMOVSR[(PMCR.N-1):HDCR.HPMN] is nonzero.

If HDCR.HPMN is less than PMCR.N, this field affects the operation of event counters in the range [HDCR.HPMN .. (PMCR.N-1)].

This field does not affect the operation of other event counters and PMCCNTR.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>.MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>.MT is zero.
0b1	PMEVTYPER<n>.MT bits not affected by this bit.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

The reset behavior of this field is:

- On a Cold reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '1'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Hyp Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped LDC to DBGDTRTXint and STC from DBGDTRRXint.

When the PE is in Debug state, HDCR.TDCC does not trap any accesses to:

- DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HLP, bit [26]

When FEAT_PMUv3p5 is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

HLP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[63:0].

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is read/write or RAZ/WI.

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range [HDCR.HPMN..(PMCR.N-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

Note

PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [25:24]

Reserved, RES0.

HCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR from counting at EL2.

HCCD	Meaning
0b0	Cycle counting by PMCCNTR is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR is prohibited at EL2.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

When FEAT_TRF is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2 for MRC or MCR accesses, reported using EC syndrome value `0x03`.

TTRF	Meaning
`0b0`	Accesses to TRFCR at EL1 are not affected by this control bit.
`0b1`	Accesses to TRFCR at EL1 generate a Hyp Trap exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When FEAT_PMUv3p1 is implemented and FEAT_Debugv8p2 is implemented:

Guest Performance Monitors Disable. Controls PMU operation in Hyp mode.

HPMD	Meaning
`0b0`	Counters are not affected by this mechanism.
`0b1`	Affected counters are prohibited from counting in Hyp mode. If PMCR.DP is 1, then PMCCNTR is disabled in Hyp mode. Otherwise, PMCCNTR is not affected by this mechanism.

The counters affected by this field are:

- Event counters PMEVCNTR<n> for values of n less than HDCR.HPMN.
- If PMCR.DP is 1, the cycle counter PMCCNTR.

Other event counters are not affected by this field.

When PMCR.DP is 0, PMCCNTR is not affected by this field.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

When FEAT_PMUv3p1 is implemented:

Guest Performance Monitors Disable. Controls PMU operation in Hyp mode when `ExternalSecureNoninvasiveDebugEnabled()` is FALSE.

HPMD	Meaning
`0b0`	Counters are not affected by this mechanism.
`0b1`	If `ExternalSecureNoninvasiveDebugEnabled()` is FALSE then all the following apply: • Affected event counters are prohibited from counting in Hyp mode. • If PMCR.DP is 1, then PMCCNTR is disabled in Hyp mode. Otherwise, PMCCNTR is not affected by this mechanism.

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE then the event counters and PMCCNTR are not affected by this field.

Otherwise, the counters affected by this field are:

- Event counters PMEVCNTR<n> for values of n less than HDCR.HPMN.
- If PMCR.DP is 1, the cycle counter, PMCCNTR.

Other event counters are not affected by this field. When PMCR.DP is 0, PMCCNTR is not affected by this field.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:12]

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register MRC or MCR accesses, reported using EC syndrome value `0x05`, and MRRC accesses, reported using EC syndrome value `0x0C`, to the Debug ROM registers to Hyp mode.

TDRA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL0 and EL1 System register accesses to the DBGDRAR or DBGDSAR are trapped to Hyp mode, unless it is trapped by DBGDSCRext.UDCCdis.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps Non-secure EL1 System register MRC or MCR accesses, reported using EC syndrome value `0x05`, to the powerdown debug registers to Hyp mode.

TDOSA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- DBGOSLSR, DBGOSLAR, DBGOSDLR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

Note

These registers are not accessible at EL0.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps Non-secure EL1 System register MRC or MCR accesses, reported using EC syndrome value 0x05, to the powerdown debug registers to Hyp mode.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- DBGOSLSR, DBGOSLAR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

Note

These registers are not accessible at EL0.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap debug access. Traps Non-secure EL0 and EL1 System register MRC or MCR accesses, reported using EC syndrome value 0x05, to those debug System registers in the (coproc==0b1110) encoding space that are not trapped by either of the following:

- HDCR.TDRA.
- HDCR.TDOSA.

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by HDCR.TDRA and HDCR.TDOSA, are trapped to Hyp mode, unless it is trapped by DBGDSCRext.UDCCdis.

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TDE, bit [8]

Trap Debug exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

TDE	Meaning
0b0	The debug target Exception level is EL1.
0b1	If EL2 is enabled for the current Effective value of SCR.NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The HDCR.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see 'Routing debug exceptions'.

When HCR.TGE == 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

HPME, bit [7]
When FEAT_PMUv3 is implemented:

Hyp Enable.

HPME	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET.

The counters affected by this field are event counters PMEVCNTR<n> for values of n greater than or equal to HDCR.HPMN and less than PMCR.N. This applies even when EL2 is disabled in the current Security state.

Other event counters and PMCCNTR are not affected by this field.

If HDCR.HPMN is equal to PMCR.N, then this field has no effect.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]
When FEAT_PMUv3 is implemented:

Trap accesses of PMU registers. Enables a trap to EL2 on accesses of PMU registers.

TPM	Meaning
0b0	Accesses of the specified PMU registers are not trapped by this mechanism.
0b1	Accesses of the specified PMU registers at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.

The instructions affected by this control are:

- MRC and MCR accesses to PMCCFILTR, PMCCNTR, PMCNTENCLR, PMCNTENSET, PMCR, PMEVCNTR<n>, PMEVTYPER<n>, PMINTENCLR, PMINTENSET, PMOVSR, PMOVSSET, PMSELR, PMSWINC, PMUSERENR, PMXEVCNTR, and PMXEVTYPER.
- MRC accesses to PMCEID0 and PMCEID1.
- MRRC and MCRR accesses to PMCCNTR.
- If FEAT_PMUv3p1 is implemented, MRC accesses to PMCEID2 and PMCEID3.
- If FEAT_PMUv3p4 is implemented, MRC accesses to PMMIR.

Unless the instruction generates a higher priority exception, trapped instructions generate a Hyp Trap exception.

Trapped instructions are reported using EC syndrome value `0x03` for `MRC` and `MCR` accesses, and `0x04` for `MRRC` and `MCRR` accesses.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When FEAT_PMUv3 is implemented:

Trap PMCR accesses. Traps Non-secure EL0 and EL1 MCR or MRC accesses to the PMCR to Hyp mode, reported using EC syndrome value `0x03`.

TPMCR	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL0 and EL1 accesses to the PMCR are trapped to Hyp mode, unless it is trapped by PMUSERENR.EN.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]

When FEAT_PMUv3 is implemented:

Defines the number of event counters PMEVCNTR<n> that are accessible from EL1 and, if permitted, from EL0.

HDCR.HPMN divides the event counters into a first range and a second range.

If HDCR.HPMN is not 0 and is less than the number of PMU event counters implemented by the PE, NUM_PMU_COUNTERS, then event counters [0..(HDCR.HPMN-1)] are in the first range, and the remaining event counters [HDCR.HPMN..(NUM_PMU_COUNTERS-1)] are in the second range.

If FEAT_HPMN0 is implemented and HDCR.HPMN is 0, then all of the following apply:

- No event counters are in the first range.
- All event counters are in the second range.

If HDCR.HPMN is equal to NUM_PMU_COUNTERS, or EL2 is not implemented, then all of the following apply:

- All event counters are in the first range.
- No event counters are in the second range.

All of the following apply for an event counter PMEVCNTR<n> in the first range:

- The counter is accessible from EL1, EL2, and EL3.
- The counter is accessible from EL0 if permitted by PMUSERENR.
- If FEAT_PMUv3p5 is implemented, then PMCR.LP determines whether the counter overflow flag PMOVSSET[n] is set on unsigned overflow of PMEVCNTR<n>[31:0] or PMEVCNTR<n>[63:0]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.
- PMCR.E and PMCNTENSET[n] enable the operation of the event counter.

All of the following apply for an event counter PMEVCNTR<n> in the second range:

- The counter is accessible from EL2 and EL3.
- If EL2 is disabled in the current Security state, then the event counter is accessible from EL1, and from EL0 if permitted by PMUSERENR.
- If FEAT_PMUv3p5 is implemented, HDCR.HLP determines whether the counter overflow flag PMOVSSET[n] is set on unsigned overflow of PMEVCNTR<n>[31:0] or PMEVCNTR<n>[63:0]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.
- HDCR.HPME and PMCNTENSET[n] enable the operation of the event counter.

Values greater than NUM_PMU_COUNTERS are reserved. If FEAT_HPMN0 is not implemented then the value 0 is reserved.

If this field is set to a reserved value, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of HDCR.HPMN is UNKNOWN.
- The number of event counters in each of the first and second ranges is UNKNOWN. That is, either:
  - The PE behaves as if HDCR.HPMN is set to an UNKNOWN nonzero value less than or equal to NUM_PMU_COUNTERS.
  - All counters are in the second range and none are in the first range.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `NUM_PMU_COUNTERS`.

Otherwise:

Reserved, RES0.

Accessing HDCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

HDFAR, Hyp Data Fault Address Register

The HDFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

Configuration

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL2[31:0].

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] (DFAR_S) when FEAT_AA32EL2 is implemented and FEAT_AA32EL3 is implemented.

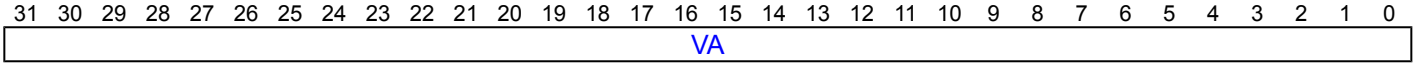
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HDFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFAR is a 32-bit register.

Field descriptions



VA, bits [31:0]

VA of faulting address of synchronous Data Abort exception taken to Hyp mode.

On a Prefetch Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HDFAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

HIFAR, Hyp Instruction Fault Address Register

The HIFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception that is taken to Hyp mode.

Configuration

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL2[63:32].

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch32 System register IFAR[31:0] (IFAR_S) when EL2 is implemented and EL3 is implemented.

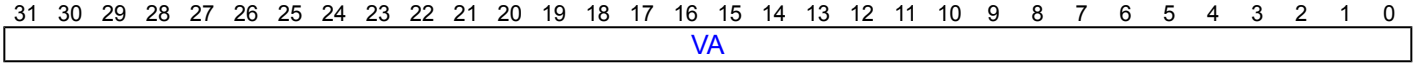
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HIFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HIFAR is a 32-bit register.

Field descriptions



VA, bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode.

On a Data Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HIFAR

HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

Purpose

Along with HMAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

Configuration

AArch32 System register HMAIR0 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HMAIR0 are UNDEFINED.

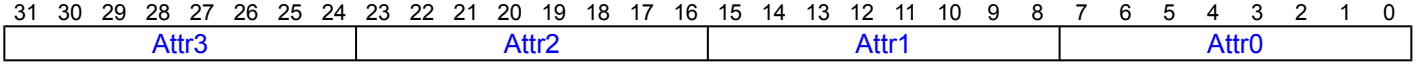
If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HMAIR0 is a 32-bit register.

Field descriptions

When TTBCR.EAE == 1:



Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HMAIR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0010	0b000

```

HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

Purpose

Along with HMAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

Configuration

AArch32 System register HMAIR1 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL2[63:32].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HMAIR1 are UNDEFINED.

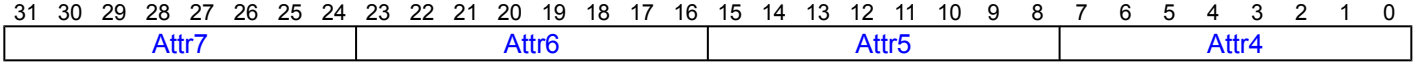
If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HMAIR1 is a 32-bit register.

Field descriptions

When TTBCR.EAE == 1:



Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 7 to 4

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HMAIR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0010	0b001

```
if !IsFeatureImplemented(FEAT_AA32EL2) then

HPFAR, Hyp IPA Fault Address Register

The HPFAR characteristics are:

Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to Hyp mode.

Configuration

AArch32 System register HPFAR bits [31:0] are architecturally mapped to AArch64 System register HPFAR_EL2[31:0].

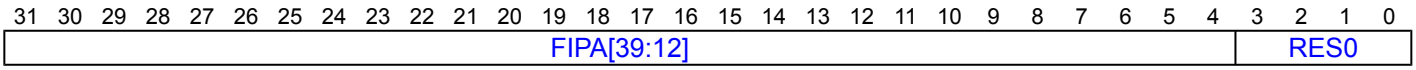
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HPFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HPFAR is a 32-bit register.

Field descriptions



Execution in any Non-secure mode other than Hyp mode makes this register UNKNOWN.

FIPA[39:12], bits [31:4]

Bits [39:12] of the faulting intermediate physical address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing HPFAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0000	0b100

HRMR, Hyp Reset Management Register

The HRMR characteristics are:

Purpose

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch32 System register HRMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL2[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to HRMR are UNDEFINED.

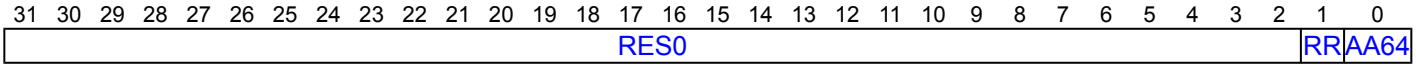
Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

HRMR is a 32-bit register.

Field descriptions



Bits [31:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

AA64, bit [0]

When EL2 can use AArch64, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch64 this bit is RAZ/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing HRMR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0000	0b010

```

HSCTLR, Hyp System Control Register

The HSCTLR characteristics are:

Purpose

Provides top-level control of the system operation in Hyp mode.

Configuration

AArch32 System register HSCTLR bits [31:0] are architecturally mapped to AArch64 System register SCTLR_EL2[31:0].

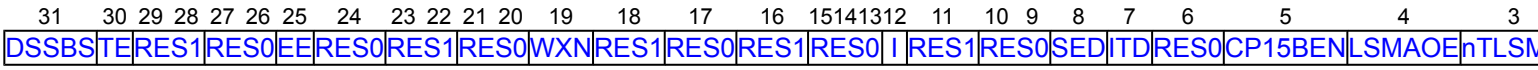
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HSCTLR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HSCTLR is a 32-bit register.

Field descriptions



DSSBS, bit [31]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to Hyp mode.
0b1	PSTATE.SSBS is set to 1 on an exception to Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

TE	Meaning
0b0	Exceptions, including reset, taken to A32 state.
0b1	Exceptions, including reset, taken to T32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [29:28]

Reserved, RES1.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on entry to Hyp mode, the endianness of stage 1 translation table walks in the EL2 translation regime, and the endianness of stage 2 translation table walks in the PL1&0 translation regime.

EE	Meaning
0b0	Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are little-endian.
0b1	Big-endian. PSTATE.E is set to 1 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bits [23:22]

Reserved, RES1.

Bits [21:20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL2 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when HSCTLR.M bit is set.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:13]

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2:

I	Meaning
0b0	All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the PL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES1.

Bits [10:9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL2.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL2.
0b1	SETEND instructions are UNDEFINED at EL2.

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL2.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL2.
0b1	Any attempt at EL2 to execute any of the following is UNDEFINED: • All encodings of the IT instruction with hw1[3:0]!=1000. • All encodings of the subsequent instruction with the following values for hw1: ◦ 0b11xxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. ◦ 0b10100xxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the HSCTLR then it must also be implemented in the SCTLR_EL1, SCTLR_EL2, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

Bit [6]

Reserved, RES0.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL2:

CP15BEN	Meaning
0b0	EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
0b1	EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the HSCTLR then it must also be implemented in the SCTLR_EL1, SCTLR_EL2, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

LSMAOE, bit [4]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL2, T32 and A32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of T32 and A32 Load Multiple and Store Multiple at EL2 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '1'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '1'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL2:

C	Meaning
0b0	All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, can be cached at all levels of data and unified cache.

This bit has no effect on the PL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

A	Meaning
0b0	Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element or data elements being accessed.
0b1	Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element or data elements being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL2 stage 1 address translation disabled. See the HSCTLR.I field for the behavior of instruction accesses to Normal memory.
0b1	EL2 stage 1 address translation enabled.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HSCTLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b000

```

HSR, Hyp Syndrome Register

The HSR characteristics are:

Purpose

Holds syndrome information for an exception taken to Hyp mode.

Configuration

AArch32 System register HSR bits [31:0] are architecturally mapped to AArch64 System register ESR_EL2[31:0].

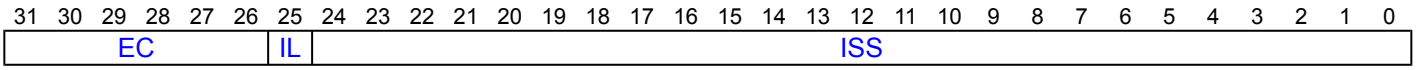
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HSR is a 32-bit register.

Field descriptions



Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:

EC	Meaning	ISS
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason
0b000001	Trapped WFI or WFE instruction execution. Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.	ISS encoding for Exception from a WFI or WFE instruction
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC value 0b000000.	ISS encoding for Exception from an MCR or MRC access
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC value 0b000000.	ISS encoding for Exception from an MCRR or MRRC access
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for Exception from an MCR or MRC access
0b000110	Trapped LDC or STC access. The only architected uses of these instructions are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for Exception from an LDC or STC instruction
0b000111	Access to Advanced SIMD or floating-point functionality trapped by a HCPTR.{TASE, TCP10} control. Excludes exceptions generated because Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.	ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR
0b001000	Trapped VMRS access, from ID group trap, that is not reported using EC value 0b000111.	ISS encoding for Exception from an MCR or MRC access
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for Exception from an MCRR or MRRC access
0b001110	Illegal exception return to AArch32 state.	ISS encoding for Exception from an Illegal state or PC alignment fault
0b010001	Exception on SVC instruction execution in AArch32 state routed to EL2.	ISS encoding for Exception from HVC or SVC instruction execution
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	ISS encoding for Exception from HVC or SVC instruction execution
0b010011	Trapped execution of SMC instruction in AArch32 state.	ISS encoding for Exception from SMC instruction execution
0b100000	Prefetch Abort from a lower Exception level.	ISS encoding for Exception from a Prefetch Abort
0b100001	Prefetch Abort taken without a change in Exception level.	ISS encoding for Exception from a Prefetch Abort
0b100010	PC alignment fault exception.	ISS encoding for Exception from an Illegal state or PC alignment fault
0b100100	Data Abort exception from a lower Exception level.	ISS encoding for Exception from a Data Abort
0b100101	Data Abort exception taken without a change in Exception level.	ISS encoding for Exception from a Data Abort

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped.

This field is RES1 and not valid for the following cases:

- When the EC value is 0b000000, indicating an exception with an unknown reason.
- Prefetch Aborts.
- Data Abort exceptions for which the HSR.ISS.ISV field is 0.
- When the EC value is 0b001110, indicating an Illegal state exception.

The IL field is not valid and is UNKNOWN on an exception from a PC alignment fault.

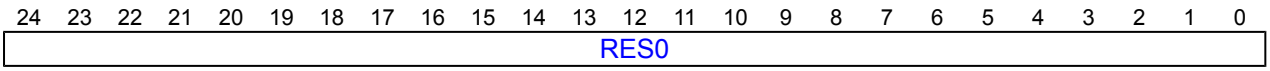
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

ISS encoding for exceptions with an unknown reason



Bits [24:0]

Reserved, RES0.

Additional information for the ISS encoding for exceptions with an unknown reason

This EC value is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or is not accessible in the current PE mode in the current Security state, including:
  - A read access using a System register encoding pattern that is not allocated for reads or that does not permit reads in the current PE mode and Security state.
  - A write access using a System register encoding pattern that is not allocated for writes or that does not permit writes in the current PE mode and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- The attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR.HCD, SCR.HCE, or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR.SCD or SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- An HVC instruction when disabled by HCR.HCD, SCR.HCE, or SCR_EL3.HCE.An SMC instruction when disabled by SCR.SCD or SCR_EL3.SMD.An HLT instruction when disabled by EDSCR.HDE.

- An exception generated because of the attempted execution of an MSR (Banked register) or MRS (Banked register) instruction that would access a Banked register that is not accessible from the Security state and PE mode at which the instruction was executed.

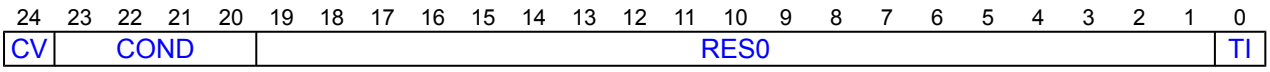
Note

An exception is generated only if the CONSTRAINED UNPREDICTABLE behavior of the instruction is that it is UNDEFINED, see 'MSR (banked register) and MRS (banked register)'.

- Attempted execution, in Debug state, of:
  - A DCPS1 instruction in Non-secure state from EL0 when EL2 is using AArch32 and the value of HCR.TGE is 1.
  - A DCPS2 instruction at EL1 or EL0 when EL2 is not implemented, or when EL3 is using AArch32 and the value of SCR.NS is 0, or when EL3 is using AArch64 and the value of SCR_EL3.NS is 0.
  - A DCPS3 instruction when EL3 is not implemented, or when the value of EDSCR.SDD is 1.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, and EL0 of an instruction that is configured to trap to EL3.

'Undefined Instruction exception, when the value of HCR.TGE is 1' describes the configuration settings for a trap that returns an EC value of `0b000000`.

ISS encoding for Exception from a WFI or WFE instruction



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

TI	Meaning
0b0	WFI trapped.
0b1	WFE trapped.

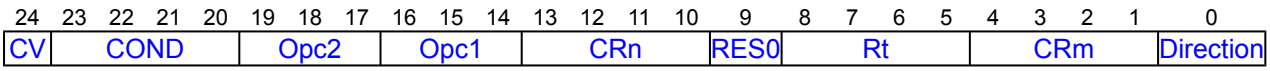
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for Exception from a WFI or WFE instruction

HCR.{TWE, TWI} describe the configuration settings for this trap.

ISS encoding for Exception from an MCR or MRC access



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value `0b000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

Rt, bits [8:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value `0b0000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for Exception from an MCR or MRC access

The following fields describe configuration settings for traps from an MCR or MCR access using coproc 0b1111 that are reported using EC value 0b000011:

- HCR.{TID1, TID2, TID3}, for Non-secure accesses to the ID registers at EL0 and EL1, trapped to EL2.
- HCR.TIDCP, for Non-secure accesses to lockdown, DMA, and TCM operations at EL0 and EL1, trapped to EL2.
- HCR.{TSW, TPC, TPU}, for Non-secure execution of cache maintenance instructions at EL1, trapped to EL2.
- HCR.TTLB, for Non-secure execution of TLB maintenance instructions at EL1, trapped to EL2.
- HCR.TAC, for Non-secure accesses to the Auxiliary Control Register at EL1, trapped to EL2.
- HDCR.{TPM, TPMCR}, for Non-secure accesses to Performance Monitors registers at EL0 and EL1, trapped to EL2.
- HCPTR.TAM, for Non-secure accesses to Activity Monitor registers at EL0 and EL1, trapped to EL2.
- HCPTR.TCPAC, for Non-secure accesses to the CPACR at EL1, trapped to EL2.
- HCR.{TRVM, TVM}, for Non-secure accesses to virtual memory control registers at EL1, trapped to EL2.
- HSTR.T<n>, for Non-secure accesses to System registers in the (coproc == 1111) encoding space at EL0 and EL1, trapped to EL2.
- HDCR.TTRF, for Non-secure accesses to trace filter control registers from System register, trapped to EL2.
- CNTHCTL.PL1PCEN, for Non-secure accesses to the Generic Timer registers at EL0 and EL1, trapped to EL2.
- HCR2.TERR, for Non-secure accesses to the RAS error record registers at EL1, trapped to EL2.

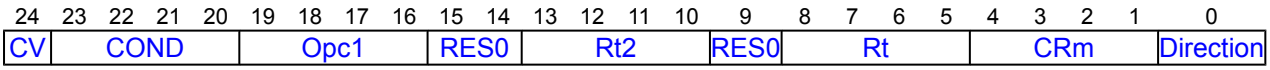
The following fields describe configuration settings for traps from an MCR or MRC access using coproc 0b1110 that are reported using EC value 0b000101:

- HCR.TID0, for Non-secure accesses to the Primary device identification registers at EL0 and EL1, trapped to EL2.
- HCPTR.TTA, for Non-secure accesses to trace registers from System register, trapped to EL2.
- HDCR.TDRA, for Non-secure accesses to Debug ROM registers from System register, trapped to EL2.
- HDCR.TDOSA, for Non-secure accesses to powerdown debug registers from System register, trapped to EL2.
- HDCR.TDA, for Non-secure accesses to debug registers from System register, trapped to EL2.

The following fields describes configuration settings for traps from a VMSR or VMRS access that are reported using EC value 0b001000:

- HCR.TID0, for Non-secure accesses to the Primary device identification registers at EL1, for ID group traps trapped to EL2.
- HCR.TID3, for Non-secure accesses to the Detailed feature identification registers at EL0 and EL1, for ID group traps trapped to EL2.
- HCPTR.{TCP10, TCP11}, for Non-secure accesses to FPSCR, FPSID, FPEXC, MVFR0, MVFR1, and MVFR2, trapped to EL2.

ISS encoding for Exception from an MCRR or MRRC access



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:14]

Reserved, RES0.

Rt2, bits [13:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

Rt, bits [8:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for Exception from an MCRR or MRRC access

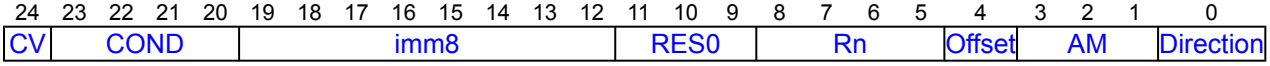
The following fields describe configuration settings for traps from an MCRR or MRRC access using coproc 0b1111 that are reported using EC value 0b000100:

- HCR.{TRVM, TVM}, for Non-secure accesses to virtual memory control registers at EL1, trapped to EL2.
- HDCR.TPM, for Non-secure accesses to Performance Monitors registers at EL0 and EL1, trapped to EL2.
- HCPTR.TAM, for Non-secure accesses to Activity Monitor registers at EL0 and EL1, trapped to EL2.
- CNTHCTL.{PL1PCEN, PL1PCTEN}, for Non-secure accesses to the Generic Timer registers at EL0 and EL1, trapped to EL2.
- HSTR.T<n>, for Non-secure accesses to System registers in the (coproc == 1111) encoding space at EL0 and EL1, trapped to EL2.
- HCR2.TERR, for Non-secure accesses to the RAS error record registers at EL1, trapped to EL2.

The following fields describe configuration settings for traps from an MCRR or MRRC access using coproc 0b1110 that are reported using EC value 0b001100:

- HCPTR.TTA, for Non-secure accesses to trace registers from System register, trapped to EL2.
- HDCR.TDRA, for Non-secure accesses to Debug ROM registers from System register, trapped to EL2.

ISS encoding for Exception from an LDC or STC instruction



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:9]

Reserved, RES0.

Rn, bits [8:5]

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
`0b0`	Subtract offset.
`0b1`	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	Literal unindexed. LDC instruction in A32 instruction set only. For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	Literal offset. LDC instruction only. For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

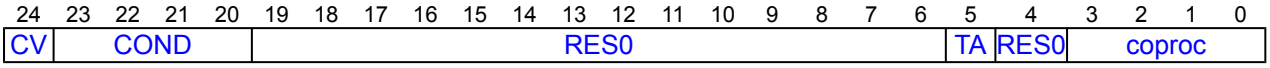
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for Exception from an LDC or STC instruction

HDCR.TDA describes the configuration settings for the trap that is reported using EC value 0b000110.

ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR



Excludes exceptions that occur because Advanced SIMD and floating-point functionality is not implemented, or because the value of HCR.TGE or HCR_EL2.TGE is 1. These are reported with EC value 0b000000.

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:6]

Reserved, RES0.

TA, bit [5]

Indicates trapped use of Advanced SIMD functionality.

TA	Meaning
`0b0`	Exception was not caused by trapped use of Advanced SIMD functionality.
`0b1`	Exception was caused by trapped use of Advanced SIMD functionality.

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the HCPTR sets this bit to 1.

For a list of these instructions, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RES0.

coproc, bits [3:0]

When the HSR.TA field returns the value 1, this field returns the value `0b1010`. Otherwise, this field is RES0.

The reset behavior of this field is:

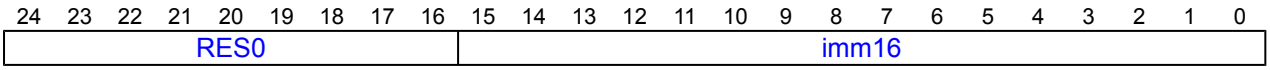
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR

The following fields describe the configuration settings for the traps that are reported using EC value `0b000111`:

- HCPTR.{TCP11, TCP10}, for Non-secure accesses to the SIMD and floating-point registers, trapped to EL2.
- HCPTR.TASE, for Non-secure accesses to Advanced SIMD functionality, trapped to EL2.

ISS encoding for Exception from HVC or SVC instruction execution



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

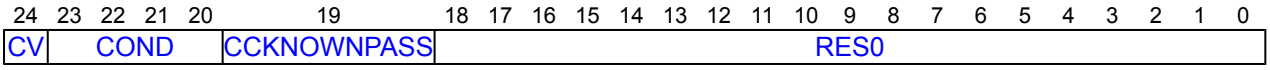
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for Exception from HVC or SVC instruction execution

The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

'Supervisor Call exception, when the value of HCR.TGE is 1' describes the configuration settings for the trap reported with EC value `0b010001`.

ISS encoding for Exception from SMC instruction execution



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both T32 and A32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
`0b0`	The instruction was unconditional, or was conditional and passed its condition code check.
`0b1`	The instruction was conditional, and might have failed its condition code check.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

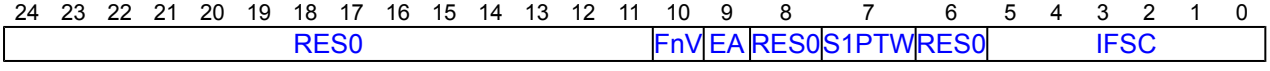
Bits [18:0]

Reserved, RES0.

Additional information for the ISS encoding for Exception from SMC instruction execution

HCR.TSC describes the configuration settings for this trap for instructions executed in Non-secure EL1.

ISS encoding for Exception from a Prefetch Abort



Bits [24:11]

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	HIFAR is valid.
0b1	HIFAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

IFSC	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

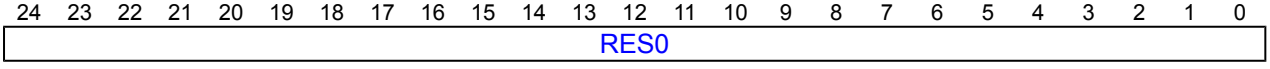
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for Exception from a Prefetch Abort

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- 'Abort exceptions, when the value of HCR.TGE is 1'.
- 'Routing debug exceptions to EL2 using AArch32'.

ISS encoding for Exception from an Illegal state or PC alignment fault



Bits [24:0]

Reserved, RES0.

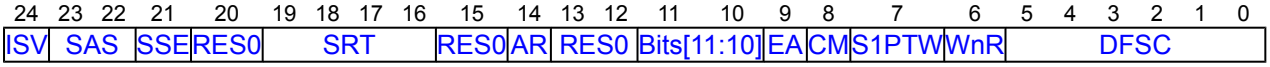
Additional information for the ISS encoding for Exception from an Illegal state or PC alignment fault

For more information about the Illegal state exception, see:

- 'Illegal changes to PSTATE.M'.
- 'Illegal return events from AArch32 state'.
- 'Legal returns that set PSTATE.IL to 1'.
- 'The Illegal Execution state exception'.

For more information about the PC alignment fault exception, see 'Branching to an unaligned PC'.

ISS encoding for Exception from a Data Abort



ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults except Data Abort exceptions generated by stage 2 address translations for which all the following apply to the instruction that generated the Data Abort exception:

- The instruction is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
- The instruction is not performing register writeback.
- The instruction is not using the PC as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, as described in 'Data Abort exceptions in Memory access mode', and otherwise indicates whether ISS[23:14] hold a valid syndrome.

Note

In the A32 instruction set, LDR*T and STR*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

ISV is set to 0 on a stage 2 abort on a stage 1 translation table walk.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [20]

Reserved, RES0.

SRT, bits [19:16]

Syndrome Register Transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [13:12]

Reserved, RES0.

Bits[11:10]
When FEAT_RAS is implemented:

AET, bits [1:0] of bits [11:10]

Asynchronous Error Type. When DFSC is `0b010001`, describes the PE error state after taking the SError exception.

AET	Meaning
`0b00`	Uncontainable (UC).
`0b01`	Unrecoverable state (UEU).
`0b10`	Restartable state (UEO).
`0b11`	Recoverable state (UER).

On a synchronous Data Abort exception, this field is RES0.

In the event of multiple errors taken as a single SError exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

When FEAT_RAS is not implemented, or when DFSC is not `0b010001`:

- Bit[11] is RES0.
- Bit[10] forms the FnV field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bit [1] of bits [11:10]

Reserved, RES0.

FnV, bit [0] of bits [11:10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
`0b0`	HDFAR is valid.
`0b1`	HDFAR is not valid, and holds an UNKNOWN value.

When FEAT_RAS is not implemented, this field is valid only if DFSC is `0b010000`. It is RES0 for all other aborts.

When FEAT_RAS is implemented:

- If DFSC is `0b010000`, this field is valid.
- If DFSC is `0b010001`, this bit forms part of the AET field, becoming AET[0].
- This field is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External Abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache Maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:

CM	Meaning
0b0	Fault not generated by a cache maintenance or address translation instruction.
0b1	Fault generated by a cache maintenance or address translation instruction.

For an asynchronous Data Abort exception, this bit is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction.

WnR	Meaning
0b0	Abort caused by a read instruction.
0b1	Abort caused by a write instruction.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

On an asynchronous Data Abort exception:

- When FEAT_RAS is not implemented, this bit is UNKNOWN.
- When FEAT_RAS is implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:

DFSC	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010001	Asynchronous SError exception.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011001	Asynchronous SError exception, from a parity or ECC error on memory access.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information for the ISS encoding for Exception from a Data Abort

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100100:

- 'Abort exceptions, when the value of HCR.TGE is 1'.
- 'Routing debug exceptions to EL2 using AArch32'.

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of 0b100000 or 0b100100:

- 'Hyp mode control of Non-secure access permissions'.
- 'Memory fault reporting in Hyp mode'.

Accessing HSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0010	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T5
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T5 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    R[t] = HSR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        R[t] = HSR;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0010	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T5
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T5 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HSR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HSR = R[t];
```

HSTR, Hyp System Trap Register

The HSTR characteristics are:

Purpose

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to System registers in the coproc == 0b1111 encoding space:

- By the CRn value used to access the register using MCR or MRC instruction.
- By the CRm value used to access the register using MCRR or MRRC instruction.

Configuration

AArch32 System register HSTR bits [31:0] are architecturally mapped to AArch64 System register HSTR_EL2[31:0].

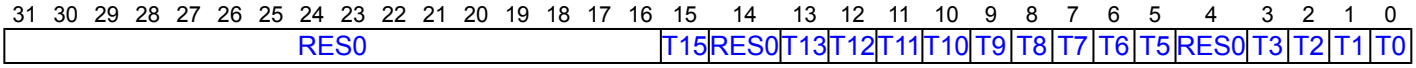
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HSTR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HSTR is a 32-bit register.

Field descriptions



Bits [31:16, 14, 4]

Reserved, RES0.

T<n>, bit [n], for n = 15, 13 to 5, 3 to 0

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR or MRC instructions, reported using EC syndrome value 0x03, and MCRR or MRRC instructions, reported using EC syndrome value 0x04, to the System registers in the coproc == 0b1111 encoding space are trapped to Hyp mode:

T<n>	Meaning
0b0	This control has no effect on Non-secure EL0 or EL1 accesses to System registers.
0b1	Any Non-secure EL1 MCR or MRC access with coproc == 0b1111 and CRn == <n> is trapped to Hyp mode. A Non-secure EL0 MCR or MRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0. Any Non-secure EL1 MCRR or MRRC access with coproc == 0b1111 and CRm == <n> is trapped to Hyp mode. A Non-secure EL0 MCRR or MRRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0.

For example, when HSTR.T7 is 1, for instructions executed at Non-secure EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to Hyp mode.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to Hyp mode.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HSTR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b011

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T1
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T1 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    R[t] = HSTR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        R[t] = HSTR;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b011

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T1
== '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR.T1 ==
'1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HSTR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HSTR = R[t];
```

HTCR, Hyp Translation Control Register

The HTCR characteristics are:

Purpose

The control register for stage 1 of the EL2 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configuration

AArch32 System register HTCR bits [31:0] are architecturally mapped to AArch64 System register TCR_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HTCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22:14	13:12	11:10	9:8	7:6	5:3	2:0
RES1	IMPLEMENTATION DEFINED	RES0	HWU62	HWU61	HWU60	HWU59	HPD	RES1	RES0	SH0	ORGN0	IRGN0	RES0		T0SZ

Bit [31]

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]

When FEAT_AA32HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the PL2 translation regime.

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

Bits [22:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using HTTBR.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using HTTBR.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using HTTBR.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:3]

Reserved, RES0.

T0SZ, bits [2:0]

The size offset of the memory region addressed by HTTBR. The region size is $2^{(32-T0SZ)}$ bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

Purpose

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

The PE makes no use of this register.

Configuration

AArch32 System register HTPIDR bits [31:0] are architecturally mapped to AArch64 System register TPIDR_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HTPIDR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

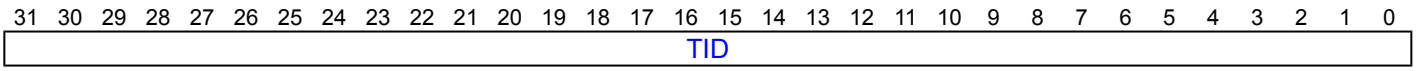
Note

The PE never updates this register.

Attributes

HTPIDR is a 32-bit register.

Field descriptions



TID, bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HTPIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

HTRFCR, Hyp Trace Filter Control Register

The HTRFCR characteristics are:

Purpose

Provides EL2 controls for Trace.

Configuration

AArch32 System register HTRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL2[31:0].

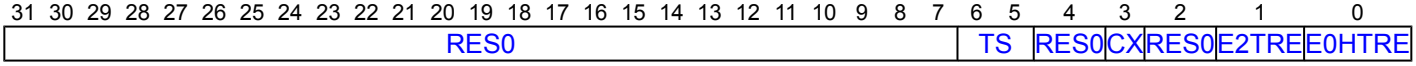
This register is present only when FEAT_AA32EL2 is implemented and FEAT_TRF is implemented. Otherwise, direct accesses to HTRFCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from Monitor mode when SCR.NS == 1.

Attributes

HTRFCR is a 32-bit register.

Field descriptions



Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning
0b00	The timestamp is controlled by TRFCR.TS.
0b01	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.
0b11	Physical timestamp. The traced timestamp is the physical counter value.

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RES0.

CX, bit [3]

VMID Trace Enable.

CX	Meaning
0b0	VMID tracing is not allowed.
0b1	VMID tracing is allowed.

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.

E2TRE	Meaning
0b0	Tracing is prohibited at EL2.
0b1	Tracing is allowed at EL2.

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

E0HTRE, bit [0]

EL0 Trace Enable.

E0HTRE	Meaning
0b0	Tracing is prohibited at EL0 when HCR.TGE == 1.
0b1	Tracing is allowed at EL0 when HCR.TGE == 1.

This field is ignored if any of the following are true:

- The PE is in Secure state.
- SelfHostedTraceEnabled() == FALSE.
- HCR.TGE == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HTRFCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0010	0b001

HTTBR, Hyp Translation Table Base Register

The HTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

Configuration

AArch32 System register HTTBR bits [47:0] are architecturally mapped to AArch64 System register TTBR0_EL2[47:0].

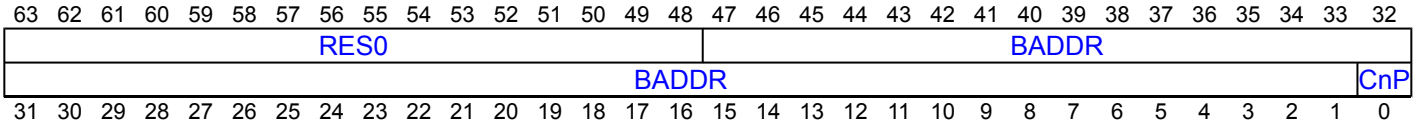
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HTTBR is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of HTCR.T0SZ as follows:

- If HTCR.T0SZ is 0 or 1, x = 5 - HTCR.T0SZ.
- If HTCR.T0SZ is greater than 1, x = 14 - HTCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by HTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by HTTBR are permitted to differ from corresponding entries for HTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of HTTBR.CnP on those other PEs.
0b1	The translation table entries pointed to by HTTBR are the same as the translation table entries pointed to by HTTBR on every other PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

Note

If the value of the HTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those HTTBRs do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HTTBR

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

Purpose

Holds the vector base address for any exception that is taken to Hyp mode.

Configuration

AArch32 System register HVBAR bits [31:0] are architecturally mapped to AArch64 System register VBAR_EL2[31:0].

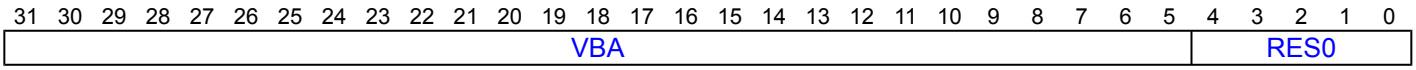
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to HVBAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HVBAR is a 32-bit register.

Field descriptions



VBA, bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:0]

Reserved, RES0.

Accessing HVBAR

ICC_AP0R<n>, Interrupt Controller Active Priorities Group 0 Registers, n = 0 - 3

The ICC_AP0R<n> characteristics are:

Purpose

Provides information about Group 0 active priorities.

Configuration

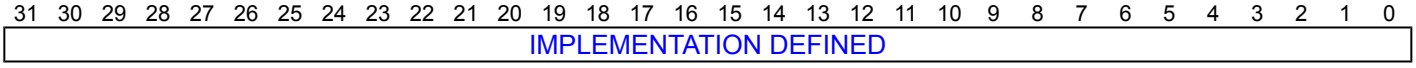
AArch32 System register ICC_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICC_AP0R<n>_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_AP0R<n> are UNDEFINED.

Attributes

ICC_AP0R<n> is a 32-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00000000000000000000000000000000'.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICC_AP0R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1 is implemented only in implementations that support 6 or more bits of preemption. ICC_AP0R2 and ICC_AP0R3 are implemented only in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR.PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC_AP0R<n>.
- Secure ICC_AP1R<n>.
- Non-secure ICC_AP1R<n>.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-3

ICC_AP1R<n>, Interrupt Controller Active Priorities Group 1 Registers, n = 0 - 3

The ICC_AP1R<n> characteristics are:

Purpose

Provides information about Group 1 active priorities.

Configuration

This register is banked between ICC_AP1R<n> and ICC_AP1R<n>_S and ICC_AP1R<n>_NS.

AArch32 System register ICC_AP1R<n> bits [31:0] (ICC_AP1R<n>_S) are architecturally mapped to AArch64 System register ICC_AP1R<n>_EL1[31:0] (ICC_AP1R<n>_EL1_S).

AArch32 System register ICC_AP1R<n> bits [31:0] (ICC_AP1R<n>_NS) are architecturally mapped to AArch64 System register ICC_AP1R<n>_EL1[31:0] (ICC_AP1R<n>_EL1_NS).

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_AP1R<n> are UNDEFINED.

Attributes

ICC_AP1R<n> is a 32-bit register.

This register has the following instances:

- ICC_AP1R<n>, when EL3 is not implemented or FEAT_AA64 is implemented.
- ICC_AP1R<n>_S, when FEAT_AA32EL3 is implemented.
- ICC_AP1R<n>_NS, when FEAT_AA32EL3 is implemented.

ICC_ASGI1R, Interrupt Controller Alias Software Generated Interrupt Group 1 Register

The ICC_ASGI1R characteristics are:

Purpose

Generates Group 1 SGIs for the Security state that is not the current Security state.

Configuration

AArch32 System register ICC_ASGI1R performs the same function as AArch64 System register ICC_ASGI1R_EL1.

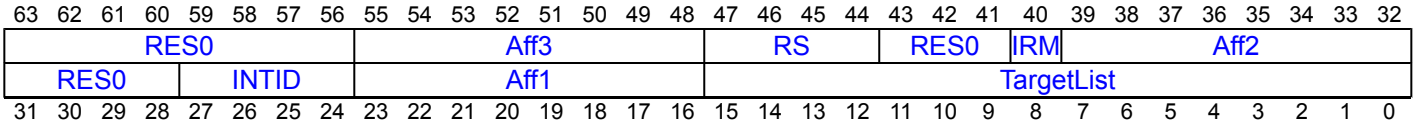
This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_ASGI1R are UNDEFINED.

Under certain conditions a write to ICC_ASGI1R can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_ASGI1R is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Accessing ICC_ASGI1R

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1100	0b0001

ICC_BPR0, Interrupt Controller Binary Point Register 0

The ICC_BPR0 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

Configuration

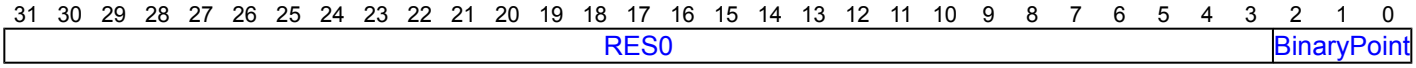
AArch32 System register ICC_BPR0 bits [31:0] are architecturally mapped to AArch64 System register ICC_BPR0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_BPR0 are UNDEFINED.

Attributes

ICC_BPR0 is a 32-bit register.

Field descriptions



Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.sssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_BPR0

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICC_CTLR.PRIbits and ICC_MCTLR.PRIbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1000	0b011

```

ICC_BPR1, Interrupt Controller Binary Point Register 1

The ICC_BPR1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

This register is banked between ICC_BPR1 and ICC_BPR1_S and ICC_BPR1_NS.

AArch32 System register ICC_BPR1 bits [31:0] (ICC_BPR1_S) are architecturally mapped to AArch64 System register ICC_BPR1_EL1[31:0] (ICC_BPR1_EL1_S).

AArch32 System register ICC_BPR1 bits [31:0] (ICC_BPR1_NS) are architecturally mapped to AArch64 System register ICC_BPR1_EL1[31:0] (ICC_BPR1_EL1_NS).

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_BPR1 are UNDEFINED.

In GIC implementations supporting two Security states, this register is Banked.

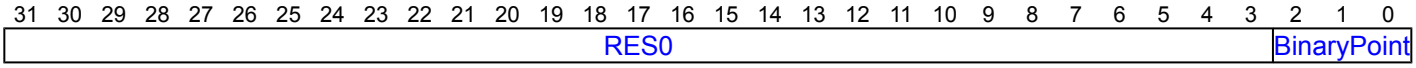
Attributes

ICC_BPR1 is a 32-bit register.

This register has the following instances:

- ICC_BPR1, when EL3 is not implemented or FEAT_AA64 is implemented.
- ICC_BPR1_S, when FEAT_AA32EL3 is implemented.
- ICC_BPR1_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Writing 0 to this field will set this field to its reset value.

If EL3 is implemented and ICC_MCTLR.CBPR_EL1S is 1:

- Accesses to this register at EL3 not in Monitor mode access the state of ICC_BPR0.
- When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, Secure accesses to this register at EL1 access the state of ICV_BPR1.
- Otherwise, Secure accesses to this register at EL1 access the state of ICC_BPR0.

If EL3 is implemented and ICC_MCTLR.CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 and EL2 behave as follows, depending on the values of HCR.IMO and SCR.IRQ:

HCR.IMO	SCR_IRQ	Behavior
0b0	0b0	Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b0	0b1	Non-secure EL1 and EL2 accesses trap to EL3.
0b1	0b0	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes ignored.
0b1	0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.

If EL3 is not implemented and ICC_CTLR.CBPR is 1, Non-secure accesses to this register at EL1 and EL2 behave as follows, depending on the values of HCR.IMO:

HCR.IMO	Behavior
0b0	Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.

This field resets to an IMPLEMENTATION DEFINED nonzero value.

Accessing ICC_BPR1

When the PE resets into an Exception level that is using AArch32, the reset value is equal to:

- For the Secure copy of the register, the minimum value of ICC_BPR0 plus one.
- For the Non-secure copy of the register, the minimum value of ICC_BPR0.

Where the minimum value of ICC_BPR0 is IMPLEMENTATION DEFINED.

If EL3 is not implemented:

- If the PE is Secure this reset value is (minimum value of ICC_BPR0 plus one).
- If the PE is Non-secure this reset value is (minimum value of ICC_BPR0).

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b011

ICC_CTLR, Interrupt Controller Control Register

The ICC_CTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

This register is banked between ICC_CTLR and ICC_CTLR_S and ICC_CTLR_NS.

AArch32 System register ICC_CTLR bits [31:0] (ICC_CTLR_S) are architecturally mapped to AArch64 System register ICC_CTLR_EL1[31:0] (ICC_CTLR_EL1_S).

AArch32 System register ICC_CTLR bits [31:0] (ICC_CTLR_NS) are architecturally mapped to AArch64 System register ICC_CTLR_EL1[31:0] (ICC_CTLR_EL1_NS).

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_CTLR are UNDEFINED.

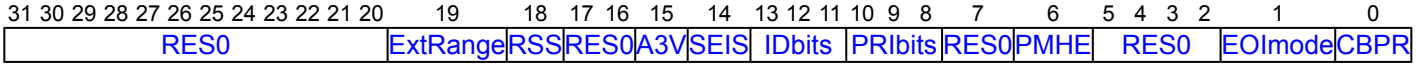
Attributes

ICC_CTLR is a 32-bit register.

This register has the following instances:

- ICC_CTLR, when EL3 is not implemented or FEAT_AA64 is implemented.
- ICC_CTLR_S, when FEAT_AA32EL3 is implemented.
- ICC_CTLR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.

Access to this field is **RO**.

RSS, bit [18]

Range Selector Support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

Access to this field is **RO**.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid.

The value of this field is an IMPLEMENTATION DEFINED choice of:

A3V	Meaning
0b0	The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The CPU interface logic supports nonzero values of Affinity 3 in SGI generation System registers.

If EL3 is implemented and using AArch32, this bit is an alias of ICC_MCTLR.A3V.

If EL3 is implemented and using AArch64, this bit is an alias of ICC_CTLR_EL3.A3V.

Access to this field is **RO**.

SEIS, bit [14]

SEI Support. Indicates whether the CPU interface supports local generation of SEIs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEIS	Meaning
0b0	The CPU interface logic does not support local generation of SEIs.
0b1	The CPU interface logic supports local generation of SEIs.

If EL3 is implemented and using AArch32, this bit is an alias of ICC_MCTLR.SEIS.

If EL3 is implemented and using AArch64, this bit is an alias of ICC_CTLR_EL3.SEIS.

Access to this field is **RO**.

IDbits, bits [13:11]

Identifier bits. The number of physical interrupt identifier bits supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is implemented and using AArch32, this field is an alias of ICC_MCTLR.IDbits.

If EL3 is implemented and using AArch64, this field is an alias of ICC_CTLR_EL3.IDbits.

Access to this field is **RO**.

PRIbits, bits [10:8]

Priority bits. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1.

If EL3 is implemented and using AArch32, physical accesses return the value from ICC_MCTLR.PRIbits.

If EL3 is implemented and using AArch64, physical accesses return the value from ICC_CTLR_EL3.PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

PMHE	Meaning
0b0	Disables use of ICC_PMR as a hint for interrupt distribution.
0b1	Enables use of ICC_PMR as a hint for interrupt distribution.

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.PMHE.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.PMHE.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read/write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Bits [5:2]

Reserved, RES0.

EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

EOImode	Meaning
0b0	ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
0b1	ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.EOImode_EL1{S, NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.EOImode_EL1{S, NS} where S or NS corresponds to the current Security state.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read/write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Group 1 interrupts.
0b1	ICC_BPR0 determines the preemption group for both Group 0 and Group 1 interrupts.

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read/write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

ICC_DIR, Interrupt Controller Deactivate Interrupt Register

The ICC_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

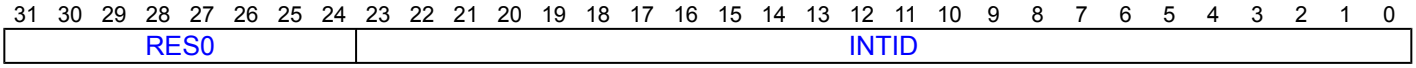
AArch32 System register ICC_DIR bits [31:0] performs the same function as AArch64 System register ICC_DIR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_DIR are UNDEFINED.

Attributes

ICC_DIR is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_DIR

There are two cases when writing to ICC_DIR_EL1 that were UNPREDICTABLE for a corresponding GICv2 write to GICC_DIR:

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be deactivated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1011	0b001

```

ICC_EOIR0, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

Configuration

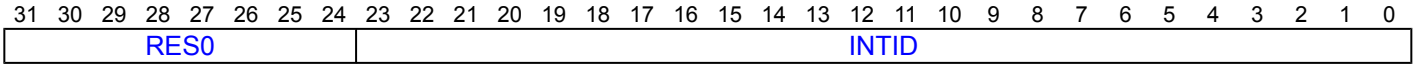
AArch32 System register ICC_EOIR0 bits [31:0] performs the same function as AArch64 System register ICC_EOIR0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_EOIR0 are UNDEFINED.

Attributes

ICC_EOIR0 is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR.EOImode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR.EOImode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
    - If the software is executing in Secure state, the bit is ICC_CTLR.EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1S.
    - If the software is executing in Non-secure state, the bit is ICC_CTLR.EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1NS.

Accessing ICC_EOIR0

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR0, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1000	0b001

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

Configuration

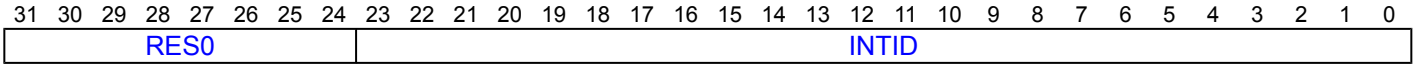
AArch32 System register ICC_EOIR1 bits [31:0] performs the same function as AArch64 System register ICC_EOIR1_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_EOIR1 are UNDEFINED.

Attributes

ICC_EOIR1 is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR.EOImode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR.EOImode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
    - If the software is executing in Secure state, the bit is ICC_CTLR.EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1S.
    - If the software is executing in Non-secure state, the bit is ICC_CTLR.EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1NS.

Accessing ICC_EOIR1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b001

ICC_HSRE, Interrupt Controller Hyp System Register Enable register

The ICC_HSRE characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

Configuration

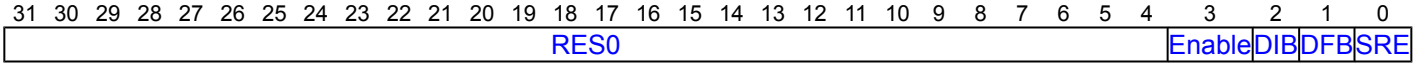
AArch32 System register ICC_HSRE bits [31:0] are architecturally mapped to AArch64 System register ICC_SRE_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented, GICv3 is implemented, and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICC_HSRE are UNDEFINED.

Attributes

ICC_HSRE is a 32-bit register.

Field descriptions



Bits [31:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE.

Enable	Meaning
0b0	Non-secure EL1 accesses to ICC_SRE trap to EL2.
0b1	Non-secure EL1 accesses to ICC_SRE do not trap to EL2.

If ICC_HSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_HSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_MSRE.DIB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read/write alias of ICC_MSRE.DIB.

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_MSRE.DFB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read/write alias of ICC_MSRE.DFB.

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Accesses at EL2 or below to any ICH_* System register, or any EL1 or EL2 ICC_* register other than ICC_SRE or ICC_HSRE, are UNDEFINED.
0b1	The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When ICC_SRE_EL3.SRE==0 this bit is RAZ/WI.

If EL3 is implemented using AArch32:

- When ICC_MSRE.SRE==0 this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_HSRE

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_HSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1001	0b101

```

ICC_IAR0, Interrupt Controller Interrupt Acknowledge Register 0

The ICC_IAR0 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch32 System register ICC_IAR0 bits [31:0] performs the same function as AArch64 System register ICC_IAR0_EL1[31:0].

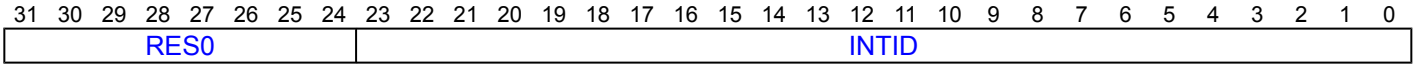
This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_IAR0 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_IAR0 is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_IAR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

0b1111	0b000	0b1100	0b1000	0b000

ICC_IAR1, Interrupt Controller Interrupt Acknowledge Register 1

The ICC_IAR1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch32 System register ICC_IAR1 bits [31:0] performs the same function as AArch64 System register ICC_IAR1_EL1[31:0].

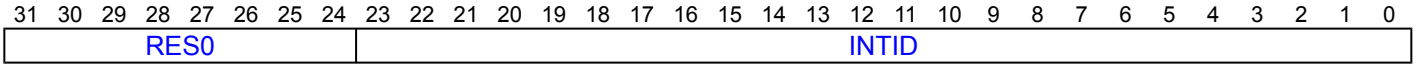
This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_IAR1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_IAR1 is a 32-bit register.

Field descriptions



Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

ICC_IGRPEN0, Interrupt Controller Interrupt Group 0 Enable register

The ICC_IGRPEN0 characteristics are:

Purpose

Controls whether Group 0 interrupts are enabled or not.

Configuration

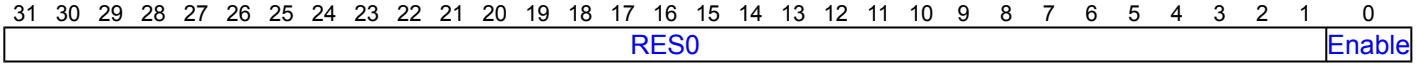
AArch32 System register ICC_IGRPEN0 bits [31:0] are architecturally mapped to AArch64 System register ICC_IGRPEN0_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_IGRPEN0 are UNDEFINED.

Attributes

ICC_IGRPEN0 is a 32-bit register.

Field descriptions



Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 0 interrupts.

Enable	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

Virtual accesses to this register update ICH_VMCR.VENG0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_IGRPEN0

The lowest Exception level at which this register can be accessed is governed by the Exception level to which FIQ is routed. This routing depends on SCR.FIQ, SCR.NS and HCR.FMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b110

```

ICC_IGRPEN1, Interrupt Controller Interrupt Group 1 Enable register

The ICC_IGRPEN1 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled for the current Security state.

Configuration

This register is banked between ICC_IGRPEN1 and ICC_IGRPEN1_S and ICC_IGRPEN1_NS.

AArch32 System register ICC_IGRPEN1 bits [31:0] (ICC_IGRPEN1_S) are architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1[31:0] (ICC_IGRPEN1_EL1_S).

AArch32 System register ICC_IGRPEN1 bits [31:0] (ICC_IGRPEN1_NS) are architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1[31:0] (ICC_IGRPEN1_EL1_NS).

This register is present only when FEAT_AA32EL1 is implemented and GICv3 is implemented. Otherwise, direct accesses to ICC_IGRPEN1 are UNDEFINED.

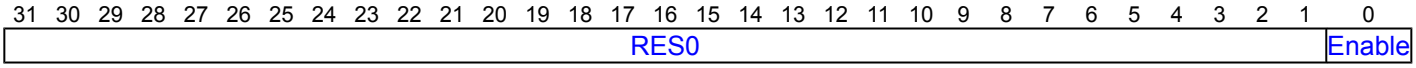
Attributes

ICC_IGRPEN1 is a 32-bit register.

This register has the following instances:

- ICC_IGRPEN1, when EL3 is not implemented or FEAT_AA64 is implemented.
- ICC_IGRPEN1_S, when FEAT_AA32EL3 is implemented.
- ICC_IGRPEN1_NS, when FEAT_AA32EL3 is implemented.

Field descriptions



Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

Enable	Meaning
0b0	Group 1 interrupts are disabled for the current Security state.
0b1	Group 1 interrupts are enabled for the current Security state.

Virtual accesses to this register update ICH_VMCR.VENG1.

If EL3 is present:

- This bit is a read/write alias of ICC_MGRPEN1.EnableGrp1{S, NS} as appropriate if EL3 is using AArch32, or ICC_IGRPEN1_EL3.EnableGrp1{S, NS} as appropriate if EL3 is using AArch64.
- When this register is accessed at EL3, the copy of this register appropriate to the current setting of SCR.NS is accessed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_IGRPEN1

The lowest Exception level at which this register can be accessed is governed by the Exception level to which IRQ is routed. This routing depends on the IRQ and NS fields of SCR or SCR_EL3 and the IMO field of HCR or HCR_EL2.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b111

```
