- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [6]

When FEAT_SYSREG128 is implemented:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL1 using an ESR_EL1.EC value of 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL1.
0b1	No accesses are trapped by this control.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EASE, bit [5]

When FEAT_DoubleFault2 is implemented:

External Aborts to SError exception vector.

EASE	Meaning
0b0	Synchronous External abort exceptions taken to EL1 are taken to the appropriate synchronous exception vector offset from VBAR_EL1.
0b1	Synchronous External abort exceptions taken to EL1 are taken to the appropriate SError exception vector offset from VBAR_EL1.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnANERR, bit [4]

When FEAT_ANERR is implemented:

Enable Asynchronous Normal Read Error.

EnANERR	Meaning
0b0	External aborts on Normal memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.
0b1	External aborts on Normal memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL1&0 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL1.EnANERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Normal memory reads.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.EnSNERR is 1.

Otherwise, this field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ADERR is implemented.
- ID_AA64MMFR3_EL1.ANERR reads as 0b0010.
- SCTLR2_EL1.EnADERR is 1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]

When FEAT_ADERR is implemented:

Enable Asynchronous Device Read Error.

EnADERR	Meaning
0b0	External aborts on Device memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.
0b1	External aborts on Device memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL1&0 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL1.EnADERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Device memory reads.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.EnSDERR is 1.

Otherwise, this field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ANERR is implemented.
- ID_AA64MMFR3_EL1.ADERR reads as `0b0010`.
- SCTLR2_EL1.EnANERR is 1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [2]
When FEAT_DoubleFault2 is implemented:

Non-maskable External Aborts. Controls whether PSTATE.A masks SError exceptions at EL1.

NMEA	Meaning
`0b0`	SError exceptions are not taken at EL1 if PSTATE.A == 1, unless routed to a higher Exception level.
`0b1`	SError exceptions are taken at EL1 regardless of the value of PSTATE.A, unless routed to a higher Exception level.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing SCTLR2_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SCTLR2_EL1 or SCTLR2_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to SCTLR2_EL1 are masked by SCTLR2MASK_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCTLR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b011

```

SCTLR2_EL2, System Control Register (EL2)

The SCTLR2_EL2 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL2.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, these controls also apply to execution at EL0.

Configuration

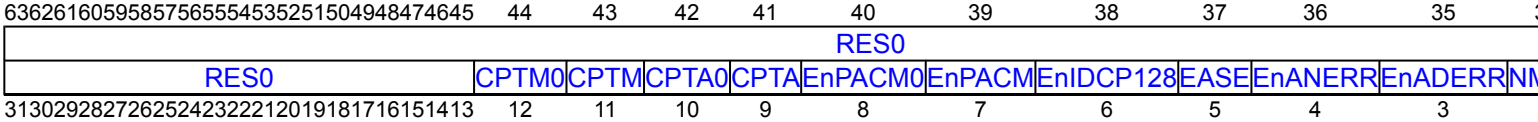
This register is present only when FEAT_SCTLR2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR2_EL2 is a 64-bit register.

Field descriptions



Bits [63:13]

Reserved, RES0.

CPTM0, bit [12]

When FEAT_CPA2 is implemented and ELIsInHost(EL2):

This field controls unprivileged Checked Pointer Arithmetic for Multiplication.

CPTM0	Meaning
0b0	Pointer Arithmetic for Multiplication is not checked.
0b1	Pointer Arithmetic for Multiplication is checked.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

If the Effective value of SCTLR2_EL2.CPTA0 is 0, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTM, bit [11]

When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Multiplication at EL2.

CPTM	Meaning
0b0	Pointer Arithmetic for Multiplication is not checked.
0b1	Pointer Arithmetic for Multiplication is checked.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

If the Effective value of SCTLR2_EL2.CPTA is 0, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA0, bit [10]

When FEAT_CPA2 is implemented and ELIsInHost(EL2):

This field controls unprivileged Checked Pointer Arithmetic for Addition.

CPTA0	Meaning
0b0	Pointer Arithmetic for Addition is not checked.
0b1	Pointer Arithmetic for Addition is checked.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA, bit [9]

When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Addition at EL2.

CPTA	Meaning
0b0	Pointer Arithmetic for Addition is not checked.
0b1	Pointer Arithmetic for Addition is checked.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM0, bit [8]
When FEAT_PAuth_LR is implemented and ELIsInHost(EL2):

PACM Enable at EL0. Controls the effect of a PACM instruction at EL0.

EnPACM0	Meaning
0b0	The effects of PACM are disabled at EL0.
0b1	A PACM instruction at EL0 causes PSTATE.PACM to be set to 0b1.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM, bit [7]
When FEAT_PAuth_LR is implemented:

PACM Enable at EL2. Controls the effect of a PACM instruction at EL2.

EnPACM	Meaning
0b0	The effects of PACM are disabled at EL2.
0b1	A PACM instruction at EL2 causes PSTATE.PACM to be set to 0b1.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [6]
When FEAT_SYSREG128 is implemented:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL2 using an ESR_EL2.EC value of 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL2.
0b1	No accesses are trapped by this control.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EASE, bit [5]

When FEAT_DoubleFault2 is implemented:

External Aborts to SError exception vector.

EASE	Meaning
0b0	Synchronous External abort exceptions taken to EL2 are taken to the appropriate synchronous exception vector offset from VBAR_EL2.
0b1	Synchronous External abort exceptions taken to EL2 are taken to the appropriate SError exception vector offset from VBAR_EL2.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnANERR, bit [4]

When FEAT_ANERR is implemented:

Enable Asynchronous Normal Read Error.

EnANERR	Meaning
0b0	External aborts on Normal memory reads generate synchronous Data Abort exceptions in the EL2 and EL2&0 translation regimes.
0b1	External aborts on Normal memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL2 and EL2&0 translation regimes.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL2.EnANERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Normal memory reads.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

Otherwise, this field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ADERR is implemented.
- ID_AA64MMFR3_EL1.ANERR reads as `0b0010`.
- SCTLR2_EL2.EnADERR is 1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]
When FEAT_ADERR is implemented:

Enable Asynchronous Device Read Error.

EnADERR	Meaning
`0b0`	External aborts on Device memory reads generate synchronous Data Abort exceptions in the EL2 and EL2&0 translation regimes.
`0b1`	External aborts on Device memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL2 and EL2&0 translation regimes.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL2.EnADERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Device memory reads.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

Otherwise, this field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ANERR is implemented.
- ID_AA64MMFR3_EL1.ADERR reads as `0b0010`.
- SCTLR2_EL2.EnANERR is 1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to `'0'`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [2]

When FEAT_DoubleFault2 is implemented:

Non-maskable External Aborts. Controls whether PSTATE.A masks SError exceptions at EL2.

NMEA	Meaning
0b0	SError exceptions are not taken at EL2 if PSTATE.A == 1, unless routed to a higher Exception level.
0b1	SError exceptions are taken at EL2 regardless of the value of PSTATE.A, unless routed to a higher Exception level.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EMEC, bit [1]

When FEAT_MEC is implemented:

Enables MEC. When enabled, memory accesses to the Realm physical address space are associated with a MECID.

EMEC	Meaning
0b0	MEC is not enabled for the Realm physical address space.
0b1	MEC is enabled for the Realm physical address space.

This bit is permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing SCTLR2_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SCTLR2_EL2 or SCTLR2_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to SCTLR2_EL2 are masked by SCTLR2MASK_EL2.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b011

SCTLR2_EL3, System Control Register (EL3)

The SCTLR2_EL3 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL3.

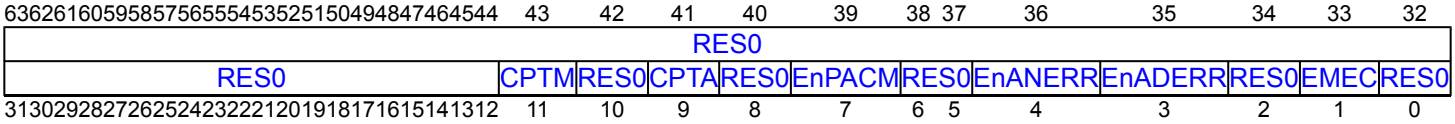
Configuration

This register is present only when FEAT_SCTLR2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR2_EL3 are UNDEFINED.

Attributes

SCTLR2_EL3 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

CPTM, bit [11]

When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Multiplication at EL3.

CPTM	Meaning
0b0	Pointer Arithmetic for Multiplication is not checked.
0b1	Pointer Arithmetic for Multiplication is checked.

If the Effective value of SCTLR2_EL3.CPTA is 0, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [10]

Reserved, RES0.

CPTA, bit [9]

When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Addition at EL3.

CPTA	Meaning
0b0	Pointer Arithmetic for Addition is not checked.
0b1	Pointer Arithmetic for Addition is checked.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

EnPACM, bit [7]

When FEAT_PAuth_LR is implemented:

PACM Enable at EL3. Controls the effect of a PACM instruction at EL3.

EnPACM	Meaning
0b0	The effects of PACM are disabled at EL3.
0b1	A PACM instruction at EL3 causes PSTATE.PACM to be set to 0b1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EnANERR, bit [4]

When FEAT_ANERR is implemented:

Enable Asynchronous Normal Read Error.

EnANERR	Meaning
0b0	External aborts on Normal memory reads generate synchronous Data Abort exceptions in the EL3 translation regime.
0b1	External aborts on Normal memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL3 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL3.EnANERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Normal memory reads.

This field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ADERR is implemented.
- ID_AA64MMFR3_EL1.ANERR reads as `0b0010`.
- SCTLR2_EL3.EnADERR is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]

When FEAT_ADERR is implemented:

Enable Asynchronous Device Read Error.

EnADERR	Meaning
`0b0`	External aborts on Device memory reads generate synchronous Data Abort exceptions in the EL3 translation regime.
`0b1`	External aborts on Device memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL3 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL3.EnADERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Device memory reads.

This field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ANERR is implemented.
- ID_AA64MMFR3_EL1.ADERR reads as `0b0010`.
- SCTLR2_EL3.EnANERR is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to `'0'`.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

EMEC, bit [1]

When FEAT_MEC is implemented:

Enables MEC. When enabled, memory accesses to the Realm physical address space are associated with MECID_RL_A_EL3.

EMEC	Meaning
0b0	MEC is not enabled for the Realm physical address space.
0b1	MEC is enabled for the Realm physical address space.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing SCTLR2_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCTLR2_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b011

```
if !(IsFeatureImplemented(FEAT_SCTLR2) && IsFeatureImplemented(FEAT_AA64)) then

SCTLR2MASK_EL1, Extended System Control Masking Register (EL1)

The SCTLR2MASK_EL1 characteristics are:

Purpose

Mask register to prevent updates of fields in SCTLR2_EL1 on writes to SCTLR2_EL1 or SCTLR2ALIAS_EL1.

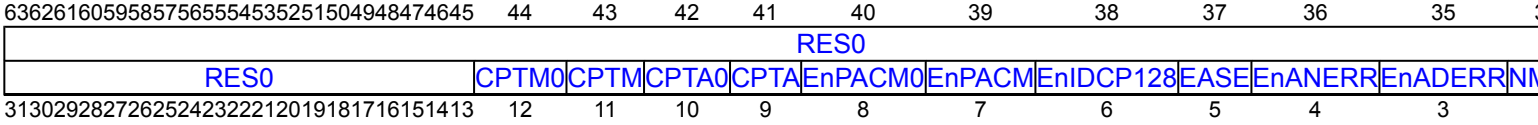
Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR2MASK_EL1 are UNDEFINED.

Attributes

SCTLR2MASK_EL1 is a 64-bit register.

Field descriptions



Bits [63:13]

Reserved, RES0.

CPTM0, bit [12]

When FEAT_CPA2 is implemented:

Mask bit for CPTM0.

CPTM0	Meaning
0b0	SCTLR2_EL1.CPTM0 is writeable.
0b1	SCTLR2_EL1.CPTM0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTM, bit [11]

When FEAT_CPA2 is implemented:

Mask bit for CPTM.

CPTM	Meaning
0b0	SCTLR2_EL1.CPTM is writeable.
0b1	SCTLR2_EL1.CPTM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA0, bit [10]
When FEAT_CPA2 is implemented:

Mask bit for CPTA0.

CPTA0	Meaning
0b0	SCTLR2_EL1.CPTA0 is writeable.
0b1	SCTLR2_EL1.CPTA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA, bit [9]
When FEAT_CPA2 is implemented:

Mask bit for CPTA.

CPTA	Meaning
0b0	SCTLR2_EL1.CPTA is writeable.
0b1	SCTLR2_EL1.CPTA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM0, bit [8]
When FEAT_PAuth_LR is implemented:

Mask bit for EnPACM0.

EnPACM0	Meaning
0b0	SCTLR2_EL1.EnPACM0 is writeable.
0b1	SCTLR2_EL1.EnPACM0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM, bit [7]
When FEAT_PAuth_LR is implemented:

Mask bit for EnPACM.

EnPACM	Meaning
0b0	SCTLR2_EL1.EnPACM is writeable.
0b1	SCTLR2_EL1.EnPACM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [6]
When FEAT_SYSREG128 is implemented:

Mask bit for EnIDCP128.

EnIDCP128	Meaning
0b0	SCTLR2_EL1.EnIDCP128 is writeable.
0b1	SCTLR2_EL1.EnIDCP128 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EASE, bit [5]
When FEAT_DoubleFault2 is implemented:

Mask bit for EASE.

EASE	Meaning
0b0	SCTLR2_EL1.EASE is writeable.
0b1	SCTLR2_EL1.EASE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnANERR, bit [4]

When FEAT_ANERR is implemented:

Mask bit for EnANERR.

EnANERR	Meaning
0b0	SCTLR2_EL1.EnANERR is writeable.
0b1	SCTLR2_EL1.EnANERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]

When FEAT_ADERR is implemented:

Mask bit for EnADERR.

EnADERR	Meaning
0b0	SCTLR2_EL1.EnADERR is writeable.
0b1	SCTLR2_EL1.EnADERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [2]

When FEAT_DoubleFault2 is implemented:

Mask bit for NMEA.

NMEA	Meaning
0b0	SCTLR2_EL1.NMEA is writeable.
0b1	SCTLR2_EL1.NMEA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing SCTLR2MASK_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SCTLR2MASK_EL1 or SCTLR2MASK_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCTLR2MASK_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0100	0b011

```
if !(IsFeatureImplemented(FEAT_SRMASK) && IsFeatureImplemented(FEAT_AA64)) then

SCTLR2MASK_EL2, Extended System Control Masking Register (EL2)

The SCTLR2MASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in SCTLR2_EL2 on writes.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR2MASK_EL2 are UNDEFINED.

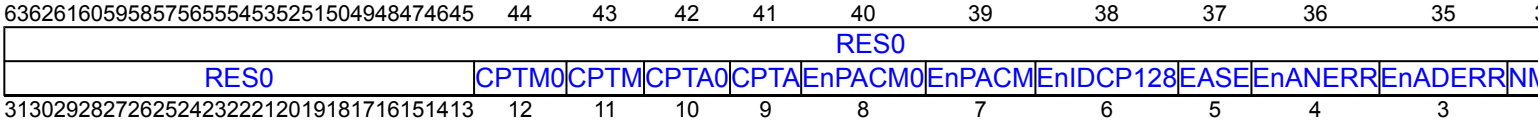
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR2MASK_EL2 is a 64-bit register.

Field descriptions



Bits [63:13]

Reserved, RES0.

CPTM0, bit [12]

When FEAT_CPA2 is implemented:

Mask bit for CPTM0.

CPTM0	Meaning
0b0	SCTLR2_EL2.CPTM0 is writeable.
0b1	SCTLR2_EL2.CPTM0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTM, bit [11]

When FEAT_CPA2 is implemented:

Mask bit for CPTM.

CPTM	Meaning
0b0	SCTLR2_EL2.CPTM is writeable.
0b1	SCTLR2_EL2.CPTM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA0, bit [10]

When FEAT_CPA2 is implemented:

Mask bit for CPTA0.

CPTA0	Meaning
0b0	SCTLR2_EL2.CPTA0 is writeable.
0b1	SCTLR2_EL2.CPTA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA, bit [9]

When FEAT_CPA2 is implemented:

Mask bit for CPTA.

CPTA	Meaning
0b0	SCTLR2_EL2.CPTA is writeable.
0b1	SCTLR2_EL2.CPTA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM0, bit [8]

When FEAT_PAuth_LR is implemented:

Mask bit for EnPACM0.

EnPACM0	Meaning
0b0	SCTLR2_EL2.EnPACM0 is writeable.
0b1	SCTLR2_EL2.EnPACM0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM, bit [7]

When FEAT_PAuth_LR is implemented:

Mask bit for EnPACM.

EnPACM	Meaning
0b0	SCTLR2_EL2.EnPACM is writeable.
0b1	SCTLR2_EL2.EnPACM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [6]

When FEAT_SYSREG128 is implemented:

Mask bit for EnIDCP128.

EnIDCP128	Meaning
0b0	SCTLR2_EL2.EnIDCP128 is writeable.
0b1	SCTLR2_EL2.EnIDCP128 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EASE, bit [5]

When FEAT_DoubleFault2 is implemented:

Mask bit for EASE.

EASE	Meaning
0b0	SCTLR2_EL2.EASE is writeable.
0b1	SCTLR2_EL2.EASE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnANERR, bit [4]

When FEAT_ANERR is implemented:

Mask bit for EnANERR.

EnANERR	Meaning
0b0	SCTLR2_EL2.EnANERR is writeable.
0b1	SCTLR2_EL2.EnANERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]

When FEAT_ADERR is implemented:

Mask bit for EnADERR.

EnADERR	Meaning
0b0	SCTLR2_EL2.EnADERR is writeable.
0b1	SCTLR2_EL2.EnADERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [2]

When FEAT_DoubleFault2 is implemented:

Mask bit for NMEA.

NMEA	Meaning
0b0	SCTLR2_EL2.NMEA is writeable.
0b1	SCTLR2_EL2.NMEA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EMEC, bit [1]

When FEAT_MEC is implemented:

Mask bit for EMEC.

EMEC	Meaning
0b0	SCTLR2_EL2.EMEC is writeable.
0b1	SCTLR2_EL2.EMEC is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing SCTLR2MASK_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SCTLR2MASK_EL2 or SCTLR2MASK_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```

SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL1 and EL0.

Configuration

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SCTLR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR_EL1 are UNDEFINED.

Attributes

SCTLR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46

EnIA	EnIB	LSMAOE	nTLSMD	EnDA	UCI	EE	E0E	SPAN	EIS	IESB	TSCXT	WXN	nTWE	RES0	nTWI	UCT	DZE	E
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	

TIDCP, bit [63]

When FEAT_TIDCP1 is implemented:

Trap IMPLEMENTATION DEFINED functionality. When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps EL0 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL1.

TIDCP	Meaning
0b0	No instructions accessing the System register or System instruction spaces are trapped by this mechanism.
0b1	Instructions accessing the following System register or System instruction spaces are trapped to EL1 by this mechanism: • In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped: ◦ IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}, and are reported using EC syndrome value 0x18. ◦ IMPLEMENTATION DEFINED System instructions, which are accessed using SYSP, with CRn == {11, 15}, and are reported using EC syndrome value 0x14. ◦ IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome value 0x18. ◦ IMPLEMENTATION DEFINED System registers, which are accessed using MRRS and MSRR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome value 0x14. • In AArch32 state, EL0 MCR and MRC access to the following encodings are trapped and reported using EC syndrome value 0x03: ◦ All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}. ◦ All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}. ◦ All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]

When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL1.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL1.

SPINTMASK	Meaning
0b0	Does not cause PSTATE.SP to mask interrupts. PSTATE.ALLINT is set to 1 on taking an exception to EL1.
0b1	When PSTATE.SP is 1 and execution is at EL1, an IRQ or FIQ interrupt that is targeted to EL1 is masked regardless of any denotion of Superpriority. PSTATE.ALLINT is set to 0 on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]

When FEAT_NMI is implemented:

Non-maskable Interrupt enable.

NMI	Meaning
0b0	This control does not affect interrupt masking behavior.
0b1	This control enables all of the following: • The use of the PSTATE.ALLINT interrupt mask. • IRQ and FIQ interrupts to have Superpriority as an additional attribute. • PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]

When FEAT_SME is implemented:

Traps instructions executed at EL0 that access TPIDR2_EL0 to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using EC syndrome value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO, bit [59]

When FEAT_MTE_STORE_ONLY is implemented:

Tag Checking Store Only.

TCSO	Meaning
0b0	This field has no effect on Tag checking.
0b1	Load instructions executed in EL1 are Tag Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO0, bit [58]

When FEAT_MTE_STORE_ONLY is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, Tag Checking Store Only in EL0.

TCSO0	Meaning
0b0	This field has no effect on Tag checking.
0b1	Load instructions executed in EL0 are Tag Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPAN, bit [57]

When FEAT_PAN3 is implemented:

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL1 data access to a page with stage 1 EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

EPAN	Meaning
0b0	No additional Permission faults are generated by this mechanism.
0b1	An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault as a result of PSTATE.PAN = 1 if the accesses were not speculative, will not cause an allocation into a cache. When executing at EL1, this does not prevent unprivileged speculative accesses generated from the EL0 hardware-defined context from causing allocation into a cache.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]

When FEAT_LS64 is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 to EL1.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]
When FEAT_LS64_ACCDATA is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an ST64BV0 instruction at EL0 to EL1.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]
When FEAT_LS64_V is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an ST64BV instruction at EL0 to EL1.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [53]
When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL1.

TME	Meaning
0b0	Any attempt to execute a TSTART instruction at EL1 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL1.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL0.

TME0	Meaning
0b0	Any attempt to execute a TSTART instruction at EL0 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0.
0b1	This control does not cause any TSTART instruction to be trapped.

If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL1.

TMT	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL1, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL0.

TMT0	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.

If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]
When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCTLR_EL1.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]
When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCTLR_EL1.nTWE.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]
When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL1.
0b1	PSTATE.SSBS is set to 1 on an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL1.

When SCR_EL3.ATA == 1 and HCR_EL2.ATA == 1, controls access to Allocation Tags and Tag Check operations in EL1.

ATA	Meaning
0b0	Access to Allocation Tags is prevented at EL1. Memory accesses at EL1 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL1. Tag Checked memory accesses at EL1 are subject to a Tag Check operation. The Tag Check operation depends on the type of tag at the memory being accessed: • For Allocation Tagged memory, an Allocation Tag Check operation. • If FEAT_MTE_CANONICAL_TAGS is implemented, for Canonically Tagged memory, a Canonical Tag Check operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL0.

When SCR_EL3.ATA == 1, HCR_EL2.ATA == 1, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, controls access to Allocation Tags and Tag Check operations in EL0.

ATA0	Meaning
0b0	Access to Allocation Tags is prevented at EL0. Memory accesses at EL0 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL0. Tag Checked memory accesses at EL0 are subject to a Tag Check operation. The Tag Check operation depends on the type of tag at the memory being accessed: • For Allocation Tagged memory, an Allocation Tag Check operation. • If FEAT_MTE_CANONICAL_TAGS is implemented, for Canonically Tagged memory, a Canonical Tag Check operation.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]
When FEAT_MTE2 is implemented:

Tag Check Fault in EL0. When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

TCF0	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]
When FEAT_MTE_ASYNC is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL1, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0_EL1 and TFSR_EL1 registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL1.
0b1	Tag Check Faults are synchronized on entry to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT1, bit [36]
When FEAT_BTI is implemented:

Configures the Branch Type compatibility of the implicit BTI behavior for the following instructions at EL1:

- PACIASP.
- PACIBSP.
- If FEAT_PAuth_LR is implemented, PACIASPPC.
- If FEAT_PAuth_LR is implemented, PACIBSPPC.

BT1	Meaning
0b0	When the PE is executing at EL1, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.jc.
0b1	When the PE is executing at EL1, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.c.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]
When FEAT_BTI is implemented:

Configures the Branch Type compatibility of the implicit BTI behavior for the following instructions at EL0:

- PACIASP.
- PACIBSP.
- If FEAT_PAuth_LR is implemented, PACIASPPC.
- If FEAT_PAuth_LR is implemented, PACIBSPPC.

BT0	Meaning
0b0	When the PE is executing at EL0, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.jc.
0b1	When the PE is executing at EL0, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.c.

When the value of the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the value of SCTLR_EL1.BT0 has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [34]
When FEAT_FPMR is implemented:

Enables direct and indirect accesses to FPMR from EL0.

When accesses to FPMR are disabled by this control:

- Direct accesses to FPMR from EL0 are trapped to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE is 1. These exceptions are reported using EC syndrome value 0x18.
- Execution of FP8 data-processing instructions that indirectly access FPMR is UNDEFINED at EL0.

EnFPM	Meaning
0b0	Direct and indirect accesses to FPMR are disabled at EL0.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0, and the SCTLR_EL2.EnFPM control is used for this purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MSCEn, bit [33]

When FEAT_MOPS is implemented and !ELIsInHost(EL0):

Memory Copy and Memory Set instructions Enable. Enables execution of the Memory Copy and Memory Set instructions at EL0.

MSCEn	Meaning
0b0	Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL0.
0b1	This control does not cause any instructions to be UNDEFINED.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [32]

When FEAT_CMOW is implemented:

Controls cache maintenance instruction permission for the following instructions executed at EL0.

- IC IVAU and DC CIVAC.
- If FEAT_MTE is implemented, DC CIGDVAC and DC CIGVAC.

CMOW	Meaning
0b0	These instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, do not generate a stage 1 permission fault.
0b1	If enabled as a result of SCTLR_EL1.UCI==1, these instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, generate a stage 1 permission fault.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

For this control, stage 1 has write permission if all of the following apply:

- AP[2] is 0 or DBM is 1 in the stage 1 descriptor.
- Where APTable is in use, APTable[1] is 0 for all levels of the translation table.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIAKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnIA	Meaning
0b0	Pointer authentication of instruction addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APIAKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APIAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. When pointer authentication is enabled, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIBKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnIB	Meaning
0b0	Pointer authentication of instruction addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APIBKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APIBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. When pointer authentication is enabled, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]
When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, T32 and A32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of T32 and A32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]
When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of data addresses, using the APDAKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnDA	Meaning
0b0	Pointer authentication of data addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APDAKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APDAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. When pointer authentication is enabled, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled in the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18, as follows:

- DC CVAU, DC CIVAC, DC CVAC, and IC IVAU.
- If FEAT_MTE is implemented, DC CIGVAC, DC CIGDVAC, DC CGVAC, and DC CGDVAC.
- If FEAT_DPB is implemented, DC CVAP.
- If FEAT_DPB and FEAT_MTE are implemented, DC CGVAP and DC CGDVAP.
- If FEAT_DPB2 is implemented, DC CVADP.
- If FEAT_DPB2 and FEAT_MTE are implemented, DC CGVADP and DC CGDVADP.
- If FEAT_OCCMO is implemented, DC CIVAOC, DC CIGDVAOC, DC CVAOC and DC CGDVAOC.

UCI	Meaning
0b0	For each of the specified instructions, if the execution of the instruction can be trapped, access at EL0 using AArch64 is trapped.
0b1	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

When FEAT_MixedEnd is implemented:

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

The EE bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

When FEAT_MixedEndEL0 is implemented:

Endianness of data accesses at EL0.

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Endianness of data accesses at EL0.

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1 .

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

SPAN, bit [23]

When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL1.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing.

EIS	Meaning
0b0	The taking of an exception to EL1 is not a context synchronizing event.
0b1	The taking of an exception to EL1 is a context synchronizing event.

If SCTLR_EL1.EIS is set to 0b0:

- Indirect writes to ESR_EL1, FAR_EL1, SPSR_EL1, ELR_EL1 are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.
- Some exception entries reported are not considered IFBEs per the memory model.

The following are not affected by the value of SCTLR_EL1.EIS:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- The memory model requirement for exception entry to generate an Instruction Fetch Barrier Effect for some exception entries. See Basic definitions for the list of exception entries.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable. Possible values are:

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: • At each exception taken to EL1. • Before the operational pseudocode of each ERET instruction executed at EL1.

If FEAT_DoubleFault2 is implemented, the PE is in Non-debug state, and the Effective value of SCTLR2_EL1.NMEA is 1, then SCTLR_EL1.IESB is ignored and the PE behaves as if SCTLR_EL1.IESB is 1 for all purposes other than direct read of the register.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each `DCPSX` instruction taken to EL1 and before each `DRPS` instruction executed at EL1, in addition to the other cases where it is added.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

TSCXT	Meaning
`0b0`	EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
`0b1`	EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The value of SCXTNUM_EL0 is treated as 0.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can restrict execute permissions on writeable pages.

WXN	Meaning
`0b0`	This control has no effect on memory access permissions.
`0b1`	In the EL1&0 translation regime, any region of memory that is writeable at EL1 is XN at EL1, and any region of memory that is writeable at EL0 is XN at EL0.

This bit applies only when SCTLR_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

This field is RES0 if TCR2_EL1.PIE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using EC syndrome value `0x01`.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Traps EL0 accesses to the CTR_EL0 to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

UCT	Meaning
0b0	Accesses to the CTR_EL0 from EL0 using AArch64 are trapped.
0b1	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Traps EL0 execution of DC ZVA instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

If FEAT_MTE is implemented, this trap also applies to DC GVA and DC GZVA.

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of data addresses, using the APDBKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnDB	Meaning
0b0	Pointer authentication of data addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APDBKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APDBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. When pointer authentication is enabled, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Stage 1 instruction access Cacheability control, for accesses at EL0 and EL1:

I	Meaning
0b0	All instruction access to Stage 1 Normal memory from EL0 and EL1 are Stage 1 Non-cacheable. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Stage 1 Cacheability of instruction access to Stage 1 Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the HCR_EL2.DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.I bit.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception Exit is Context Synchronizing.

EOS	Meaning
0b0	An exception return from EL1 is not a context synchronizing event
0b1	An exception return from EL1 is a context synchronizing event

If SCTLR_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL1 and ELR_EL1 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented:

Enable EL0 access to the following System instructions:

- CFPRCTX, DVPRCTX and CPPRCTX instructions.
- If FEAT_SPECRES2 is implemented, COSPRCTX.
- CFP RCTX, DVP RCTX and CPP RCTX instructions.
- If FEAT_SPECRES2 is implemented, COSP RCTX.

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.
0b1	EL0 access to these instructions is enabled.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

UMA	Meaning
0b0	Any attempt at EL0 using AArch64 to execute an MRS, MSR(REGISTER), or MSR(IMMEDIATE) instruction that accesses the DAIF is trapped.
0b1	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the value of this bit is treated as 0 for all purposes other than reading the value of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SED, bit [8]

When FEAT_AA32EL0 is implemented:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, reported using EC syndrome value 0x00.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

ITD, bit [7]

When FEAT_AA32EL0 is implemented:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using EC syndrome value 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1: • All encodings of the IT instruction with hw1[3:0]!=1000. • All encodings of the subsequent instruction with the following values for hw1: ◦ 0b11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. ◦ 0b10100xxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR_EL1 then it must also be implemented in the SCTLR_EL2, HSCTLR, and SCTLR.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

Otherwise:

Reserved, RES1.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

The following instructions generate an Alignment fault if all bytes being accessed are not within a single naturally aligned 16-byte quantity, for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH.
- If FEAT_LRCPC3 is implemented, the post index versions of LDAPR and the pre index versions of STLR.
- If FEAT_LRCPC3 and Advanced SIMD and floating-point instructions are implemented, LDAPUR (SIMD&FP), LDAP1 (SIMD&FP), STLUR (SIMD&FP), and STL1 (SIMD&FP).

If FEAT_LRCPC3 is implemented, the following instructions generate an Alignment fault if all bytes being accessed for a single register are not within a single naturally aligned 16-byte quantity, for access:

- LDIAPP, STILP.

nAA	Meaning
0b0	Unaligned accesses by the specified instructions generate an Alignment fault.
0b1	This control does not generate Alignment faults.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When FEAT_AA32EL0 is implemented:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using EC syndrome value 0x00.
0b1	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR_EL1 then it must also be implemented in the SCTLR_EL2, HSCTLR, and SCTLR.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

Otherwise:

Reserved, RES0.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Stage 1 Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Stage 1 Normal memory from EL0 and EL1, and all Normal memory accesses from unified cache to the EL1&0 Stage 1 translation tables, are treated as Stage 1 Non-cacheable.
0b1	This control has no effect on the Stage 1 Cacheability of: • Data access to Normal memory from EL0 and EL1. • Normal memory accesses to the EL1&0 Stage 1 translation tables.

When the Effective value of the HCR_EL2.DC bit in the current Security state is 1, the PE ignores SCTLR_EL1.C. This means that EL0 and EL1 data accesses to Normal memory are Cacheable.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

A	Meaning
0b0	Alignment fault checking is disabled when executing at EL1 or EL0. Alignment checks on some instructions are not disabled by this control. For more information, see 'Alignment of data accesses'.
0b1	Alignment fault checking is enabled when executing at EL1 or EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the value of this bit is treated as 0 for all purposes other than reading the value of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL1&0 stage 1 address translation.

M	Meaning
0b0	EL1&0 stage 1 address translation disabled. See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1&0 stage 1 address translation enabled.

If the Effective value of HCR_EL2.{DC, TGE} in the current Security state is not {0, 0} then the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset:
    - When the highest implemented Exception level is EL1, this field resets to `'0'`.
    - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing SCTLR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SCTLR_EL1 or SCTLR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to SCTLR_EL1 are masked by SCTLRMASK_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCTLR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);

SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL2.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, these controls apply also to execution at EL0.

Configuration

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSCTLR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR_EL2 are UNDEFINED.

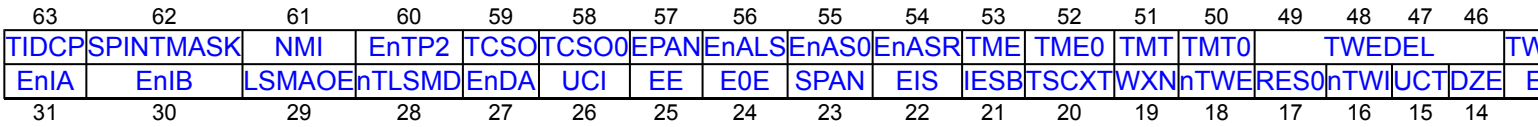
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR_EL2 is a 64-bit register.

Field descriptions



TIDCP, bit [63]

When FEAT_TIDCP1 is implemented and ELIsInHost(EL2):

Trap IMPLEMENTATION DEFINED functionality. Traps EL0 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2.

TIDCP	Meaning
0b0	No instructions accessing the System register or System instruction spaces are trapped by this mechanism.
0b1	If HCR_EL2.TGE==0, no instructions accessing the System register or System instruction spaces are trapped by this mechanism. If HCR_EL2.TGE==1, instructions accessing the following System register or System instruction spaces are trapped to EL2 by this mechanism: • In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped: ◦ IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}, and are reported using EC syndrome value 0x18. ◦ IMPLEMENTATION DEFINED System instructions, which are accessed using SYSP, with CRn == {11, 15}, and are reported using EC syndrome value 0x14. ◦ IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome value 0x18. ◦ IMPLEMENTATION DEFINED System registers, which are accessed using MRRS and MSRR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome value 0x14. • In AArch32 state, EL0 MCR and MRC accesses to the following encodings are trapped and reported using EC syndrome value 0x03: ◦ All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}. ◦ All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}. ◦ All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]

When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL2.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL2.

SPINTMASK	Meaning
0b0	Does not cause PSTATE.SP to mask interrupts. PSTATE.ALLINT is set to 1 on taking an exception to EL2.
0b1	When PSTATE.SP is 1 and execution is at EL2, an IRQ or FIQ interrupt that is targeted to EL2 is masked regardless of any denotation of Superpriority. PSTATE.ALLINT is set to 0 on taking an exception to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]

When FEAT_NMI is implemented:

Non-maskable Interrupt enable.

NMI	Meaning
0b0	This control does not affect interrupt masking behavior.
0b1	This control enables all of the following: • The use of the PSTATE.ALLINT interrupt mask. • IRQ and FIQ interrupts to have Superpriority as an additional attribute. • PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]

When FEAT_SME is implemented and ELIsInHost(EL2):

Traps instructions executed at EL0 that access TPIDR2_EL0 to EL2 when EL2 is implemented and enabled for the current Security state. The exception is reported using EC syndrome value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO, bit [59]

When FEAT_MTE_STORE_ONLY is implemented:

Tag Checking Store Only.

TCSO	Meaning
0b0	This field has no effect on Tag checking.
0b1	Load instructions executed in EL2 are Tag Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO0, bit [58]

When FEAT_MTE_STORE_ONLY is implemented and ELIsInHost(EL2):

Tag Checking Store Only in EL0.

TCSO0	Meaning
0b0	This field has no effect on Tag checking.
0b1	Load instructions executed in EL0 are Tag Unchecked.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPAN, bit [57]

When FEAT_PAN3 is implemented and ELIsInHost(EL2):

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL2 data access to a page with EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

EPAN	Meaning
0b0	No additional Permission faults are generated by this mechanism.
0b1	An EL2 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault as a result of PSTATE.PAN = 1 if the accesses were not speculative, will not cause an allocation into a cache. When executing at EL2, and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this does not prevent unprivileged speculative accesses generated from the EL0 hardware-defined context from causing allocation into a cache.

Note

The value of HCR_EL2.TGE does not change the effect of this field on privileged accesses.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]

When FEAT_LS64 is implemented and ELIsInHost(EL2):

Traps execution of an LD64B or ST64B instruction at EL0 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

A trap of an LD64B or ST64B instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]
When FEAT_LS64_ACCDATA is implemented and ELIsInHost(EL2):

Traps execution of an ST64BV0 instruction at EL0 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

A trap of an ST64BV0 instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]
When FEAT_LS64_V is implemented and ELIsInHost(EL2):

Traps execution of an ST64BV instruction at EL0 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

A trap of an ST64BV instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [53]
When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL2.

TME	Meaning
0b0	Any attempt to execute a TSTART instruction at EL2 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL2.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]

When FEAT_TME is implemented and ELIsInHost(EL2):

Enables the Transactional Memory Extension at EL0.

TME0	Meaning
0b0	Any attempt to execute a TSTART instruction at EL0 is trapped to EL2, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0.
0b1	This control does not cause any TSTART instruction to be trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL2.

TMT	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL2, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]

When FEAT_TME is implemented and ELIsInHost(EL2):

Forces a trivial implementation of the Transactional Memory Extension at EL0.

TMT0	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]
When FEAT_TWED is implemented and ELIsInHost(EL2):

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]
When FEAT_TWED is implemented and ELIsInHost(EL2):

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL2.nTWE.

TWEDEn	Meaning
0b0	The delay for taking a WFE trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]
When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on exception entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL2.
0b1	PSTATE.SSBS is set to 1 on an exception to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]
When FEAT_MTE2 is implemented:

Allocation Tag Access in EL2.

When SCR_EL3.ATA is 1, controls access to Allocation Tags and Tag Check operations in EL2.

ATA	Meaning
0b0	Access to Allocation Tags is prevented at EL2. Memory accesses at EL2 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL2. Tag Checked memory accesses at EL2 are subject to a Tag Check operation. The Tag Check operation depends on the type of tag at the memory being accessed: • For Allocation Tagged memory, an Allocation Tag Check operation. • If FEAT_MTE_CANONICAL_TAGS is implemented, for Canonically Tagged memory, a Canonical Tag Check operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]
When FEAT_MTE2 is implemented and ELIsInHost(EL2):

Allocation Tag Access in EL0.

When SCR_EL3.ATA is 1, controls access to Allocation Tags and Tag Check operations in EL0.

ATA0	Meaning
0b0	Access to Allocation Tags is prevented at EL0. Memory accesses at EL0 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL0. Tag Checked memory accesses at EL0 are subject to a Tag Check operation. The Tag Check operation depends on the type of tag at the memory being accessed: • For Allocation Tagged memory, an Allocation Tag Check operation. • If FEAT_MTE_CANONICAL_TAGS is implemented, for Canonically Tagged memory, a Canonical Tag Check operation.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]

When FEAT_MTE2 is implemented and ELIsInHost(EL2):

Tag Check Fault in EL0. Controls the effect of Tag Check Faults due to Loads and Stores in EL0.

TCF0	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE_ASYNC is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL2, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0_EL1, TFSR_EL1, and TFSR_EL2 registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL2.
0b1	Tag Check Faults are synchronized on entry to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]

When FEAT_BTI is implemented:

Indicates the Branch Type compatibility of the implicit BTI behavior for the following instructions at EL2:

- PACIASP.
- PACIBSP.
- If FEAT_PAuth_LR is implemented, PACIASPPC.
- If FEAT_PAuth_LR is implemented, PACIBSPPC.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit is named BT1.

BT	Meaning
0b0	When the PE is executing at EL2, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.jc.
0b1	When the PE is executing at EL2, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.c.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]

When FEAT_BTI is implemented and ELIsInHost(EL2):

Indicates the Branch Type compatibility of the implicit BTI behavior for the following instructions at EL0:

- PACIASP.
- PACIBSP.
- If FEAT_PAuth_LR is implemented, PACIASPPC.
- If FEAT_PAuth_LR is implemented, PACIBSPPC.

BT0	Meaning
0b0	When the PE is executing at EL0, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.jc.
0b1	When the PE is executing at EL0, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.c.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [34]
When FEAT_FPMR is implemented and ELIsInHost(EL0):

Enables direct and indirect accesses to FPMR from EL0.

When accesses to FPMR are disabled by this control:

- Direct accesses to FPMR from EL0 are trapped to EL2 and reported using EC syndrome value `0x18`.
- Execution of FP8 data-processing instructions that indirectly access FPMR is UNDEFINED at EL0.

EnFPM	Meaning
`0b0`	Direct and indirect accesses to FPMR are disabled at EL0.
`0b1`	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

If EL2 is not implemented or is disabled in the current Security state, the Effective value of this field is `0b1`.

When HCR_EL2.TGE is 0, this field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MSCEn, bit [33]
When FEAT_MOPS is implemented and ELIsInHost(EL2):

Memory Copy and Memory Set instructions Enable. Enables execution of the Memory Copy and Memory Set instructions at EL0.

MSCEn	Meaning
`0b0`	Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL0.
`0b1`	This control does not cause any instructions to be UNDEFINED.

If HCR_EL2.TGE == `0b0`, the field is IGNORED for all purposes other than direct reads and writes of the register.

When FEAT_MOPS is implemented and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the Effective value of this bit is `0b1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [32]

When FEAT_CMOW is implemented and ELIsInHost(EL2):

Controls cache maintenance instruction permission for the following instructions executed at EL0.

- IC IVAU and DC CIVAC.
- If FEAT_MTE is implemented, DC CIGDVAC and DC CIGVAC.

CMOW	Meaning
0b0	These instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, do not generate a stage 1 permission fault.
0b1	If enabled as a result of SCTLR_EL2.UCI==1, these instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, generate a stage 1 permission fault.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

For this control, stage 1 has write permission if all of the following apply:

- AP[2] is 0 or DBM is 1 in the stage 1 descriptor.
- Where APTable is in use, APTable[1] is 0 for all levels of the translation table.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIAKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnIA	Meaning
0b0	Pointer authentication of instruction addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APIAKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APIAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. When pointer authentication is enabled, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIBKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnIB	Meaning
0b0	Pointer authentication of instruction addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APIBKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APIBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. When pointer authentication is enabled, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When FEAT_LSMAOC is implemented and ELIsInHost(EL2):

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, T32 and A32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of T32 and A32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When FEAT_LSMAOC is implemented and ELIsInHost(EL2):

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of data addresses, using the APDAKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnDA	Meaning
0b0	Pointer authentication of data addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APDAKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APDAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. When pointer authentication is enabled, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]
When ELIsInHost(EL2):

Traps execution of cache maintenance instructions at EL0 to EL2, from AArch64 state only, reported using EC syndrome value 0x18, as follows:

- DC CVAU, DC CIVAC, DC CVAC, and IC IVAU.
- If FEAT_MTE is implemented, DC CIGVAC, DC CIGDVAC, DC CGVAC, and DC CGDVAC.
- If FEAT_DPB is implemented, DC CVAP.
- If FEAT_DPB and FEAT_MTE are implemented, DC CGVAP and DC CGDVAP.
- If FEAT_DPB2 is implemented, DC CVADP.
- If FEAT_DPB2 and FEAT_MTE are implemented, DC CGVADP and DC CGDVADP.
- If FEAT_OCCMO is implemented, DC CIVAOC, DC CIGDVAOC, DC CVAOC and DC CGDVAOC.

UCI	Meaning
0b0	For each of the specified instructions, if the execution of the instruction can be trapped, access at EL0 using AArch64 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bit [25]
When FEAT_MixedEnd is implemented:

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are are little-endian.
0b1	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]
When ELIsInHost(EL2) and FEAT_MixedEndEL0 is implemented:

Endianness of data accesses at EL0.

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Endianness of data accesses at EL0.

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

When ELIsInHost(EL2):

Set Privileged Access Never, on taking an exception to EL2.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL2.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception entry is a context synchronization event.

EIS	Meaning
0b0	The taking of an exception to EL2 is not a context synchronization event.
0b1	The taking of an exception to EL2 is a context synchronization event.

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, and HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.
- Some exception entries reported are not considered IFBEs per the memory model.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- The memory model requirement for exception entry to generate an Instruction Fetch Barrier Effect for some exception entries. See Basic definitions for the list of exception entries.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: • At each exception taken to EL2. • Before the operational pseudocode of each ERET instruction executed at EL2.

If FEAT_DoubleFault2 is implemented, the PE is in Non-debug state, and the Effective value of SCTLR2_EL2.NMEA is 1, then SCTLR_EL2.IESB is ignored and the PE behaves as if SCTLR_EL2.IESB is 1 for all purposes other than direct read of the register.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented) and ELIsInHost(EL2):

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

TSCXT	Meaning
0b0	EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
0b1	EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated as 0.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_CSV2_2 is not implemented, FEAT_CSV2_1p2 is not implemented, and ELIsInHost(EL0):

Reserved, RES1.

Otherwise:

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can restrict execute permissions on writeable pages.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	In the EL2 or EL2&0 translation regime, any region of memory that is writeable at EL2 is XN at EL2. In the EL2&0 translation regime, any region of memory that is writeable at EL0 is XN at EL0.

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

This field is RES0 if TCR2_EL2.PIE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

When ELIsInHost(EL2):

Traps execution of WFE instructions at EL0 to EL2, from both Execution states.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

When ELIsInHost(EL2):

Traps execution of WFI instructions at EL0 to EL2, from both Execution states.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

UCT, bit [15]

When ELIsInHost(EL2):

Traps EL0 accesses to the CTR_EL0 to EL2, from AArch64 state only.

UCT	Meaning
0b0	Accesses to the CTR_EL0 from EL0 using AArch64 are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DZE, bit [14]

When ELIsInHost(EL2):

Traps execution of DC ZVA instructions at EL0 to EL2, from AArch64 state only.

If FEAT_MTE is implemented, this trap also applies to DC GVA and DC GZVA.

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDB, bit [13]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of data addresses, using the APDBKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnDB	Meaning
0b0	Pointer authentication of data addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APDBKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APDBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. When pointer authentication is enabled, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL0.

I	Meaning
0b0	All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, all instruction accesses to Normal memory from EL0 are Non-cacheable for all levels of instruction and unified cache. If SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, instruction access to Normal memory from EL0. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EOS, bit [11]
When FEAT_ExS is implemented:

Exception exit is a context synchronization event.

EOS	Meaning
0b0	An exception return from EL2 is not a context synchronization event.
0b1	An exception return from EL2 is a context synchronization event.

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]
When FEAT_SPECRES is implemented and ELIsInHost(EL2):

Enable EL0 access to the following System instructions:

- CFPRCTX, DVPRCTX and CPPRCTX instructions.

- If FEAT_SPECRES2 is implemented, COSPRCTX.
- CFP RCTX, DVP RCTX and CPP RCTX instructions.
- If FEAT_SPECRES2 is implemented, COSP RCTX.

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL2.
0b1	EL0 access to these instructions is enabled.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

When FEAT_AA32EL0 is implemented and ELIsInHost(EL2):

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_AA32EL0 is not implemented and ELIsInHost(EL2):

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

Access to this field is **RES1**.

Otherwise:

Reserved, RES0.

ITD, bit [7]

When FEAT_AA32EL0 is implemented and ELIsInHost(EL2):

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED : • All encodings of the IT instruction with hw1[3:0]!=1000. • All encodings of the subsequent instruction with the following values for hw1: ◦ 0b11xxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. ◦ 0b10100xxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the SCTLR_EL1, HSCTLR, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

When FEAT_AA32EL0 is not implemented and ELIsInHost(EL2):

Reserved, RES1.

Otherwise:

Reserved, RES0.

nAA, bit [6]
When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults under certain conditions at EL2, and, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL0.

The following instructions generate an Alignment fault if all bytes being accessed are not within a single naturally aligned 16-byte quantity, for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH.

- If FEAT_LRCPC3 is implemented, the post index versions of LDAPR and the pre index versions of STLR.
- If FEAT_LRCPC3 and Advanced SIMD and floating-point instructions are implemented, LDAPUR (SIMD&FP), LDAP1 (SIMD&FP), STLUR (SIMD&FP), and STL1 (SIMD&FP).

If FEAT_LRCPC3 is implemented, the following instructions generate an Alignment fault if all bytes being accessed for a single register are not within a single naturally aligned 16-byte quantity, for access:

- LDIAPP, STILP.

nAA	Meaning
0b0	Unaligned accesses by the specified instructions generate an Alignment fault.
0b1	Unaligned accesses by the specified instructions do not generate an Alignment fault.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]
When FEAT_AA32EL0 is implemented and ELIsInHost(EL2):

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
0b1	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

CP15BEN is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the SCTLR_EL1, HSCTLR, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_AA32EL0 is not implemented and ELIsInHost(EL2):

Access to this field is **RES0**.

Otherwise:

Reserved, RES1.

SA0, bit [4]
When ELIsInHost(EL2):

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

If HCR_EL2.TGE == 0b0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Data access Cacheability control, for accesses at EL2 and, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL0

C	Meaning
0b0	The following are Non-cacheable for all levels of data and unified cache: • Data accesses to Normal memory from EL2. • When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, Normal memory accesses to the EL2 translation tables. • When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}: ◦ Data accesses to Normal memory from EL0. ◦ Normal memory accesses to the EL2&0 translation tables.
0b1	This control has no effect on the Cacheability of: • Data access to Normal memory from EL2. • When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, Normal memory accesses to the EL2 translation tables. • When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}: ◦ Data accesses to Normal memory from EL0. ◦ Normal memory accesses to the EL2&0 translation tables.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL0.

A	Meaning
0b0	Alignment fault checking is disabled when executing at EL2. When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, alignment fault checking disabled when executing at EL0. Alignment checks on some instructions are not disabled by this control. For more information, see 'Alignment of data accesses'.
0b1	Alignment fault checking is enabled when executing at EL2. When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, alignment fault checking enabled when executing at EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 or EL2&0 stage 1 address translation.

M	Meaning
0b0	When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL2 stage 1 address translation disabled. When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL2&0 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
0b1	When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL2 stage 1 address translation enabled. When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL2&0 stage 1 address translation enabled.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing SCTLR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to SCTLR_EL2 are masked by SCTLRMASK_EL2.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCTLR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = SCTLR_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SCTLR_EL2;
```

```
MSR SCTLR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if IsFeatureImplemented(FEAT_SRMASK) then
        SCTLR_EL2 = (X[t, 64] AND NOT EffectiveSCTLRMASK_EL2()) OR (SCTLR_EL2 AND
EffectiveSCTLRMASK_EL2());
    else
        SCTLR_EL2 = X[t, 64];
elsif PSTATE.EL == EL3 then
    SCTLR_EL2 = X[t, 64];
```

When FEAT_VHE is implemented

```
MRS <Xt>, SCTLR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1')
&& HFGRTR_EL2.SCTLR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EffectiveHCR_EL2_NVx() IN {'111'} then
        X[t, 64] = NVMem[0x110];
    else
        X[t, 64] = SCTLR_EL1;
elsif PSTATE.EL == EL2 then
    if ELIsInHost(EL2) then
        X[t, 64] = SCTLR_EL2;
    else
        X[t, 64] = SCTLR_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SCTLR_EL1;
```

When FEAT_VHE is implemented

```
MSR SCTLR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1')
&& HFGWTR_EL2.SCTLR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EffectiveHCR_EL2_NVx() IN {'111'} then
        NVMem[0x110] = X[t, 64];
    else
        if IsFeatureImplemented(FEAT_SRMASK) then
            SCTLR_EL1 = (X[t, 64] AND NOT EffectiveSCTLRMASK_EL1()) OR (SCTLR_EL1 AND
EffectiveSCTLRMASK_EL1());
        else
            SCTLR_EL1 = X[t, 64];
elsif PSTATE.EL == EL2 then
    if ELIsInHost(EL2) then
        if IsFeatureImplemented(FEAT_SRMASK) then
            SCTLR_EL2 = (X[t, 64] AND NOT EffectiveSCTLRMASK_EL2()) OR (SCTLR_EL2 AND
EffectiveSCTLRMASK_EL2());
        else
            SCTLR_EL2 = X[t, 64];
    else
        SCTLR_EL1 = X[t, 64];
elsif PSTATE.EL == EL3 then
    SCTLR_EL1 = X[t, 64];
```

SCTLR_EL3, System Control Register (EL3)

The SCTLR_EL3 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL3.

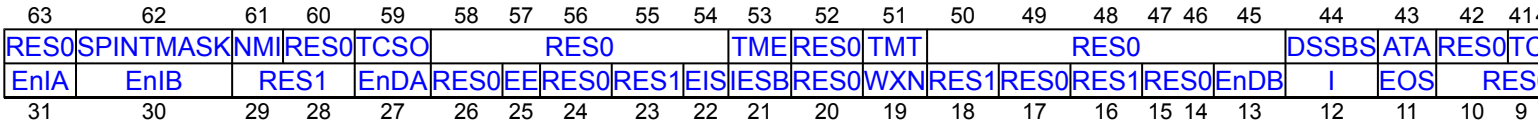
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR_EL3 are UNDEFINED.

Attributes

SCTLR_EL3 is a 64-bit register.

Field descriptions



Bit [63]

Reserved, RES0.

SPINTMASK, bit [62]

When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL3.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL3.

SPINTMASK	Meaning
0b0	Does not cause PSTATE.SP to mask interrupts. PSTATE.ALLINT is set to 1 on taking an exception to EL3.
0b1	When PSTATE.SP is 1 and execution is at EL3, an IRQ or FIQ interrupt that is targeted to EL3 is masked regardless of any denotion of Superpriority. PSTATE.ALLINT is set to 0 on taking an exception to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]

When FEAT_NMI is implemented:

Non-maskable Interrupt enable.

NMI	Meaning
0b0	This control does not affect interrupt masking behavior.
0b1	This control enables all of the following: • The use of the PSTATE.ALLINT interrupt mask. • IRQ and FIQ interrupts to have Superpriority as an additional attribute. • PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [60]

Reserved, RES0.

TCSO, bit [59]

When FEAT_MTE_STORE_ONLY is implemented:

Tag Checking Store Only.

TCSO	Meaning
0b0	This field has no effect on Tag checking.
0b1	Load instructions executed in EL3 are Tag Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:54]

Reserved, RES0.

TME, bit [53]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL3.

TME	Meaning
0b0	Any attempt to execute a TSTART instruction at EL3 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL3.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [52]

Reserved, RES0.

TMT, bit [51]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL3.

TMT	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL3, the transaction fails with a TRIVIAL failure cause.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [50:45]

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL3.
0b1	PSTATE.SSBS is set to 1 on an exception to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL3.

Controls access to Allocation Tags and Tag Check operations in EL3.

ATA	Meaning
0b0	Access to Allocation Tags is prevented at EL3. Memory accesses at EL3 are not subject to a Tag Check operation.
0b1	This control does not prevent access to Allocation Tags at EL3. Tag Checked memory accesses at EL3 are subject to a Tag Check operation. The Tag Check operation depends on the type of tag at the memory being accessed: • For Allocation Tagged memory, an Allocation Tag Check operation. • If FEAT_MTE_CANONICAL_TAGS is implemented, for Canonically Tagged memory, a Canonical Tag Check operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

Tag Check Fault in EL3. Controls the effect of Tag Check Faults due to Loads and Stores in EL3.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE_ASYNC is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL3, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0_EL1 and TFSR_ELx registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL3.
0b1	Tag Check Faults are synchronized on entry to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]

When FEAT_BTI is implemented:

Indicates the Branch Type compatibility of the implicit BTI behavior for the following instructions at EL3:

- PACIASP.
- PACIBSP.
- If FEAT_PAuth_LR is implemented, PACIASPPC.
- If FEAT_PAuth_LR is implemented, PACIBSPPC.

BT	Meaning
0b0	When the PE is executing at EL3, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.jc.
0b1	When the PE is executing at EL3, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.c.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIAKey_EL1 key, in the EL3 translation regime.

Possible values of this bit are:

EnIA	Meaning
0b0	Pointer authentication of instruction addresses, using the APIAKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses, using the APIAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIBKey_EL1 key, in the EL3 translation regime.

Possible values of this bit are:

EnIB	Meaning
0b0	Pointer authentication of instruction addresses, using the APIBKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses, using the APIBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APDAKey_EL1 key, in the EL3 translation regime.

EnDA	Meaning
0b0	Pointer authentication of data addresses, using the APDAKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses, using the APDAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

When FEAT_MixedEnd is implemented:

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.
0b1	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.
0b1	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bit [23]

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing.

EIS	Meaning
0b0	The taking of an exception to EL3 is not a context synchronizing event.
0b1	The taking of an exception to EL3 is a context synchronizing event.

If SCTLR_EL3.EIS is set to 0b0:

- Indirect writes to ESR_EL3, FAR_EL3, SPSR_EL3, ELR_EL3 are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.
- Some exception entries reported are not considered IFBEs per the memory model.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- The memory model requirement for exception entry to generate an Instruction Fetch Barrier Effect for some exception entries. See Basic definitions for the list of exception entries.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: • At each exception taken to EL3. • Before the operational pseudocode of each ERET instruction executed at EL3.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field and, if implemented, SCR_EL3.NMEA. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

When FEAT_DoubleFault is implemented, the PE is in Non-debug state, and the Effective value of SCR_EL3.NMEA is 1, this field is ignored and its Effective value is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.

This bit applies only when SCTLR_EL3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

This field is RES0 if TCR_EL3.PIE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APDBKey_EL1 key, in the EL3 translation regime.

EnDB	Meaning
0b0	Pointer authentication of data addresses, using the APDBKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses, using the APDBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

I	Meaning
0b0	All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception Exit is Context Synchronizing.

EOS	Meaning
0b0	An exception return from EL3 is not a context synchronizing event
0b1	An exception return from EL3 is a context synchronizing event

If SCTLR_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL3 and ELR_EL3 on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

The following instructions generate an Alignment fault if all bytes being accessed are not within a single naturally aligned 16-byte quantity, for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH.
- If FEAT_LRCPC3 is implemented, the post index versions of LDAPR and the pre index versions of STLR.
- If FEAT_LRCPC3 and Advanced SIMD and floating-point instructions are implemented, LDAPUR (SIMD&FP), LDAP1 (SIMD&FP), STLUR (SIMD&FP), and STL1 (SIMD&FP).

If FEAT_LRCPC3 is implemented, the following instructions generate an Alignment fault if all bytes being accessed for a single register are not within a single naturally aligned 16-byte quantity, for access:

- LDIAPP, STILP.

nAA	Meaning
0b0	Unaligned accesses by the specified instructions generate an Alignment fault.
0b1	Unaligned accesses by the specified instructions do not generate an Alignment fault.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: • Data access to Normal memory from EL3. • Normal memory accesses to the EL3 translation tables.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

A	Meaning
0b0	Alignment fault checking is disabled when executing at EL3. Alignment checks on some instructions are not disabled by this control. For more information, see 'Alignment of data accesses'.
0b1	Alignment fault checking is enabled when executing at EL3. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL3 stage 1 address translation disabled. See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.
0b1	EL3 stage 1 address translation enabled.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Accessing SCTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCTLR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SCTLR_EL3;
```

```
MSR SCTLR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if IsFeatureImplemented(FEAT_FGWTE3) && FGWTE3_EL3.SCTLR_EL3 == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        SCTLR_EL3 = X[t, 64];
```

SCTLRMASK_EL1, System Control Masking Register (EL1)

The SCTLRMASK_EL1 characteristics are:

Purpose

Mask register to prevent updates of fields in SCTLR_EL1 on writes to SCTLR_EL1 or SCTLRALIAS_EL1.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLRMASK_EL1 are UNDEFINED.

Attributes

SCTLRMASK_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46
TIDCP	SPINTMASK	NMI	EnTP2	TCSO	TCSO0	EPAN	EnALS	EnAS0	EnASR	TME	TME0	TMT	TMT0	RES0			TWEDE
EnIA	EnIB	LSMAOE	nTLSMD	EnDA	UCI	EE	E0E	SPAN	EIS	IESB	TSCXT	WXN	nTWE	RES0	nTWI	UCT	DZE
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14

TIDCP, bit [63]

When FEAT_TIDCP1 is implemented:

Mask bit for TIDCP.

TIDCP	Meaning
0b0	SCTLR_EL1.TIDCP is writeable.
0b1	SCTLR_EL1.TIDCP is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]

When FEAT_NMI is implemented:

Mask bit for SPINTMASK.

SPINTMASK	Meaning
0b0	SCTLR_EL1.SPINTMASK is writeable.
0b1	SCTLR_EL1.SPINTMASK is not writeable.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL1, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]
When FEAT_NMI is implemented:

Mask bit for NMI.

NMI	Meaning
0b0	SCTLR_EL1.NMI is writeable.
0b1	SCTLR_EL1.NMI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]
When FEAT_SME is implemented:

Mask bit for EnTP2.

EnTP2	Meaning
0b0	SCTLR_EL1.EnTP2 is writeable.
0b1	SCTLR_EL1.EnTP2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO, bit [59]
When FEAT_MTE_STORE_ONLY is implemented:

Mask bit for TCSO.

TCSO	Meaning
0b0	SCTLR_EL1.TCSO is writeable.
0b1	SCTLR_EL1.TCSO is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO0, bit [58]
When FEAT_MTE_STORE_ONLY is implemented:

Mask bit for TCSO0.

TCSO0	Meaning
0b0	SCTLR_EL1.TCSO0 is writeable.
0b1	SCTLR_EL1.TCSO0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPAN, bit [57]
When FEAT_PAN3 is implemented:

Mask bit for EPAN.

EPAN	Meaning
0b0	SCTLR_EL1.EPAN is writeable.
0b1	SCTLR_EL1.EPAN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]
When FEAT_LS64 is implemented:

Mask bit for EnALS.

EnALS	Meaning
0b0	SCTLR_EL1.EnALS is writeable.
0b1	SCTLR_EL1.EnALS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]
When FEAT_LS64_ACCDATA is implemented:

Mask bit for EnAS0.

EnAS0	Meaning
0b0	SCTLR_EL1.EnAS0 is writeable.
0b1	SCTLR_EL1.EnAS0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]
When FEAT_LS64_V is implemented:

Mask bit for EnASR.

EnASR	Meaning
0b0	SCTLR_EL1.EnASR is writeable.
0b1	SCTLR_EL1.EnASR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [53]
When FEAT_TME is implemented:

Mask bit for TME.

TME	Meaning
0b0	SCTLR_EL1.TME is writeable.
0b1	SCTLR_EL1.TME is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]
When FEAT_TME is implemented:

Mask bit for TME0.

TME0	Meaning
0b0	SCTLR_EL1.TME0 is writeable.
0b1	SCTLR_EL1.TME0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]
When FEAT_TME is implemented:

Mask bit for TMT.

TMT	Meaning
0b0	SCTLR_EL1.TMT is writeable.
0b1	SCTLR_EL1.TMT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]
When FEAT_TME is implemented:

Mask bit for TMT0.

TMT0	Meaning
0b0	SCTLR_EL1.TMT0 is writeable.
0b1	SCTLR_EL1.TMT0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [49:47]

Reserved, RES0.

TWEDEL, bit [46]
When FEAT_TWED is implemented:

Mask bit for TWEDEL.

TWEDEL	Meaning
0b0	SCTLR_EL1.TWEDEL is writeable.
0b1	SCTLR_EL1.TWEDEL is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]
When FEAT_TWED is implemented:

Mask bit for TWEDEn.

TWEDEn	Meaning
0b0	SCTLR_EL1.TWEDEn is writeable.
0b1	SCTLR_EL1.TWEDEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]
When FEAT_SSBS is implemented:

Mask bit for DSSBS.

DSSBS	Meaning
0b0	SCTLR_EL1.DSSBS is writeable.
0b1	SCTLR_EL1.DSSBS is not writeable.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL1, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

Mask bit for ATA.

ATA	Meaning
0b0	SCTLR_EL1.ATA is writeable.
0b1	SCTLR_EL1.ATA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented:

Mask bit for ATA0.

ATA0	Meaning
0b0	SCTLR_EL1.ATA0 is writeable.
0b1	SCTLR_EL1.ATA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [41]

Reserved, RES0.

TCF, bit [40]

When FEAT_MTE2 is implemented:

Mask bit for TCF.

TCF	Meaning
0b0	SCTLR_EL1.TCF is writeable.
0b1	SCTLR_EL1.TCF is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

TCF0, bit [38]

When FEAT_MTE2 is implemented:

Mask bit for TCF0.

TCF0	Meaning
0b0	SCTLR_EL1.TCF0 is writeable.
0b1	SCTLR_EL1.TCF0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE_ASYNC is implemented:

Mask bit for ITFSB.

ITFSB	Meaning
0b0	SCTLR_EL1.ITFSB is writeable.
0b1	SCTLR_EL1.ITFSB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT1, bit [36]

When FEAT_BTI is implemented:

Mask bit for BT1.

BT1	Meaning
0b0	SCTLR_EL1.BT1 is writeable.
0b1	SCTLR_EL1.BT1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]
When FEAT_BTI is implemented:

Mask bit for BT0.

BT0	Meaning
0b0	SCTLR_EL1.BT0 is writeable.
0b1	SCTLR_EL1.BT0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [34]
When FEAT_FPMR is implemented:

Mask bit for EnFPM.

EnFPM	Meaning
0b0	SCTLR_EL1.EnFPM is writeable.
0b1	SCTLR_EL1.EnFPM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MSCEn, bit [33]
When FEAT_MOPS is implemented:

Mask bit for MSCEn.

MSCEn	Meaning
0b0	SCTLR_EL1.MSCEn is writeable.
0b1	SCTLR_EL1.MSCEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [32]
When FEAT_CMOW is implemented:

Mask bit for CMOW.

CMOW	Meaning
0b0	SCTLR_EL1.CMOW is writeable.
0b1	SCTLR_EL1.CMOW is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA, bit [31]
When FEAT_PAuth is implemented:

Mask bit for EnIA.

EnIA	Meaning
0b0	SCTLR_EL1.EnIA is writeable.
0b1	SCTLR_EL1.EnIA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]
When FEAT_PAuth is implemented:

Mask bit for EnIB.

EnIB	Meaning
0b0	SCTLR_EL1.EnIB is writeable.
0b1	SCTLR_EL1.EnIB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When FEAT_LSMAOC is implemented:

Mask bit for LSMAOE.

LSMAOE	Meaning
0b0	SCTLR_EL1.LSMAOE is writeable.
0b1	SCTLR_EL1.LSMAOE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTLSMD, bit [28]

When FEAT_LSMAOC is implemented:

Mask bit for nTLSMD.

nTLSMD	Meaning
0b0	SCTLR_EL1.nTLSMD is writeable.
0b1	SCTLR_EL1.nTLSMD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDA, bit [27]

When FEAT_PAuth is implemented:

Mask bit for EnDA.

EnDA	Meaning
0b0	SCTLR_EL1.EnDA is writeable.
0b1	SCTLR_EL1.EnDA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Mask bit for UCI.

UCI	Meaning
0b0	SCTLR_EL1.UCI is writeable.
0b1	SCTLR_EL1.UCI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

When FEAT_MixedEnd is implemented:

Mask bit for EE.

EE	Meaning
0b0	SCTLR_EL1.EE is writeable.
0b1	SCTLR_EL1.EE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0E, bit [24]

When FEAT_MixedEndEL0 is implemented:

Mask bit for E0E.

E0E	Meaning
0b0	SCTLR_EL1.E0E is writeable.
0b1	SCTLR_EL1.E0E is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPAN, bit [23]
When FEAT_PAN is implemented:

Mask bit for SPAN.

SPAN	Meaning
0b0	SCTLR_EL1.SPAN is writeable.
0b1	SCTLR_EL1.SPAN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EIS, bit [22]
When FEAT_ExS is implemented:

Mask bit for EIS.

EIS	Meaning
0b0	SCTLR_EL1.EIS is writeable.
0b1	SCTLR_EL1.EIS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IESB, bit [21]
When FEAT_IESB is implemented:

Mask bit for IESB.

IESB	Meaning
0b0	SCTLR_EL1.IESB is writeable.
0b1	SCTLR_EL1.IESB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Mask bit for TSCXT.

TSCXT	Meaning
0b0	SCTLR_EL1.TSCXT is writeable.
0b1	SCTLR_EL1.TSCXT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WXN, bit [19]

Mask bit for WXN.

WXN	Meaning
0b0	SCTLR_EL1.WXN is writeable.
0b1	SCTLR_EL1.WXN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Mask bit for nTWE.

nTWE	Meaning
0b0	SCTLR_EL1.nTWE is writeable.
0b1	SCTLR_EL1.nTWE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Mask bit for nTWI.

nTWI	Meaning
0b0	SCTLR_EL1.nTWI is writeable.
0b1	SCTLR_EL1.nTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Mask bit for UCT.

UCT	Meaning
0b0	SCTLR_EL1.UCT is writeable.
0b1	SCTLR_EL1.UCT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Mask bit for DZE.

DZE	Meaning
0b0	SCTLR_EL1.DZE is writeable.
0b1	SCTLR_EL1.DZE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

When FEAT_PAuth is implemented:

Mask bit for EnDB.

EnDB	Meaning
0b0	SCTLR_EL1.EnDB is writeable.
0b1	SCTLR_EL1.EnDB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Mask bit for I.

I	Meaning
0b0	SCTLR_EL1.I is writeable.
0b1	SCTLR_EL1.I is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EOS, bit [11]

When FEAT_ExS is implemented:

Mask bit for EOS.

EOS	Meaning
0b0	SCTLR_EL1.EOS is writeable.
0b1	SCTLR_EL1.EOS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented:

Mask bit for EnRCTX.

EnRCTX	Meaning
0b0	SCTLR_EL1.EnRCTX is writeable.
0b1	SCTLR_EL1.EnRCTX is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UMA, bit [9]

Mask bit for UMA.

UMA	Meaning
0b0	SCTLR_EL1.UMA is writeable.
0b1	SCTLR_EL1.UMA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SED, bit [8]

When FEAT_AA32EL0 is implemented:

Mask bit for SED.

SED	Meaning
0b0	SCTLR_EL1.SED is writeable.
0b1	SCTLR_EL1.SED is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITD, bit [7]

When FEAT_AA32EL0 is implemented:

Mask bit for ITD.

ITD	Meaning
0b0	SCTLR_EL1.ITD is writeable.
0b1	SCTLR_EL1.ITD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nAA, bit [6]

When FEAT_LSE2:

Mask bit for nAA.

nAA	Meaning
0b0	SCTLR_EL1.nAA is writeable.
0b1	SCTLR_EL1.nAA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When FEAT_AA32EL0 is implemented:

Mask bit for CP15BEN.

CP15BEN	Meaning
0b0	SCTLR_EL1.CP15BEN is writeable.
0b1	SCTLR_EL1.CP15BEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SA0, bit [4]

Mask bit for SA0.

SA0	Meaning
0b0	SCTLR_EL1.SA0 is writeable.
0b1	SCTLR_EL1.SA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

Mask bit for SA.

SA	Meaning
0b0	SCTLR_EL1.SA is writeable.
0b1	SCTLR_EL1.SA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Mask bit for C.

C	Meaning
0b0	SCTLR_EL1.C is writeable.
0b1	SCTLR_EL1.C is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A, bit [1]

Mask bit for A.

A	Meaning
0b0	SCTLR_EL1.A is writeable.
0b1	SCTLR_EL1.A is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

M, bit [0]

Mask bit for M.

M	Meaning
0b0	SCTLR_EL1.M is writeable.
0b1	SCTLR_EL1.M is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing SCTLRMASK_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SCTLRMASK_EL1 or SCTLRMASK_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCTLRMASK_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0100	0b000

```

SCTLRMASK_EL2, System Control Masking Register (EL2)

The SCTLRMASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in SCTLR_EL2 on writes.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLRMASK_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLRMASK_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46
TIDCP	SPINTMASK	NMI	EnTP2	TCSO	TCSO0	EPAN	EnALS	EnAS0	EnASR	TME	TME0	TMT	TMT0	RES0			TWEDE
EnIA	EnIB	LSMAOE	nTLSMD	EnDA	UCI	EE	E0E	SPAN	EIS	IESB	TSCXT	WXN	nTWE	RES0	nTWI	UCT	DZE
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14

TIDCP, bit [63]

When FEAT_TIDCP1 is implemented:

Mask bit for TIDCP.

TIDCP	Meaning
0b0	SCTLR_EL2.TIDCP is writeable.
0b1	SCTLR_EL2.TIDCP is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]

When FEAT_NMI is implemented:

Mask bit for SPINTMASK.

SPINTMASK	Meaning
0b0	SCTLR_EL2.SPINTMASK is writeable.
0b1	SCTLR_EL2.SPINTMASK is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]
When FEAT_NMI is implemented:

Mask bit for NMI.

NMI	Meaning
0b0	SCTLR_EL2.NMI is writeable.
0b1	SCTLR_EL2.NMI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]
When FEAT_SME is implemented:

Mask bit for EnTP2.

EnTP2	Meaning
0b0	SCTLR_EL2.EnTP2 is writeable.
0b1	SCTLR_EL2.EnTP2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO, bit [59]
When FEAT_MTE_STORE_ONLY is implemented:

Mask bit for TCSO.

TCSO	Meaning
0b0	SCTLR_EL2.TCSO is writeable.
0b1	SCTLR_EL2.TCSO is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO0, bit [58]
When FEAT_MTE_STORE_ONLY is implemented:

Mask bit for TCSO0.

TCSO0	Meaning
0b0	SCTLR_EL2.TCSO0 is writeable.
0b1	SCTLR_EL2.TCSO0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPAN, bit [57]
When FEAT_PAN3 is implemented:

Mask bit for EPAN.

EPAN	Meaning
0b0	SCTLR_EL2.EPAN is writeable.
0b1	SCTLR_EL2.EPAN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]
When FEAT_LS64 is implemented:

Mask bit for EnALS.

EnALS	Meaning
0b0	SCTLR_EL2.EnALS is writeable.
0b1	SCTLR_EL2.EnALS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]
When FEAT_LS64_ACCDATA is implemented:

Mask bit for EnAS0.

EnAS0	Meaning
0b0	SCTLR_EL2.EnAS0 is writeable.
0b1	SCTLR_EL2.EnAS0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]
When FEAT_LS64_V is implemented:

Mask bit for EnASR.

EnASR	Meaning
0b0	SCTLR_EL2.EnASR is writeable.
0b1	SCTLR_EL2.EnASR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [53]
When FEAT_TME is implemented:

Mask bit for TME.

TME	Meaning
0b0	SCTLR_EL2.TME is writeable.
0b1	SCTLR_EL2.TME is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]

When FEAT_TME is implemented:

Mask bit for TME0.

TME0	Meaning
0b0	SCTLR_EL2.TME0 is writeable.
0b1	SCTLR_EL2.TME0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]

When FEAT_TME is implemented:

Mask bit for TMT.

TMT	Meaning
0b0	SCTLR_EL2.TMT is writeable.
0b1	SCTLR_EL2.TMT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]

When FEAT_TME is implemented:

Mask bit for TMT0.

TMT0	Meaning
0b0	SCTLR_EL2.TMT0 is writeable.
0b1	SCTLR_EL2.TMT0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [49:47]

Reserved, RES0.

TWEDEL, bit [46]

When FEAT_TWED is implemented:

Mask bit for TWEDEL.

TWEDEL	Meaning
0b0	SCTLR_EL2.TWEDEL is writeable.
0b1	SCTLR_EL2.TWEDEL is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]

When FEAT_TWED is implemented:

Mask bit for TWEDEn.

TWEDEn	Meaning
0b0	SCTLR_EL2.TWEDEn is writeable.
0b1	SCTLR_EL2.TWEDEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:

Mask bit for DSSBS.

DSSBS	Meaning
0b0	SCTLR_EL2.DSSBS is writeable.
0b1	SCTLR_EL2.DSSBS is not writeable.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

Mask bit for ATA.

ATA	Meaning
0b0	SCTLR_EL2.ATA is writeable.
0b1	SCTLR_EL2.ATA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented:

Mask bit for ATA0.

ATA0	Meaning
0b0	SCTLR_EL2.ATA0 is writeable.
0b1	SCTLR_EL2.ATA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [41]

Reserved, RES0.

TCF, bit [40]

When FEAT_MTE2 is implemented:

Mask bit for TCF.

TCF	Meaning
0b0	SCTLR_EL2.TCF is writeable.
0b1	SCTLR_EL2.TCF is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

TCF0, bit [38]

When FEAT_MTE2 is implemented:

Mask bit for TCF0.

TCF0	Meaning
0b0	SCTLR_EL2.TCF0 is writeable.
0b1	SCTLR_EL2.TCF0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE_ASYNC is implemented:

Mask bit for ITFSB.

ITFSB	Meaning
0b0	SCTLR_EL2.ITFSB is writeable.
0b1	SCTLR_EL2.ITFSB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]

When FEAT_BTI is implemented:

Mask bit for BT.

BT	Meaning
0b0	SCTLR_EL2.BT is writeable.
0b1	SCTLR_EL2.BT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]

When FEAT_BTI is implemented:

Mask bit for BT0.

BT0	Meaning
0b0	SCTLR_EL2.BT0 is writeable.
0b1	SCTLR_EL2.BT0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [34]

When FEAT_FPMR is implemented:

Mask bit for EnFPM.

EnFPM	Meaning
0b0	SCTLR_EL2.EnFPM is writeable.
0b1	SCTLR_EL2.EnFPM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MSCEn, bit [33]

When FEAT_MOPS is implemented:

Mask bit for MSCEn.

MSCEn	Meaning
0b0	SCTLR_EL2.MSCEn is writeable.
0b1	SCTLR_EL2.MSCEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [32]
When FEAT_CMOW is implemented:

Mask bit for CMOW.

CMOW	Meaning
0b0	SCTLR_EL2.CMOW is writeable.
0b1	SCTLR_EL2.CMOW is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA, bit [31]
When FEAT_PAuth is implemented:

Mask bit for EnIA.

EnIA	Meaning
0b0	SCTLR_EL2.EnIA is writeable.
0b1	SCTLR_EL2.EnIA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]
When FEAT_PAuth is implemented:

Mask bit for EnIB.

EnIB	Meaning
0b0	SCTLR_EL2.EnIB is writeable.
0b1	SCTLR_EL2.EnIB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]
When FEAT_LSMAOC is implemented:

Mask bit for LSMAOE.

LSMAOE	Meaning
0b0	SCTLR_EL2.LSMAOE is writeable.
0b1	SCTLR_EL2.LSMAOE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTLSMD, bit [28]
When FEAT_LSMAOC is implemented:

Mask bit for nTLSMD.

nTLSMD	Meaning
0b0	SCTLR_EL2.nTLSMD is writeable.
0b1	SCTLR_EL2.nTLSMD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDA, bit [27]
When FEAT_PAuth is implemented:

Mask bit for EnDA.

EnDA	Meaning
0b0	SCTLR_EL2.EnDA is writeable.
0b1	SCTLR_EL2.EnDA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Mask bit for UCI.

UCI	Meaning
0b0	SCTLR_EL2.UCI is writeable.
0b1	SCTLR_EL2.UCI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

When FEAT_MixedEnd is implemented:

Mask bit for EE.

EE	Meaning
0b0	SCTLR_EL2.EE is writeable.
0b1	SCTLR_EL2.EE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0E, bit [24]

When FEAT_MixedEndEL0 is implemented:

Mask bit for E0E.

E0E	Meaning
0b0	SCTLR_EL2.E0E is writeable.
0b1	SCTLR_EL2.E0E is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPAN, bit [23]

Mask bit for SPAN.

SPAN	Meaning
0b0	SCTLR_EL2.SPAN is writeable.
0b1	SCTLR_EL2.SPAN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EIS, bit [22]

When FEAT_ExS is implemented:

Mask bit for EIS.

EIS	Meaning
0b0	SCTLR_EL2.EIS is writeable.
0b1	SCTLR_EL2.EIS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IESB, bit [21]

When FEAT_IESB is implemented:

Mask bit for IESB.

IESB	Meaning
0b0	SCTLR_EL2.IESB is writeable.
0b1	SCTLR_EL2.IESB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Mask bit for TSCXT.

TSCXT	Meaning
0b0	SCTLR_EL2.TSCXT is writeable.
0b1	SCTLR_EL2.TSCXT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WXN, bit [19]

Mask bit for WXN.

WXN	Meaning
0b0	SCTLR_EL2.WXN is writeable.
0b1	SCTLR_EL2.WXN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Mask bit for nTWE.

nTWE	Meaning
0b0	SCTLR_EL2.nTWE is writeable.
0b1	SCTLR_EL2.nTWE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Mask bit for nTWI.

nTWI	Meaning
0b0	SCTLR_EL2.nTWI is writeable.
0b1	SCTLR_EL2.nTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Mask bit for UCT.

UCT	Meaning
0b0	SCTLR_EL2.UCT is writeable.
0b1	SCTLR_EL2.UCT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Mask bit for DZE.

DZE	Meaning
0b0	SCTLR_EL2.DZE is writeable.
0b1	SCTLR_EL2.DZE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

When FEAT_PAuth is implemented:

Mask bit for EnDB.

EnDB	Meaning
0b0	SCTLR_EL2.EnDB is writeable.
0b1	SCTLR_EL2.EnDB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Mask bit for I.

I	Meaning
0b0	SCTLR_EL2.I is writeable.
0b1	SCTLR_EL2.I is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EOS, bit [11]

When FEAT_ExS is implemented:

Mask bit for EOS.

EOS	Meaning
0b0	SCTLR_EL2.EOS is writeable.
0b1	SCTLR_EL2.EOS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented:

Mask bit for EnRCTX.

EnRCTX	Meaning
0b0	SCTLR_EL2.EnRCTX is writeable.
0b1	SCTLR_EL2.EnRCTX is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

When FEAT_AA32EL0 is implemented:

Mask bit for SED.

SED	Meaning
0b0	SCTLR_EL2.SED is writeable.
0b1	SCTLR_EL2.SED is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITD, bit [7]

When FEAT_AA32EL0 is implemented:

Mask bit for ITD.

ITD	Meaning
0b0	SCTLR_EL2.ITD is writeable.
0b1	SCTLR_EL2.ITD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nAA, bit [6]

Mask bit for nAA.

nAA	Meaning
0b0	SCTLR_EL2.nAA is writeable.
0b1	SCTLR_EL2.nAA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

When FEAT_AA32EL0 is implemented:

Mask bit for CP15BEN.

CP15BEN	Meaning
0b0	SCTLR_EL2.CP15BEN is writeable.
0b1	SCTLR_EL2.CP15BEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SA0, bit [4]

Mask bit for SA0.

SA0	Meaning
0b0	SCTLR_EL2.SA0 is writeable.
0b1	SCTLR_EL2.SA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

Mask bit for SA.

SA	Meaning
0b0	SCTLR_EL2.SA is writeable.
0b1	SCTLR_EL2.SA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Mask bit for C.

C	Meaning
0b0	SCTLR_EL2.C is writeable.
0b1	SCTLR_EL2.C is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A, bit [1]

Mask bit for A.

A	Meaning
0b0	SCTLR_EL2.A is writeable.
0b1	SCTLR_EL2.A is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

M, bit [0]

Mask bit for M.

M	Meaning
0b0	SCTLR_EL2.M is writeable.
0b1	SCTLR_EL2.M is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing SCTLRMASK_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SCTLRMASK_EL2 or SCTLRMASK_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCTLRMASK_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0100	0b000

```
if !(IsFeatureImplemented(FEAT_SRMASK) && IsFeatureImplemented(FEAT_AA64)) then

SCXTNUM_EL0, EL0 Read/Write Software Context Number

The SCXTNUM_EL0 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL0 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

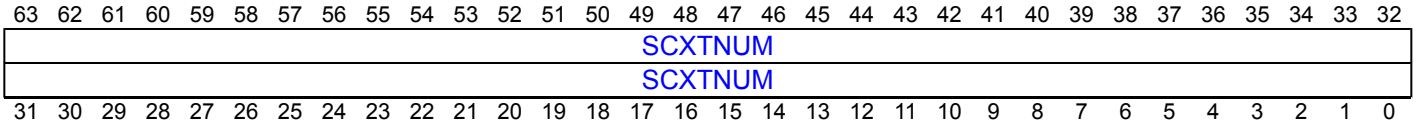
Configuration

This register is present only when (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to SCXTNUM_EL0 are UNDEFINED.

Attributes

SCXTNUM_EL0 is a 64-bit register.

Field descriptions



SCXTNUM, bits [63:0]

Software Context Number. A number to identify the context within the EL0 exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCXTNUM_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCXTNUM_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0000	0b111

SCXTNUM_EL1, EL1 Read/Write Software Context Number

The SCXTNUM_EL1 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL1 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

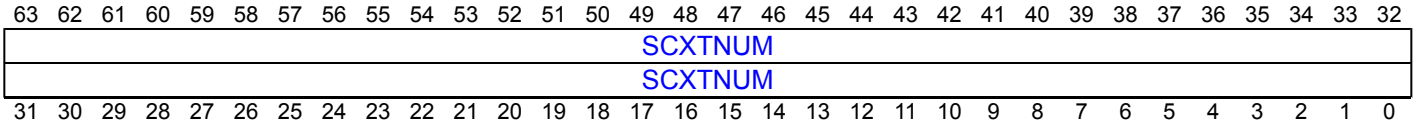
Configuration

This register is present only when (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to SCXTNUM_EL1 are UNDEFINED.

Attributes

SCXTNUM_EL1 is a 64-bit register.

Field descriptions



SCXTNUM, bits [63:0]

Software Context Number. A number to identify the context within the EL1 exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCXTNUM_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SCXTNUM_EL1 or SCXTNUM_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCXTNUM_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1101	0b0000	0b111

SCXTNUM_EL3, EL3 Read/Write Software Context Number

The SCXTNUM_EL3 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL3 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

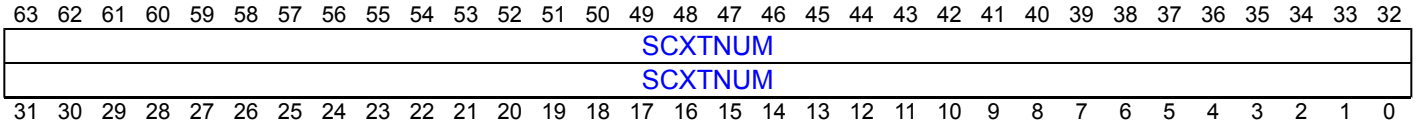
Configuration

This register is present only when EL3 is implemented, (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to SCXTNUM_EL3 are UNDEFINED.

Attributes

SCXTNUM_EL3 is a 64-bit register.

Field descriptions



SCXTNUM, bits [63:0]

Software Context Number. A number to identify the context within the EL3 exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCXTNUM_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SCXTNUM_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1101	0b0000	0b111

SDER32_EL2, AArch32 Secure Debug Enable Register

The SDER32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register SDER from Secure EL2 and EL3 only.

Configuration

AArch64 System register SDER32_EL2 bits [63:0] are architecturally mapped to AArch64 System register SDER32_EL3[63:0] when EL3 is implemented.

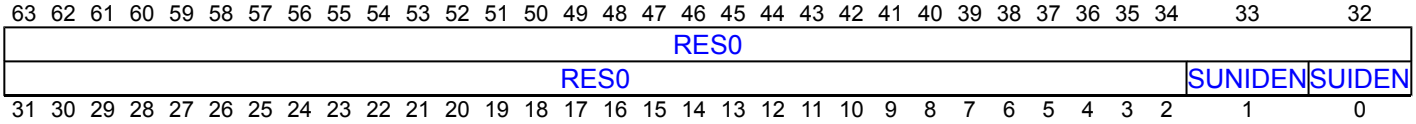
AArch64 System register SDER32_EL2 bits [31:0] are architecturally mapped to AArch32 System register SDER[31:0].

This register is present only when EL2 is implemented, FEAT_SEL2 is implemented, FEAT_AA32EL1 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to SDER32_EL2 are UNDEFINED.

Attributes

SDER32_EL2 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

SUNIDEN	Meaning
0b0	This bit has no effect on non-invasive debug.
0b1	Non-invasive debug is allowed in Secure EL0 using AArch32.

When Secure EL1 is using AArch32, the forms of non-invasive debug affected by this control are:

- The PC Sample-based Profiling Extension. See About the PC Sample-based Profiling Extension.
- When SelfHostedTraceEnabled() == FALSE, processor trace.
- When EL3 is implemented, Performance Monitors.

When Secure EL1 is using AArch64, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SUIDEN, bit [0]

When EL3 is implemented:

Secure User Invasive Debug Enable.

SUIDEN	Meaning
0b0	This bit does not affect the generation of debug exceptions at Secure EL0.
0b1	If EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing SDER32_EL2

Accesses to this register use the following encodings in the System register encoding space:

SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

Purpose

Allows access to the AArch32 register SDER from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register SDER32_EL3 bits [63:0] are architecturally mapped to AArch64 System register SDER32_EL2[63:0] when EL2 is implemented and FEAT_SEL2 is implemented.

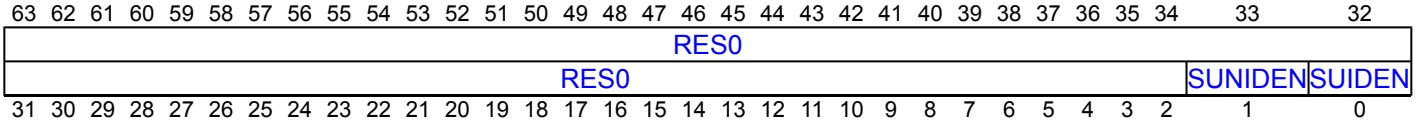
AArch64 System register SDER32_EL3 bits [31:0] are architecturally mapped to AArch32 System register SDER[31:0].

This register is present only when EL3 is implemented, FEAT_AA32EL1 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to SDER32_EL3 are UNDEFINED.

Attributes

SDER32_EL3 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

SUNIDEN	Meaning
0b0	This bit has no effect on non-invasive debug.
0b1	Non-invasive debug is allowed in Secure EL0 using AArch32.

When Secure EL1 is using AArch32, the forms of non-invasive debug affected by this control are:

- The PC Sample-based Profiling Extension. See About the PC Sample-based Profiling Extension.
- When SelfHostedTraceEnabled() == FALSE, processor trace.
- Performance Monitors.

When Secure EL1 is using AArch64, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SUIDEN, bit [0]

Secure User Invasive Debug Enable.

SUIDEN	Meaning
0b0	This bit does not affect the generation of debug exceptions at Secure EL0.
0b1	If EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SDER32_EL3

Accesses to this register use the following encodings in the System register encoding space:

```

SMCR_EL1, SME Control Register (EL1)

The SMCR_EL1 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at Exception levels EL1 and EL0.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMCR_EL1 are UNDEFINED.

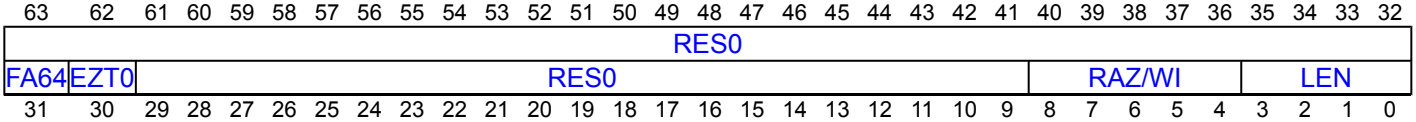
This register has no effect if the PE is not in Streaming SVE mode.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this register has no effect on execution at EL0.

Attributes

SMCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

FA64, bit [31]

When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction at EL1 is considered legal when executed in Streaming SVE mode.

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, controls whether execution of an A64 instruction at EL0 is considered legal when executed in Streaming SVE mode.

FA64	Meaning
0b0	This control does not cause any instruction to be treated as legal when executed in Streaming SVE mode.
0b1	This control causes all implemented A64 instructions to be treated as legal when executed in Streaming SVE mode at EL1 and EL0, if they are treated as legal at more privileged Exception levels in the current Security state.

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EZT0, bit [30]

When FEAT_SME2 is implemented:

Traps execution at EL1 and EL0 of the LDR, LUTI2, LUTI4, MOVT, STR, and ZERO instructions that access the ZT0 register to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE is 1.

The exception is reported using ESR_EL1.EC or ESR_EL2.EC value `0x1D`, with an ISS code of `0x0000004`, at a lower priority than a trap due to PSTATE.SM or PSTATE.ZA.

EZT0	Meaning
`0b0`	This control causes execution of these instructions at EL1 and EL0 to be trapped.
`0b1`	This control does not cause execution of any instruction to be trapped.

Changes to this field only affect whether instructions that access ZT0 are trapped. They do not affect the contents of ZT0, which remain valid so long as PSTATE.ZA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL1 of (LEN+1)*128 bits. This field also defines the Effective Streaming SVE vector length at EL0 when EL2 is not implemented, or EL2 is not enabled in the current Security state, or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL.

When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See ZCR_EL1.

For all purposes other than returning the result of a direct read of SMCR_EL1, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

1. If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
2. If EL2 is implemented and enabled in the current Security state, and the requested length is greater than the Effective length at EL2, then the Effective length at EL2 is used.
3. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
4. Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SMCR_EL1 or SMCR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SMCR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0010	0b110

SMCR_EL2, SME Control Register (EL2)

The SMCR_EL2 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at Exception levels EL2, EL1, and EL0.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMCR_EL2 are UNDEFINED.

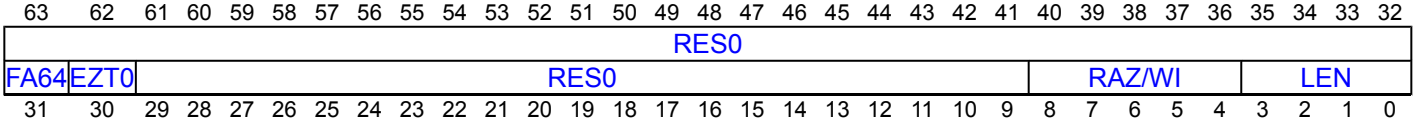
This register has no effect if the PE is not in Streaming SVE mode, or if EL2 is not enabled in the current Security state.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SMCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

FA64, bit [31]

When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction at EL2, EL1, and EL0 when EL2 is implemented and enabled in the current Security state is considered legal when executed in Streaming SVE mode.

FA64	Meaning
0b0	This control does not cause any instruction to be treated as legal when executed in Streaming SVE mode.
0b1	This control causes all implemented A64 instructions to be treated as legal when executed in Streaming SVE mode at EL2, EL1, and EL0, if they are treated as legal at EL3.

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EZT0, bit [30]

When FEAT_SME2 is implemented:

Traps execution at EL2, EL1, and EL0 of the LDR, LUTI2, LUTI4, MOVT, STR, and ZERO instructions that access the ZT0 register to EL2, when EL2 is enabled in the current Security state.

The exception is reported using ESR_EL2.EC value `0x1D`, with an ISS code of `0x0000004`, at a lower priority than a trap due to PSTATE.SM or PSTATE.ZA.

EZT0	Meaning
`0b0`	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
`0b1`	This control does not cause execution of any instruction to be trapped.

Changes to this field only affect whether instructions that access ZT0 are trapped. They do not affect the contents of ZT0, which remain valid so long as PSTATE.ZA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL2 of (LEN+1)*128 bits. This field also defines the Effective Streaming SVE vector length at EL0 when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL.

When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See ZCR_EL2.

For all purposes other than returning the result of a direct read of SMCR_EL2, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

1. If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
2. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
3. Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SMCR_EL2 or SMCR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SMCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0010	0b110

SMCR_EL3, SME Control Register (EL3)

The SMCR_EL3 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at all Exception levels.

Configuration

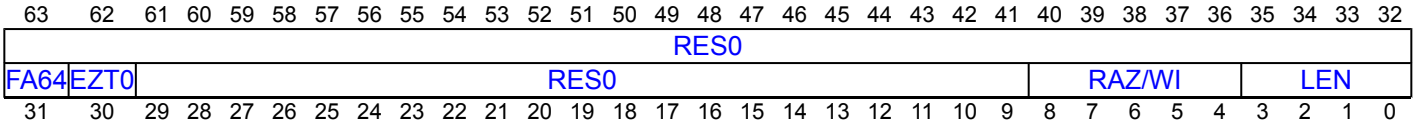
This register is present only when FEAT_SME is implemented and EL3 is implemented. Otherwise, direct accesses to SMCR_EL3 are UNDEFINED.

This register has no effect if the PE is not in Streaming SVE mode.

Attributes

SMCR_EL3 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

FA64, bit [31]

When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction is considered legal when executed in Streaming SVE mode.

FA64	Meaning
0b0	This control does not cause any instruction to be treated as legal when executed in Streaming SVE mode.
0b1	This control causes all implemented A64 instructions to be treated as legal when executed in Streaming SVE mode .

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EZT0, bit [30]

When FEAT_SME2 is implemented:

Traps execution at all Exception levels of the LDR, LUTI2, LUTI4, MOVT, STR, and ZERO instructions that access the ZT0 register to EL3.

The exception is reported using ESR_EL3.EC value 0x1D, with an ISS code of 0x0000004, at a lower priority than a trap due to PSTATE.SM or PSTATE.ZA.

EZT0	Meaning
0b0	This control causes execution of these instructions at all Exception levels to be trapped.
0b1	This control does not cause execution of any instruction to be trapped.

Changes to this field only affect whether instructions that access ZT0 are trapped. They do not affect the contents of ZT0, which remain valid so long as PSTATE.ZA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL3 of (LEN+1)*128 bits.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL.

When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See ZCR_EL3.

For all purposes other than returning the result of a direct read of SMCR_EL3, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

1. If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
2. Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL3.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMIDR_EL1, Streaming Mode Identification Register

The SMIDR_EL1 characteristics are:

Purpose

Provides additional identification mechanisms for scheduling purposes, for a PE that supports Streaming SVE mode.

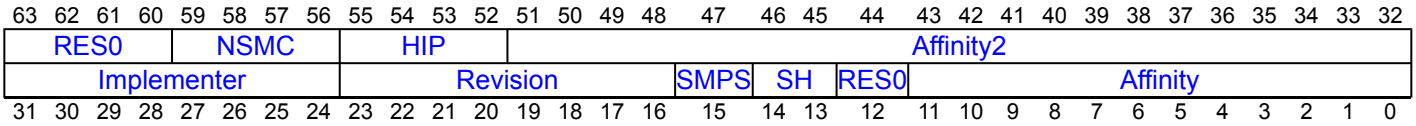
Configuration

This register is present only when FEAT_SME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SMIDR_EL1 are UNDEFINED.

Attributes

SMIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:60]

Reserved, RES0.

NSMC, bits [59:56]

If SMIDR_EL1.{SH,Affinity} indicates that the implementation of Streaming SVE mode is shared, then this field identifies the number of SMCUs, minus 1, associated with the concatenated SMIDR_EL1.{Affinity2,Affinity} 32-bit value.

If SMIDR_EL1.{SH,Affinity} indicates that the implementation of Streaming SVE mode is not shared, then this field is zero and should be ignored by software.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NSMC	Meaning
0b0000	The implementation of Streaming SVE mode associated with this PE is not shared or is a single SMCU.
0b0001..0b1110	The number of SMCUs in the group of SMCUs providing the implementation of Streaming SVE mode for this PE, minus 1.
0b1111	Reserved.

Access to this field is **RO**.

HIP, bits [55:52]

When FEAT_SME2p2 is implemented and SMIDR_EL1.SMPS == 1:

Highest Implemented Priority. If Streaming SVE mode execution priority is supported, this field indicates the range of priority levels implemented by the PE, and the Highest Implemented Priority value.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HIP	Meaning
0b0000	All streaming execution priorities from 0 to 15 are implemented. The Highest Implemented Priority value is 15.
0b0001..0b1111	All streaming execution priorities less than or equal to this value are implemented. The Highest Implemented Priority value is the value of this field.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Affinity2, bits [51:32]

The most significant 20 bits of the SMCU affinity for this PE, to be used in conjunction with SMIDR_EL1.Affinity.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

It is not required that this value is the same as the value of MIDR_EL1.Implementer.

Access to this field is **RO**.

Revision, bits [23:16]

Revision number for the Streaming Mode Compute Unit (SMCU).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SMPS, bit [15]

Indicates support for Streaming SVE mode execution priority.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SMPS	Meaning
0b0	Priority control not supported.
0b1	Priority control supported.

Access to this field is **RO**.

SH, bits [14:13]

Indicates whether the implementation of Streaming SVE mode in this PE is shared with other PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SH	Meaning
0b00	Refer to SMIDR_EL1.Affinity.
0b01	Reserved.
0b10	The implementation of Streaming SVE mode is not shared with other PEs.
0b11	The implementation of Streaming SVE mode is shared with other PEs.

Access to this field is **RO**.

Bit [12]

Reserved, RES0.

Affinity, bits [11:0]

The least significant 12 bits of the SMCU affinity for this PE.

If the implementation of Streaming SVE mode is shared, then the concatenated SMIDR_EL1.{Affinity2,Affinity} 32-bit value identifies which shared SMCUs are associated with this PE. Every PE that shares the same SMCUs has the same 32-bit affinity value. The 32-bit affinity value is unique within the system as a whole.

The SMIDR_EL1.SH field indicates whether the implementation of Streaming SVE mode is shared with other PEs. However, if SMIDR_EL1.SH is zero, then SMIDR_EL1.Affinity is used to indicate whether the implementation of Streaming SVE is shared, as follows:

- If SMIDR_EL1.Affinity is zero, then the implementation of Streaming SVE mode is not shared with other PEs.
- If SMIDR_EL1.Affinity is not zero, then the implementation of Streaming SVE mode is shared with other PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing SMIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SMIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b110

```
if !(IsFeatureImplemented(FEAT_SME) && IsFeatureImplemented(FEAT_AA64)) then
    UnimplementedIDRegister();
elsif PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then

SMPRI_EL1, Streaming Mode Priority Register

The SMPRI_EL1 characteristics are:

Purpose

Configures the streaming execution priority for instructions executed on a shared Streaming Mode Compute Unit (SMCU) when the PE is in Streaming SVE mode at any Exception level.

Configuration

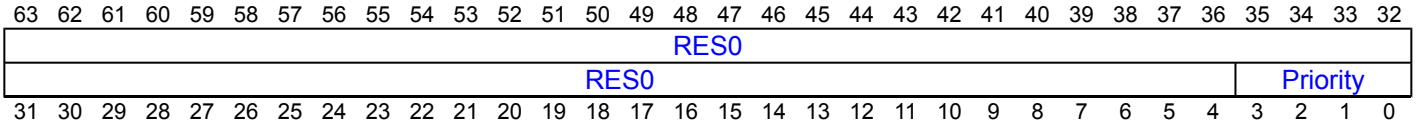
This register is present only when FEAT_SME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SMPRI_EL1 are UNDEFINED.

When SMIDR_EL1.SMPS is '0', this register is RES0.

Attributes

SMPRI_EL1 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

Priority, bits [3:0]

Streaming execution priority value.

Either this value is used directly, or it is mapped into an effective priority value using SMPRIMAP_EL2.

This value is used directly when any of the following are true:

- The current Exception level is EL3 or EL2.
- The current Exception level is EL1 or EL0, if EL2 is implemented and enabled in the current Security state and HCRX_EL2.SMPME is '0'.
- The current Exception level is EL1 or EL0, if EL2 is either not implemented or not enabled in the current Security state.

The precise meaning and behavior of each streaming execution priority value is IMPLEMENTATION DEFINED.

In an implementation that shares execution resources between PEs, higher priority values are allocated more processing resource than other PEs configured with lower priority values in the same Priority domain.

If FEAT_SME2p2 is implemented, and this field is greater than the Highest Implemented Priority value indicated by SMIDR_EL1.HIP, then the PE uses the Highest Implemented Priority value as the priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMPRIMAP_EL2, Streaming Mode Priority Mapping Register

The SMPRIMAP_EL2 characteristics are:

Purpose

Maps the value in SMPRI_EL1 to a streaming execution priority value for instructions executed at EL1 and EL0 in the same Security states as EL2.

Configuration

This register is present only when FEAT_SME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SMPRIMAP_EL2 are UNDEFINED.

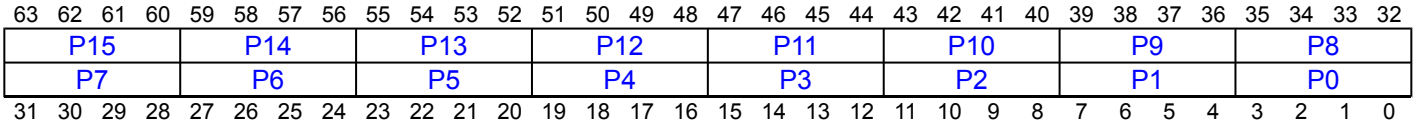
When SMIDR_EL1.SMPS is '0', this register is RES0.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SMPRIMAP_EL2 is a 64-bit register.

Field descriptions



When all of the following are true, the value in SMPRI_EL1 is mapped to a streaming execution priority using this register:

- The current Exception level is EL1 or EL0.
- EL2 is implemented and enabled in the current Security state.
- HCRX_EL2.SMPME is '1'.

Otherwise, SMPRI_EL1 holds the streaming execution priority value.

P15, bits [63:60]

Priority Mapping Entry 15. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '15'.

This value is the highest streaming execution priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P14, bits [59:56]

Priority Mapping Entry 14. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '14'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P13, bits [55:52]

Priority Mapping Entry 13. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '13'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P12, bits [51:48]

Priority Mapping Entry 12. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '12'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P11, bits [47:44]

Priority Mapping Entry 11. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '11'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P10, bits [43:40]

Priority Mapping Entry 10. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '10'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P9, bits [39:36]

Priority Mapping Entry 9. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '9'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P8, bits [35:32]

Priority Mapping Entry 8. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '8'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P7, bits [31:28]

Priority Mapping Entry 7. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '7'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P6, bits [27:24]

Priority Mapping Entry 6. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '6'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P5, bits [23:20]

Priority Mapping Entry 5. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '5'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P4, bits [19:16]

Priority Mapping Entry 4. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '4'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P3, bits [15:12]

Priority Mapping Entry 3. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '3'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P2, bits [11:8]

Priority Mapping Entry 2. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '2'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P1, bits [7:4]

Priority Mapping Entry 1. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '1'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P0, bits [3:0]

Priority Mapping Entry 0. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '0'.

This value is the lowest streaming execution priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMPRIMAP_EL2

SP_EL3, Stack Pointer (EL3)

The SP_EL3 characteristics are:

Purpose

Holds the stack pointer associated with EL3. The value of SPSel.SP determines the current stack pointer.

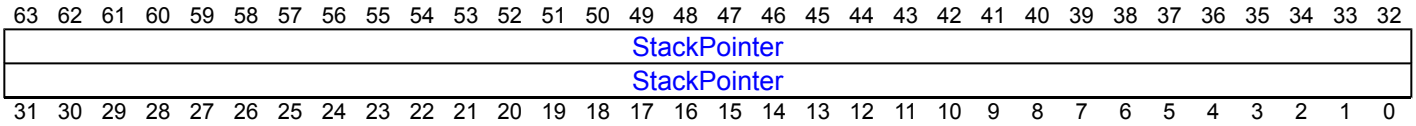
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SP_EL3 are UNDEFINED.

Attributes

SP_EL3 is a 64-bit register.

Field descriptions



StackPointer, bits [63:0]

Stack pointer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SP_EL3

This register is not accessible using MRS and MSR instructions.

When the value of SPSel.SP is 1, this register is accessible at EL3 as the current stack pointer.

Note

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

P<m>, bits [2m+1:2m], for m = 31 to 0

System PMU <m> access. Controls access to System PMU <m>.

P<m>	Meaning
0b00	MRS read and MSR write System register accesses to System PMU <m> at EL0 are trapped to EL1, unless the instruction generates a higher priority exception.
0b01	MSR write System register accesses to System PMU <m> at EL0 are trapped to EL1, unless the instruction generates a higher priority exception.
0b11	This control does not cause any instructions to be trapped.

All other values are reserved.

The registers trapped by this control are:

AArch64: SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMOVSCLR_EL0, and SPMOVSSET_EL0.

This field is ignored by the PE when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H,TGE} is {1,1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m > UInt(ID_AA64DFR1_EL1.SYSPMUID), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Accessing SPMACCESSR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SPMACCESSR_EL1 or SPMACCESSR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMACCESSR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b011

SPMACCESSR_EL2, System Performance Monitors Access Register (EL2)

The SPMACCESSR_EL2 characteristics are:

Purpose

Controls access to System PMUs from EL1 and EL0.

Configuration

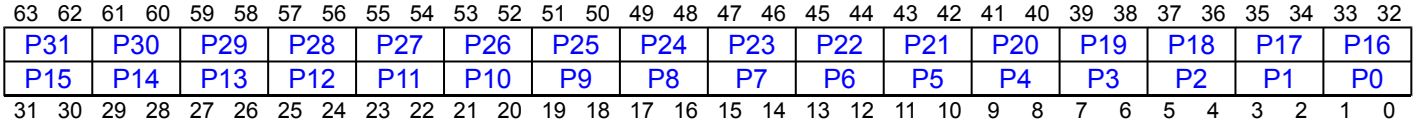
This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMACCESSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SPMACCESSR_EL2 is a 64-bit register.

Field descriptions



P<m>, bits [2m+1:2m], for m = 31 to 0

System PMU <m> access. Controls access to System PMU <m>.

P<m>	Meaning
0b00	MRS read and MSR write System register accesses to System PMU <m> at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.
0b01	MSR write System register accesses to System PMU <m> at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.
0b11	This control does not cause any instructions to be trapped.

All other values are reserved.

The registers trapped by this control are:

AArch64: SPMCFGR_EL1, SPMCGCR<n>_EL1, SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMDEVAFF_EL1, SPMDEVARCH_EL1, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMIIDR_EL1, SPMINTENCLR_EL1, SPMINTENSET_EL1, SPMOVSCLR_EL0, SPMOVSSET_EL0, and SPMSCR_EL1.

This field is ignored by the PE when EL2 is not implemented or disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m > UInt(ID_AA64DFR1_EL1.SYSPMUID), access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Accessing SPMACCESSR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SPMACCESSR_EL2 or SPMACCESSR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMACCESSR_EL2

Purpose

Describes the capabilities of System PMU <s>.

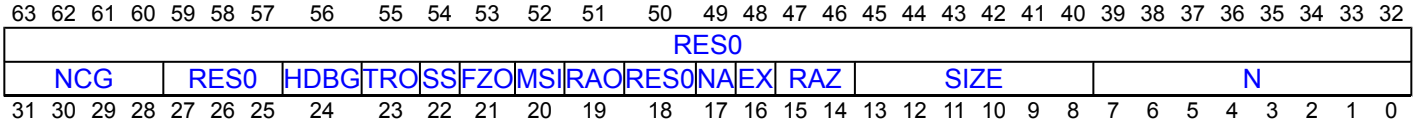
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMCFGR_EL1 are UNDEFINED.

Attributes

SPMCFGR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

NCG, bits [31:28]

Counter Groups.

Defines the number of counter groups implemented by System PMU <s>, minus one.

If this field is zero, then one counter group is implemented and SPMCGCR<n>_EL1 read-as-zero.

Otherwise, for each counter group <m>, SPMCGCR<m DIV 8>_EL1.N<m MOD 8> defines the number of counters in the group.

Locating the first counter in each group depends on the number of implemented groups. Each counter group starts with counter:

- SPMEVTYPER<m×32>_EL0, meaning there are at most 32 counters per group, if there are 2 counter groups.
- SPMEVTYPER<m×16>_EL0, meaning there are at most 16 counters per group, if there are 3 or 4 counter groups.
- SPMEVTYPER<m×8>_EL0, meaning there are at most 8 counters per group, if there are between 5 and 8 counter groups.
- SPMEVTYPER<m×4>_EL0, meaning there are at most 4 counters per group, if there are more than 8 counter groups.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

TRO, bit [23]

Trace output supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SS, bit [22]

Snapshot supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

FZO, bit [21]

Freeze-on-overflow supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

MSI, bit [20]

Message-signaled interrupts supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [19]

Reserved, RAO.

Bit [18]

Reserved, RES0.

NA, bit [17]

No write access when running. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

EX, bit [16]

Export supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [15:14]

Reserved, RAZ.

SIZE, bits [13:8]

Counter size. The size of the largest counter implemented by System PMU <s>.

SIZE	Meaning
0b000111	8-bit counters.
0b001001	10-bit counters.
0b001011	12-bit counters.
0b001111	16-bit counters.
0b010011	20-bit counters.
0b010111	24-bit counters.
0b011111	32-bit counters.
0b100011	36-bit counters.
0b100111	40-bit counters.
0b101011	44-bit counters.
0b101111	48-bit counters.
0b110011	52-bit counters.
0b110111	56-bit counters.
0b111111	64-bit counters.

All other values are reserved.

Not all counters must be this size. For example, a System PMU might include a mix of 32-bit and 64-bit counters.

N, bits [7:0]

Number of event counters implemented by System PMU <s>, minus 1.

N	Meaning
0x00..0x3F	Number of event counters implemented by System PMU <s>, minus 1.

All other values are reserved.

Accessing SPMCFGR_EL1

To access SPMCFGR_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMCFGR_EL1 reads-as-zero if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMCFGR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b111

SPMCGCR<n>_EL1, System PMU Counter Group Configuration Registers, n = 0 - 1

The SPMCGCR<n>_EL1 characteristics are:

Purpose

Describes the configuration of counter groups in System PMU <s>.

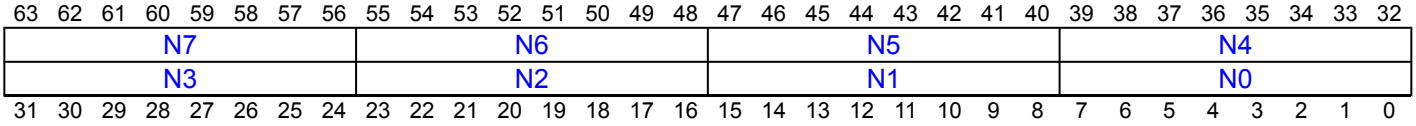
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMCGCR<n>_EL1 are UNDEFINED.

Attributes

SPMCGCR<n>_EL1 is a 64-bit register.

Field descriptions



N<m>, bits [8m+7:8m], for m = 7 to 0

Number of counters in counter group 8n+m.

The maximum size of each counter group depends on the number of implemented groups and the largest implemented counter size. For more information, see SPMCFGR_EL1.NCG.

Accessing SPMCGCR<n>_EL1

To access SPMCGCR<n>_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMCGCR<n>_EL1 reads-as-zero if any of the following are true:

- System PMU <s> implements one counter group (SPMCFGR_EL1.NCG is zero).
- System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMCGCR<m>_EL1 ; Where m = 0-1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b00:m[0]

```
integer m = UInt(op2<0>);

SPMCNTENCLR_EL0, System Performance Monitors Count Enable Clear Register

The SPMCNTENCLR_EL0 characteristics are:

Purpose

Disable event counters in System PMU <s>.

Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMCNTENCLR_EL0 are UNDEFINED.

Attributes

SPMCNTENCLR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33

P<m>, bit [m], for m = 63 to 0

Event counter <m> disable.

P<m>	Meaning
0b0	Event counter <m> in System PMU <s> is disabled.
0b1	Event counter <m> in System PMU <s> is enabled.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When event counter <m> is not implemented by System PMU <s>, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1C**.

Accessing SPMCNTENCLR_EL0

To access SPMCNTENCLR_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMCNTENCLR_EL0 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMCNTENCLR_EL0
```

SPMCNTENSET_EL0, System Performance Monitors Count Enable Set Register

The SPMCNTENSET_EL0 characteristics are:

Purpose

Enables event counters in System PMU <s>.

Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMCNTENSET_EL0 are UNDEFINED.

Attributes

SPMCNTENSET_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33

P<m>, bit [m], for m = 63 to 0

Event counter <m> enable.

P<m>	Meaning
0b0	Event counter <m> in System PMU <s> is disabled.
0b1	Event counter <m> in System PMU <s> is enabled.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When event counter <m> is not implemented by System PMU <s>, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **W1S**.

Accessing SPMCNTENSET_EL0

To access SPMCNTENSET_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMCNTENSET_EL0 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMCNTENSET_EL0
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b001

SPMCR_EL0, System Performance Monitor Control Register

The SPMCR_EL0 characteristics are:

Purpose

Main control register for System PMU <s>.

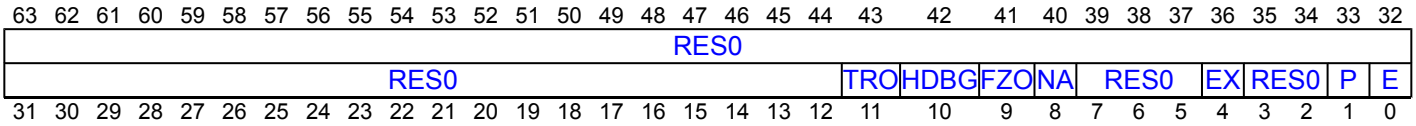
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMCR_EL0 are UNDEFINED.

Attributes

SPMCR_EL0 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

TRO, bit [11]

When SPMCFGR_EL1.TRO == 1:

Trace enable. For more information on this field, see 'CoreSight PMU Architecture'.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When PSTATE.EL == EL0, access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

HDBG, bit [10]

When SPMCFGR_EL1.HDBG == 1:

Halt-on-debug. For more information on this field, see 'CoreSight PMU Architecture'.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When PSTATE.EL == EL0, access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

FZO, bit [9]
When SPMCFGR_EL1.FZO == 1:

Freeze-on-overflow. For more information on this field, see 'CoreSight PMU Architecture'.

Note

If implemented by a System PMU, then freeze-on-overflow affects only the counters of System PMU <s>, not other System PMUs nor the PE PMU.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NA, bit [8]
When SPMCFGR_EL1.NA == 1:

Not accessible. For more information on this field, see 'CoreSight PMU Architecture'.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [7:5]

Reserved, RES0.

EX, bit [4]
When SPMCFGR_EL1.EX == 1:

Export enable. For more information on this field, see 'CoreSight PMU Architecture'.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [3:2]

Reserved, RES0.

P, bit [1]

Event counter reset.

P	Meaning
0b0	Write is ignored.
0b1	Reset all event counters in System PMU <s> to zero.

Note

Resetting the event counters does not affect any overflow flags.

Access to this field is **WO/RAZ**.

E, bit [0]

Count enable. This field controls System PMU <s>.

E	Meaning
0b0	Monitor is disabled.
0b1	Monitor is enabled.

Performance monitor overflow IRQs are only signaled by System PMU <s> when this field is 1.

The reset behavior of this field is:

- On a System PMU reset, this field resets to '0'.

Accessing SPMCR_EL0

To access SPMCR_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMCR_EL0 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMCR_EL0
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b000

SPMDEVAFF_EL1, System Performance Monitors Device Affinity Register

The SPMDEVAFF_EL1 characteristics are:

Purpose

For additional information, see the CoreSight Architecture Specification.

For a System PMU that has affinity with a single PE or a group of PEs, SPMDEVAFF_EL1 is a copy of MPIDR_EL1 or part of MPIDR_EL1:

- If the System PMU has affinity with a single PE, then the affinity level is 0 and SPMDEVAFF_EL1 reads the same value as MPIDR_EL1, and SPMDEVAFF_EL1.F0V reads-as-one to indicate affinity level 0.
- If the System PMU has affinity with a group of PEs, then the affinity level is 1, 2, or 3, parts of SPMDEVAFF_EL1 reads the same value as parts of MPIDR_EL1, and the rest of SPMDEVAFF_EL1 indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in MPIDR_EL1.{Aff3,Aff2}, and these values are equal to SPMDEVAFF_EL1.{Aff3,Aff2}.
- SPMDEVAFF_EL1.Aff1 is nonzero and not `0x80`, and SPMDEVAFF_EL1.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the System PMU has affinity with is indicated by the least-significant set bit in SPMDEVAFF_EL1.Aff1. In this example, if SPMDEVAFF_EL1.Aff1[2:0] is `0b100`, then the System PMU has affinity with the up-to 8 PEs that have MPIDR_EL1.Aff1[7:3] == SPMDEVAFF_EL1.Aff1[7:3].

Depending on the IMPLEMENTATION DEFINED nature of the system, it might be possible that SPMDEVAFF_EL1 is read before system firmware has configured the System PMU and/or the PE or group of PEs that the System PMU has affinity with. When this is the case, SPMDEVAFF_EL1 reads-as-zero.

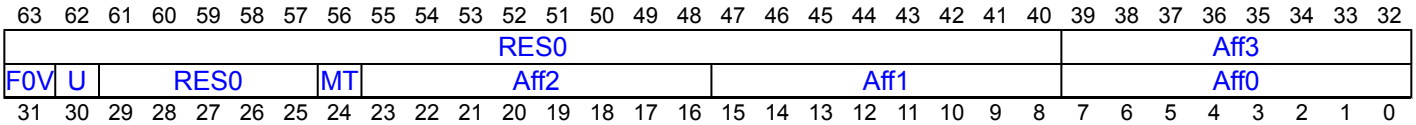
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMDEVAFF_EL1 are UNDEFINED.

Attributes

SPMDEVAFF_EL1 is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

PE affinity level 3. The MPIDR_EL1.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

F0V, bit [31]

Indicates that the SPMDEVAFF_EL1.Aff0 field is valid.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F0V	Meaning
0b0	SPMDEVAFF_EL1.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.
0b1	SPMDEVAFF_EL1.Aff0 is valid, and the PE affinity is at level 0.

Access to this field is **RO**.

U, bit [30]

When SPMDEVAFF_EL1.F0V == 1:

Uniprocessor. The MPIDR_EL1.U field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

When SPMDEVAFF_EL1.F0V == 1:

Multithreaded. The MPIDR_EL1.MT field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]

When affine with a PE or PEs at affinity level 2 or below:

PE affinity level 2. The MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When affine with a sub-set of PEs at affinity level 2:

PE affinity level 2. Defines part of the MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff2	Meaning
0bxxxxxxx1	SPMDEVAFF_EL1.Aff2[7:1] is the value of MPIDR_EL1.Aff2[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	SPMDEVAFF_EL1.Aff2[7:2] is the value of MPIDR_EL1.Aff2[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	SPMDEVAFF_EL1.Aff2[7:3] is the value of MPIDR_EL1.Aff2[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	SPMDEVAFF_EL1.Aff2[7:4] is the value of MPIDR_EL1.Aff2[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	SPMDEVAFF_EL1.Aff2[7:5] is the value of MPIDR_EL1.Aff2[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	SPMDEVAFF_EL1.Aff2[7:6] is the value of MPIDR_EL1.Aff2[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	SPMDEVAFF_EL1.Aff2[7] is the value of MPIDR_EL1.Aff2[7], viewed from the highest Exception level of the associated PEs.

Access to this field is **RO**.

Otherwise:

PE affinity level NOT DEFINED. Indicates whether the PE affinity is at level 3.

Aff2	Meaning
0x80	PE affinity is at level 3.

All other values are reserved.

Access to this field is **RO**.

Aff1, bits [15:8]

When affine with a PE or PEs at affinity level 1 or below:

PE affinity level 1. The MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When affine with a sub-set of PEs at affinity level 1:

PE affinity level 1. Defines part of the MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff1	Meaning
0bxxxxxxx1	SPMDEVAFF_EL1.Aff1[7:1] is the value of MPIDR_EL1.Aff1[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	SPMDEVAFF_EL1.Aff1[7:2] is the value of MPIDR_EL1.Aff1[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	SPMDEVAFF_EL1.Aff1[7:3] is the value of MPIDR_EL1.Aff1[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	SPMDEVAFF_EL1.Aff1[7:4] is the value of MPIDR_EL1.Aff1[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	SPMDEVAFF_EL1.Aff1[7:5] is the value of MPIDR_EL1.Aff1[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	SPMDEVAFF_EL1.Aff1[7:6] is the value of MPIDR_EL1.Aff1[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	SPMDEVAFF_EL1.Aff1[7] is the value of MPIDR_EL1.Aff1[7], viewed from the highest Exception level of the associated PEs.

Access to this field is **RO**.

Otherwise:

PE affinity level 1. Indicates whether the PE affinity is at level 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff1	Meaning
0x00	PE affinity is above level 2 or a subset of level 2.
0x80	PE affinity is at level 2.

Access to this field is **RO**.

Aff0, bits [7:0]

When affine with a PE at affinity level 0:

PE affinity level 0. The MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When affine with a sub-set of PEs at affinity level 0:

PE affinity level 0. Defines part of the MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff0	Meaning
0bxxxxxxx1	SPMDEVAFF_EL1.Aff0[7:1] is the value of MPIDR_EL1.Aff0[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	SPMDEVAFF_EL1.Aff0[7:2] is the value of MPIDR_EL1.Aff0[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	SPMDEVAFF_EL1.Aff0[7:3] is the value of MPIDR_EL1.Aff0[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	SPMDEVAFF_EL1.Aff0[7:4] is the value of MPIDR_EL1.Aff0[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	SPMDEVAFF_EL1.Aff0[7:5] is the value of MPIDR_EL1.Aff0[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	SPMDEVAFF_EL1.Aff0[7:6] is the value of MPIDR_EL1.Aff0[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	SPMDEVAFF_EL1.Aff0[7] is the value of MPIDR_EL1.Aff0[7], viewed from the highest Exception level of the associated PEs.

Access to this field is **RO**.

Otherwise:

PE affinity level 0. Indicates whether the PE affinity is at level 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff0	Meaning
0x00	PE affinity is above level 1 or a subset of level 1.
0x80	PE affinity is at level 1.

Access to this field is **RO**.

Accessing SPMDEVAFF_EL1

Reads of SPMDEVAFF_EL1 are not affected by the value of VMPIDR_EL2 at any Exception level.

If System PMU <s> has affinity only with this PE, then it is IMPLEMENTATION DEFINED whether SPMDEVAFF_EL1 reads-as-zero or reads the same value as MPIDR_EL1.

To access SPMDEVAFF_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMDEVAFF_EL1 reads-as-zero if any of the following are true:

- System PMU <s> is not implemented.
- System PMU <s> has no affinity with the PE or cluster of PEs.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMDEVAFF_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b110

```

SPMDEVARCH_EL1, System Performance Monitors Device Architecture Register

The SPMDEVARCH_EL1 characteristics are:

Purpose

Provides discovery information for System PMU <s>.

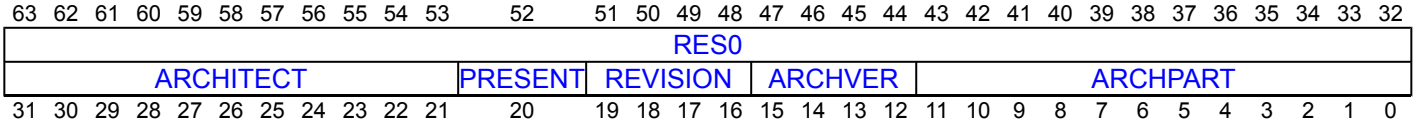
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMDEVARCH_EL1 are UNDEFINED.

Attributes

SPMDEVARCH_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PRESENT, bit [20]

DEVARCH present. Defines that SPMDEVARCH_EL1 register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

If SPMDEVARCH_EL1 is not present, the register is RES0.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

SPMDEVARCH_EL1.ARCHVER and SPMDEVARCH_EL1.ARCHPART are also defined as a single field, SPMDEVARCH_EL1.ARCHID, so that SPMDEVARCH_EL1.ARCHVER is SPMDEVARCH_EL1.ARCHID[15:12].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

SPMDEVARCH_EL1.ARCHVER and SPMDEVARCH_EL1.ARCHPART are also defined as a single field, SPMDEVARCH_EL1.ARCHID, so that SPMDEVARCH_EL1.ARCHPART is SPMDEVARCH_EL1.ARCHID[11:0].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing SPMDEVARCH_EL1

To access SPMDEVARCH_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMDEVARCH_EL1 reads-as-zero if any of the following are true:

- System PMU <s> is not implemented.
- System PMU <s> does not implement SPMDEVARCH_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```

SPMEVCNTR<n>_EL0, System Performance Monitors Event Count Register, n = 0 - 63

The SPMEVCNTR<n>_EL0 characteristics are:

Purpose

Event counter <n> in System PMU <s>, where n is 0 to 63.

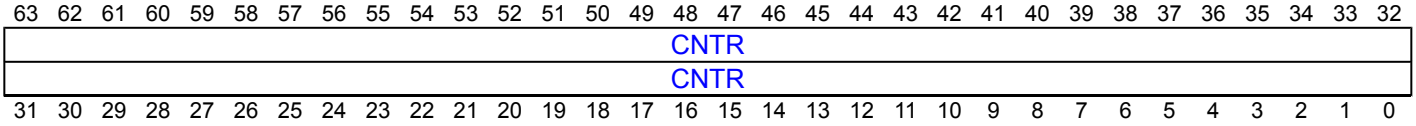
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMEVCNTR<n>_EL0 are UNDEFINED.

Attributes

SPMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions



CNTR, bits [63:0]

Event counter n.

The number of implemented bits for SPMEVCNTR<n>_EL0 is IMPLEMENTATION DEFINED. Unimplemented bits are RES0.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing SPMEVCNTR<n>_EL0

To access SPMEVCNTR<n>_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s and SPMSELR_EL0.BANK to n[5:4].

SPMEVCNTR<n>_EL0 reads-as-zero and ignores writes if any of the following are true:

- Event counter <n> is not implemented by System PMU <s>.
- System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMEVCNTR<m>_EL0 ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b1110	0b000:m[3]	m[2:0]

```
integer m = UInt(CRm<0>:op2<2:0>);

SPMEVFILT2R<n>_EL0, System Performance Monitors Event Filter Control Register 2, n = 0 - 63

The SPMEVFILT2R<n>_EL0 characteristics are:

Purpose

With SPMEVTYPER<n>_EL0 and SPMEVFILTR<n>_EL0, configures when event counter SPMEVCNTR<n>_EL0 in System PMU <s> increments.

The contents of this register are IMPLEMENTATION DEFINED. For more information, see SPMEVTYPER<n>_EL0.

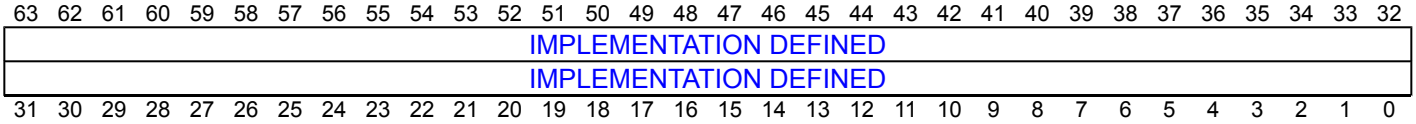
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMEVFILT2R<n>_EL0 are UNDEFINED.

Attributes

SPMEVFILT2R<n>_EL0 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing SPMEVFILT2R<n>_EL0

To access SPMEVFILT2R<n>_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s and SPMSELR_EL0.BANK to n[5:4].

SPMEVFILT2R<n>_EL0 reads-as-zero and ignores writes if any of the following are true:

- Event counter <n> is not implemented by System PMU <s>.
- System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMEVFILT2R<m>_EL0 ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b1110	0b011:m[3]	m[2:0]

SPMEVFILTR<n>_EL0, System Performance Monitors Event Filter Control Register, n = 0 - 63

The SPMEVFILTR<n>_EL0 characteristics are:

Purpose

With SPMEVTYPER<n>_EL0 and SPMEVFILT2R<n>_EL0, configures when event counter SPMEVCNTR<n>_EL0 in System PMU <s> increments.

The contents of this register are IMPLEMENTATION DEFINED. For more information, see SPMEVTYPER<n>_EL0.

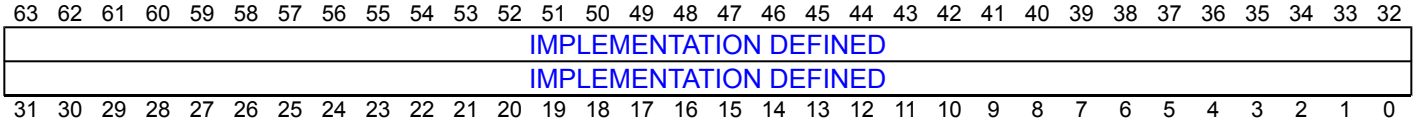
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMEVFILTR<n>_EL0 are UNDEFINED.

Attributes

SPMEVFILTR<n>_EL0 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing SPMEVFILTR<n>_EL0

To access SPMEVFILTR<n>_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s and SPMSELR_EL0.BANK to n[5:4].

SPMEVFILTR<n>_EL0 reads-as-zero and ignores writes if any of the following are true:

- Event counter <n> is not implemented by System PMU <s>.
- System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMEVFILTR<m>_EL0 ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b1110	0b010:m[3]	m[2:0]

```
integer m = UInt(CRm<0>:op2<2:0>);

SPMEVTYPER<n>_EL0, System Performance Monitors Event Type Register, n = 0 - 63

The SPMEVTYPER<n>_EL0 characteristics are:

Purpose

With SPMEVFILTR<n>_EL0 and SPMEVFILT2R<n>_EL0, configures when event counter SPMEVCNTR<n>_EL0 in System PMU <s> increments.

The contents of this register are IMPLEMENTATION DEFINED. An Event Type Select Register typically contains:

- A field defining the event that the counter is responsive to, in the least-significant bits.
- Controls for per-counter filtering, such as by mode or state.
- Additional controls, such as for a per-counter state machine.

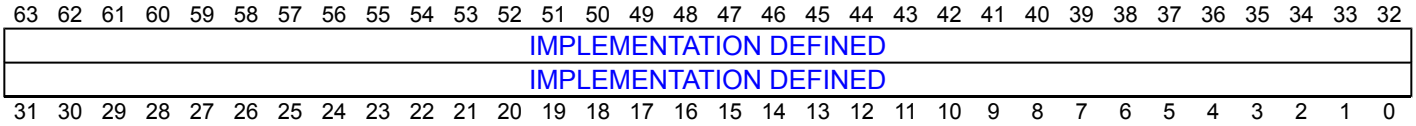
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMEVTYPER<n>_EL0 are UNDEFINED.

Attributes

SPMEVTYPER<n>_EL0 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing SPMEVTYPER<n>_EL0

To access SPMEVTYPER<n>_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s and SPMSELR_EL0.BANK to n[5:4].

SPMEVTYPER<n>_EL0 reads-as-zero and ignores writes if any of the following are true:

- Event counter <n> is not implemented by System PMU <s>.
- System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMEVTYPER<m>_EL0 ; Where m = 0-15
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b1110	0b001:m[3]	m[2:0]

```
integer m = UInt(CRm<0>:op2<2:0>);

SPMIIDR_EL1, System PMU Implementation Identification Register

The SPMIIDR_EL1 characteristics are:

Purpose

Provides discovery information for System PMU <s>.

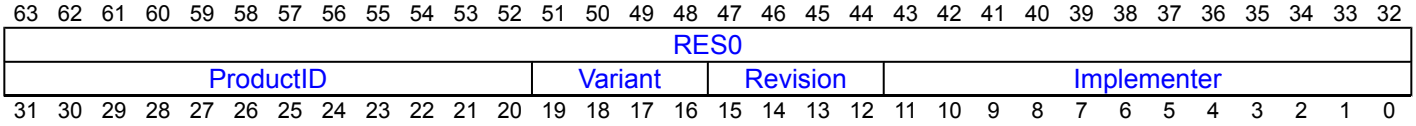
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMIIDR_EL1 are UNDEFINED.

Attributes

SPMIIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by SPMIIDR_EL1.ProductID, or the major revision of the component.

When defining a major revision, SPMIIDR_EL1.Variant and SPMIIDR_EL1.Revision together form the revision number of the component, with SPMIIDR_EL1.Variant being the most significant part and SPMIIDR_EL1.Revision the least significant part. When a component is changed, SPMIIDR_EL1.Variant or SPMIIDR_EL1.Revision is increased to ensure that software can differentiate the different revisions of the component. If SPMIIDR_EL1.Variant is increased then SPMIIDR_EL1.Revision should be set to `0b0000`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Component minor revision.

When a component is changed:

- If SPMIIDR_EL1.Variant and SPMIIDR_EL1.Revision together form the revision number of the component then:
  - SPMIIDR_EL1.Variant or SPMIIDR_EL1.Revision is increased to ensure that software can differentiate the different revisions of the component.
  - If Variant is increased then Revision should be set to `0b0000`.
- Otherwise, SPMIIDR_EL1.Revision is increased to ensure that software can differentiate the different revisions of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the System PMU.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

For an implementation designed by Arm, this field reads as `0x43B`.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing SPMIIDR_EL1

To access SPMIIDR_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMIIDR_EL1 reads-as-zero if any of the following are true:

- System PMU <s> is not implemented.
- System PMU <s> does not implement SPMIIDR_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMIIDR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b100

SPMINTENCLR_EL1, System Performance Monitors Interrupt Enable Clear Register

The SPMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from event counters in System PMU <s>.

Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMINTENCLR_EL1 are UNDEFINED.

Attributes

SPMINTENCLR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33

P<m>, bit [m], for m = 63 to 0

Event counter <m> overflow interrupt request disable.

P<m>	Meaning
0b0	Event counter <m> in System PMU <s> interrupt request is disabled.
0b1	Event counter <m> in System PMU <s> interrupt request is enabled.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if any the following are true:
  - event counter <m> is not implemented by System PMU <s>.
  - event counter <m> does not implement an overflow flag.
  - System PMU <s> does not implement an overflow interrupt request.
- Otherwise, access to this field is **W1C**.

Accessing SPMINTENCLR_EL1

To access SPMINTENCLR_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMINTENCLR_EL1 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMINTENCLR_EL1
```

op0	op1	CRn	CRm	op2

0b10	0b000	0b1001	0b1110	0b010

```

P<m>	Meaning
0b0	Event counter <m> in System PMU <s> has not overflowed.
0b1	Event counter <m> in System PMU <s> has overflowed.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if any the following are true:
  - event counter <m> is not implemented by System PMU <s>.
  - event counter <m> does not implement an overflow flag.
- Otherwise, access to this field is **W1C**.

Accessing SPMOVSCLR_EL0

To access SPMOVSCLR_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMOVSCLR_EL0 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMOVSCLR_EL0
```

op0	op1	CRn	CRm	op2

0b10	0b011	0b1001	0b1100	0b011

```

SPMOVSSET_EL0, System Performance Monitors Overflow Flag Status Set Register

The SPMOVSSET_EL0 characteristics are:

Purpose

Sets the state of overflow bits for event counters in System PMU <s>.

Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMOVSSET_EL0 are UNDEFINED.

Attributes

SPMOVSSET_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33

P<m>, bit [m], for m = 63 to 0

Event counter <m> unsigned overflow bit set.

P<m>	Meaning
0b0	Event counter <m> in System PMU <s> has not overflowed.
0b1	Event counter <m> in System PMU <s> has overflowed.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is **RAZ/WI** if any the following are true:
  - event counter <m> is not implemented by System PMU <s>.
  - event counter <m> does not implement an overflow flag.
- Otherwise, access to this field is **W1S**.

Accessing SPMOVSSET_EL0

To access SPMOVSSET_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMOVSSET_EL0 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMOVSSET_EL0
```

op0	op1	CRn	CRm	op2

0b10	0b011	0b1001	0b1110	0b011

SPMROOTCR_EL3, System Performance Monitors Root and Realm Control Register

The SPMROOTCR_EL3 characteristics are:

Purpose

Controls observability of Root and Realm events by System PMU <s>.

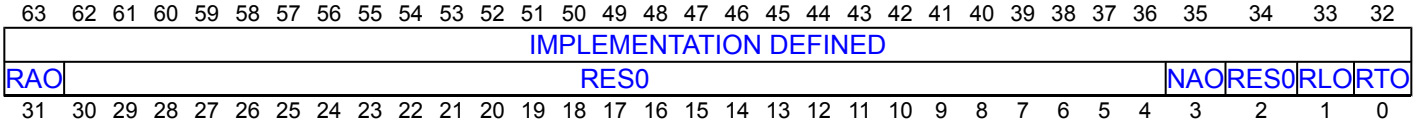
Configuration

This register is present only when FEAT_RME is implemented, FEAT_SPMU is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMROOTCR_EL3 are UNDEFINED.

Attributes

SPMROOTCR_EL3 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:32]

IMPLEMENTATION DEFINED observation controls. Additional IMPLEMENTATION DEFINED bits to control certain types of filter or events by System PMU <s>.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [31]

Reserved, RAO.

Indicates SPMROOTCR_EL3 is implemented by System PMU <s>.

Bits [30:4]

Reserved, RES0.

NAO, bit [3]

When System PMU <s> can count or monitor non-attributable events:

Non-attributable Observation. Controls whether events or monitorable characteristics not attributable with any source can be monitored by System PMU <s>.

NAO	Meaning
0b0	Events not attributable with any event source are not counted by System PMU <s>.
0b1	Counting non-attributable events by System PMU <s> is not prevented by this mechanism.

When both SPMROOTCR_EL3 and SPMSCR_EL1 are implemented, non-attributable events are counted only if both SPMROOTCR_EL3.NAO is 1 and SPMSCR_EL1.{NAO, SO} is nonzero.

SPMROOTCR_EL3.NAO has the opposite reset polarity to SPMSCR_EL1.NAO.

The reset behavior of this field is:

- On a System PMU reset, this field resets to `'1'`.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

RLO, bit [1]

Realm Observation. Controls whether events or monitorable characteristics attributable to a Realm event source can be monitored by System PMU <s>.

RLO	Meaning
`0b0`	Events attributable to a Realm event source are not counted by System PMU <s>.
`0b1`	Counting events by System PMU <s> that are attributable to a Realm event source is not prevented by this mechanism.

The reset behavior of this field is:

- On a System PMU reset, this field resets to `'0'`.

RTO, bit [0]

Root Observation. Controls whether events or monitorable characteristics attributable to a Root event source can be monitored by System PMU <s>.

RTO	Meaning
`0b0`	Events attributable to a Root event source are not counted by System PMU <s>.
`0b1`	Counting events by System PMU <s> that are attributable to a Root event source is not prevented by this mechanism.

The reset behavior of this field is:

- On a System PMU reset, this field resets to `'0'`.

Accessing SPMROOTCR_EL3

To access SPMROOTCR_EL3 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMROOTCR_EL3 reads-as-zero and ignores writes if any of the following are true:

- System PMU <s> is not implemented.
- System PMU <s> does not implement SPMROOTCR_EL3.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMROOTCR_EL3
```

op0	op1	CRn	CRm	op2
0b10	0b110	0b1001	0b1110	0b111

```
if !(IsFeatureImplemented(FEAT_RME) && IsFeatureImplemented(FEAT_SPMU) &&
IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPMROOTCR_EL3[UInt(SPMSELR_EL0.SYSPMUSEL)];
```

```
MSR SPMROOTCR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b10	0b110	0b1001	0b1110	0b111

```
if !(IsFeatureImplemented(FEAT_RME) && IsFeatureImplemented(FEAT_SPMU) &&
IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;

SPMSCR_EL1, System Performance Monitors Secure Control Register

The SPMSCR_EL1 characteristics are:

Purpose

Controls observability of Secure events by System PMU <s>, and optionally controls Secure attributes for message signaled interrupts and Non-secure access to the performance monitor registers.

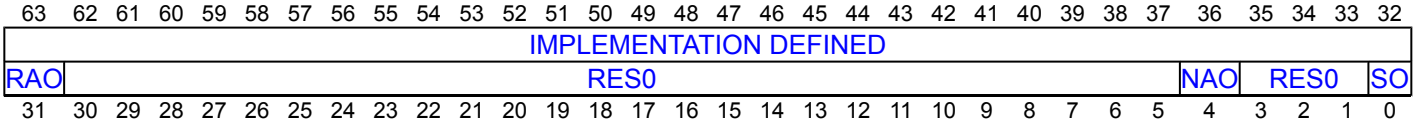
Configuration

This register is present only when Secure EL1 is implemented, FEAT_SPMU is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMSCR_EL1 are UNDEFINED.

Attributes

SPMSCR_EL1 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:32]

IMPLEMENTATION DEFINED observation controls. Additional IMPLEMENTATION DEFINED bits to control certain types of filter or events by System PMU <s>.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [31]

Reserved, RAO.

Indicates SPMSCR_EL1 is implemented by System PMU <s>.

This field reads-as-one.

Bits [30:5]

Reserved, RES0.

NAO, bit [4]

When System PMU <s> can count or monitor non-attributable events:

Non-attributable Observation. Controls whether events or monitorable characteristics not attributable with any source can be monitored by System PMU <s>.

NAO	Meaning
0b0	Events not attributable with any event source are not counted by System PMU <s>, unless overridden by SPMSCR_EL1.SO.
0b1	Counting non-attributable events by System PMU <s> is not prevented by this mechanism.

When both SPMROOTCR_EL3 and SPMSCR_EL1 are implemented, non-attributable events are counted only if both SPMROOTCR_EL3.NAO is 1 and SPMSCR_EL1.{NAO, SO} is nonzero.

SPMSCR_EL1.NAO has the opposite reset polarity to SPMROOTCR_EL3.NAO.

This field is optional if Root and Realm states are not implemented. When this field is not implemented, System PMU <s> behaves as if SPMSCR_EL1.NAO is 0, and whether events or monitorable characteristics not attributable with any source can be monitored is controlled by SPMSCR_EL1.SO.

The reset behavior of this field is:

- On a System PMU reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [3:1]

Reserved, RES0.

SO, bit [0]

Secure Observation. Controls whether events or monitorable characteristics attributable to a Secure event source can be monitored by System PMU <s>.

SO	Meaning
0b0	Events attributable to a Secure event source are not counted by System PMU <s>.
0b1	Counting events by System PMU <s> that are attributable to a Secure event source is not prevented by this mechanism.

Also controls whether events or monitorable characteristics not attributable with any source can be monitored by System PMU <s>. See SPMSCR_EL1.NAO.

The reset behavior of this field is:

- On a System PMU reset, this field resets to '0'.

Accessing SPMSCR_EL1

To access SPMSCR_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMSCR_EL1 reads-as-zero and ignores writes if any of the following are true:

- System PMU <s> is not implemented.
- System PMU <s> does not implement SPMSCR_EL1.

SPMSCR_EL1 is UNDEFINED if accessed in Non-secure or Realm state.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPMSCR_EL1
```

SPMSELR_EL0, System Performance Monitors Select Register

The SPMSELR_EL0 characteristics are:

Purpose

Selects the System PMU and event counter registers to access.

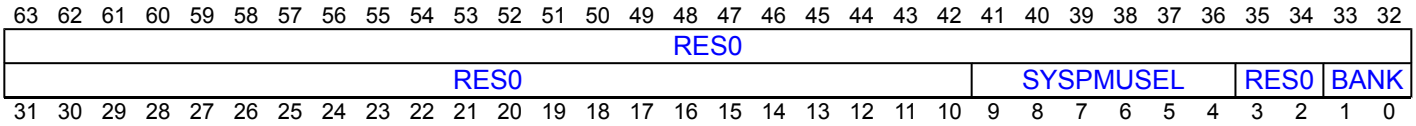
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMSELR_EL0 are UNDEFINED.

Attributes

SPMSELR_EL0 is a 64-bit register.

Field descriptions



Bits [63:10]

Reserved, RES0.

SYSPMUSEL, bits [9:4]

System PMU Select. Selects a System PMU <s> to access.

Values `0x20` to `0x3F` are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

BANK, bits [1:0]

System PMU bank access control. Selects a bank of 16 System PMU event counters and related controls to access.

BANK	Meaning
`0b00`	Select event counters 0 to 15.
`0b01`	Select event counters 16 to 31.
`0b10`	Select event counters 32 to 47.
`0b11`	Select event counters 48 to 63.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPMSELR_EL0

Accesses to this register use the following encodings in the System register encoding space:

SPMZR_EL0, System Performance Monitors Zero with Mask

The SPMZR_EL0 characteristics are:

Purpose

Zero the set of System PMU event counters specified by the mask written to SPMZR_EL0.

Configuration

This register is present only when FEAT_SPMU2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMZR_EL0 are UNDEFINED.

Attributes

SPMZR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33

P<m>, bit [m], for m = 63 to 0

Zero event counter <m>.

P<m>	Meaning
0b0	Write is ignored.
0b1	Set event counter<m> in System PMU <s> to zero.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When event counter <m> is not implemented by System PMU <s>, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **WO/RAZ**.

Accessing SPMZR_EL0

To access SPMZR_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMZR_EL0 ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR SPMZR_EL0, <Xt>
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b100

```

SPSel, Stack Pointer Select

The SPSel characteristics are:

Purpose

Allows the Stack Pointer to be selected between SP_EL0 and SP_ELx.

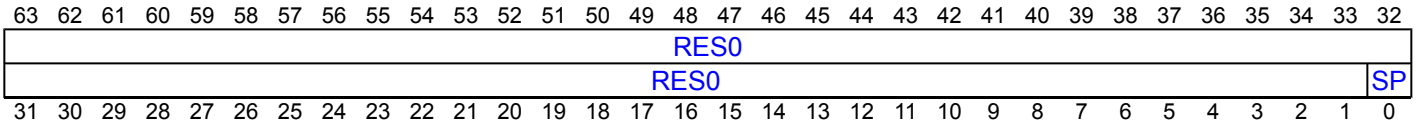
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSel are UNDEFINED.

Attributes

SPSel is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

SP, bit [0]

Stack pointer to use. Possible values of this bit are:

SP	Meaning
0b0	Use SP_EL0 at all Exception levels.
0b1	Use SP_ELx for Exception level ELx. When FEAT_NMI is implemented and SCTLR_ELx.SPINTMASK is 1, if execution is at ELx, an IRQ or FIQ interrupt that is targeted to ELx is masked regardless of any denotion of Superpriority.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Accessing SPSel

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPSel
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0010	0b000

```

SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configuration

AArch64 System register SPSR_abt bits [31:0] are architecturally mapped to AArch32 System register SPSR_abt[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_abt are UNDEFINED.

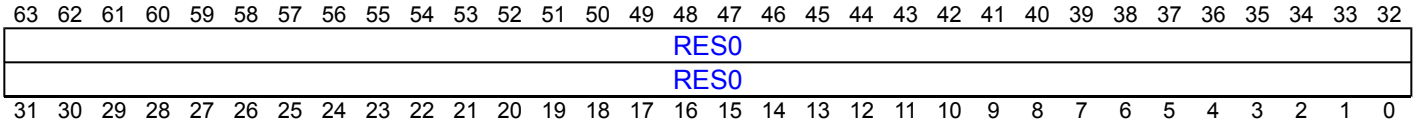
If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_abt is a 64-bit register.

Field descriptions

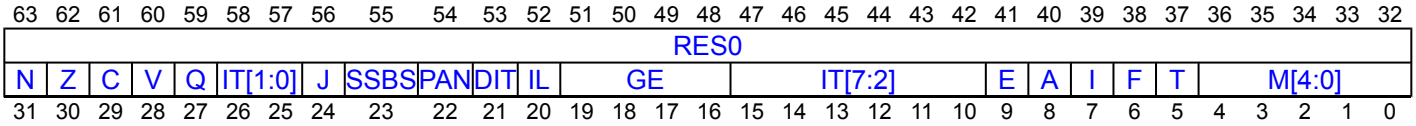
When FEAT_AA32EL1 is not implemented:



Bits [63:0]

Reserved, RES0.

Otherwise:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Abort mode, and copied to PSTATE.IT on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode, SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_abt[26:25].
- IT[7:2] is SPSR_abt[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_abt

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPSR_abt
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then

SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL1.

Configuration

AArch64 System register SPSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SPSR_svc[31:0].

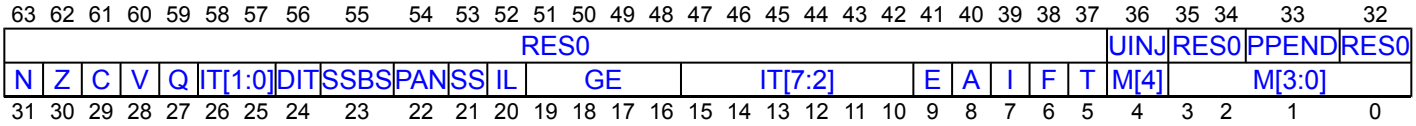
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_EL1 are UNDEFINED.

Attributes

SPSR_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented and exception taken from AArch32 state:



An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]

When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL1, and copied to PSTATE.UINJ on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:34]

Reserved, RES0.

PPEND, bit [33]

When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL1, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL1, and copied to PSTATE.IT on executing an exception return operation in EL1.

On executing an exception return operation in EL1, SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL1[26:25].
- IT[7:2] is SPSR_EL1[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL1, and copied to PSTATE.GE on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL1, and copied to PSTATE.E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to `0b1`, the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
`0b1`	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

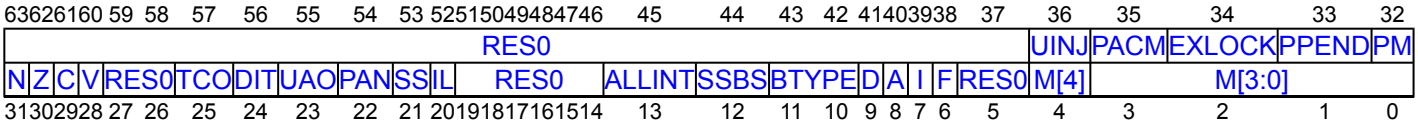
M[3:0]	Meaning
`0b0000`	User.
`0b0001`	FIQ.
`0b0010`	IRQ.
`0b0011`	Supervisor.
`0b0111`	Abort.
`0b1011`	Undefined.
`0b1111`	System.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:



An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]

When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL1, and copied to PSTATE.UINJ on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PACM, bit [35]
When FEAT_PAuth_LR is implemented:

PACM. Set to the value of PSTATE.PACM on taking an exception to EL1, and copied to PSTATE.PACM on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLOCK, bit [34]
When FEAT_GCS is implemented:

Exception return state lock. Set to the value of PSTATE.EXLOCK on taking an exception to EL1, and copied to PSTATE.EXLOCK on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PPEND, bit [33]
When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL1, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]
When FEAT_EBEP is implemented:

Profiling exception mask bit. Set to the value of PSTATE.PM on taking an exception to EL1, and copied to PSTATE.PM on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]
When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]
When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]

When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL1, and copied to PSTATE.ALLINT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL1, and copied to PSTATE.BTYPE on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to `0b0`, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
`0b0`	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
`0b0000`	EL0.
`0b0100`	EL1 with SP_EL0 (EL1t).
`0b0101`	EL1 with SP_EL1 (EL1h).
`0b1000`	EL1 with SP_EL0 (EL1t) and either HCR_EL2.{NV, NV1} is {1,0} or HCR_EL2.{NV, NV2} is {1,1}.
`0b1001`	EL1 with SP_EL1 (EL1h) and either HCR_EL2.{NV, NV1} is {1,0} or HCR_EL2.{NV, NV2} is {1,1}.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2]: On an exception to EL1:
  - If the exception is taken from EL0:
    - M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1.
  - If the exception is taken from EL1:
    - If the Effective value of HCR_EL2.{NV, NV1} is not {1,0} and the Effective value of HCR_EL2.{NV, NV2} is not {1,1}, then M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1.
    - If the Effective value of HCR_EL2.{NV, NV1} is {1,0} or if the Effective value of HCR_EL2.{NV, NV2} is {1,1}, then M[3:2] is set to `0b10`.
  - M[3:2] is copied to PSTATE.EL on executing a legal exception return operation in EL1.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPSR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL2.

Configuration

AArch64 System register SPSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register SPSR_hyp[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_EL2 are UNDEFINED.

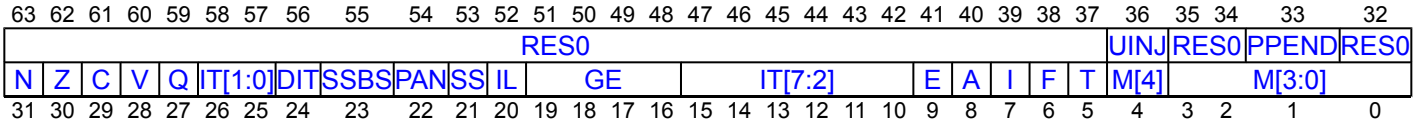
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SPSR_EL2 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented and exception taken from AArch32 state:



An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]

When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL2, and copied to PSTATE.UINJ on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:34]

Reserved, RES0.

PPEND, bit [33]

When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL2, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL2, and copied to PSTATE.Q on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL2, and copied to PSTATE.IT on executing an exception return operation in EL2.

On executing an exception return operation in EL2, SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL2[26:25].
- IT[7:2] is SPSR_EL2[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL2.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to `0b1`, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
`0b1`	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

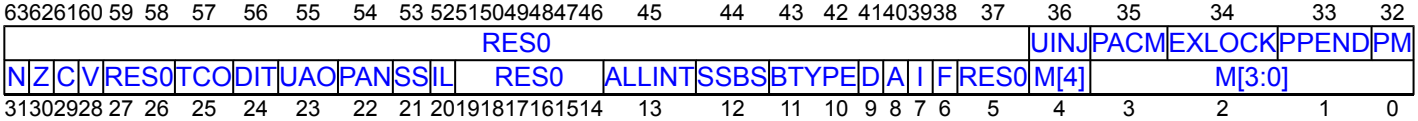
M[3:0]	Meaning
`0b0000`	User.
`0b0001`	FIQ.
`0b0010`	IRQ.
`0b0011`	Supervisor.
`0b0111`	Abort.
`0b1010`	Hyp.
`0b1011`	Undefined.
`0b1111`	System.

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:



An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]

When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL2, and copied to PSTATE.UINJ on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PACM, bit [35]
When FEAT_PAuth_LR is implemented:

PACM. Set to the value of PSTATE.PACM on taking an exception to EL2, and copied to PSTATE.PACM on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLOCK, bit [34]
When FEAT_GCS is implemented:

Exception return state lock. Set to the value of PSTATE.EXLOCK on taking an exception to EL2, and copied to PSTATE.EXLOCK on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PPEND, bit [33]
When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL2, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]
When FEAT_EBEP is implemented:

Profiling exception mask bit. Set to the value of PSTATE.PM on taking an exception to EL2, and copied to PSTATE.PM on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]
When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]
When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]

When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL2, and copied to PSTATE.ALLINT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL2, and copied to PSTATE.BTYPE on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to `0b0`, the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
`0b0`	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
`0b0000`	EL0.
`0b0100`	EL1 with SP_EL0 (EL1t).
`0b0101`	EL1 with SP_EL1 (EL1h).
`0b1000`	EL2 with SP_EL0 (EL2t).
`0b1001`	EL2 with SP_EL2 (EL2h).

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SPSR_EL2 or SPSR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPSR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then
        X[t, 64] = SPSR_EL1;
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = SPSR_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPSR_EL2;
```

```
MSR SPSR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if IsFeatureImplemented(FEAT_GCS) && GetCurrentEXLOCKEN() && !Halted() && PSTATE.EXLOCK == '1'
&& EffectiveHCR_EL2_NVx() IN {'xx1'} then
        EXLOCKException();
    elsif EffectiveHCR_EL2_NVx() IN {'1x1'} then
        SPSR_EL1 = X[t, 64];
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else

SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL3.

Configuration

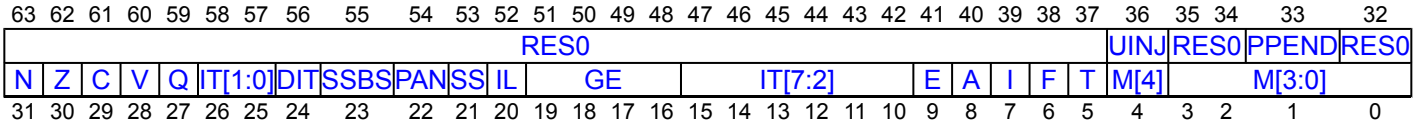
This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_EL3 are UNDEFINED.

Attributes

SPSR_EL3 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented and exception taken from AArch32 state:



An exception return from EL3 using AArch64 makes SPSR_EL3 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]

When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL3, and copied to PSTATE.UINJ on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:34]

Reserved, RES0.

PPEND, bit [33]

When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL3, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL3, and copied to PSTATE.IT on executing an exception return operation in EL3.

On executing an exception return operation in EL3, SPSR_EL3.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL3[26:25].
- IT[7:2] is SPSR_EL3[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL3, and copied to PSTATE.GE on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL3, and copied to PSTATE.E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR_EL3.E is RES0. If the implementation does not support little-endian operation, SPSR_EL3.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL3.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL3.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to `0b1`, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
`0b1`	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

M[3:0]	Meaning
`0b0000`	User.
`0b0001`	FIQ.
`0b0010`	IRQ.
`0b0011`	Supervisor.
`0b0110`	Monitor.
`0b0111`	Abort.
`0b1010`	Hyp.
`0b1011`	Undefined.
`0b1111`	System.

Other values are reserved. If SPSR_EL3.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																											UINJ	PACM	EXLOCK	PPEND	PM
N	Z	C	V	RES0		TCO	DIT	UAO	PAN	SS	IL	RES0						ALLINT	SSBS	BTYPE		D	A	I	F	RES0	M[4]	M[3:0]			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL3 using AArch64 makes SPSR_EL3 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]

When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL3, and copied to PSTATE.UINJ on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PACM, bit [35]

When FEAT_PAuth_LR is implemented:

PACM. Set to the value of PSTATE.PACM on taking an exception to EL3, and copied to PSTATE.PACM on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLOCK, bit [34]

When FEAT_GCS is implemented:

Exception return state lock. Set to the value of PSTATE.EXLOCK on taking an exception to EL3, and copied to PSTATE.EXLOCK on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PPEND, bit [33]

When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL3, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]

When FEAT_EBEP is implemented:

Profiling exception mask bit. Set to the value of PSTATE.PM on taking an exception to EL3, and copied to PSTATE.PM on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]
When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]

When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL3, and copied to PSTATE.ALLINT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL3, and copied to PSTATE.BTYPE on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to `0b0`, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
`0b0`	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
`0b0000`	EL0.
`0b0100`	EL1 with SP_EL0 (EL1t).
`0b0101`	EL1 with SP_EL1 (EL1h).
`0b1000`	EL2 with SP_EL0 (EL2t).
`0b1001`	EL2 with SP_EL2 (EL2h).
`0b1100`	EL3 with SP_EL0 (EL3t).
`0b1101`	EL3 with SP_EL3 (EL3h).

Other values are reserved. If SPSR_EL3.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL3 and copied to PSTATE.EL on executing an exception return operation in EL3.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL3 and copied to PSTATE.SP on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPSR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPSR_EL3;
```

```
MSR SPSR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if IsFeatureImplemented(FEAT_GCS) && GetCurrentEXLOCKEN() && !Halted() && PSTATE.EXLOCK == '1'
then
        EXLOCKException();
    else
        SPSR_EL3 = X[t, 64];
```

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

AArch64 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch32 System register SPSR_fiq[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_fiq are UNDEFINED.

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_fiq is a 64-bit register.

Field descriptions

When FEAT_AA32EL1 is not implemented:

RES0																															
N	Z	C	V	Q	IT[1:0]		J	SSBS	PAN	DIT	IL	GE				IT[7:2]						E	A	I	F	T	M[4:0]				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to FIQ mode, and copied to PSTATE.IT on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode, SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_fiq[26:25].
- IT[7:2] is SPSR_fiq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_fiq

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPSR_fiq

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to IRQ mode, and copied to PSTATE.IT on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode, SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_irq[26:25].
- IT[7:2] is SPSR_irq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_irq

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SPSR_irq
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = SPSR_irq;
elsif PSTATE.EL == EL3 then
    X[t, 64] = SPSR_irq;
```

```
MSR SPSR_irq, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configuration

AArch64 System register SPSR_und bits [31:0] are architecturally mapped to AArch32 System register SPSR_und[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_und are UNDEFINED.

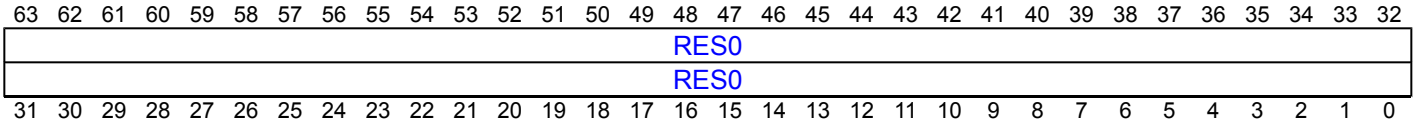
If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_und is a 64-bit register.

Field descriptions

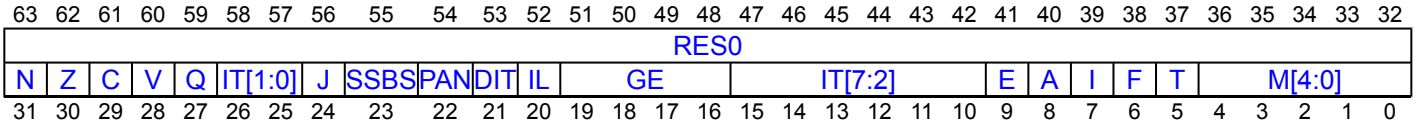
When FEAT_AA32EL1 is not implemented:



Bits [63:0]

Reserved, RES0.

Otherwise:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Undefined mode, and copied to PSTATE.IT on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode, SPSR_und.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_und[26:25].
- IT[7:2] is SPSR_und[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_und

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_und

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b010

SSBS, Speculative Store Bypass Safe

The SSBS characteristics are:

Purpose

Allows access to the Speculative Store Bypass Safe bit.

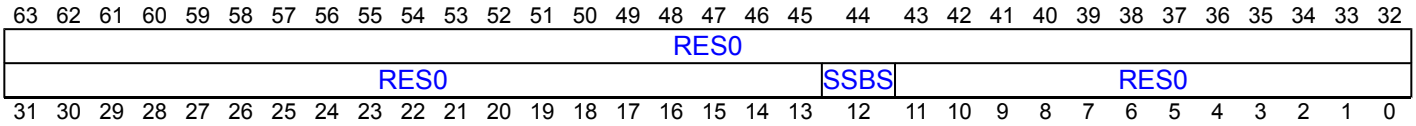
Configuration

This register is present only when FEAT_SSBS2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SSBS are UNDEFINED.

Attributes

SSBS is a 64-bit register.

Field descriptions



Bits [63:13]

Reserved, RES0.

SSBS, bit [12]

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A speculative value in a register is used in a potentially speculatively exploitable manner if it is used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence or if the execution timing of any other instructions in the speculative sequence is a function of the data loaded under speculation.

SSBS	Meaning
0b0	Hardware is not permitted to use speculative register values in a potentially speculatively exploitable manner if the speculative read that loads the register is from earlier in the coherence order than the entry generated by the latest store to that location using the same virtual address as the load instruction.
0b1	When the value of PSTATE.SSBS is 1, hardware is permitted to use speculative register values in a potentially speculatively exploitable manner if the speculative read that loads the register is from earlier in the coherence order than the entry generated by the latest store to that location using the same virtual address as the load instruction.

The value of this bit is set to the value in the SCTLR_ELx.DSSBS field on taking an exception to ELx.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [11:0]

Reserved, RES0.

Accessing SSBS

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SSBS

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b110

```
if !(IsFeatureImplemented(FEAT_SSBS2) && IsFeatureImplemented(FEAT_AA64)) then

SVCR, Streaming Vector Control Register

The SVCR characteristics are:

Purpose

Controls Streaming SVE mode and SME behavior.

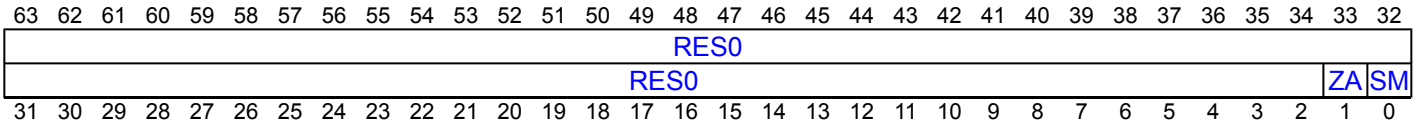
Configuration

This register is present only when FEAT_SME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SVCR are UNDEFINED.

Attributes

SVCR is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

ZA, bit [1]

Enables SME ZA storage. If FEAT_SME2 is implemented, also enables SME2 ZT0 storage.

When this storage is disabled, execution of an instruction which can access it is trapped. The exception is reported using an ESR_ELx.{EC, SMTC} value of {0x1D, 0x3}.

The possible values of this bit are:

ZA	Meaning
0b0	SME ZA storage and, if implemented, ZT0 storage are invalid and not accessible. This control causes execution at any Exception level of instructions that can access this storage to be trapped.
0b1	SME ZA storage and, if implemented, ZT0 storage are valid and accessible. This control does not cause execution of any instructions to be trapped.

When a write to SVCR.ZA changes the value of PSTATE.ZA from 0 to 1, all implemented bits of the storage are set to zero.

Changes to this field do not have an effect on the SVE vector and predicate registers and FPSR.

A direct or indirect read of ZA appears to occur in program order relative to a direct write of SVCR, and to MSR SVCRZA and MSR SVCRSMZA instructions, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SM, bit [0]

Enables Streaming SVE mode.

When the PE is in Streaming SVE mode, the Streaming SVE vector length (SVL) applies to SVE instructions, and execution at any Exception level of an instruction which is illegal in that mode is trapped. The exception is reported using an ESR_ELx.{EC, SMTC} value of {0x1D, 0x1}.

When the PE is not in Streaming SVE mode, the SVE vector length (VL) applies to SVE instructions, and execution at any Exception level of an instruction which is only legal in that mode is trapped. The exception is reported using an ESR_ELx.{EC, SMTC} value of {0x1D, 0x2}.

The possible values of this bit are:

SM	Meaning
0b0	The PE is not in Streaming SVE mode.
0b1	The PE is in Streaming SVE mode.

When a write to SVCR.SM changes the value of PSTATE.SM, the following applies:

- When changed from 0 to 1, an entry to Streaming SVE mode is performed.
- When changed from 1 to 0, an exit from Streaming SVE mode is performed.
- All implemented bits of the SVE registers Z0-Z31, P0-P15, and FFR in the new mode are set to zero.
- All bits in FPMR are set to zero.
- FPSR in the new mode is set to 0x0000_0000_0800_009f, in which all cumulative status bits are set to 1.

Changes to this field do not have an effect on SME ZA storage or, if implemented, ZT0 storage.

A direct or indirect read of SM appears to occur in program order relative to a direct write of SVCR, and to MSR SVCRSM and MSR SVCRSMZA instructions, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing SVCR

SVCR is read/write and can be accessed from any Exception level.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, SVCR
```

op0	op1	CRn	CRm	op2

TCO, Tag Check Override

The TCO characteristics are:

Purpose

When FEAT_MTE is implemented, this register allows tag checks to be disabled globally.

When FEAT_MTE2 is not implemented, it is IMPLEMENTATION DEFINED if accesses to this register access PSTATE.TCO or are RAZ/WI.

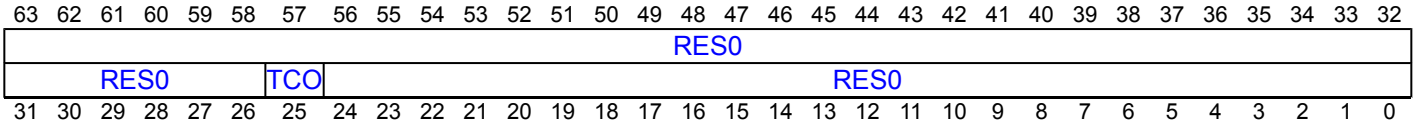
Configuration

This register is present only when FEAT_MTE is implemented. Otherwise, direct accesses to TCO are UNDEFINED.

Attributes

TCO is a 64-bit register.

Field descriptions



Bits [63:26]

Reserved, RES0.

TCO, bit [25]

Allows memory tag checks to be globally disabled.

TCO	Meaning
0b0	Loads and Stores are not affected by this control.
0b1	Loads and Stores are unchecked.

Bits [24:0]

Reserved, RES0.

Accessing TCO

For information about the operation of the MSR (immediate) accessor, see MSR (immediate).

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TCO
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b111

```
if !IsFeatureImplemented(FEAT_MTE) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    X[t, 64] = Zeros(38):PSTATE.TCO:Zeros(25);
elsif PSTATE.EL == EL1 then
    X[t, 64] = Zeros(38):PSTATE.TCO:Zeros(25);
elsif PSTATE.EL == EL2 then
    X[t, 64] = Zeros(38):PSTATE.TCO:Zeros(25);
elsif PSTATE.EL == EL3 then
    X[t, 64] = Zeros(38):PSTATE.TCO:Zeros(25);
```

TCR2_EL1, Extended Translation Control Register (EL1)

The TCR2_EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

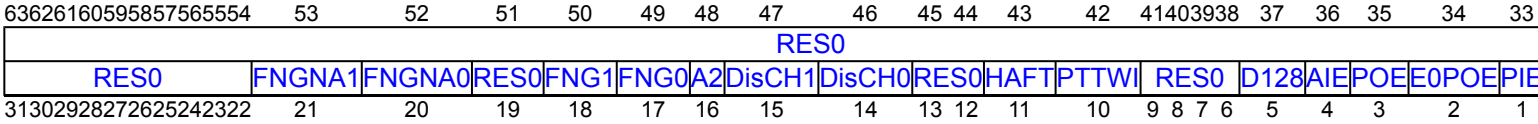
Configuration

This register is present only when FEAT_TCR2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCR2_EL1 are UNDEFINED.

Attributes

TCR2_EL1 is a 64-bit register.

Field descriptions



Unless stated otherwise, all the bits in TCR2_EL1 are permitted to be cached in a TLB.

Bits [63:22]

Reserved, RES0.

FNGNA1, bit [21]

When FEAT_THE is implemented:

Force non-global for unassured translations using TTBR1_EL1.

FNGNA1	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations using TTBR1_EL1 are treated as non-global regardless of the value of the nG bit if all of the following is true: • The translation is for the EL1&0 translation regime. • Stage 1 and stage 2 translation are enabled. • Protection is enabled. • The final stage 1 translation using the descriptor does not have the Assured Translation property.

This bit is permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNGNA0, bit [20]

When FEAT_THE is implemented:

Force non-global for unassured translations using TTBR0_EL1.

FNGNA0	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations using TTBR0_EL1 are treated as non-global regardless of the value of the nG bit if all of the following is true: • The translation is for the EL1&0 translation regime. • Stage 1 and stage 2 translation are enabled. • Protection is enabled. • The final stage 1 translation using the descriptor does not have the Assured Translation property.

This bit is permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

FNG1, bit [18]

When FEAT_ASID2 is implemented:

Force non-global translations for TTBR1_EL1.

FNG1	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations using TTBR1_EL1 are treated as non-global regardless of the value of the nG bit.

This bit is permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNG0, bit [17]

When FEAT_ASID2 is implemented:

Force non-global translations for TTBR0_EL1.

FNG0	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations using TTBR0_EL1 are treated as non-global regardless of the value of the nG bit.

This bit is permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

A2, bit [16]

When FEAT_ASID2 is implemented:

Enable use of two ASIDs.

A2	Meaning
0b0	Use of two ASIDs is disabled.
0b1	Use of two ASIDs is enabled.

This bit is permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH1, bit [15]

When FEAT_D128 is implemented and TCR2_EL1.D128 == 1:

Disable the Contiguous bit for the Start Table for TTBR1_EL1.

DisCH1	Meaning
0b0	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR1_EL1 is not affected by this field.
0b1	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR1_EL1 is treated as 0.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH0, bit [14]

When FEAT_D128 is implemented and TCR2_EL1.D128 == 1:

Disable the Contiguous bit for the Start Table for TTBR0_EL1.

DisCH0	Meaning
0b0	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR0_EL1 is not affected by this field.
0b1	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR0_EL1 is treated as 0.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

HAFT, bit [11]

When FEAT_HAFT is implemented:

Hardware managed Access Flag for Table descriptors.

Enables the Hardware managed Access Flag for Table descriptors.

HAFT	Meaning
0b0	Hardware managed Access Flag for Table descriptors is disabled.
0b1	Hardware managed Access Flag for Table descriptors is enabled.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]

When FEAT_THE is implemented:

Permit Translation table walk Incoherence.

Permits RCWS instructions to generate writes that have the Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL1&0 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL1&0 have the Reduced Coherence property if HCRX_EL2.PTTWI is 1.

This bit is permitted to be implemented as a read-only bit with a fixed value of 0.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [9:6]

Reserved, RES0.

D128, bit [5]

When FEAT_D128 is implemented:

Enables VMSAv9-128 translation system.

D128	Meaning
0b0	Translation system follows VMSAv8-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [4]

When FEAT_AIE is implemented:

Enable Attribute Indexing Extension.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

This field is RES1 when TCR2_EL1.D128 is 1.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]

When FEAT_S1POE is implemented:

Enables Permission Overlays for privileged accesses from EL1&0 translation regime.

POE	Meaning
0b0	Permission overlay disabled for EL1 access in stage 1 of EL1&0 translation regime.
0b1	Permission overlay enabled for EL1 access in stage 1 of EL1&0 translation regime.

This bit is not permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [2]

When FEAT_S1POE is implemented:

Enables Permission Overlays for unprivileged accesses from EL1&0 translation regime.

E0POE	Meaning
0b0	Permission overlay disabled for EL0 access in stage 1 of EL1&0 translation regime.
0b1	Permission overlay enabled for EL0 access in stage 1 of EL1&0 translation regime.

This bit is not permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [1]

When FEAT_S1PIE is implemented:

Enables usage of Indirect Permission Scheme.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when TCR2_EL1.D128 is 1.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]
When FEAT_THE is implemented:

Protected attribute enable. Enables use of bit[52] of the stage 1 translation table entries as the Protected bit, for translations using TTBRn_EL1.

PnCH	Meaning
0b0	For translations using TTBRn_EL1, bit[52] of each stage 1 translation table entry is not the Protected bit.
0b1	For translations using TTBRn_EL1, bit[52] of each stage 1 translation table entry is the Protected bit.

If bit[52] is used as the Protected bit, it is not used as the Contiguous bit.

This field is RES0 when TCR2_EL1.D128 is 1.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TCR2_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TCR2_EL1 or TCR2_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to TCR2_EL1 are masked by TCR2MASK_EL1.

Accesses to this register use the following encodings in the System register encoding space:

TCR2_EL2, Extended Translation Control Register (EL2)

The TCR2_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2&0 translation regime.

Configuration

This register is present only when FEAT_TCR2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCR2_EL2 are UNDEFINED.

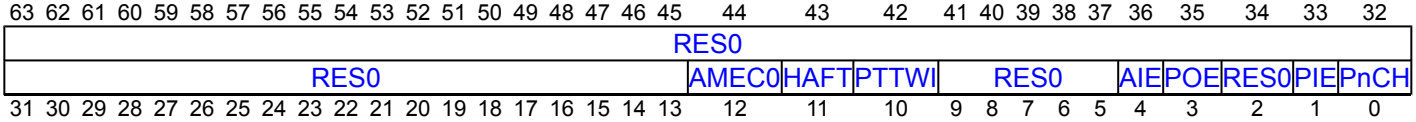
If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TCR2_EL2 is a 64-bit register.

Field descriptions

When !ELIsInHost(EL2):



Unless stated otherwise, all the bits in TCR2_EL2 are permitted to be cached in a TLB.

Bits [63:13]

Reserved, RES0.

AMEC0, bit [12]

When FEAT_MEC is implemented:

This field controls the enabling of the Alternate MECID translations for the EL2 translation regime.

TCR2_EL2.AMEC0 is provided to enable the safe update of MECID_A0_EL2, by disabling access and speculation to AMEC==1 Block or Page descriptors during the update.

AMEC0	Meaning
0b0	Use of a Block or Page descriptor containing AMEC == 1 generates a Translation fault.
0b1	Accesses translated by a Block or Page descriptor containing AMEC == 1 are associated with the MECID configured in MECID_A0_EL2.

This bit is permitted to be cached in a TLB only if it is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

When SCTLR2_EL2.EMEC is 0, this field is ignored by the PE and the bit position of AMEC is RES0 in Block and Page descriptors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When IsCurrentSecurityState(SS_Secure), access to this field is **RES0**.
- When IsCurrentSecurityState(SS_NonSecure), access to this field is **RES0**.

Otherwise:

Reserved, RES0.

HAFT, bit [11]
When FEAT_HAFT is implemented:

Hardware managed Access Flag for Table descriptors.

Enables the Hardware managed Access Flag for Table descriptors.

HAFT	Meaning
0b0	Hardware managed Access Flag for Table descriptors is disabled.
0b1	Hardware managed Access Flag for Table descriptors is enabled.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]
When FEAT_THE is implemented:

Permit Translation table walk Incoherence.

Permits RCWS instructions to generate writes that have the Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL2 or EL2&0 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL2 or EL2&0 have the Reduced Coherence property.

This bit is permitted to be implemented as a read-only bit with a fixed value of 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [9:5]

Reserved, RES0.

AIE, bit [4]

When FEAT_AIE is implemented:

Enable Attribute Indexing Extension.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]

When FEAT_S1POE is implemented:

Enables Permission Overlay for EL2 accesses.

POE	Meaning
0b0	Permission overlay disabled for EL2 access in stage 1 of EL2 translation regime.
0b1	Permission overlay enabled for EL2 access in stage 1 of EL2 translation regime.

This bit is not permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

PIE, bit [1]

When FEAT_S1PIE is implemented:

Enables usage of Indirect Permission Scheme.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]
When FEAT_THE is implemented:

Protected attribute enable. Enables use of bit[52] of stage 1 translation table entries as the Protected bit, for translations using TTBR0_EL2 when HCR_EL2.E2H is 0.

PnCH	Meaning
0b0	For translations using TTBRn_EL2, bit[52] of each stage 1 translation table entry is not the Protected bit.
0b1	For translations using TTBR0_EL2, bit[52] of each stage 1 translation table entry is the Protected bit.

If bit[52] is used as the Protected bit, it is not used as the Contiguous bit.

This field is RES0 when TCR2_EL2.D128 is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When ELIsInHost(EL2):

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0													FNG1	FNG0	A2	DisCH1	DisCH0	AMEC1	AMEC0	HAFT	PTTWI	RES0				D128	AIE	POE	E0POE	PIE	PnCH

Unless stated otherwise, all the bits in TCR2_EL2 are permitted to be cached in a TLB.

Bits [63:19]

Reserved, RES0.

FNG1, bit [18]
When FEAT_ASID2 is implemented:

Force non-global translations for TTBR1_EL2.

FNG1	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations are treated as non-global regardless of the value of the nG bit.

This bit is permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNG0, bit [17]
When FEAT_ASID2 is implemented:

Force non-global translations for TTBR0_EL2.

FNG0	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations are treated as non-global regardless of the value of the nG bit.

This bit is permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

A2, bit [16]
When FEAT_ASID2 is implemented:

Enable use of two ASIDs.

A2	Meaning
0b0	Use of two ASIDs is disabled.
0b1	Use of two ASIDs is enabled.

This bit is permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH1, bit [15]
When FEAT_D128 is implemented and TCR2_EL2.D128 == 1:

Disable the Contiguous bit for the Start Table for TTBR1_EL2.

DisCH1	Meaning
0b0	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR1_EL2 is not affected by this field.
0b1	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR1_EL2 is treated as 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH0, bit [14]

When FEAT_D128 is implemented and TCR2_EL2.D128 == 1:

Disable the Contiguous bit for the Start Table for TTBR0_EL2.

DisCH0	Meaning
0b0	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR0_EL2 is not affected by this field.
0b1	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR0_EL2 is treated as 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMEC1, bit [13]

When FEAT_MEC is implemented:

This field controls the enabling of the Alternate MECID translations for accesses in the TTBR1_EL2 half of the VA range, for the EL2&0 translation regime.

TCR2_EL2.AMEC1 is provided to enable the safe update of MECID_A1_EL2, by disabling access and speculation to AMEC == 1 Block or Page descriptors during the update.

AMEC1	Meaning
0b0	Use of a Block or Page descriptor containing AMEC == 1 generates a Translation fault.
0b1	Accesses translated by a Block or Page descriptor containing AMEC == 1 are associated with the MECID configured in MECID_A1_EL2.

This bit is permitted to be cached in a TLB only if it is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

When SCTLR2_EL2.EMEC is 0, this field is ignored by the PE and the bit position of AMEC is RES0 in Block and Page descriptors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When IsCurrentSecurityState(SS_Secure), access to this field is **RES0**.
- When IsCurrentSecurityState(SS_NonSecure), access to this field is **RES0**.

Otherwise:

Reserved, RES0.

AMEC0, bit [12]

When FEAT_MEC is implemented:

This field controls the enabling of the Alternate MECID translations for accesses in the TTBR0_EL2 half of the VA range, for the EL2&0 translation regime.

TCR2_EL2.AMEC0 is provided to enable the safe update of MECID_A0_EL2, by disabling access and speculation to AMEC==1 Block or Page descriptors during the update.

AMEC0	Meaning
0b0	Use of a Block or Page descriptor containing AMEC == 1 generates a Translation fault.
0b1	Accesses translated by a Block or Page descriptor containing AMEC == 1 are associated with the MECID configured in MECID_A0_EL2.

This bit is permitted to be cached in a TLB only if it is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

When SCTLR2_EL2.EMEC is 0, this field is ignored by the PE and the bit position of AMEC is RES0 in Block and Page descriptors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When IsCurrentSecurityState(SS_Secure), access to this field is **RES0**.
- When IsCurrentSecurityState(SS_NonSecure), access to this field is **RES0**.

Otherwise:

Reserved, RES0.

HAFT, bit [11]

When FEAT_HAFT is implemented:

Hardware managed Access Flag for Table descriptors.

Enables the Hardware managed Access Flag for Table descriptors.

HAFT	Meaning
0b0	Hardware managed Access Flag for Table descriptors is disabled.
0b1	Hardware managed Access Flag for Table descriptors is enabled.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]

When FEAT_THE is implemented:

Permit Translation table walk Incoherence.

Permits RCWS instructions to generate writes that have the Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS have the Reduced Coherence property.

This bit is permitted to be implemented as a read-only bit with a fixed value of 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [9:6]

Reserved, RES0.

D128, bit [5]

When FEAT_D128 is implemented:

Enables VMSAv9-128 translation system.

D128	Meaning
0b0	Translation system follows VMSAv8-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [4]

When FEAT_AIE is implemented:

Enable Attribute Indexing Extension.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

This field is RES1 when TCR2_EL2.D128 is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]
When FEAT_S1POE is implemented:

Enables Permission Overlay for privileged accesses from EL2&0 translation regime.

POE	Meaning
0b0	Permission overlay disabled for EL2 access in stage 1 of EL2&0 translation regime.
0b1	Permission overlay enabled for EL2 access in stage 1 of EL2&0 translation regime.

This bit is not permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [2]
When FEAT_S1POE is implemented:

Enables Permission Overlay for unprivileged accesses from EL2&0 translation regime.

E0POE	Meaning
0b0	Permission overlay disabled for EL0 access in stage 1 of EL2&0 translation regime.
0b1	Permission overlay enabled for EL0 access in stage 1 of EL2&0 translation regime.

This bit is not permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [1]
When FEAT_S1PIE is implemented:

Enables usage of Indirect Permission Scheme.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when TCR2_EL2.D128 is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]
When FEAT_THE is implemented:

Protected attribute enable. Enables use of bit[52] of stage 1 translation table entries as the Protected bit, for translations using TTBRn_EL2 when HCR_EL2.E2H is 1.

PnCH	Meaning
0b0	For translations using TTBRn_EL2, bit[52] of each stage 1 translation table entry is not the Protected bit.
0b1	For translations using TTBR0_EL2, bit[52] of each stage 1 translation table entry is the Protected bit.

If bit[52] is used as the Protected bit, it is not used as the Contiguous bit.

This field is RES0 when TCR2_EL2.D128 is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TCR2_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TCR2_EL2 or TCR2_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to TCR2_EL2 are masked by TCR2MASK_EL2.

Accesses to this register use the following encodings in the System register encoding space:

When FEAT_VHE is implemented

```
MRS <Xt>, TCR2_EL2

TCR2MASK_EL1, Extended Translation Control Masking Register (EL1)

The TCR2MASK_EL1 characteristics are:

Purpose

Mask register to prevent updates of fields in TCR2_EL1 on writes to TCR2_EL1 or TCR2ALIAS_EL1.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCR2MASK_EL1 are UNDEFINED.

Attributes

TCR2MASK_EL1 is a 64-bit register.

Field descriptions

Bits [63:22]

Reserved, RES0.

FNGNA1, bit [21]

When FEAT_THE is implemented:

Mask bit for FNGNA1.

FNGNA1	Meaning
0b0	TCR2_EL1.FNGNA1 is writeable.
0b1	TCR2_EL1.FNGNA1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNGNA0, bit [20]

When FEAT_THE is implemented:

Mask bit for FNGNA0.

FNGNA0	Meaning
0b0	TCR2_EL1.FNGNA0 is writeable.
0b1	TCR2_EL1.FNGNA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

FNG1, bit [18]

When FEAT_ASID2 is implemented:

Mask bit for FNG1.

FNG1	Meaning
0b0	TCR2_EL1.FNG1 is writeable.
0b1	TCR2_EL1.FNG1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNG0, bit [17]

When FEAT_ASID2 is implemented:

Mask bit for FNG0.

FNG0	Meaning
0b0	TCR2_EL1.FNG0 is writeable.
0b1	TCR2_EL1.FNG0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

A2, bit [16]

When FEAT_ASID2 is implemented:

Mask bit for A2.

A2	Meaning
0b0	TCR2_EL1.A2 is writeable.
0b1	TCR2_EL1.A2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH1, bit [15]

When FEAT_D128 is implemented:

Mask bit for DisCH1.

DisCH1	Meaning
0b0	TCR2_EL1.DisCH1 is writeable.
0b1	TCR2_EL1.DisCH1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH0, bit [14]

When FEAT_D128 is implemented:

Mask bit for DisCH0.

DisCH0	Meaning
0b0	TCR2_EL1.DisCH0 is writeable.
0b1	TCR2_EL1.DisCH0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

HAFT, bit [11]

When FEAT_HAFT is implemented:

Mask bit for HAFT.

HAFT	Meaning
0b0	TCR2_EL1.HAFT is writeable.
0b1	TCR2_EL1.HAFT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]

When FEAT_THE is implemented:

Mask bit for PTTWI.

PTTWI	Meaning
0b0	TCR2_EL1.PTTWI is writeable.
0b1	TCR2_EL1.PTTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [9:6]

Reserved, RES0.

D128, bit [5]

When FEAT_D128 is implemented:

Mask bit for D128.

D128	Meaning
0b0	TCR2_EL1.D128 is writeable.
0b1	TCR2_EL1.D128 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [4]
When FEAT_AIE is implemented:

Mask bit for AIE.

AIE	Meaning
0b0	TCR2_EL1.AIE is writeable.
0b1	TCR2_EL1.AIE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]
When FEAT_S1POE is implemented:

Mask bit for POE.

POE	Meaning
0b0	TCR2_EL1.POE is writeable.
0b1	TCR2_EL1.POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [2]
When FEAT_S1POE is implemented:

Mask bit for E0POE.

E0POE	Meaning
0b0	TCR2_EL1.E0POE is writeable.
0b1	TCR2_EL1.E0POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [1]
When FEAT_S1PIE is implemented:

Mask bit for PIE.

PIE	Meaning
0b0	TCR2_EL1.PIE is writeable.
0b1	TCR2_EL1.PIE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]
When FEAT_THE is implemented:

Mask bit for PnCH.

PnCH	Meaning
0b0	TCR2_EL1.PnCH is writeable.
0b1	TCR2_EL1.PnCH is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TCR2MASK_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TCR2MASK_EL1 or TCR2MASK_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

TCR2MASK_EL2, Extended Translation Control Masking Register (EL2)

The TCR2MASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in TCR2_EL2 on writes.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCR2MASK_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

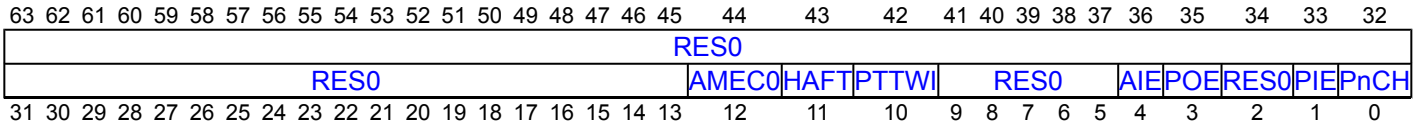
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TCR2MASK_EL2 is a 64-bit register.

Field descriptions

When !ELIsInHost(EL2):



Bits [63:13]

Reserved, RES0.

AMEC0, bit [12]

When FEAT_MEC is implemented:

Mask bit for AMEC0.

AMEC0	Meaning
0b0	TCR2_EL2.AMEC0 is writeable.
0b1	TCR2_EL2.AMEC0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HAFT, bit [11]

When FEAT_HAFT is implemented:

Mask bit for HAFT.

HAFT	Meaning
0b0	TCR2_EL2.HAFT is writeable.
0b1	TCR2_EL2.HAFT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]

When FEAT_THE is implemented:

Mask bit for PTTWI.

PTTWI	Meaning
0b0	TCR2_EL2.PTTWI is writeable.
0b1	TCR2_EL2.PTTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [9:5]

Reserved, RES0.

AIE, bit [4]

When FEAT_AIE is implemented:

Mask bit for AIE.

AIE	Meaning
0b0	TCR2_EL2.AIE is writeable.
0b1	TCR2_EL2.AIE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]

When FEAT_S1POE is implemented:

Mask bit for POE.

POE	Meaning
0b0	TCR2_EL2.POE is writeable.
0b1	TCR2_EL2.POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

PIE, bit [1]

When FEAT_S1PIE is implemented:

Mask bit for PIE.

PIE	Meaning
0b0	TCR2_EL2.PIE is writeable.
0b1	TCR2_EL2.PIE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]

When FEAT_THE is implemented:

Mask bit for PnCH.

PnCH	Meaning
0b0	TCR2_EL2.PnCH is writeable.
0b1	TCR2_EL2.PnCH is not writeable.

The reset behavior of this field is:

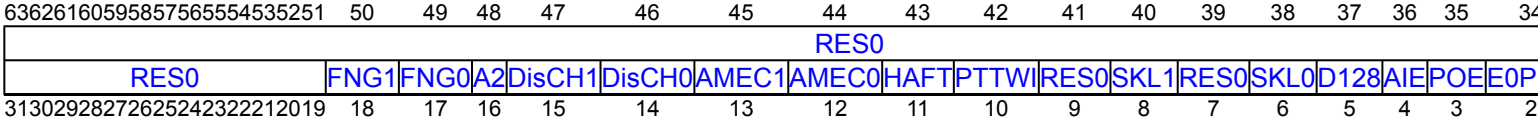
- On a Warm reset:

- When the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When ELIsInHost(EL2):



Bits [63:19]

Reserved, RES0.

FNG1, bit [18]

When FEAT_ASID2 is implemented:

Mask bit for FNG1.

FNG1	Meaning
0b0	TCR2_EL2.FNG1 is writeable.
0b1	TCR2_EL2.FNG1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNG0, bit [17]

When FEAT_ASID2 is implemented:

Mask bit for FNG0.

FNG0	Meaning
0b0	TCR2_EL2.FNG0 is writeable.
0b1	TCR2_EL2.FNG0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

A2, bit [16]

When FEAT_ASID2 is implemented:

Mask bit for A2.

A2	Meaning
0b0	TCR2_EL2.A2 is writeable.
0b1	TCR2_EL2.A2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH1, bit [15]

When FEAT_D128 is implemented:

Mask bit for DisCH1.

DisCH1	Meaning
0b0	TCR2_EL2.DisCH1 is writeable.
0b1	TCR2_EL2.DisCH1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH0, bit [14]

When FEAT_D128 is implemented:

Mask bit for DisCH0.

DisCH0	Meaning
0b0	TCR2_EL2.DisCH0 is writeable.
0b1	TCR2_EL2.DisCH0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMEC1, bit [13]

When FEAT_MEC is implemented:

Mask bit for AMEC1.

AMEC1	Meaning
0b0	TCR2_EL2.AMEC1 is writeable.
0b1	TCR2_EL2.AMEC1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMEC0, bit [12]

When FEAT_MEC is implemented:

Mask bit for AMEC0.

AMEC0	Meaning
0b0	TCR2_EL2.AMEC0 is writeable.
0b1	TCR2_EL2.AMEC0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HAFT, bit [11]

When FEAT_HAFT is implemented:

Mask bit for HAFT.

HAFT	Meaning
0b0	TCR2_EL2.HAFT is writeable.
0b1	TCR2_EL2.HAFT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]

When FEAT_THE is implemented:

Mask bit for PTTWI.

PTTWI	Meaning
0b0	TCR2_EL2.PTTWI is writeable.
0b1	TCR2_EL2.PTTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SKL1, bit [8]

When FEAT_D128 is implemented:

Mask bit for SKL1.

SKL1	Meaning
0b0	TCR2_EL2.SKL1 is writeable.
0b1	TCR2_EL2.SKL1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

SKL0, bit [6]

When FEAT_D128 is implemented:

Mask bit for SKL0.

SKL0	Meaning
0b0	TCR2_EL2.SKL0 is writeable.
0b1	TCR2_EL2.SKL0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D128, bit [5]
When FEAT_D128 is implemented:

Mask bit for D128.

D128	Meaning
0b0	TCR2_EL2.D128 is writeable.
0b1	TCR2_EL2.D128 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [4]
When FEAT_AIE is implemented:

Mask bit for AIE.

AIE	Meaning
0b0	TCR2_EL2.AIE is writeable.
0b1	TCR2_EL2.AIE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]
When FEAT_S1POE is implemented:

Mask bit for POE.

POE	Meaning
0b0	TCR2_EL2.POE is writeable.
0b1	TCR2_EL2.POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [2]
When FEAT_S1POE is implemented:

Mask bit for E0POE.

E0POE	Meaning
0b0	TCR2_EL2.E0POE is writeable.
0b1	TCR2_EL2.E0POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [1]
When FEAT_S1PIE is implemented:

Mask bit for PIE.

PIE	Meaning
0b0	TCR2_EL2.PIE is writeable.
0b1	TCR2_EL2.PIE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]
When FEAT_THE is implemented:

Mask bit for PnCH.

PnCH	Meaning
0b0	TCR2_EL2.PnCH is writeable.
0b1	TCR2_EL2.PnCH is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TCR2MASK_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TCR2MASK_EL2 or TCR2MASK_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TCR2MASK_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0111	0b011

```
if !(IsFeatureImplemented(FEAT_SRMASK) && IsFeatureImplemented(FEAT_AA64)) then

TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

Configuration

AArch64 System register TCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TTBCR[31:0].

AArch64 System register TCR_EL1 bits [63:32] are architecturally mapped to AArch32 System register TTBCR2[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TCR_EL1 are UNDEFINED.

Attributes

TCR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13

Any of the bits in TCR_EL1, other than the EPDx bits when they have the value 1, and the A1 bit are permitted to be cached in a TLB.

Bits [63:62]

Reserved, RES0.

MTX1, bit [61]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL0 and EL1 are using AArch64 where the data address would be translated by tables pointed to by TTBR1_EL1.

This control has an effect regardless of whether stage 1 of the EL1&0 translation regime is enabled or not.

MTX1	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b1111 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX0, bit [60]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL0 and EL1 are using AArch64 where the data address would be translated by tables pointed to by TTBR0_EL1.

This control has an effect regardless of whether stage 1 of the EL1&0 translation regime is enabled or not.

MTX0	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b0000 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented and (FEAT_D128 is not implemented or TCR2_EL1.D128 == 0):

This field affects:

- Whether a 52-bit output address can be described by the translation tables of the 4KB or 16KB translation granules.
- The minimum value of TCR_EL1.{T0SZ,T1SZ}.
- How and where shareability for Block and Page descriptors are encoded.

DS	Meaning
0b0	Bits[49:48] of translation descriptors are RES0. Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in Table descriptors are ignored by hardware. The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.
0b1	Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of Translation table descriptors hold output address[51:50]. The shareability information of Block and Page descriptors for cacheable locations is determined by: • TCR_EL1.SH0 if the VA is translated using tables pointed to by TTBR0_EL1. • TCR_EL1.SH1 if the VA is translated using tables pointed to by TTBR1_EL1. The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0_EL1 or TTBR1_EL1 are used to hold bits[51:48] of the output address in all cases. **Note** As FEAT_LVA must be implemented if TCR_EL1.DS == 1, the minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12, as determined by that extension. For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00. **Note** This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

The Effective value of this bit is 0b0.

Access to this field is **RES0**.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]

When FEAT_E0PD is implemented:

Faulting control for unprivileged access to any address translated by TTBR1_EL1.

E0PD1	Meaning
0b0	Unprivileged access to any address translated by TTBR1_EL1 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR1_EL1 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]

When FEAT_E0PD is implemented:

Faulting control for unprivileged access to any address translated by TTBR0_EL1.

E0PD0	Meaning
0b0	Unprivileged access to any address translated by TTBR0_EL1 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR0_EL1 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]
When FEAT_SVE is implemented or FEAT_TME is implemented:

Non-Fault translation timing Disable when using TTBR1_EL1.

Controls how a TLB miss is reported in response to a non-fault unprivileged access for a virtual address that is translated using TTBR1_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD1	Meaning
0b0	Does not affect the handling of a TLB miss on accesses translated using TTBR1_EL1.
0b1	A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. The amount of time that the failure takes to be handled should not predictively leak whether it was caused by a TLB miss or a Permission fault, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]
When FEAT_SVE is implemented or FEAT_TME is implemented:

Non-Fault translation timing Disable when using TTBR0_EL1.

Controls how a TLB miss is reported in response to a non-fault unprivileged access for a virtual address that is translated using TTBR0_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD0	Meaning
0b0	Does not affect the handling of a TLB miss on accesses translated using TTBR0_EL1.
0b1	A TLB miss on a virtual address that is translated using TTBR0_EL1 due to the specified access types causes the access to fail without taking an exception. The amount of time that the failure takes to be handled should not predictively leak whether it was caused by a TLB miss or a Permission fault, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging'.

TBID1	Meaning
0b0	TCR_EL1.TBI1 applies to Instruction and Data accesses.
0b1	TCR_EL1.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging'.

TBID0	Meaning
0b0	TCR_EL1.TBI0 applies to Instruction and Data accesses.
0b1	TCR_EL1.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU162	Meaning
0b0	For translations using TTBR1_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU161	Meaning
0b0	For translations using TTBR1_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU160	Meaning
0b0	For translations using TTBR1_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU159	Meaning
0b0	For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU062	Meaning
0b0	For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU061	Meaning
0b0	For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU060	Meaning
0b0	For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU059	Meaning
0b0	For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL1.

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL1.

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled.

When the Effective value of TCR_EL1.HA is 0, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL0 and EL1.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL1 region, or ignored and used for tagged addresses.

TBI1	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL1 region, or ignored and used for tagged addresses.

TBI0	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

AS	Meaning
0b0	8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

IPS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.
0b111	56 bits, 64PB.

The value 0b110 represents the following output address sizes:

- For the 64KB translation granule size, if FEAT_LPA is implemented, the value 0b110 represents 52 bits.
- For the 4KB and 16KB translation granule sizes, if FEAT_LPA is implemented and the Effective value of TCR_EL1.DS is 0b1, then the value 0b110 represents 52 bits.
- Otherwise, the value 0b110 behaves as the 0b101 value and represents 48 bits.

If the value of ID_AA64MMFR0_EL1.PARange is 0b0111, and the value of this field is not 0b111 or a value treated as 0b111, then bits[55:52] of every translation table base address are 0b0000 for the stage of translation controlled by TCR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the TTBR1_EL1.

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1_EL1.

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL1. The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using TTBR1_EL1.
0b1	A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether TTBR0_EL1 or TTBR1_EL1 defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	TTBR0_EL1.ASID defines the ASID.
0b1	TTBR1_EL1.ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by TTBR1_EL1. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL1.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL1.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the TTBR0_EL1.

TG0	Meaning
0b00	4KB
0b01	64KB
0b10	16KB

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL1.

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using TTBR0_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL1. The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using TTBR0_EL1.
0b1	A TLB miss on an address that is translated using TTBR0_EL1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL1. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL1.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL1.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TCR_EL1 or TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to TCR_EL1 are masked by TCRMASK_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TCR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then

TCR_EL2, Translation Control Register (EL2)

The TCR_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of HCR_EL2.E2H is not 1, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using TTBR0_EL2.
- When the Effective value of HCR_EL2.E2H is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
  - A lower VA range, translated using TTBR0_EL2.
  - A higher VA range, translated using TTBR1_EL2.

Configuration

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTCR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

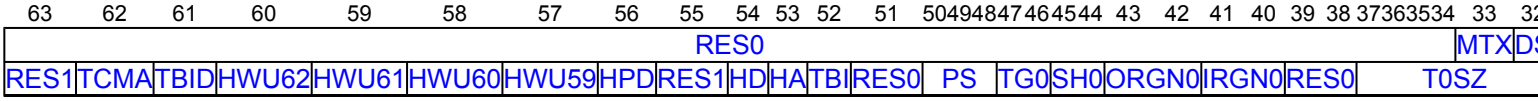
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TCR_EL2 is a 64-bit register.

Field descriptions

When !ELIsInHost(EL2):



Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

Bits [63:34]

Reserved, RES0.

MTX, bit [33]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL2 is using AArch64 where the data address would be translated by tables pointed to by TTBR0_EL2.

This control has an effect regardless of whether stage 1 of the EL2 translation regime is enabled or not.

MTX	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b0000 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [32]
When FEAT_LPA2 is implemented:

This field affects:

- Whether a 52-bit output address can be described by the translation tables of the 4KB or 16KB translation granules.
- The minimum value of TCR_EL2.T0SZ.
- How and where shareability for Block and Page descriptors are encoded.

DS	Meaning
0b0	Bits[49:48] of translation descriptors are RES0. Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware. The minimum value of TCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.
0b1	Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of Translation table descriptors hold output address[51:50]. The shareability information of Block and Page descriptors for cacheable locations is determined by TCR_EL2.SH0. The minimum value of TCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0_EL2 are used to hold bits[51:48] of the output address in all cases. **Note** As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.T0SZ field is 12, as determined by that extension. For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00. **Note** This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

The Effective value of this bit is 0b0.

Access to this field is **RES0**.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.

TCMA	Meaning
0b0	This control has no effect on the generation of Unchecked accesses.
0b1	All accesses are Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging'.

TBID	Meaning
0b0	TCR_EL2.TBI applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled. **Note** In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled.

When the Effective value of TCR_EL2.HA is 0, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]
When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL2.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses.

For more information, see 'Address tagging'.

TBI	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

PS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

The value 0b110 represents the following output address sizes:

- For the 64KB translation granule size, if FEAT_LPA is implemented, the value 0b110 represents 52 bits.
- For the 4KB and 16KB translation granule sizes, if FEAT_LPA is implemented and the Effective value of TCR_EL2.DS is 0b1, then the value 0b110 represents 52 bits.
- Otherwise, the value 0b110 behaves as the 0b101 value and represents 48 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the TTBR0_EL2.

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

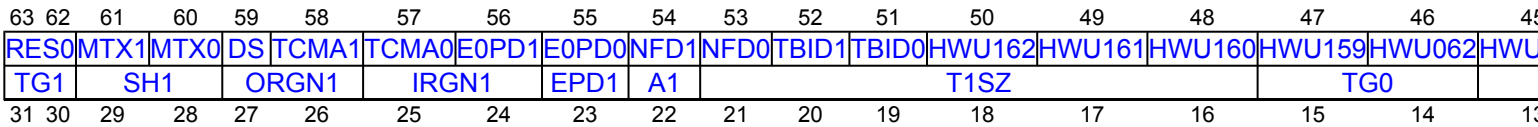
For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When ELIsInHost(EL2):



Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:62]

Reserved, RES0.

MTX1, bit [61]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL0 and EL2 are using AArch64 where the data address would be translated by tables pointed to by TTBR1_EL2.

This control has an effect regardless of whether stage 1 of the EL2&0 translation regime is enabled or not.

MTX1	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b1111 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX0, bit [60]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL0 and EL2 are using AArch64 where the data address would be translated by tables pointed to by TTBR0_EL2.

This control has an effect regardless of whether stage 1 of the EL2&0 translation regime is enabled or not.

MTX0	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b0000 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented and (FEAT_D128 is not implemented or TCR2_EL2.D128 == 0):

This field affects:

- Whether a 52-bit output address can be described by the translation tables of the 4KB or 16KB translation granules.
- The minimum value of TCR_EL2.{T0SZ,T1SZ}.
- How and where shareability for Block and Page descriptors are encoded.

DS	Meaning
0b0	Bits[49:48] of translation descriptors are RES0. Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware. The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.
0b1	Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of Translation table descriptors hold output address[51:50]. The shareability information of Block and Page descriptors for cacheable locations is determined by: • TCR_EL2.SH0 if the VA is an address that is translated using tables pointed to by TTBR0_EL2. • TCR_EL2.SH1 if the VA is an address that is translated using tables pointed to by TTBR1_EL2. The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 16 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0_EL2 or TTBR1_EL2 are used to hold bits[51:48] of the output address in all cases. **Note** As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12, as determined by that extension. For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00. **Note** This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0, and the Effective value of this bit is 0b0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
0b1	All accesses are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
0b1	All accesses are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]

When FEAT_E0PD is implemented:

Faulting control for unprivileged access to any address translated by TTBR1_EL2.

E0PD1	Meaning
0b0	Unprivileged access to any address translated by TTBR1_EL2 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR1_EL2 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]

When FEAT_E0PD is implemented:

Faulting control for unprivileged access to any address translated by TTBR0_EL2.

E0PD0	Meaning
0b0	Unprivileged access to any address translated by TTBR0_EL2 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR0_EL2 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]
When FEAT_SVE is implemented or FEAT_TME is implemented:

Non-Fault translation timing Disable when using TTBR1_EL2.

Controls how a TLB miss is reported in response to a non-fault unprivileged access for a virtual address that is translated using TTBR1_EL2.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD1	Meaning
0b0	Does not affect the handling of a TLB miss on accesses translated using TTBR1_EL2.
0b1	A TLB miss on a virtual address that is translated using TTBR1_EL2 due to the specified access types causes the access to fail without taking an exception. The amount of time that the failure takes to be handled should not predictively leak whether it was caused by a TLB miss or a Permission fault, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]
When FEAT_SVE is implemented or FEAT_TME is implemented:

Non-Fault translation timing Disable when using TTBR0_EL2.

Controls how a TLB miss is reported in response to a non-fault unprivileged access for a virtual address that is translated using TTBR0_EL2.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD0	Meaning
0b0	Does not affect the handling of a TLB miss on accesses translated using TTBR0_EL2.
0b1	A TLB miss on a virtual address that is translated using TTBR0_EL2 due to the specified access types causes the access to fail without taking an exception. The amount of time that the failure takes to be handled should not predictively leak whether it was caused by a TLB miss or a Permission fault, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging'.

TBID1	Meaning
0b0	TCR_EL2.TBI1 applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For more information, see 'Address tagging'.

TBID0	Meaning
0b0	TCR_EL2.TBI0 applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

HWU162	Meaning
0b0	For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

HWU161	Meaning
0b0	For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

HWU160	Meaning
0b0	For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

HWU159	Meaning
0b0	For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU062	Meaning
0b0	For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU061	Meaning
0b0	For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU060	Meaning
0b0	For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU059	Meaning
0b0	For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL2.

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled.

When the Effective value of TCR_EL2.HA is 0, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL2.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL2 region, or ignored and used for tagged addresses.

For more information, see 'Address tagging'.

TBI1	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses.

For more information, see 'Address tagging'.

TBI0	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

AS	Meaning
0b0	8 bit - the upper 8 bits of TTBR0_EL2 and TTBR1_EL2 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of TTBR0_EL2 and TTBR1_EL2 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

IPS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.
0b111	56 bits, 64PB.

The value 0b110 represents the following output address sizes:

- For the 64KB translation granule size, if FEAT_LPA is implemented, the value 0b110 represents 52 bits.

- For the 4KB and 16KB translation granule sizes, if FEAT_LPA is implemented and the Effective value of TCR_EL2.DS is 0b1, then the value 0b110 represents 52 bits.
- Otherwise, the value 0b110 behaves as the 0b101 value and represents 48 bits.

If the value of ID_AA64MMFR0_EL1.PARange is 0b0111, and the value of this field is not 0b111 or a value treated as 0b111, then bits[55:52] of every translation table base address are 0b0000 for the stage of translation controlled by TCR_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the TTBR1_EL2.

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1_EL2.

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL2.

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL2.

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL2. The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using TTBR1_EL2.
0b1	A TLB miss on an address that is translated using TTBR1_EL2 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether TTBR0_EL2 or TTBR1_EL2 defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	TTBR0_EL2.ASID defines the ASID.
0b1	TTBR1_EL2.ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by TTBR1_EL2. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the TTBR0_EL2.

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using TTBR0_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL2. The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using TTBR0_EL2.
0b1	A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to TCR_EL2 are masked by TCRMASK_EL2.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    X[t, 64] = TCR_EL2;
elsif PSTATE.EL == EL3 then
    X[t, 64] = TCR_EL2;
```

```
MSR TCR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if IsFeatureImplemented(FEAT_SRMASK) then
        TCR_EL2 = (X[t, 64] AND NOT EffectiveTCRMASK_EL2()) OR (TCR_EL2 AND
EffectiveTCRMASK_EL2());
    else
        TCR_EL2 = X[t, 64];
elsif PSTATE.EL == EL3 then
    TCR_EL2 = X[t, 64];
```

When FEAT_VHE is implemented

```
MRS <Xt>, TCR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1')
&& HFGRTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EffectiveHCR_EL2_NVx() IN {'111'} then
        X[t, 64] = NVMem[0x120];
    else
        X[t, 64] = TCR_EL1;
elsif PSTATE.EL == EL2 then
    if ELIsInHost(EL2) then
        X[t, 64] = TCR_EL2;
    else
        X[t, 64] = TCR_EL1;
elsif PSTATE.EL == EL3 then
    X[t, 64] = TCR_EL1;
```

When FEAT_VHE is implemented

```
MSR TCR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1')
&& HFGWTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EffectiveHCR_EL2_NVx() IN {'111'} then
        NVMem[0x120] = X[t, 64];
    else
        if IsFeatureImplemented(FEAT_SRMASK) then
            TCR_EL1 = (X[t, 64] AND NOT EffectiveTCRMASK_EL1()) OR (TCR_EL1 AND
EffectiveTCRMASK_EL1());
        else
            TCR_EL1 = X[t, 64];
elsif PSTATE.EL == EL2 then
    if ELIsInHost(EL2) then
        if IsFeatureImplemented(FEAT_SRMASK) then
            TCR_EL2 = (X[t, 64] AND NOT EffectiveTCRMASK_EL2()) OR (TCR_EL2 AND
EffectiveTCRMASK_EL2());
        else
            TCR_EL2 = X[t, 64];
    else
        TCR_EL1 = X[t, 64];
elsif PSTATE.EL == EL3 then
    TCR_EL1 = X[t, 64];
```

TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

Purpose

The control register for stage 1 of the EL3 translation regime.

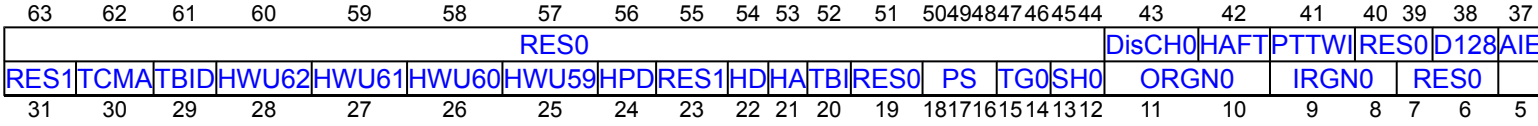
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCR_EL3 are UNDEFINED.

Attributes

TCR_EL3 is a 64-bit register.

Field descriptions



Unless stated otherwise, any of the bits in TCR_EL3 are permitted to be cached in a TLB.

Bits [63:44]

Reserved, RES0.

DisCH0, bit [43]

When FEAT_D128 is implemented and TCR_EL3.D128 == 1:

Disable the Contiguous bit for the Start Table.

DisCH0	Meaning
0b0	The Contiguous bit of Block or Page descriptors of the Start Table is not affected by this field.
0b1	The Contiguous bit of Block or Page descriptors of the Start Table is treated as 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HAFT, bit [42]

When FEAT_HAFT is implemented:

Hardware managed Access Flag for Table descriptors.

Enables the Hardware managed Access Flag for Table descriptors.

HAFT	Meaning
0b0	Hardware managed Access Flag for Table descriptors is disabled.
0b1	Hardware managed Access Flag for Table descriptors is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [41]
When FEAT_THE is implemented:

Permit Translation table walk Incoherence.

Permits RCWS instructions to generate writes that have the Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL3 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL3 have the Reduced Coherence property.

This bit is permitted to be implemented as a read-only bit with a fixed value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [40:39]

Reserved, RES0.

D128, bit [38]
When FEAT_D128 is implemented:

Enables VMSAv9-128 translation system.

D128	Meaning
0b0	Translation system follows VMSAv8-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [37]

When FEAT_AIE is implemented:

Enable Attribute Indexing Extension.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [36]

When FEAT_S1POE is implemented:

Enables Permission Overlay for EL3 accesses.

POE	Meaning
0b0	Permission overlay disabled for EL3 access in stage 1 of EL3 translation regime.
0b1	Permission overlay enabled for EL3 access in stage 1 of EL3 translation regime.

This bit is not permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [35]

When FEAT_S1PIE is implemented:

Enables usage of Indirect Permission Scheme.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when TCR_EL3.D128 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [34]

When FEAT_THE is implemented:

Protected attribute enable. Enables use of bit[52] of the stage 1 translation table entries as the Protected bit, for translations using TTBR0_EL3.

PnCH	Meaning
0b0	For translations using TTBR0_EL3, bit[52] of each stage 1 translation table entry is not the Protected bit.
0b1	For translations using TTBR0_EL3, bit[52] of each stage 1 translation table entry is the Protected bit.

If bit[52] is used as the Protected bit, it is not used as the Contiguous bit.

This field is RES0 when TCR_EL3.D128 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX, bit [33]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and tag checking when EL3 is using AArch64 where the data address would be translated by tables pointed to by TTBR0_EL3.

This control has an effect regardless of whether stage 1 of the EL3 translation regime is enabled or not.

MTX	Meaning
0b0	This control has no effect on the PE.
0b1	Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b0000 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented and (FEAT_D128 is not implemented or TCR_EL3.D128 == 0):

This field affects:

- Whether a 52-bit output address can be described by the translation tables of the 4KB or 16KB translation granules.
- The minimum value of TCR_EL3.T0SZ.
- How and where shareability for Block and Page descriptors are encoded.

DS	Meaning
0b0	Bits[49:48] of translation descriptors are RES0. Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in Table descriptors are ignored by hardware. The minimum value of TCR_EL3.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.
0b1	Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of table translation descriptors hold output address[51:50]. The shareability information of Block and Page descriptors for cacheable locations is determined by TCR_EL3.SH0. The minimum value of TCR_EL3.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0_EL3 are used to hold bits[51:48] of the output address in all cases. **Note** As FEAT_LVA must be implemented if TCR_EL3.DS == 1, the minimum value of the TCR_EL3.T0SZ field is 12, as determined by that extension. For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00. **Note** This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

The Effective value of this bit is 0b0.

Access to this field is **RES0**.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

TCMA	Meaning
0b0	This control has no effect on the generation of Unchecked accesses.
0b1	All accesses are Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]
When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

TBID	Meaning
0b0	TCR_EL3.TBI applies to Instruction and Data accesses.
0b1	TCR_EL3.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL3.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]
When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL3.

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled. **Note** In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL3.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled.

When the Effective value of TCR_EL3.HA is 0, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL3.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL3 region, or ignored and used for tagged addresses.

TBI	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL3. It has an effect whether the EL3 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see 'Address tagging'.

Note

This control detrmines the scope of address tagging. It never causes an exception to be generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

PS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.
0b111	56 bits, 64PB.

The value 0b110 represents the following output address sizes:

- For the 64KB translation granule size, if FEAT_LPA is implemented, the value 0b110 represents 52 bits.
- For the 4KB and 16KB translation granule sizes, if FEAT_LPA is implemented and the Effective value of TCR_EL3.DS is 0b1, then the value 0b110 represents 52 bits.
- Otherwise, the value 0b110 behaves as the 0b101 value and represents 48 bits.

If the value of ID_AA64MMFR0_EL1.PARange is 0b0111, and the value of this field is not 0b111 or a value treated as 0b111, then bits[55:52] of every translation table base address are 0b0000 for the stage of translation controlled by TCR_EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the TTBR0_EL3.

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL3.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL3. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL3.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL3.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TCR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0000	0b010

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then

TCRMASK_EL1, Translation Control Masking Register (EL1)

The TCRMASK_EL1 characteristics are:

Purpose

Mask register to prevent updates of fields in TCR_EL1 on writes to TCR_EL1 or TCRALIAS_EL1.

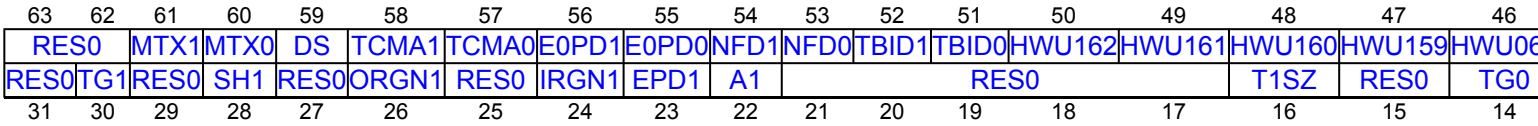
Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCRMASK_EL1 are UNDEFINED.

Attributes

TCRMASK_EL1 is a 64-bit register.

Field descriptions



Bits [63:62]

Reserved, RES0.

MTX1, bit [61]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Mask bit for MTX1.

MTX1	Meaning
0b0	TCR_EL1.MTX1 is writeable.
0b1	TCR_EL1.MTX1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX0, bit [60]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Mask bit for MTX0.

MTX0	Meaning
0b0	TCR_EL1.MTX0 is writeable.
0b1	TCR_EL1.MTX0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

Mask bit for DS.

DS	Meaning
0b0	TCR_EL1.DS is writeable.
0b1	TCR_EL1.DS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Mask bit for TCMA1.

TCMA1	Meaning
0b0	TCR_EL1.TCMA1 is writeable.
0b1	TCR_EL1.TCMA1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Mask bit for TCMA0.

TCMA0	Meaning
0b0	TCR_EL1.TCMA0 is writeable.
0b1	TCR_EL1.TCMA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]

When FEAT_E0PD is implemented:

Mask bit for E0PD1.

E0PD1	Meaning
0b0	TCR_EL1.E0PD1 is writeable.
0b1	TCR_EL1.E0PD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]

When FEAT_E0PD is implemented:

Mask bit for E0PD0.

E0PD0	Meaning
0b0	TCR_EL1.E0PD0 is writeable.
0b1	TCR_EL1.E0PD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]

When FEAT_SVE is implemented or FEAT_TME is implemented:

Mask bit for NFD1.

NFD1	Meaning
0b0	TCR_EL1.NFD1 is writeable.
0b1	TCR_EL1.NFD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When FEAT_SVE is implemented or FEAT_TME is implemented:

Mask bit for NFD0.

NFD0	Meaning
0b0	TCR_EL1.NFD0 is writeable.
0b1	TCR_EL1.NFD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

Mask bit for TBID1.

TBID1	Meaning
0b0	TCR_EL1.TBID1 is writeable.
0b1	TCR_EL1.TBID1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

Mask bit for TBID0.

TBID0	Meaning
0b0	TCR_EL1.TBID0 is writeable.
0b1	TCR_EL1.TBID0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

Mask bit for HWU162.

HWU162	Meaning
0b0	TCR_EL1.HWU162 is writeable.
0b1	TCR_EL1.HWU162 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

Mask bit for HWU161.

HWU161	Meaning
0b0	TCR_EL1.HWU161 is writeable.
0b1	TCR_EL1.HWU161 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]

When FEAT_HPDS2 is implemented:

Mask bit for HWU160.

HWU160	Meaning
0b0	TCR_EL1.HWU160 is writeable.
0b1	TCR_EL1.HWU160 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]

When FEAT_HPDS2 is implemented:

Mask bit for HWU159.

HWU159	Meaning
0b0	TCR_EL1.HWU159 is writeable.
0b1	TCR_EL1.HWU159 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]

When FEAT_HPDS2 is implemented:

Mask bit for HWU062.

HWU062	Meaning
0b0	TCR_EL1.HWU062 is writeable.
0b1	TCR_EL1.HWU062 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

Mask bit for HWU061.

HWU061	Meaning
0b0	TCR_EL1.HWU061 is writeable.
0b1	TCR_EL1.HWU061 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]

When FEAT_HPDS2 is implemented:

Mask bit for HWU060.

HWU060	Meaning
0b0	TCR_EL1.HWU060 is writeable.
0b1	TCR_EL1.HWU060 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

Mask bit for HWU059.

HWU059	Meaning
0b0	TCR_EL1.HWU059 is writeable.
0b1	TCR_EL1.HWU059 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]

When FEAT_HPDS is implemented:

Mask bit for HPD1.

HPD1	Meaning
0b0	TCR_EL1.HPD1 is writeable.
0b1	TCR_EL1.HPD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When FEAT_HPDS is implemented:

Mask bit for HPD0.

HPD0	Meaning
0b0	TCR_EL1.HPD0 is writeable.
0b1	TCR_EL1.HPD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

Mask bit for HD.

HD	Meaning
0b0	TCR_EL1.HD is writeable.
0b1	TCR_EL1.HD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

Mask bit for HA.

HA	Meaning
0b0	TCR_EL1.HA is writeable.
0b1	TCR_EL1.HA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Mask bit for TBI1.

TBI1	Meaning
0b0	TCR_EL1.TBI1 is writeable.
0b1	TCR_EL1.TBI1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Mask bit for TBI0.

TBI0	Meaning
0b0	TCR_EL1.TBI0 is writeable.
0b1	TCR_EL1.TBI0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

Mask bit for AS.

AS	Meaning
0b0	TCR_EL1.AS is writeable.
0b1	TCR_EL1.AS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [35:33]

Reserved, RES0.

IPS, bit [32]

Mask bit for IPS.

IPS	Meaning
0b0	TCR_EL1.IPS is writeable.
0b1	TCR_EL1.IPS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [31]

Reserved, RES0.

TG1, bit [30]

Mask bit for TG1.

TG1	Meaning
0b0	TCR_EL1.TG1 is writeable.
0b1	TCR_EL1.TG1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

SH1, bit [28]

Mask bit for SH1.

SH1	Meaning
0b0	TCR_EL1.SH1 is writeable.
0b1	TCR_EL1.SH1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [27]

Reserved, RES0.

ORGN1, bit [26]

Mask bit for ORGN1.

ORGN1	Meaning
0b0	TCR_EL1.ORGN1 is writeable.
0b1	TCR_EL1.ORGN1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [25]

Reserved, RES0.

IRGN1, bit [24]

Mask bit for IRGN1.

IRGN1	Meaning
0b0	TCR_EL1.IRGN1 is writeable.
0b1	TCR_EL1.IRGN1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Mask bit for EPD1.

EPD1	Meaning
0b0	TCR_EL1.EPD1 is writeable.
0b1	TCR_EL1.EPD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Mask bit for A1.

A1	Meaning
0b0	TCR_EL1.A1 is writeable.
0b1	TCR_EL1.A1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [21:17]

Reserved, RES0.

T1SZ, bit [16]

Mask bit for T1SZ.

T1SZ	Meaning
0b0	TCR_EL1.T1SZ is writeable.
0b1	TCR_EL1.T1SZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

TG0, bit [14]

Mask bit for TG0.

TG0	Meaning
0b0	TCR_EL1.TG0 is writeable.
0b1	TCR_EL1.TG0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

SH0, bit [12]

Mask bit for SH0.

SH0	Meaning
0b0	TCR_EL1.SH0 is writeable.
0b1	TCR_EL1.SH0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

ORGN0, bit [10]

Mask bit for ORGN0.

ORGN0	Meaning
0b0	TCR_EL1.ORGN0 is writeable.
0b1	TCR_EL1.ORGN0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

IRGN0, bit [8]

Mask bit for IRGN0.

IRGN0	Meaning
0b0	TCR_EL1.IRGN0 is writeable.
0b1	TCR_EL1.IRGN0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Mask bit for EPD0.

EPD0	Meaning
0b0	TCR_EL1.EPD0 is writeable.
0b1	TCR_EL1.EPD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

T0SZ, bit [0]

Mask bit for T0SZ.

T0SZ	Meaning
0b0	TCR_EL1.T0SZ is writeable.
0b1	TCR_EL1.T0SZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing TCRMASK_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TCRMASK_EL1 or TCRMASK_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TCRMASK_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0111	0b010

TCRMASK_EL2, Translation Control Masking Register (EL2)

The TCRMASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in TCR_EL2 on writes.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCRMASK_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

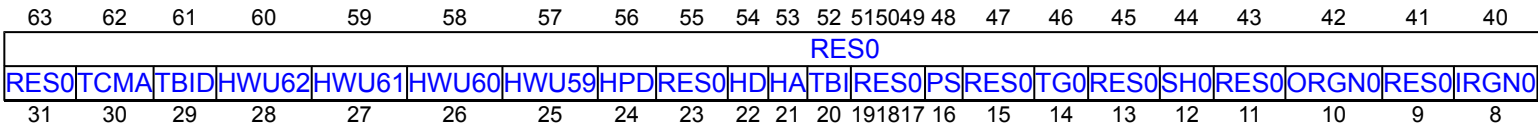
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TCRMASK_EL2 is a 64-bit register.

Field descriptions

When !ELIsInHost(EL2):



Bits [63:34]

Reserved, RES0.

MTX, bit [33]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Mask bit for MTX.

MTX	Meaning
0b0	TCR_EL2.MTX is writeable.
0b1	TCR_EL2.MTX is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented:

Mask bit for DS.

DS	Meaning
0b0	TCR_EL2.DS is writeable.
0b1	TCR_EL2.DS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES0.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

Mask bit for TCMA.

TCMA	Meaning
0b0	TCR_EL2.TCMA is writeable.
0b1	TCR_EL2.TCMA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When FEAT_PAuth is implemented:

Mask bit for TBID.

TBID	Meaning
0b0	TCR_EL2.TBID is writeable.
0b1	TCR_EL2.TBID is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]
When FEAT_HPDS2 is implemented:

Mask bit for HWU62.

HWU62	Meaning
0b0	TCR_EL2.HWU62 is writeable.
0b1	TCR_EL2.HWU62 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]
When FEAT_HPDS2 is implemented:

Mask bit for HWU61.

HWU61	Meaning
0b0	TCR_EL2.HWU61 is writeable.
0b1	TCR_EL2.HWU61 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]
When FEAT_HPDS2 is implemented:

Mask bit for HWU60.

HWU60	Meaning
0b0	TCR_EL2.HWU60 is writeable.
0b1	TCR_EL2.HWU60 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]
When FEAT_HPDS2 is implemented:

Mask bit for HWU59.

HWU59	Meaning
0b0	TCR_EL2.HWU59 is writeable.
0b1	TCR_EL2.HWU59 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]
When FEAT_HPDS is implemented:

Mask bit for HPD.

HPD	Meaning
0b0	TCR_EL2.HPD is writeable.
0b1	TCR_EL2.HPD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

HD, bit [22]
When FEAT_HAFDBS is implemented:

Mask bit for HD.

HD	Meaning
0b0	TCR_EL2.HD is writeable.
0b1	TCR_EL2.HD is not writeable.

The reset behavior of this field is:

- On a Warm reset:

- When the highest implemented Exception level is EL2, this field resets to '0'.
- Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When FEAT_HAFDBS is implemented:

Mask bit for HA.

HA	Meaning
0b0	TCR_EL2.HA is writeable.
0b1	TCR_EL2.HA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Mask bit for TBI.

TBI	Meaning
0b0	TCR_EL2.TBI is writeable.
0b1	TCR_EL2.TBI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [19:17]

Reserved, RES0.

PS, bit [16]

Mask bit for PS.

PS	Meaning
0b0	TCR_EL2.PS is writeable.
0b1	TCR_EL2.PS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

TG0, bit [14]

Mask bit for TG0.

TG0	Meaning
0b0	TCR_EL2.TG0 is writeable.
0b1	TCR_EL2.TG0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

SH0, bit [12]

Mask bit for SH0.

SH0	Meaning
0b0	TCR_EL2.SH0 is writeable.
0b1	TCR_EL2.SH0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

ORGN0, bit [10]

Mask bit for ORGN0.

ORGN0	Meaning
0b0	TCR_EL2.ORGN0 is writeable.
0b1	TCR_EL2.ORGN0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

IRGN0, bit [8]

Mask bit for IRGN0.

IRGN0	Meaning
0b0	TCR_EL2.IRGN0 is writeable.
0b1	TCR_EL2.IRGN0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [7:1]

Reserved, RES0.

T0SZ, bit [0]

Mask bit for T0SZ.

T0SZ	Meaning
0b0	TCR_EL2.T0SZ is writeable.
0b1	TCR_EL2.T0SZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

When ELIsInHost(EL2):

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46
RES0		MTX1	MTX0	DS	TCMA1	TCMA0	E0PD1	E0PD0	NFD1	NFD0	TBID1	TBID0	HWU162	HWU161	HWU160	HWU159	HWU06
RES0	TG1	RES0	SH1	RES0	ORGN1	RES0	IRGN1	EPD1	A1	RES0					T1SZ	RES0	TG0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14

Bits [63:62]

Reserved, RES0.

MTX1, bit [61]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Mask bit for MTX1.

MTX1	Meaning
0b0	TCR_EL2.MTX1 is writeable.
0b1	TCR_EL2.MTX1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX0, bit [60]

When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Mask bit for MTX0.

MTX0	Meaning
0b0	TCR_EL2.MTX0 is writeable.
0b1	TCR_EL2.MTX0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

Mask bit for DS.

DS	Meaning
0b0	TCR_EL2.DS is writeable.
0b1	TCR_EL2.DS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Mask bit for TCMA1.

TCMA1	Meaning
0b0	TCR_EL2.TCMA1 is writeable.
0b1	TCR_EL2.TCMA1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Mask bit for TCMA0.

TCMA0	Meaning
0b0	TCR_EL2.TCMA0 is writeable.
0b1	TCR_EL2.TCMA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]

When FEAT_E0PD is implemented:

Mask bit for E0PD1.

E0PD1	Meaning
0b0	TCR_EL2.E0PD1 is writeable.
0b1	TCR_EL2.E0PD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]

When FEAT_E0PD is implemented:

Mask bit for E0PD0.

E0PD0	Meaning
0b0	TCR_EL2.E0PD0 is writeable.
0b1	TCR_EL2.E0PD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]

When FEAT_SVE is implemented or FEAT_TME is implemented:

Mask bit for NFD1.

NFD1	Meaning
0b0	TCR_EL2.NFD1 is writeable.
0b1	TCR_EL2.NFD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When FEAT_SVE is implemented or FEAT_TME is implemented:

Mask bit for NFD0.

NFD0	Meaning
0b0	TCR_EL2.NFD0 is writeable.
0b1	TCR_EL2.NFD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

Mask bit for TBID1.

TBID1	Meaning
0b0	TCR_EL2.TBID1 is writeable.
0b1	TCR_EL2.TBID1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

Mask bit for TBID0.

TBID0	Meaning
0b0	TCR_EL2.TBID0 is writeable.
0b1	TCR_EL2.TBID0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

Mask bit for HWU162.

HWU162	Meaning
0b0	TCR_EL2.HWU162 is writeable.
0b1	TCR_EL2.HWU162 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

Mask bit for HWU161.

HWU161	Meaning
0b0	TCR_EL2.HWU161 is writeable.
0b1	TCR_EL2.HWU161 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]

When FEAT_HPDS2 is implemented:

Mask bit for HWU160.

HWU160	Meaning
0b0	TCR_EL2.HWU160 is writeable.
0b1	TCR_EL2.HWU160 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]

When FEAT_HPDS2 is implemented:

Mask bit for HWU159.

HWU159	Meaning
0b0	TCR_EL2.HWU159 is writeable.
0b1	TCR_EL2.HWU159 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]

When FEAT_HPDS2 is implemented:

Mask bit for HWU062.

HWU062	Meaning
0b0	TCR_EL2.HWU062 is writeable.
0b1	TCR_EL2.HWU062 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

Mask bit for HWU061.

HWU061	Meaning
0b0	TCR_EL2.HWU061 is writeable.
0b1	TCR_EL2.HWU061 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]

When FEAT_HPDS2 is implemented:

Mask bit for HWU060.

HWU060	Meaning
0b0	TCR_EL2.HWU060 is writeable.
0b1	TCR_EL2.HWU060 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

Mask bit for HWU059.

HWU059	Meaning
0b0	TCR_EL2.HWU059 is writeable.
0b1	TCR_EL2.HWU059 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]

When FEAT_HPDS is implemented:

Mask bit for HPD1.

HPD1	Meaning
0b0	TCR_EL2.HPD1 is writeable.
0b1	TCR_EL2.HPD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When FEAT_HPDS is implemented:

Mask bit for HPD0.

HPD0	Meaning
0b0	TCR_EL2.HPD0 is writeable.
0b1	TCR_EL2.HPD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

Mask bit for HD.

HD	Meaning
0b0	TCR_EL2.HD is writeable.
0b1	TCR_EL2.HD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

Mask bit for HA.

HA	Meaning
0b0	TCR_EL2.HA is writeable.
0b1	TCR_EL2.HA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Mask bit for TBI1.

TBI1	Meaning
0b0	TCR_EL2.TBI1 is writeable.
0b1	TCR_EL2.TBI1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Mask bit for TBI0.

TBI0	Meaning
0b0	TCR_EL2.TBI0 is writeable.
0b1	TCR_EL2.TBI0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

Mask bit for AS.

AS	Meaning
0b0	TCR_EL2.AS is writeable.
0b1	TCR_EL2.AS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [35:33]

Reserved, RES0.

IPS, bit [32]

Mask bit for IPS.

IPS	Meaning
0b0	TCR_EL2.IPS is writeable.
0b1	TCR_EL2.IPS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [31]

Reserved, RES0.

TG1, bit [30]

Mask bit for TG1.

TG1	Meaning
0b0	TCR_EL2.TG1 is writeable.
0b1	TCR_EL2.TG1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

SH1, bit [28]

Mask bit for SH1.

SH1	Meaning
0b0	TCR_EL2.SH1 is writeable.
0b1	TCR_EL2.SH1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [27]

Reserved, RES0.

ORGN1, bit [26]

Mask bit for ORGN1.

ORGN1	Meaning
0b0	TCR_EL2.ORGN1 is writeable.
0b1	TCR_EL2.ORGN1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [25]

Reserved, RES0.

IRGN1, bit [24]

Mask bit for IRGN1.

IRGN1	Meaning
0b0	TCR_EL2.IRGN1 is writeable.
0b1	TCR_EL2.IRGN1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Mask bit for EPD1.

EPD1	Meaning
0b0	TCR_EL2.EPD1 is writeable.
0b1	TCR_EL2.EPD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Mask bit for A1.

A1	Meaning
0b0	TCR_EL2.A1 is writeable.
0b1	TCR_EL2.A1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [21:17]

Reserved, RES0.

T1SZ, bit [16]

Mask bit for T1SZ.

T1SZ	Meaning
0b0	TCR_EL2.T1SZ is writeable.
0b1	TCR_EL2.T1SZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

TG0, bit [14]

Mask bit for TG0.

TG0	Meaning
0b0	TCR_EL2.TG0 is writeable.
0b1	TCR_EL2.TG0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

SH0, bit [12]

Mask bit for SH0.

SH0	Meaning
0b0	TCR_EL2.SH0 is writeable.
0b1	TCR_EL2.SH0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

ORGN0, bit [10]

Mask bit for ORGN0.

ORGN0	Meaning
0b0	TCR_EL2.ORGN0 is writeable.
0b1	TCR_EL2.ORGN0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

IRGN0, bit [8]

Mask bit for IRGN0.

IRGN0	Meaning
0b0	TCR_EL2.IRGN0 is writeable.
0b1	TCR_EL2.IRGN0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Mask bit for EPD0.

EPD0	Meaning
0b0	TCR_EL2.EPD0 is writeable.
0b1	TCR_EL2.EPD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

T0SZ, bit [0]

Mask bit for T0SZ.

T0SZ	Meaning
0b0	TCR_EL2.T0SZ is writeable.
0b1	TCR_EL2.T0SZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing TCRMASK_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TCRMASK_EL2 or TCRMASK_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TCRMASK_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0111	0b010

```

TFSR_EL1, Tag Fault Status Register (EL1)

The TFSR_EL1 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL1 that are not taken precisely.

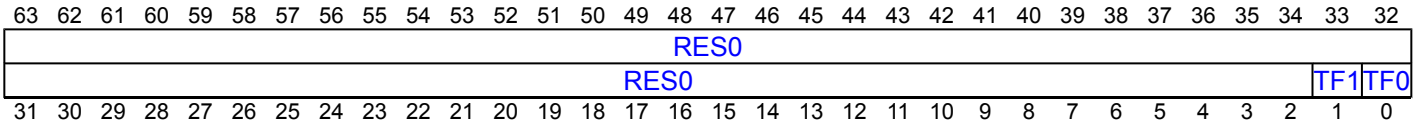
Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL1 are UNDEFINED.

Attributes

TFSR_EL1 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

TF1, bit [1]

When FEAT_MTE_ASYNC is implemented:

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == `0b1` occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TF0, bit [0]

When FEAT_MTE_ASYNC is implemented:

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == `0b0` occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TFSR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TFSR_EL1 or TFSR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TFSR_EL1
```

TFSR_EL2, Tag Fault Status Register (EL2)

The TFSR_EL2 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL2 that are not taken precisely.

Configuration

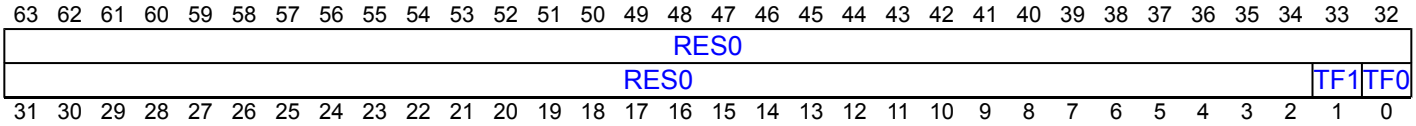
This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TFSR_EL2 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

TF1, bit [1]

When FEAT_MTE_ASYNC is implemented:

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == `0b1` occurs.

When the Effective value of HCR_EL2.E2H is not 1, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TF0, bit [0]

When FEAT_MTE_ASYNC is implemented:

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == `0b0` occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TFSR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TFSR_EL2 or TFSR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TFSR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0110	0b000

TLBI ALLE1, TLBI ALLE1NXS, TLB Invalidate All, EL1

The TLBI ALLE1, TLBI ALLE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation only applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE1, TLBI ALLE1NXS are UNDEFINED.

Attributes

TLBI ALLE1, TLBI ALLE1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI ALLE1, TLBI ALLE1NXS

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI ALLE1{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0111	0b100

```

TLBI ALLE1IS, TLBI ALLE1ISNXS, TLB Invalidate All, EL1, Inner Shareable

The TLBI ALLE1IS, TLBI ALLE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE1IS, TLBI ALLE1ISNXS are UNDEFINED.

Attributes

TLBI ALLE1IS, TLBI ALLE1ISNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI ALLE1IS, TLBI ALLE1ISNXS

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI ALLE1IS{, <Xt>}
```

TLBI ALLE1OS, TLBI ALLE1OSNXS, TLB Invalidate All, EL1, Outer Shareable

The TLBI ALLE1OS, TLBI ALLE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE1OS, TLBI ALLE1OSNXS are UNDEFINED.

Attributes

TLBI ALLE1OS, TLBI ALLE1OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI ALLE1OS, TLBI ALLE1OSNXS

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI ALLE1OS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0001	0b100

```
if !(IsFeatureImplemented(FEAT_TLBIOS) && IsFeatureImplemented(FEAT_AA64)) then

TLBI ALLE3, TLBI ALLE3NXS, TLB Invalidate All, EL3

The TLBI ALLE3, TLBI ALLE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be required to translate an address using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE3, TLBI ALLE3NXS are UNDEFINED.

Attributes

TLBI ALLE3, TLBI ALLE3NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI ALLE3, TLBI ALLE3NXS

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI ALLE3{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0111	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

TLBI ALLE3OS, TLBI ALLE3OSNXS, TLB Invalidate All, EL3, Outer Shareable

The TLBI ALLE3OS, TLBI ALLE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be required to translate an address using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE3OS, TLBI ALLE3OSNXS are UNDEFINED.

Attributes

TLBI ALLE3OS, TLBI ALLE3OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI ALLE3OS, TLBI ALLE3OSNXS

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

TLBI ASIDE1, TLBI ASIDE1NXS, TLB Invalidate by ASID, EL1

The TLBI ASIDE1, TLBI ASIDE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

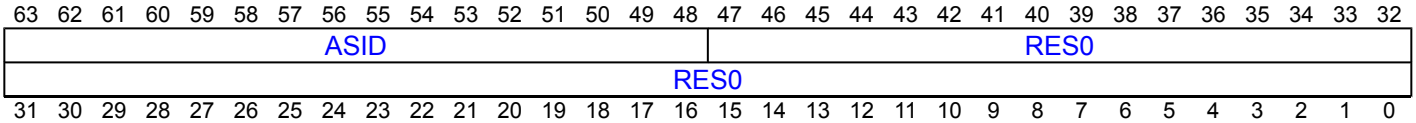
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ASIDE1, TLBI ASIDE1NXS are UNDEFINED.

Attributes

TLBI ASIDE1, TLBI ASIDE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Bits [47:0]

Reserved, RES0.

Executing TLBI ASIDE1, TLBI ASIDE1NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI ASIDE1{, <Xt>}
```

TLBI ASIDE1OS, TLBI ASIDE1OSNXS, TLB Invalidate by ASID, EL1, Outer Shareable

The TLBI ASIDE1OS, TLBI ASIDE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

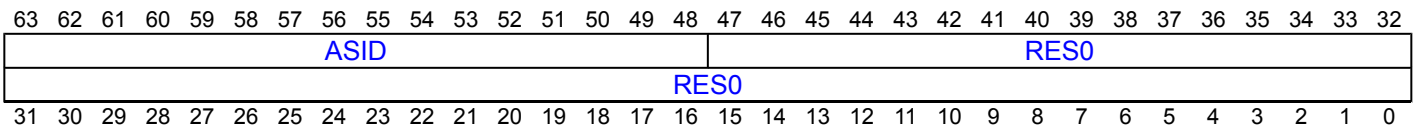
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ASIDE1OS, TLBI ASIDE1OSNXS are UNDEFINED.

Attributes

TLBI ASIDE1OS, TLBI ASIDE1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Bits [47:0]

Reserved, RES0.

Executing TLBI ASIDE1OS, TLBI ASIDE1OSNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI ASIDE1OS{, <Xt>}

TLBI IPAS2E1, TLBI IPAS2E1NXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI IPAS2E1, TLBI IPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

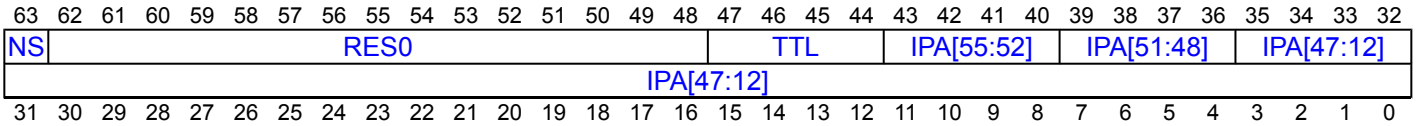
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2E1, TLBI IPAS2E1NXS are UNDEFINED.

Attributes

TLBI IPAS2E1, TLBI IPAS2E1NXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

IPA[55:52], bits [43:40]
When FEAT_D128 is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[51:48], bits [39:36]
When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0111, bits IPA[55:48] form the upper part of the address value.

If ID_AA64MMFR0_EL1.PARange is 0b0110, bits IPA[51:48] form the upper part of the address value and bits IPA[55:52] are RES0.

If ID_AA64MMFR0_EL1.PARange is not 0b0110 and not 0b0111, bits IPA[55:48] are RES0.

Executing TLBI IPAS2E1, TLBI IPAS2E1NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI IPAS2E1{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;

TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

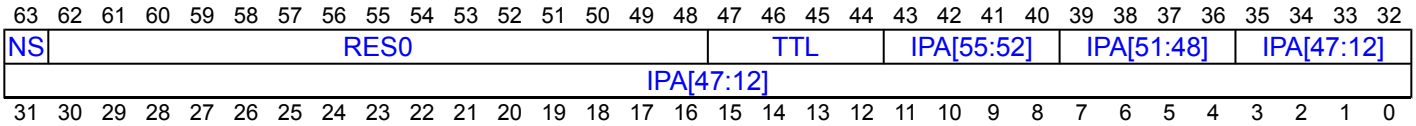
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS are UNDEFINED.

Attributes

TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

IPA[55:52], bits [43:40]
When FEAT_D128 is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[51:48], bits [39:36]
When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0111, bits IPA[55:48] form the upper part of the address value.

If ID_AA64MMFR0_EL1.PARange is 0b0110, bits IPA[51:48] form the upper part of the address value and bits IPA[55:52] are RES0.

If ID_AA64MMFR0_EL1.PARange is not 0b0110 and not 0b0111, bits IPA[55:48] are RES0.

Executing TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI IPAS2E1IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0000	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

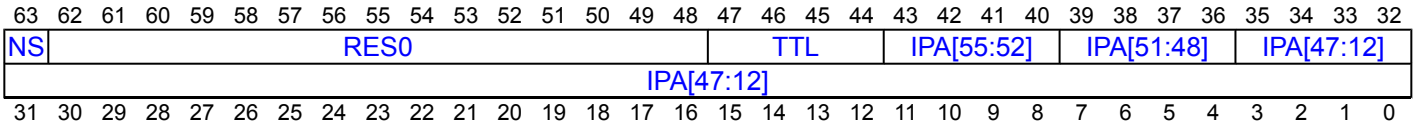
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS are UNDEFINED.

Attributes

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

IPA[55:52], bits [43:40]
When FEAT_D128 is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[51:48], bits [39:36]

Extension to IPA[47:12]. For more information, see IPA[47:12].

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0111, bits IPA[55:48] form the upper part of the address value.

If ID_AA64MMFR0_EL1.PARange is 0b0110, bits IPA[51:48] form the upper part of the address value and bits IPA[55:52] are RES0.

If ID_AA64MMFR0_EL1.PARange is not 0b0110 and not 0b0111, bits IPA[55:48] are RES0.

Executing TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI IPAS2E1OS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b000

```
if !(IsFeatureImplemented(FEAT_TLBIOS) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

TLBI IPAS2LE1, TLBI IPAS2LE1NXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI IPAS2LE1, TLBI IPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

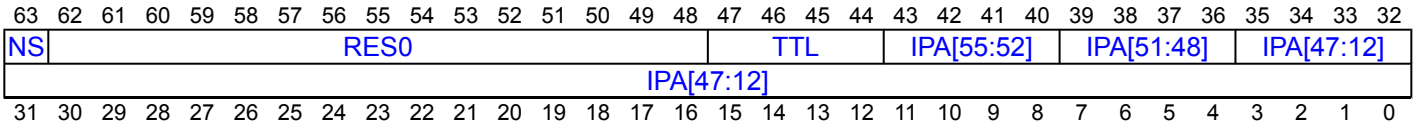
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2LE1, TLBI IPAS2LE1NXS are UNDEFINED.

Attributes

TLBI IPAS2LE1, TLBI IPAS2LE1NXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

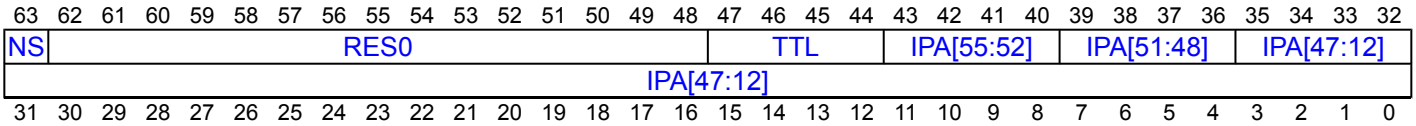
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

IPA[55:52], bits [43:40]
When FEAT_D128 is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[51:48], bits [39:36]
When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0111, bits IPA[55:48] form the upper part of the address value.

If ID_AA64MMFR0_EL1.PARange is 0b0110, bits IPA[51:48] form the upper part of the address value and bits IPA[55:52] are RES0.

If ID_AA64MMFR0_EL1.PARange is not 0b0110 and not 0b0111, bits IPA[55:48] are RES0.

Executing TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI IPAS2LE1IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0000	0b101

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;

TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

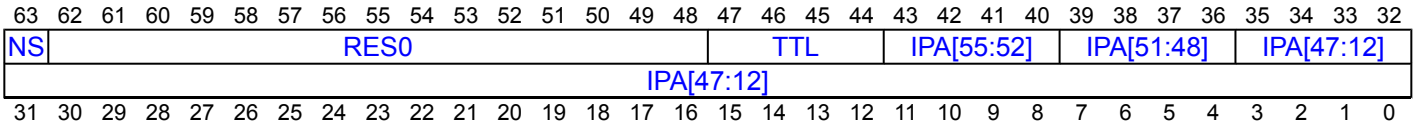
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

IPA[55:52], bits [43:40]
When FEAT_D128 is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[51:48], bits [39:36]

Extension to IPA[47:12]. For more information, see IPA[47:12].

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0111, bits IPA[55:48] form the upper part of the address value.

If ID_AA64MMFR0_EL1.PARange is 0b0110, bits IPA[51:48] form the upper part of the address value and bits IPA[55:52] are RES0.

If ID_AA64MMFR0_EL1.PARange is not 0b0110 and not 0b0111, bits IPA[55:48] are RES0.

Executing TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI IPAS2LE1OS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b100

```

TLBI PAALL, TLB Invalidate GPT Information by PA, All Entries, Local

The TLBI PAALL characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation applies to all TLB entries containing GPT information.
- The invalidation affects only the TLBs for the PE executing the operation.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: TLBI PAALL, TLBI PAALLOS, TLBI RPALOS, and TLBI RPAOS.

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

Configuration

This instruction is present only when FEAT_RME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI PAALL are UNDEFINED.

Attributes

TLBI PAALL is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI PAALL

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI PAALL{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0111	0b100

```
if !(IsFeatureImplemented(FEAT_RME) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then

TLBI RIPAS2E1, TLBI RIPAS2E1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI RIPAS2E1, TLBI RIPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

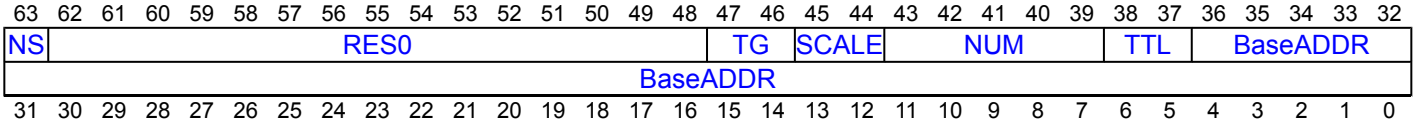
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2E1, TLBI RIPAS2E1NXS are UNDEFINED.

Attributes

TLBI RIPAS2E1, TLBI RIPAS2E1NXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and VTCR_EL2.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RIPAS2E1, TLBI RIPAS2E1NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI RIPAS2E1{, <Xt>}
```

op0	op1	CRn	CRm	op2

0b01	0b100	0b1000	0b0100	0b010

```

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

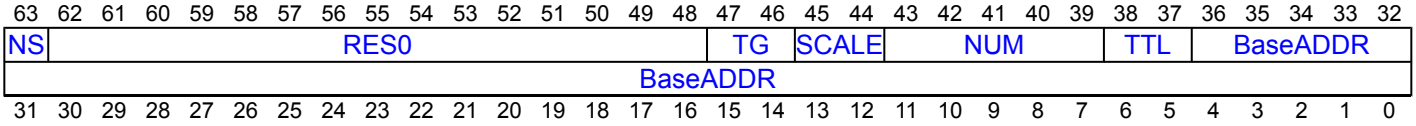
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and VTCR_EL2.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

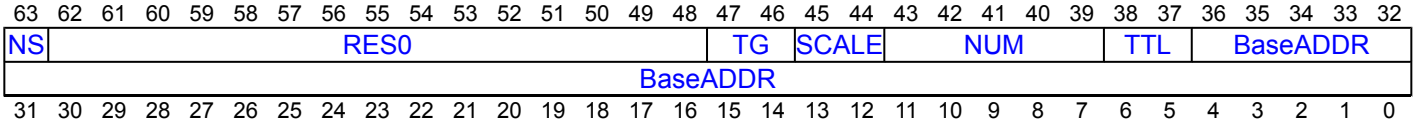
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS are UNDEFINED.

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

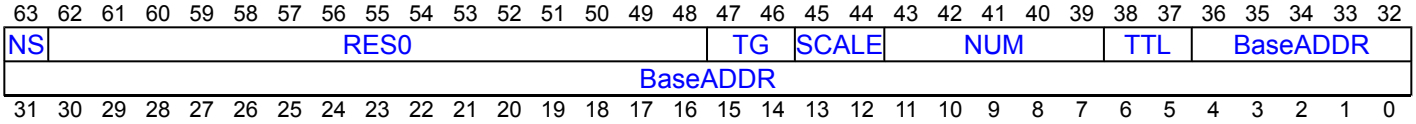
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and VTCR_EL2.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI RIPAS2LE1IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0000	0b110

```
if !(IsFeatureImplemented(FEAT_TLBIRANGE) && IsFeatureImplemented(FEAT_AA64)) then

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.

- If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

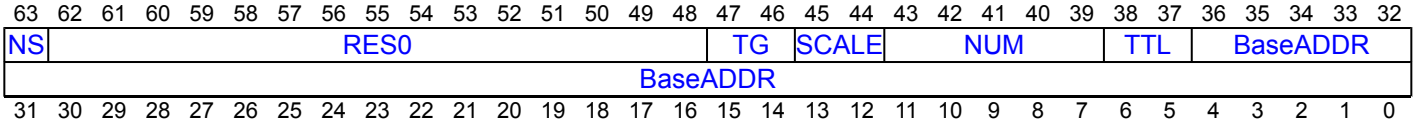
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and VTCR_EL2.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RPALOS, TLB Range Invalidate GPT Information by PA, Last level, Outer Shareable

The TLBI RPALOS characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation affects all TLBs in the Outer Shareable domain.
- Invalidates TLB entries containing GPT information from the final level of the GPT walk that relates to the supplied physical address.
- Invalidations are range-based, invalidating TLB entries starting from the address in BaseADDR, within the range as specified by SIZE.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: TLBI PAALL, TLBI PAALLOS, TLBI RPALOS, and TLBI RPAOS.

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

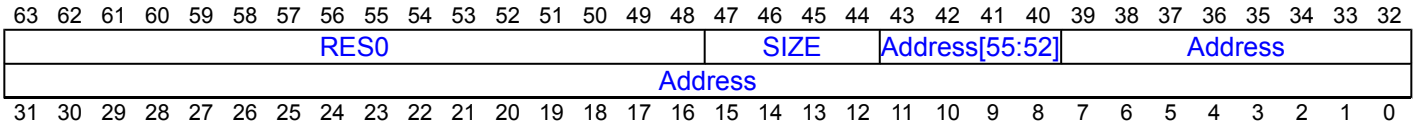
Configuration

This instruction is present only when FEAT_RME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RPALOS are UNDEFINED.

Attributes

TLBI RPALOS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

SIZE, bits [47:44]

Size of the range for invalidation.

If SIZE is a reserved value, no TLB entries are required to be invalidated.

SIZE	Meaning
0b0000	4KB.
0b0001	16KB.
0b0010	64KB.
0b0011	2MB.
0b0100	32MB.
0b0101	512MB.
0b0110	1GB.
0b0111	16GB.
0b1000	64GB.
0b1001	512GB.

All other values are reserved.

If SIZE gives a range smaller than the configured physical granule size in GPCCR_EL3.PGS, then the Effective value of SIZE is taken to be the size configured by GPCCR_EL3.PGS.

If GPCCR_EL3.PGS is configured to a reserved value, no TLB entries are required to be invalidated.

If GPCCR_EL3.PGS is configured to different values at the broadcasting PE and receiving PE, no TLB entries are required to be invalidated at the receiving PE.

Address[55:52], bits [43:40]

When FEAT_D128 is implemented:

Extension to Address. For more information, see Address.

Otherwise:

Reserved, RES0.

Address, bits [39:0]

The starting address for the range of the maintenance instruction.

This field is decoded with reference to the value of GPCCR_EL3.PGS to give BaseADDR as follows:

GPCCR_EL3.PGS	BaseADDR
0b00 (4KB)	BaseADDR[51:12] = Xt[39:0]
0b10 (16KB)	BaseADDR[51:14] = Xt[39:2]
0b01 (64KB)	BaseADDR[51:16] = Xt[39:4]

Other bits of BaseADDR are treated as zero, to give the Effective value of BaseADDR.

If the Effective value of BaseADDR is not aligned to the size of the Effective value of SIZE, no TLB entries are required to be invalidated.

If the Effective value of BaseADDR targets an address above the implemented PA range that ID_AA64MMFR0_EL1.PARange indicates, no TLB entries are required to be invalidated.

If ID_AA64MMFR0_EL1.PARange is 0b0111, Address[55:52] form the upper part of the BaseADDR value. Otherwise, Address[55:52] are RES0.

Executing TLBI RPALOS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI RPALOS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0100	0b111

```

TLBI RPAOS, TLB Range Invalidate GPT Information by PA, Outer Shareable

The TLBI RPAOS characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation affects all TLBs in the Outer Shareable domain.
- Invalidates TLB entries containing GPT information from all levels of the GPT walk that relates to the supplied physical address.
- Invalidations are range-based, invalidating TLB entries starting from the address in BaseADDR, within the range as specified by SIZE.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: TLBI PAALL, TLBI PAALLOS, TLBI RPALOS, and TLBI RPAOS.

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

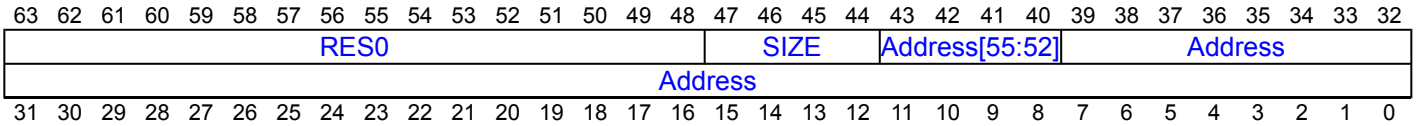
Configuration

This instruction is present only when FEAT_RME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RPAOS are UNDEFINED.

Attributes

TLBI RPAOS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

SIZE, bits [47:44]

Size of the range for invalidation.

If SIZE is a reserved value, no TLB entries are required to be invalidated.

SIZE	Meaning
0b0000	4KB.
0b0001	16KB.
0b0010	64KB.
0b0011	2MB.
0b0100	32MB.
0b0101	512MB.
0b0110	1GB.
0b0111	16GB.
0b1000	64GB.
0b1001	512GB.

All other values are reserved.

If SIZE gives a range smaller than the configured physical granule size in GPCCR_EL3.PGS, then the Effective value of SIZE is taken to be the size configured by GPCCR_EL3.PGS.

If GPCCR_EL3.PGS is configured to a reserved value, no TLB entries are required to be invalidated.

If GPCCR_EL3.PGS is configured to different values at the broadcasting PE and receiving PE, no TLB entries are required to be invalidated at the receiving PE.

Address[55:52], bits [43:40]

When FEAT_D128 is implemented:

Extension to Address. For more information, see Address.

Otherwise:

Reserved, RES0.

Address, bits [39:0]

The starting address for the range of the maintenance instruction.

This field is decoded with reference to the value of GPCCR_EL3.PGS to give BaseADDR as follows:

GPCCR_EL3.PGS	BaseADDR
0b00 (4KB)	BaseADDR[51:12] = Xt[39:0]
0b10 (16KB)	BaseADDR[51:14] = Xt[39:2]
0b01 (64KB)	BaseADDR[51:16] = Xt[39:4]

Other bits of BaseADDR are treated as zero, to give the Effective value of BaseADDR.

If the Effective value of BaseADDR is not aligned to the size of the Effective value of SIZE, no TLB entries are required to be invalidated.

If the Effective value of BaseADDR targets an address above the implemented PA range that ID_AA64MMFR0_EL1.PARange indicates, no TLB entries are required to be invalidated.

If ID_AA64MMFR0_EL1.PARange is 0b0111, Address[55:52] form the upper part of the BaseADDR value. Otherwise, Address[55:52] are RES0.

Executing TLBI RPAOS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI RPAOS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0100	0b011

```
if !(IsFeatureImplemented(FEAT_RME) && IsFeatureImplemented(FEAT_AA64)) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_RPA(TLBILevel_Any, X[t, 64], Broadcast_OSH);
```

TLBI RVAAE1, TLBI RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBI RVAAE1, TLBI RVAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

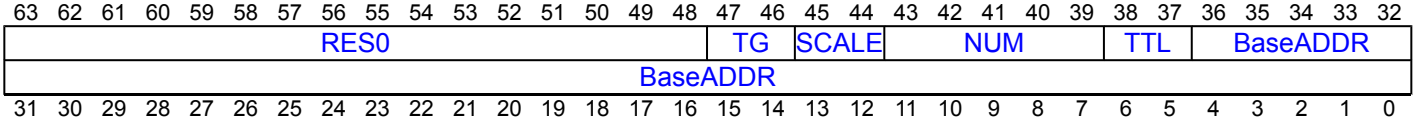
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAAE1, TLBI RVAAE1NXS are UNDEFINED.

Attributes

TLBI RVAAE1, TLBI RVAAE1NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as `0b0000`.

When using a 16KB translation granule, BaseADDR[15:14] is treated as `0b00`.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAAE1, TLBI RVAAE1NXS

TLBI RVAAE1IS, TLBI RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI RVAAE1IS, TLBI RVAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
    - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
    - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

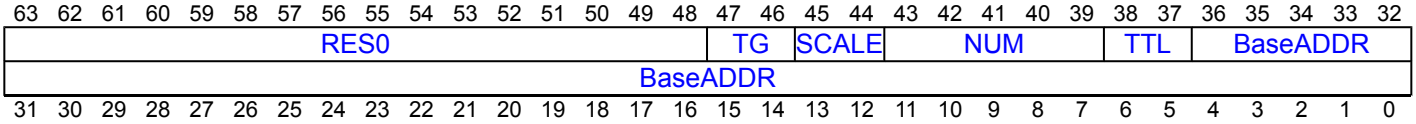
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAAE1IS, TLBI RVAAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAAE1IS, TLBI RVAAE1ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI RVAAE1OS, TLBI RVAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
    - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
    - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

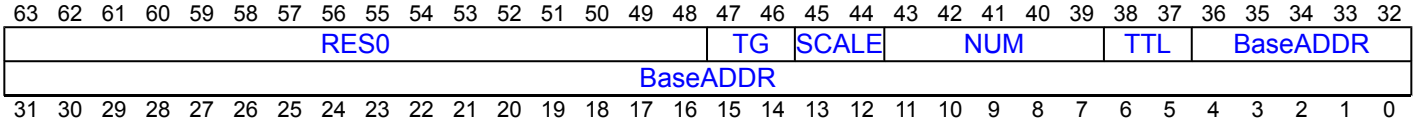
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAAE1OS, TLBI RVAAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAAE1OS, TLBI RVAAE1OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAAE1OS, TLBI RVAAE1OSNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI RVAAE1OS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0101	0b011

TLBI RVAALE1, TLBI RVAALE1NXS, TLB Range Invalidate by VA, All ASID, Last level, EL1

The TLBI RVAALE1, TLBI RVAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

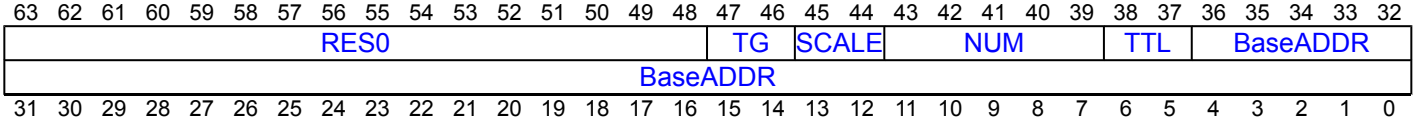
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAALE1, TLBI RVAALE1NXS are UNDEFINED.

Attributes

TLBI RVAALE1, TLBI RVAALE1NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

TLBI RVAALE1IS, TLBI RVAALE1ISNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI RVAALE1IS, TLBI RVAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
    - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
    - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

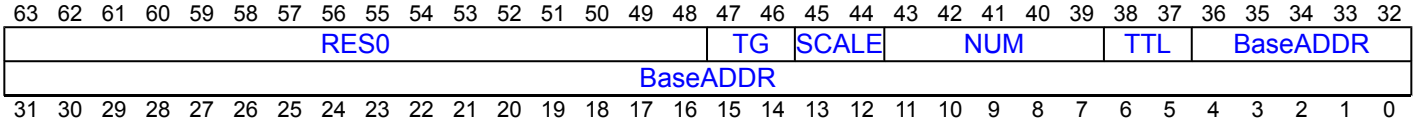
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAALE1IS, TLBI RVAALE1ISNXS are UNDEFINED.

Attributes

TLBI RVAALE1IS, TLBI RVAALE1ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAALE1IS, TLBI RVAALE1ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAALE1OS, TLBI RVAALE1OSNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI RVAALE1OS, TLBI RVAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

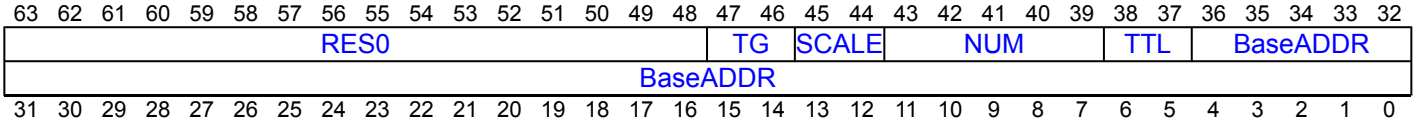
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAALE1OS, TLBI RVAALE1OSNXS are UNDEFINED.

Attributes

TLBI RVAALE1OS, TLBI RVAALE1OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAALE1OS, TLBI RVAALE1OSNXS

TLBI RVAE1, TLBI RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBI RVAE1, TLBI RVAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

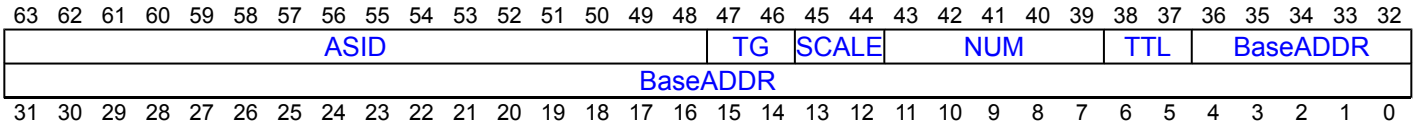
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE1, TLBI RVAE1NXS are UNDEFINED.

Attributes

TLBI RVAE1, TLBI RVAE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as `0b0000`.

When using a 16KB translation granule, BaseADDR[15:14] is treated as `0b00`.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAE1, TLBI RVAE1NXS

TLBI RVAE1IS, TLBI RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBI RVAE1IS, TLBI RVAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:

    - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:

    - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
    - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

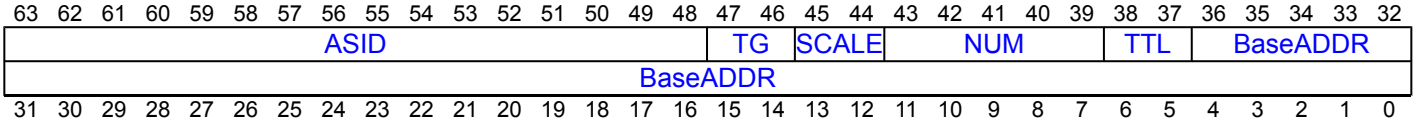
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE1IS, TLBI RVAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAE1IS, TLBI RVAE1ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAE1OS, TLBI RVAE1OSNXS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBI RVAE1OS, TLBI RVAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:

- If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

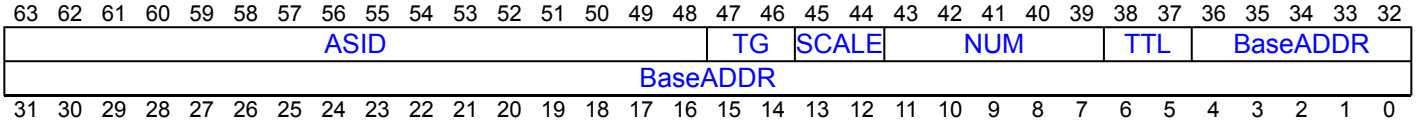
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE1OS, TLBI RVAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAE1OS, TLBI RVAE1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAE1OS, TLBI RVAE1OSNXS

TLBI RVAE2, TLBI RVAE2NXS, TLB Range Invalidate by VA, EL2

The TLBI RVAE2, TLBI RVAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

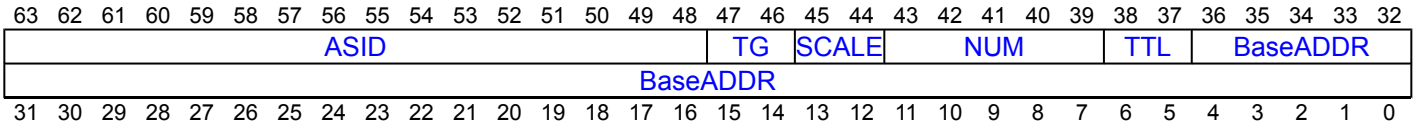
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE2, TLBI RVAE2NXS are UNDEFINED.

Attributes

TLBI RVAE2, TLBI RVAE2NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL2.DS == 1) or (FEAT_D128 is implemented and TCR2_EL2.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAE2IS, TLBI RVAE2ISNXS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBI RVAE2IS, TLBI RVAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

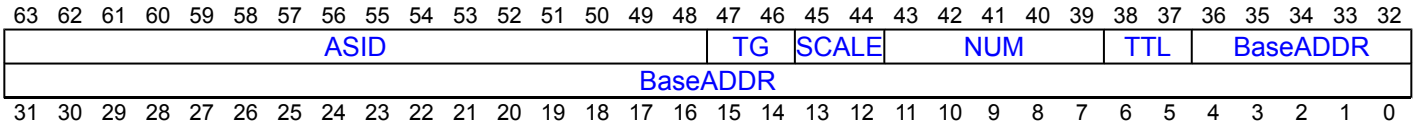
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE2IS, TLBI RVAE2ISNXS are UNDEFINED.

Attributes

TLBI RVAE2IS, TLBI RVAE2ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL2.DS == 1) or (FEAT_D128 is implemented and TCR2_EL2.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAE2IS, TLBI RVAE2ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI RVAE2IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0010	0b001

```

TLBI RVAE2OS, TLBI RVAE2OSNXS, TLB Range Invalidate by VA, EL2, Outer Shareable

The TLBI RVAE2OS, TLBI RVAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

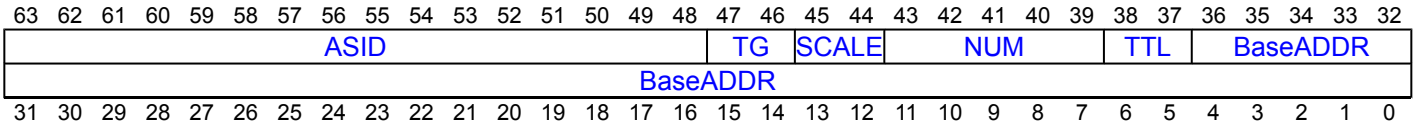
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE2OS, TLBI RVAE2OSNXS are UNDEFINED.

Attributes

TLBI RVAE2OS, TLBI RVAE2OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL2.DS == 1) or (FEAT_D128 is implemented and TCR2_EL2.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAE3, TLBI RVAE3NXS, TLB Range Invalidate by VA, EL3

The TLBI RVAE3, TLBI RVAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

TLBI RVAE3IS, TLBI RVAE3ISNXS, TLB Range Invalidate by VA, EL3, Inner Shareable

The TLBI RVAE3IS, TLBI RVAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

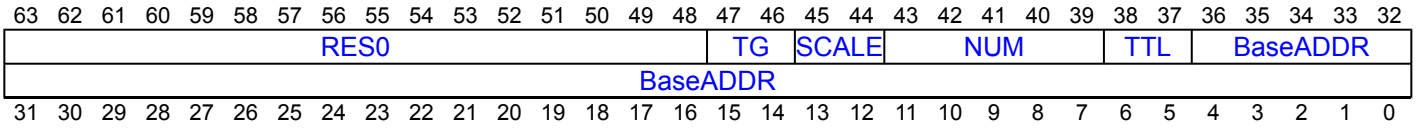
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE3IS, TLBI RVAE3ISNXS are UNDEFINED.

Attributes

TLBI RVAE3IS, TLBI RVAE3ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

TLBI RVAE3OS, TLBI RVAE3OSNXS, TLB Range Invalidate by VA, EL3, Outer Shareable

The TLBI RVAE3OS, TLBI RVAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

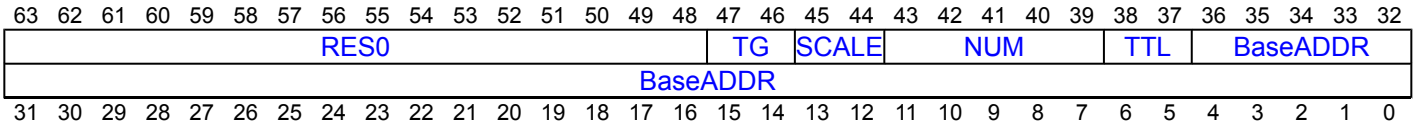
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE3OS, TLBI RVAE3OSNXS are UNDEFINED.

Attributes

TLBI RVAE3OS, TLBI RVAE3OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL3.DS == 1) or (FEAT_D128 is implemented and TCR_EL3.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAE3OS, TLBI RVAE3OSNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI RVAE3OS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0101	0b001

```

TLBI RVALE1, TLBI RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

The TLBI RVALE1, TLBI RVALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

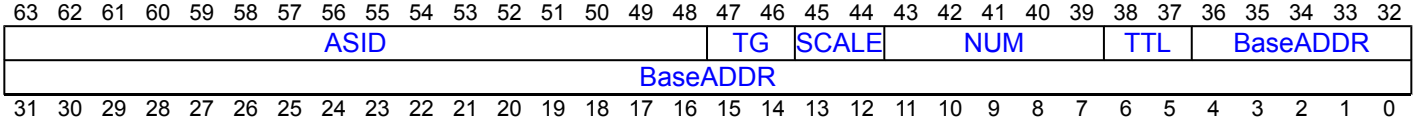
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE1, TLBI RVALE1NXS are UNDEFINED.

Attributes

TLBI RVALE1, TLBI RVALE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as `0b0000`.

When using a 16KB translation granule, BaseADDR[15:14] is treated as `0b00`.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVALE1IS, TLBI RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI RVALE1IS, TLBI RVALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
    - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
    - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

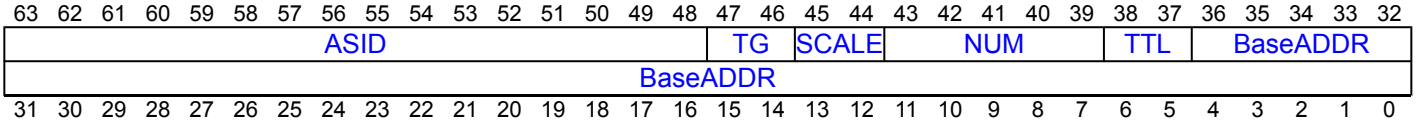
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE1IS, TLBI RVALE1ISNXS are UNDEFINED.

Attributes

TLBI RVALE1IS, TLBI RVALE1ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVALE1IS, TLBI RVALE1ISNXS

TLBI RVALE1OS, TLBI RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI RVALE1OS, TLBI RVALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
    - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
    - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

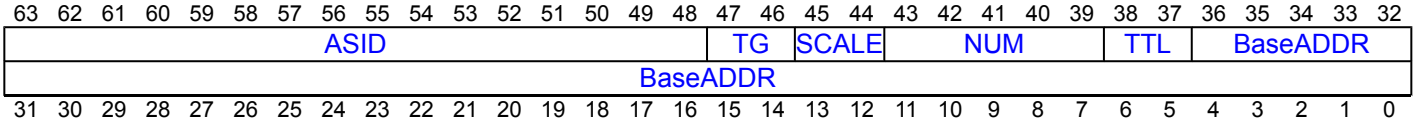
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE1OS, TLBI RVALE1OSNXS are UNDEFINED.

Attributes

TLBI RVALE1OS, TLBI RVALE1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL1.DS == 1) or (FEAT_D128 is implemented and TCR2_EL1.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVALE1OS, TLBI RVALE1OSNXS

TLBI RVALE2, TLBI RVALE2NXS, TLB Range Invalidate by VA, Last level, EL2

The TLBI RVALE2, TLBI RVALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

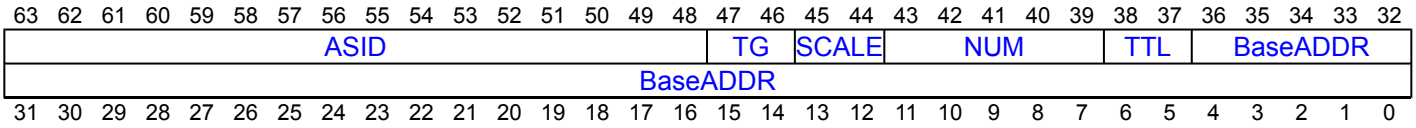
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE2, TLBI RVALE2NXS are UNDEFINED.

Attributes

TLBI RVALE2, TLBI RVALE2NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL2.DS == 1) or (FEAT_D128 is implemented and TCR2_EL2.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVALE2, TLBI RVALE2NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE2IS, TLBI RVALE2ISNXS, TLB Range Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI RVALE2IS, TLBI RVALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

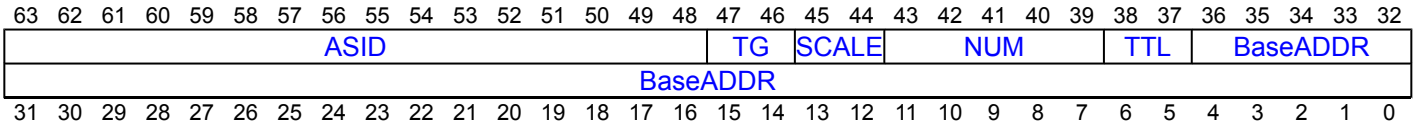
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE2IS, TLBI RVALE2ISNXS are UNDEFINED.

Attributes

TLBI RVALE2IS, TLBI RVALE2ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL2.DS == 1) or (FEAT_D128 is implemented and TCR2_EL2.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVALE2IS, TLBI RVALE2ISNXS

TLBI RVALE2OS, TLBI RVALE2OSNXS, TLB Range Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI RVALE2OS, TLBI RVALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

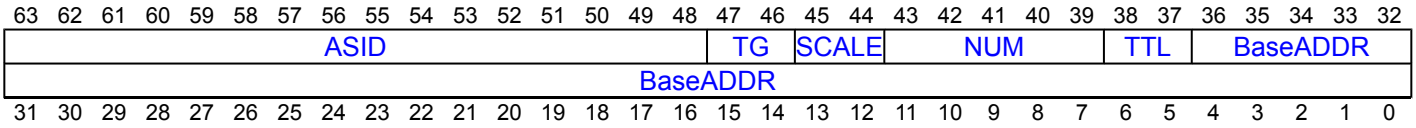
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE2OS, TLBI RVALE2OSNXS are UNDEFINED.

Attributes

TLBI RVALE2OS, TLBI RVALE2OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL2.DS == 1) or (FEAT_D128 is implemented and TCR2_EL2.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVALE2OS, TLBI RVALE2OSNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI RVALE2OS{, <Xt>}
```

op0	op1	CRn	CRm	op2

TLBI RVALE3, TLBI RVALE3NXS, TLB Range Invalidate by VA, Last level, EL3

The TLBI RVALE3, TLBI RVALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

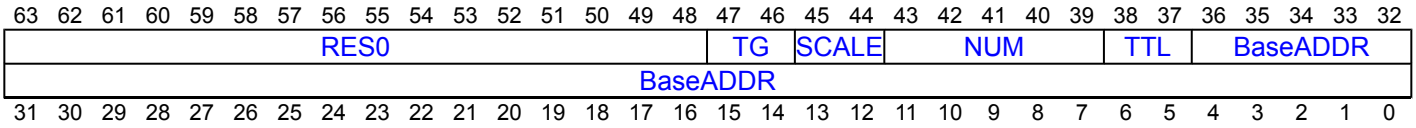
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE3, TLBI RVALE3NXS are UNDEFINED.

Attributes

TLBI RVALE3, TLBI RVALE3NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]

When (FEAT_LPA2 is implemented and TCR_EL3.DS == 1) or (FEAT_D128 is implemented and TCR_EL3.D128 == 1):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVALE3, TLBI RVALE3NXS

TLBI RVALE3IS, TLBI RVALE3ISNXS, TLB Range Invalidate by VA, Last level, EL3, Inner Shareable

The TLBI RVALE3IS, TLBI RVALE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE3IS, TLBI RVALE3ISNXS are UNDEFINED.

Attributes

TLBI RVALE3IS, TLBI RVALE3ISNXS is a 64-bit System instruction.

TLBI RVALE3OS, TLBI RVALE3OSNXS, TLB Range Invalidate by VA, Last level, EL3, Outer Shareable

The TLBI RVALE3OS, TLBI RVALE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE3OS, TLBI RVALE3OSNXS are UNDEFINED.

Attributes

TLBI RVALE3OS, TLBI RVALE3OSNXS is a 64-bit System instruction.

TLBI VAAE1, TLBI VAAE1NXS, TLB Invalidate by VA, All ASID, EL1

The TLBI VAAE1, TLBI VAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

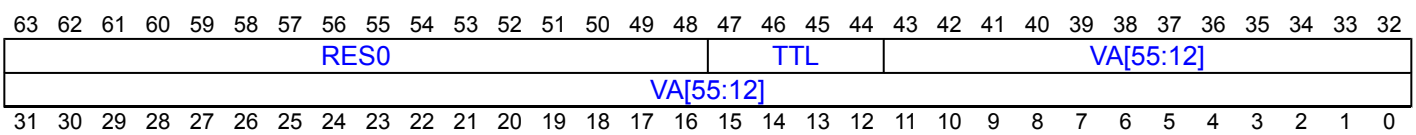
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAAE1, TLBI VAAE1NXS are UNDEFINED.

Attributes

TLBI VAAE1, TLBI VAAE1NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAAE1, TLBI VAAE1NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VAAE1{, <Xt>}
```

TLBI VAAE1IS, TLBI VAAE1ISNXS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS, TLBI VAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

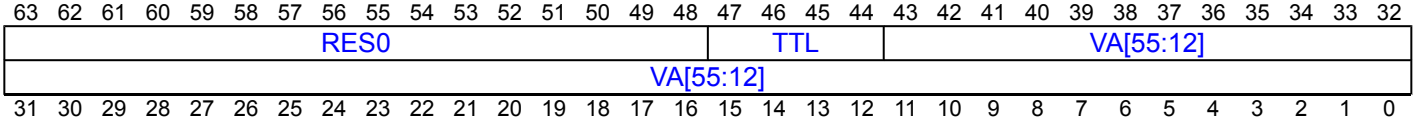
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAAE1IS, TLBI VAAE1ISNXS are UNDEFINED.

Attributes

TLBI VAAE1IS, TLBI VAAE1ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAAE1IS, TLBI VAAE1ISNXS

TLBI VAAE1OS, TLBI VAAE1OSNXS, TLB Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI VAAE1OS, TLBI VAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

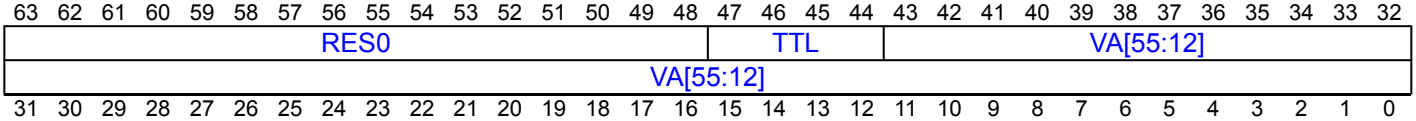
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAAE1OS, TLBI VAAE1OSNXS are UNDEFINED.

Attributes

TLBI VAAE1OS, TLBI VAAE1OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VAALE1, TLBI VAALE1NXS, TLB Invalidate by VA, All ASID, Last level, EL1

The TLBI VAALE1, TLBI VAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

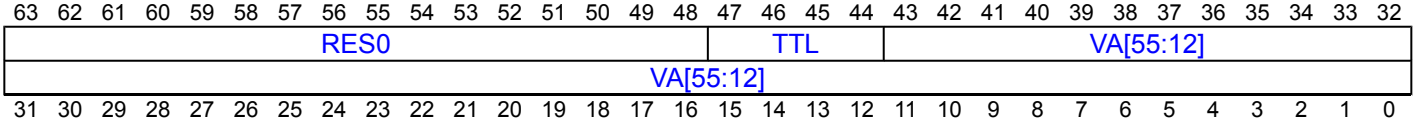
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAALE1, TLBI VAALE1NXS are UNDEFINED.

Attributes

TLBI VAALE1, TLBI VAALE1NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAALE1, TLBI VAALE1NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VAALE1{, <Xt>}
```

TLBI VAALE1IS, TLBI VAALE1ISNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI VAALE1IS, TLBI VAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

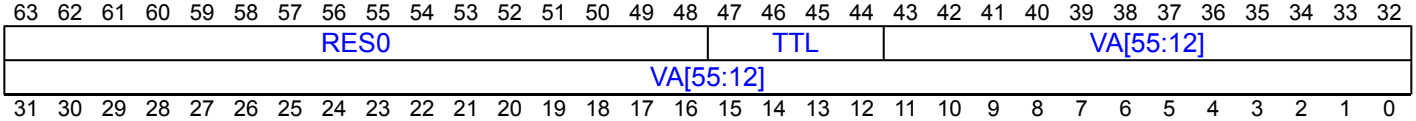
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAALE1IS, TLBI VAALE1ISNXS are UNDEFINED.

Attributes

TLBI VAALE1IS, TLBI VAALE1ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VAALE1OS, TLBI VAALE1OSNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI VAALE1OS, TLBI VAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

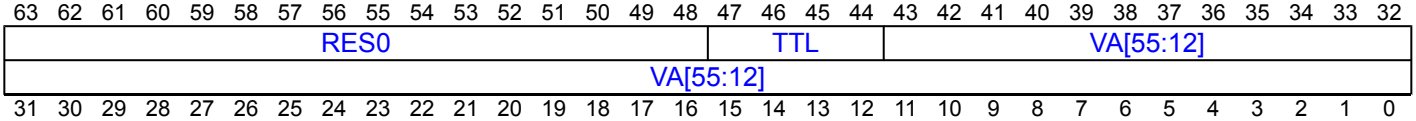
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAALE1OS, TLBI VAALE1OSNXS are UNDEFINED.

Attributes

TLBI VAALE1OS, TLBI VAALE1OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAALE1OS, TLBI VAALE1OSNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VAALE1OS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0001	0b111

```

TLBI VAE1, TLBI VAE1NXS, TLB Invalidate by VA, EL1

The TLBI VAE1, TLBI VAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

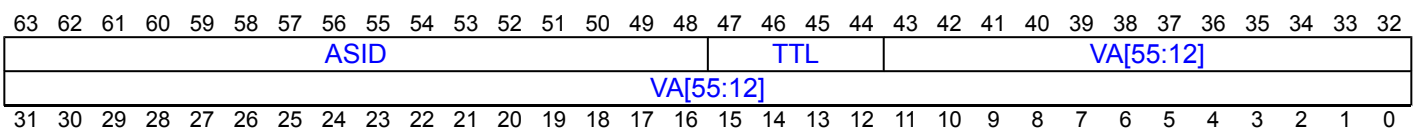
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE1, TLBI VAE1NXS are UNDEFINED.

Attributes

TLBI VAE1, TLBI VAE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VAE1IS, TLBI VAE1ISNXS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS, TLBI VAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

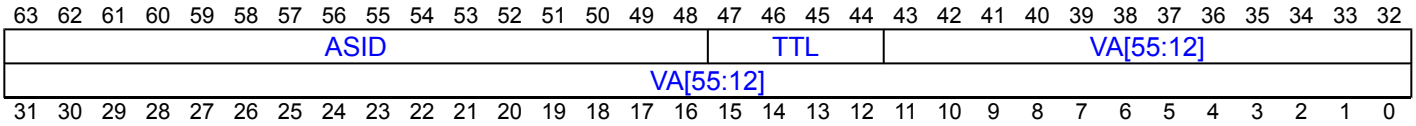
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE1IS, TLBI VAE1ISNXS are UNDEFINED.

Attributes

TLBI VAE1IS, TLBI VAE1ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE1IS, TLBI VAE1ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VAE1IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;

TLBI VAE1OS, TLBI VAE1OSNXS, TLB Invalidate by VA, EL1, Outer Shareable

The TLBI VAE1OS, TLBI VAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

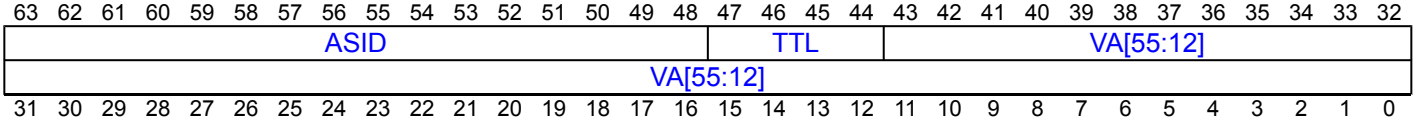
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE1OS, TLBI VAE1OSNXS are UNDEFINED.

Attributes

TLBI VAE1OS, TLBI VAE1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VAE2, TLBI VAE2NXS, TLB Invalidate by VA, EL2

The TLBI VAE2, TLBI VAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

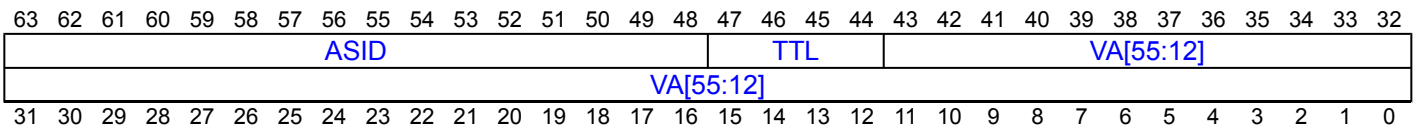
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE2, TLBI VAE2NXS are UNDEFINED.

Attributes

TLBI VAE2, TLBI VAE2NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE2, TLBI VAE2NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VAE2{, <Xt>}

TLBI VAE2IS, TLBI VAE2ISNXS, TLB Invalidate by VA, EL2, Inner Shareable

The TLBI VAE2IS, TLBI VAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

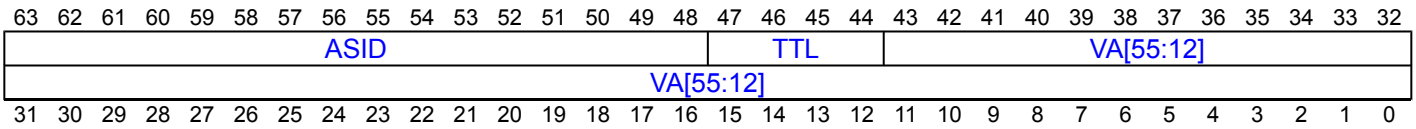
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE2IS, TLBI VAE2ISNXS are UNDEFINED.

Attributes

TLBI VAE2IS, TLBI VAE2ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE2IS, TLBI VAE2ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VAE2IS{, <Xt>}
```

op0	op1	CRn	CRm	op2

TLBI VAE2OS, TLBI VAE2OSNXS, TLB Invalidate by VA, EL2, Outer Shareable

The TLBI VAE2OS, TLBI VAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

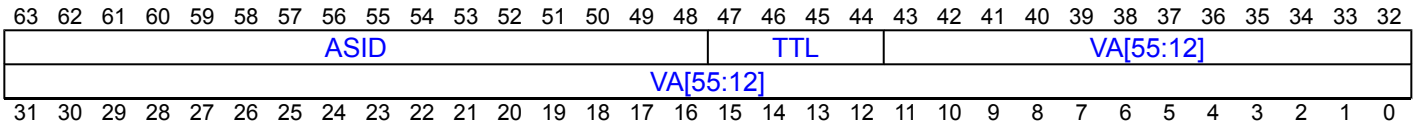
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE2OS, TLBI VAE2OSNXS are UNDEFINED.

Attributes

TLBI VAE2OS, TLBI VAE2OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VAE3, TLBI VAE3NXS, TLB Invalidate by VA, EL3

The TLBI VAE3, TLBI VAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

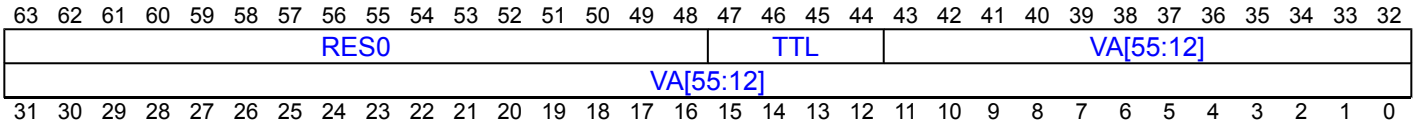
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE3, TLBI VAE3NXS are UNDEFINED.

Attributes

TLBI VAE3, TLBI VAE3NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE3, TLBI VAE3NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VAE3{, <Xt>}
```

op0	op1	CRn	CRm	op2

TLBI VAE3IS, TLBI VAE3ISNXS, TLB Invalidate by VA, EL3, Inner Shareable

The TLBI VAE3IS, TLBI VAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

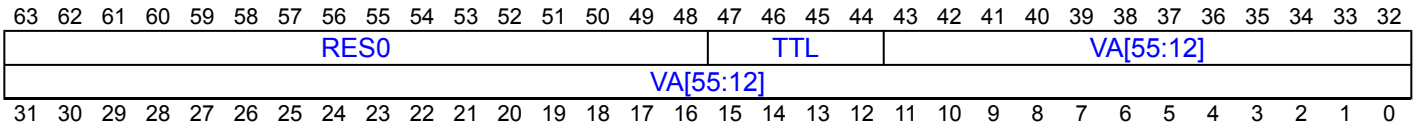
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE3IS, TLBI VAE3ISNXS are UNDEFINED.

Attributes

TLBI VAE3IS, TLBI VAE3ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE3IS, TLBI VAE3ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VAE3IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0011	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

TLBI VAE3OS, TLBI VAE3OSNXS, TLB Invalidate by VA, EL3, Outer Shareable

The TLBI VAE3OS, TLBI VAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

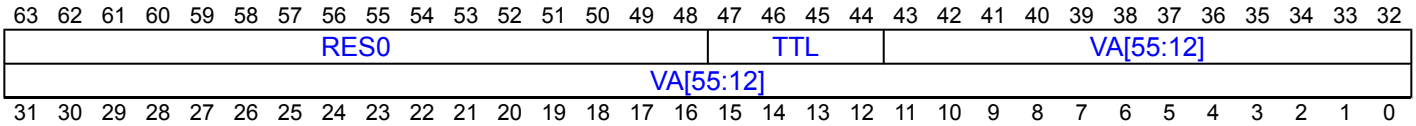
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE3OS, TLBI VAE3OSNXS are UNDEFINED.

Attributes

TLBI VAE3OS, TLBI VAE3OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VALE1, TLBI VALE1NXS, TLB Invalidate by VA, Last level, EL1

The TLBI VALE1, TLBI VALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

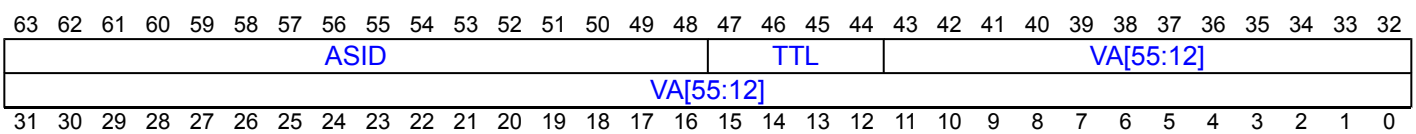
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE1, TLBI VALE1NXS are UNDEFINED.

Attributes

TLBI VALE1, TLBI VALE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE1, TLBI VALE1NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VALE1{, <Xt>}

TLBI VALE1IS, TLBI VALE1ISNXS, TLB Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI VALE1IS, TLBI VALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

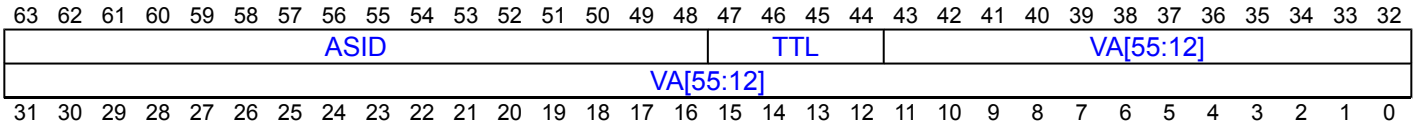
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE1IS, TLBI VALE1ISNXS are UNDEFINED.

Attributes

TLBI VALE1IS, TLBI VALE1ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VALE1OS, TLBI VALE1OSNXS, TLB Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI VALE1OS, TLBI VALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

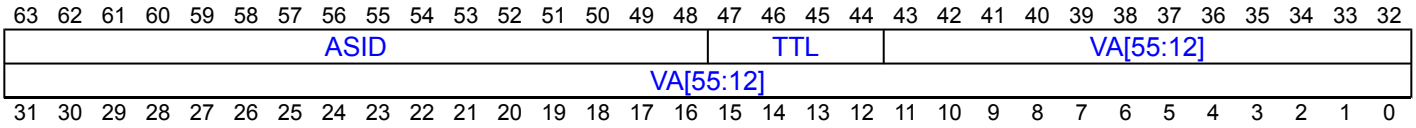
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE1OS, TLBI VALE1OSNXS are UNDEFINED.

Attributes

TLBI VALE1OS, TLBI VALE1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VALE2, TLBI VALE2NXS, TLB Invalidate by VA, Last level, EL2

The TLBI VALE2, TLBI VALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

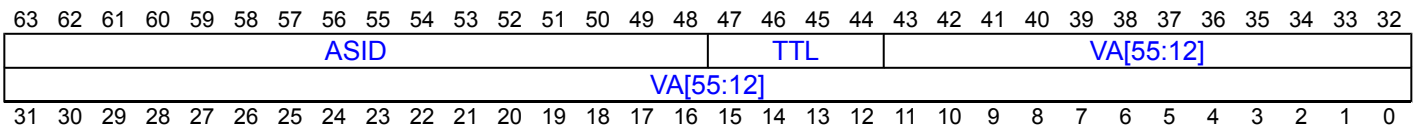
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE2, TLBI VALE2NXS are UNDEFINED.

Attributes

TLBI VALE2, TLBI VALE2NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE2, TLBI VALE2NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VALE2{, <Xt>}

TLBI VALE2IS, TLBI VALE2ISNXS, TLB Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI VALE2IS, TLBI VALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

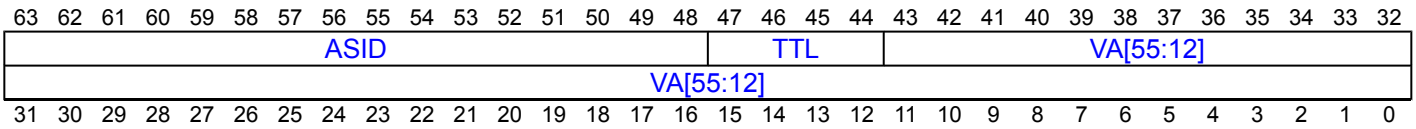
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE2IS, TLBI VALE2ISNXS are UNDEFINED.

Attributes

TLBI VALE2IS, TLBI VALE2ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE2IS, TLBI VALE2ISNXS

TLBI VALE2OS, TLBI VALE2OSNXS, TLB Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI VALE2OS, TLBI VALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

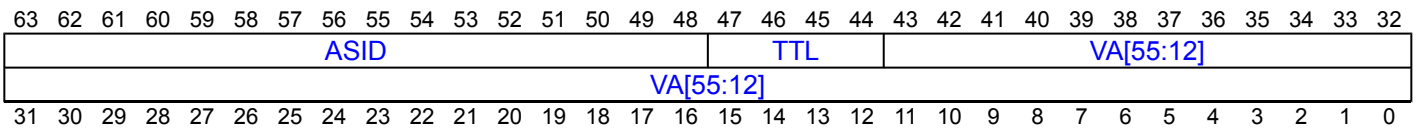
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE2OS, TLBI VALE2OSNXS are UNDEFINED.

Attributes

TLBI VALE2OS, TLBI VALE2OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VALE3, TLBI VALE3NXS, TLB Invalidate by VA, Last level, EL3

The TLBI VALE3, TLBI VALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

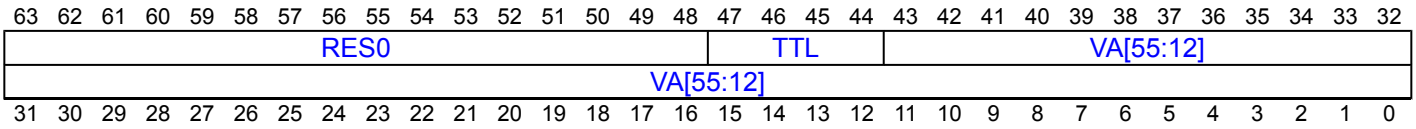
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE3, TLBI VALE3NXS are UNDEFINED.

Attributes

TLBI VALE3, TLBI VALE3NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VALE3IS, TLBI VALE3ISNXS, TLB Invalidate by VA, Last level, EL3, Inner Shareable

The TLBI VALE3IS, TLBI VALE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

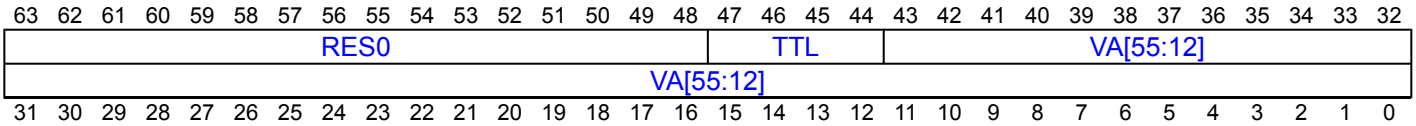
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE3IS, TLBI VALE3ISNXS are UNDEFINED.

Attributes

TLBI VALE3IS, TLBI VALE3ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE3IS, TLBI VALE3ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VALE3IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0011	0b101

```
if !IsFeatureImplemented(FEAT_AA64) then

TLBI VALE3OS, TLBI VALE3OSNXS, TLB Invalidate by VA, Last level, EL3, Outer Shareable

The TLBI VALE3OS, TLBI VALE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

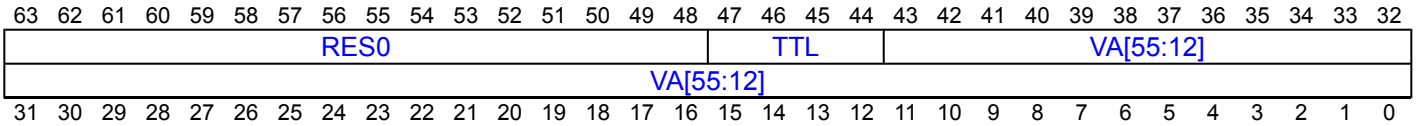
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE3OS, TLBI VALE3OSNXS are UNDEFINED.

Attributes

TLBI VALE3OS, TLBI VALE3OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE3OS, TLBI VALE3OSNXS

TLBI VMALLE1, TLBI VMALLE1NXS, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1, TLBI VMALLE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VMALLE1, TLBI VMALLE1NXS are UNDEFINED.

Attributes

TLBI VMALLE1, TLBI VMALLE1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI VMALLE1, TLBI VMALLE1NXS

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VMALLE1IS, TLBI VMALLE1ISNXS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable

The TLBI VMALLE1IS, TLBI VMALLE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

TLBI VMALLE1OS, TLBI VMALLE1OSNXS, TLB Invalidate by VMID, All at stage 1, EL1, Outer Shareable

The TLBI VMALLE1OS, TLBI VMALLE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VMALLE1OS, TLBI VMALLE1OSNXS are UNDEFINED.

Attributes

TLBI VMALLE1OS, TLBI VMALLE1OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI VMALLE1OS, TLBI VMALLE1OSNXS

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable

The TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - If SCR_EL3.{NSE, NS} is {0, 0}, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {0, 1}, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {1, 1}, then:
    - The entry would be required to translate an address using the Realm EL1&0 translation regime.
    - The entry would be used with the current VMID.
- If FEAT_RME is not implemented, one of the following applies:
  - If SCR_EL3.NS is 0, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.NS is 1, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS are UNDEFINED.

TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Outer Shareable

The TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - If SCR_EL3.{NSE, NS} is {0, 0}, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {0, 1}, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {1, 1}, then:
    - The entry would be required to translate an address using the Realm EL1&0 translation regime.
    - The entry would be used with the current VMID.
- If FEAT_RME is not implemented, one of the following applies:
  - If SCR_EL3.NS is 0, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.NS is 1, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS are UNDEFINED.

Attributes

TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI VMALLS12E1OS{, <Xt>}

TLBIP IPAS2E1, TLBIP IPAS2E1NXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1

The TLBIP IPAS2E1, TLBIP IPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

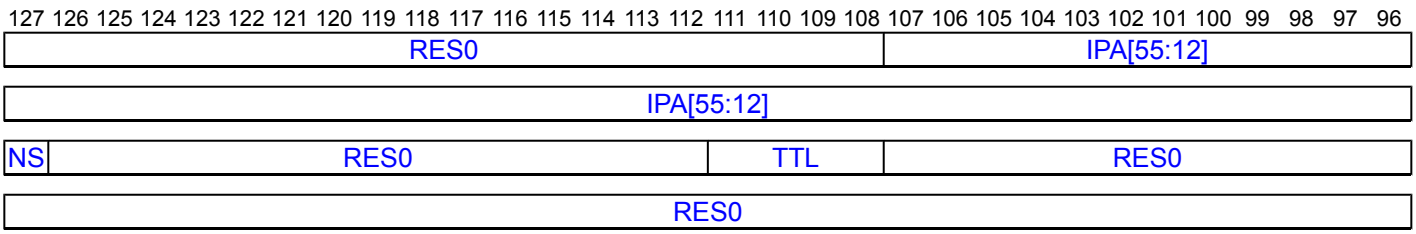
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2E1, TLBIP IPAS2E1NXS are UNDEFINED.

Attributes

TLBIP IPAS2E1, TLBIP IPAS2E1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

IPA[55:12], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

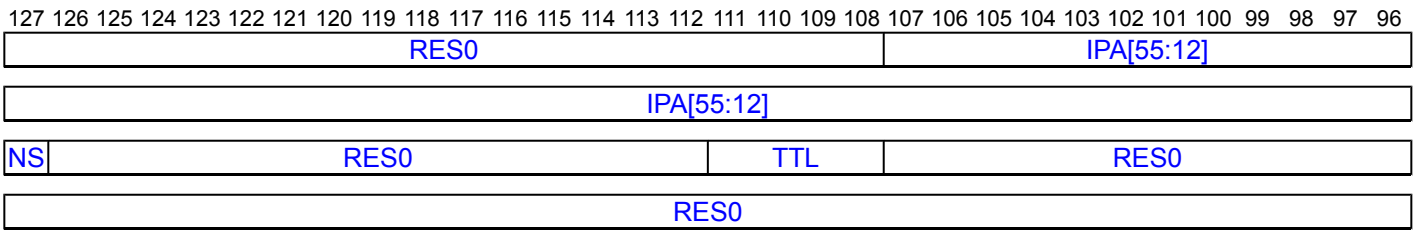
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS are UNDEFINED.

Attributes

TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

IPA[55:12], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

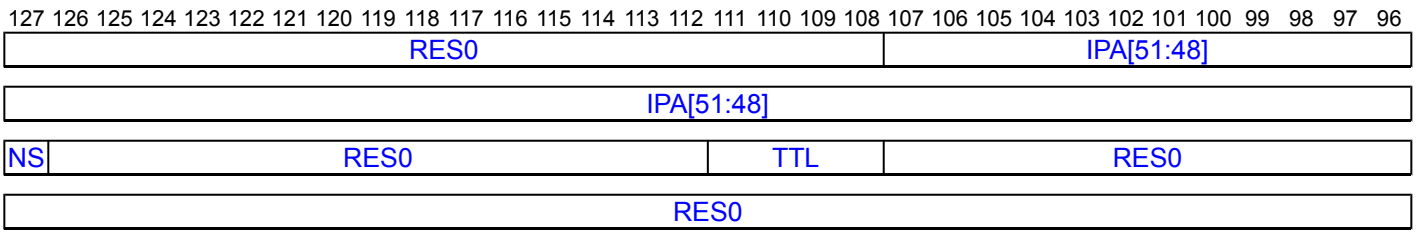
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS are UNDEFINED.

Attributes

TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

IPA[51:48], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP IPAS2LE1, TLBIP IPAS2LE1NXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBIP IPAS2LE1, TLBIP IPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the final level of the translation table walk.
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

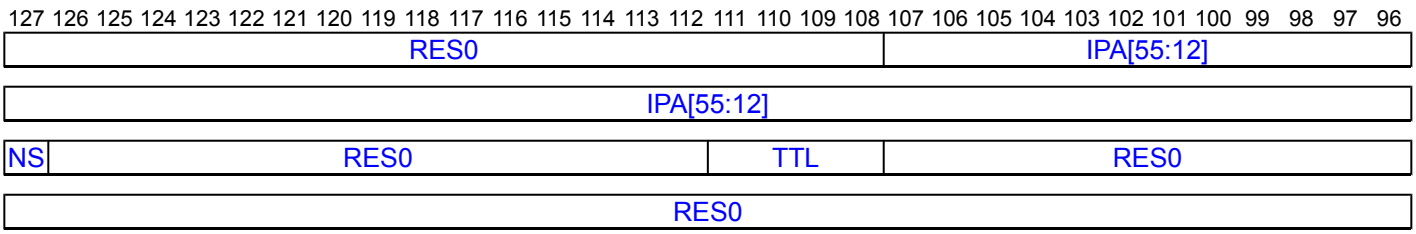
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2LE1, TLBIP IPAS2LE1NXS are UNDEFINED.

Attributes

TLBIP IPAS2LE1, TLBIP IPAS2LE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

IPA[55:12], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

Executing TLBIP IPAS2LE1, TLBIP IPAS2LE1NXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP IPAS2LE1IS, TLBIP IPAS2LE1ISNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBIP IPAS2LE1IS, TLBIP IPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the final level of the translation table walk.
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

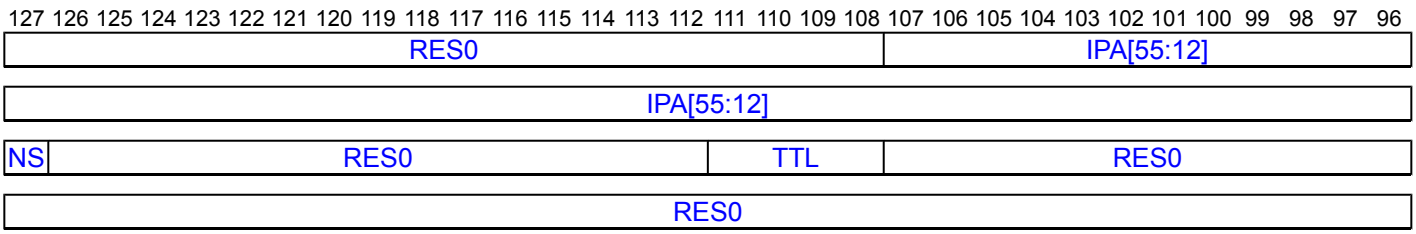
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2LE1IS, TLBIP IPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBIP IPAS2LE1IS, TLBIP IPAS2LE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the final level of the translation table walk.
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

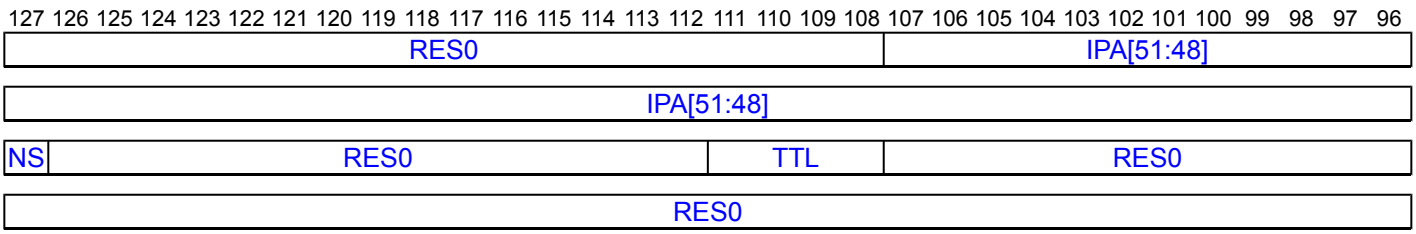
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

IPA[51:48], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

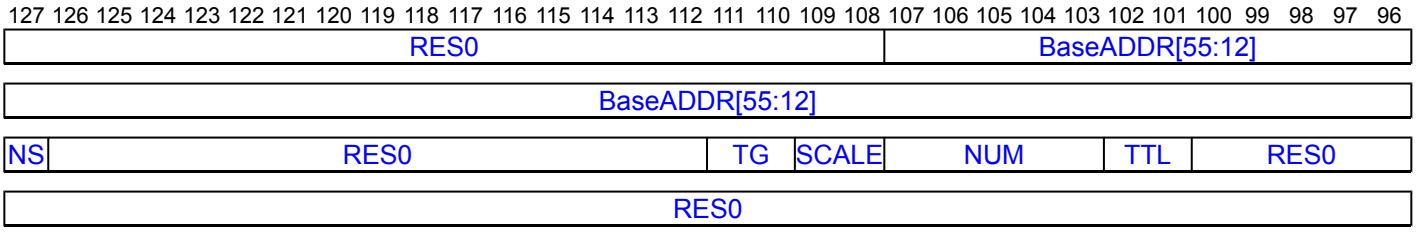
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS are UNDEFINED.

Attributes

TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

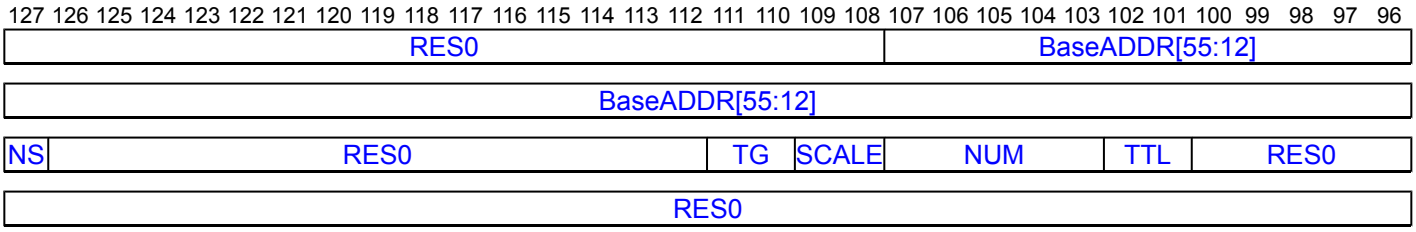
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS are UNDEFINED.

Attributes

TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

TLBIP RIPAS2E1OS, TLBIP RIPAS2E1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBIP RIPAS2E1OS, TLBIP RIPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

TLBIP RIPAS2LE1, TLBIP RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBIP RIPAS2LE1, TLBIP RIPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

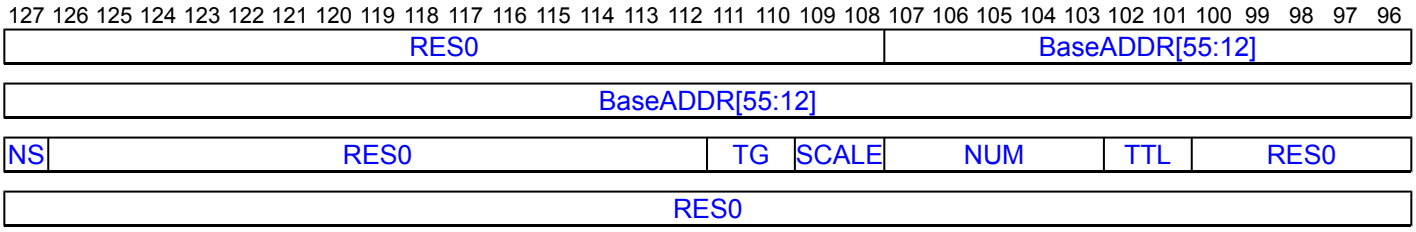
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RIPAS2LE1, TLBIP RIPAS2LE1NXS are UNDEFINED.

Attributes

TLBIP RIPAS2LE1, TLBIP RIPAS2LE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

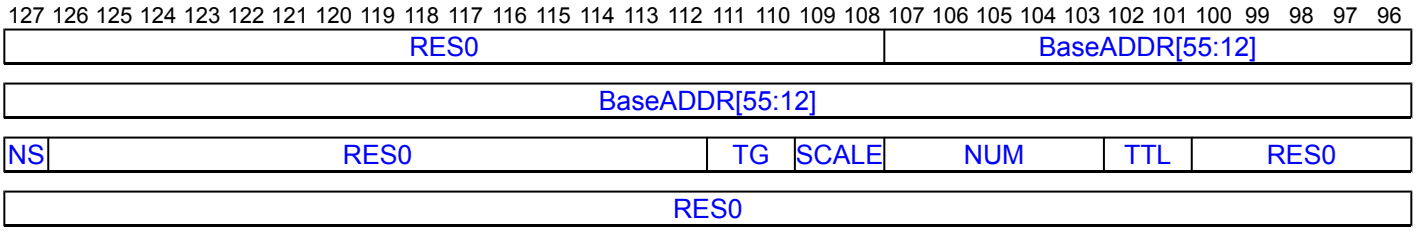
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

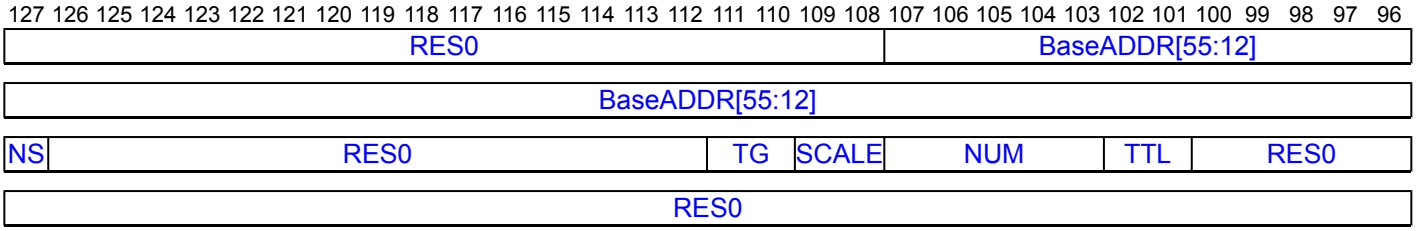
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

TLBIP RVAAE1, TLBIP RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBIP RVAAE1, TLBIP RVAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

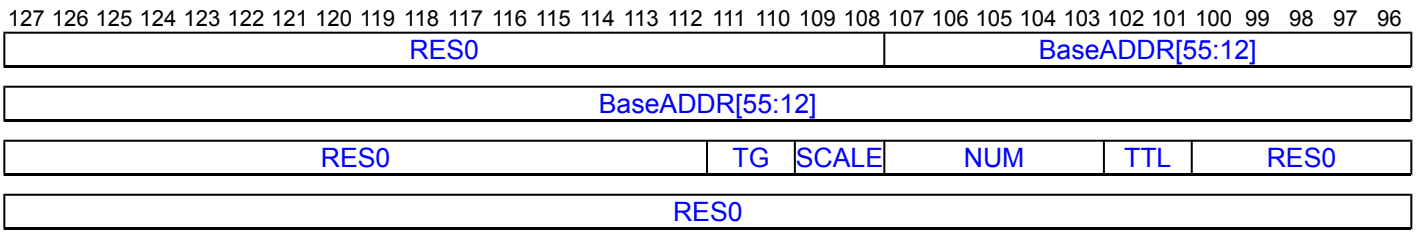
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAAE1, TLBIP RVAAE1NXS are UNDEFINED.

Attributes

TLBIP RVAAE1, TLBIP RVAAE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

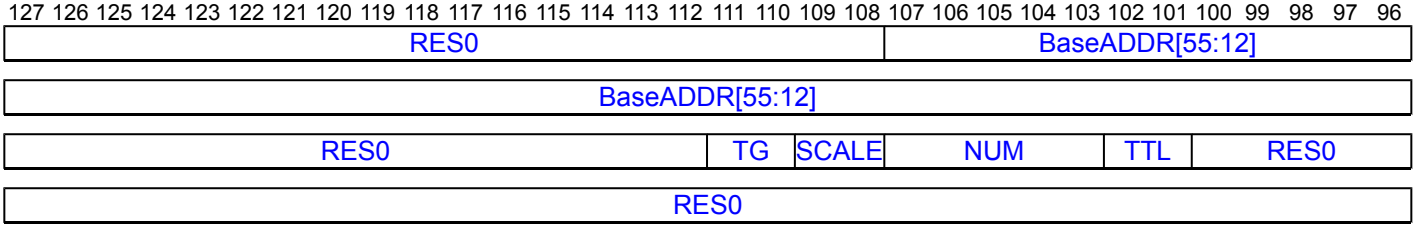
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS are UNDEFINED.

Attributes

TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.

- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

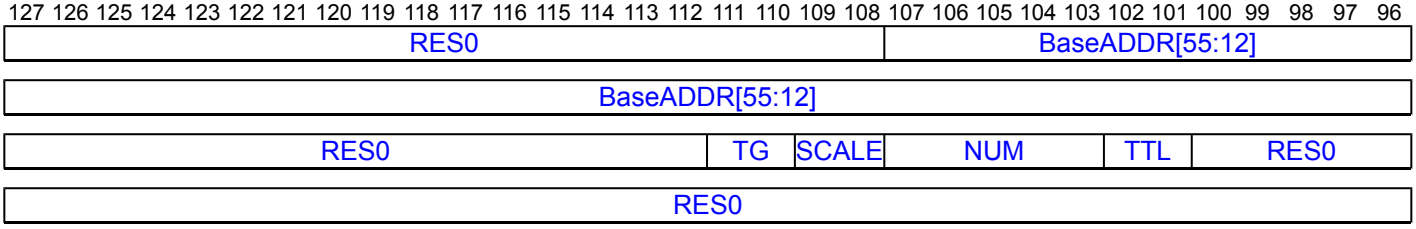
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS are UNDEFINED.

Attributes

TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.

- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAALE1, TLBIP RVAALE1NXS, TLB Range Invalidate by VA, All ASID, Last level, EL1

The TLBIP RVAALE1, TLBIP RVAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - A 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

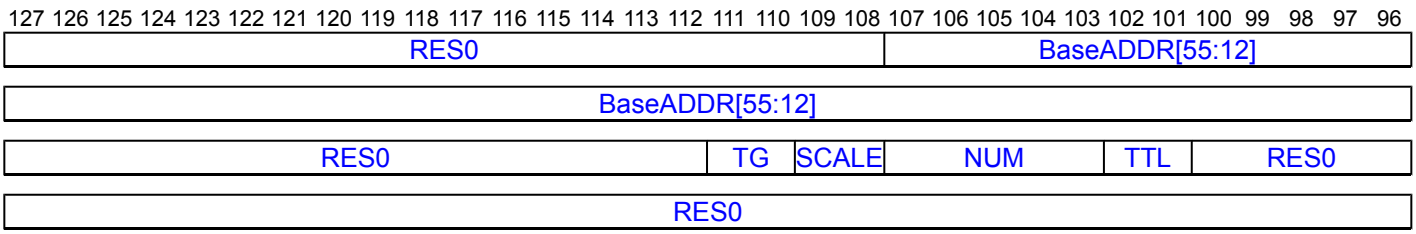
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAALE1, TLBIP RVAALE1NXS are UNDEFINED.

Attributes

TLBIP RVAALE1, TLBIP RVAALE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - A 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

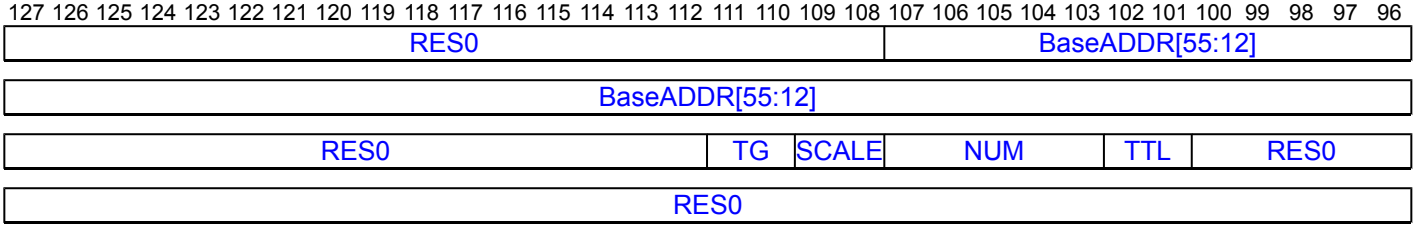
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS are UNDEFINED.

Attributes

TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - A 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is `0b00`.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

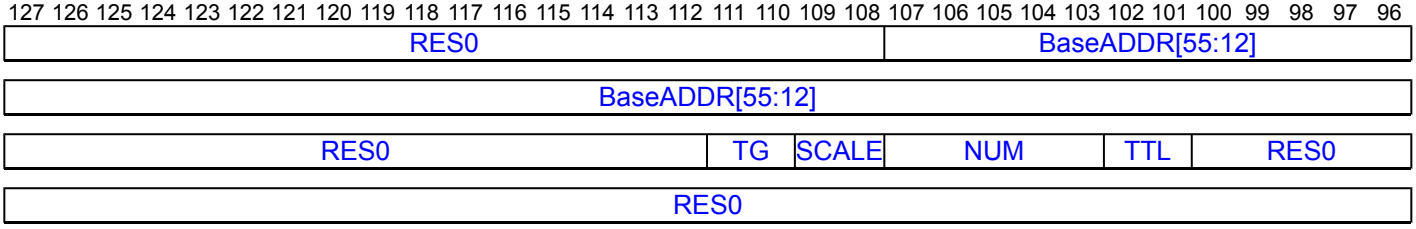
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS are UNDEFINED.

Attributes

TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.

- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAE1, TLBIP RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBIP RVAE1, TLBIP RVAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

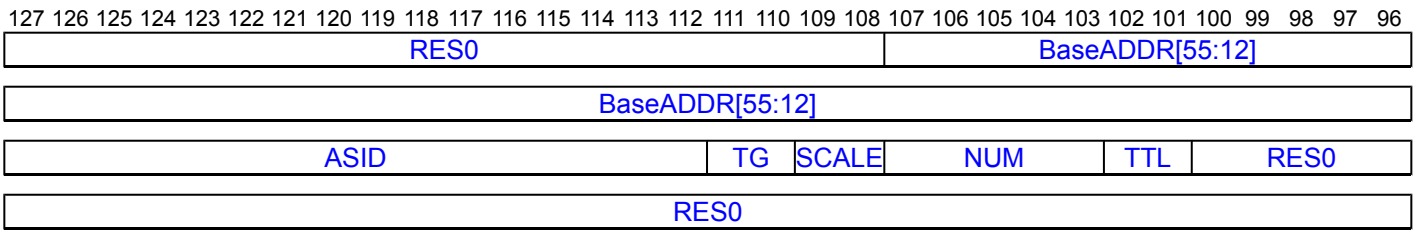
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE1, TLBIP RVAE1NXS are UNDEFINED.

Attributes

TLBIP RVAE1, TLBIP RVAE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAE1IS, TLBIP RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBIP RVAE1IS, TLBIP RVAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

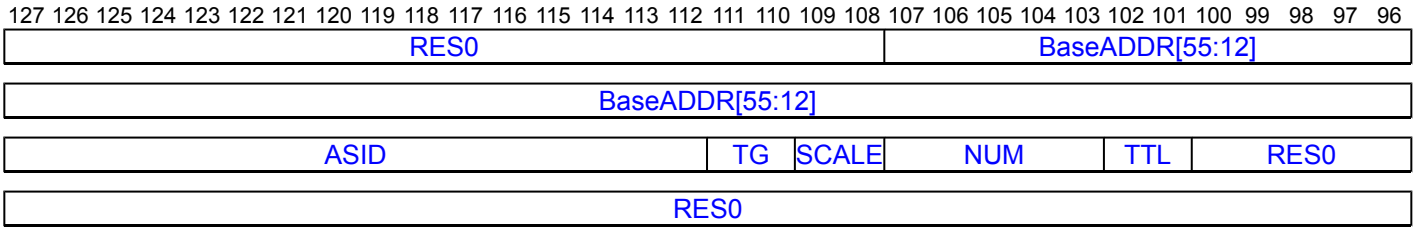
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE1IS, TLBIP RVAE1ISNXS are UNDEFINED.

Attributes

TLBIP RVAE1IS, TLBIP RVAE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

Executing TLBIP RVAE1IS, TLBIP RVAE1ISNXS

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBIP RVAE1IS{, <Xt>, <Xt2>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0010	0b001

```
if !(IsFeatureImplemented(FEAT_D128) && IsFeatureImplemented(FEAT_AA64)) then

TLBIP RVAE1OS, TLBIP RVAE1OSNXS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBIP RVAE1OS, TLBIP RVAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

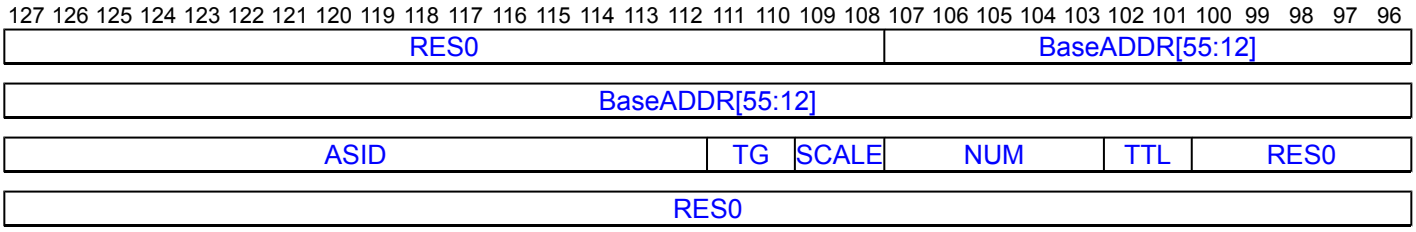
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE1OS, TLBIP RVAE1OSNXS are UNDEFINED.

Attributes

TLBIP RVAE1OS, TLBIP RVAE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAE2, TLBIP RVAE2NXS, TLB Range Invalidate by VA, EL2

The TLBIP RVAE2, TLBIP RVAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

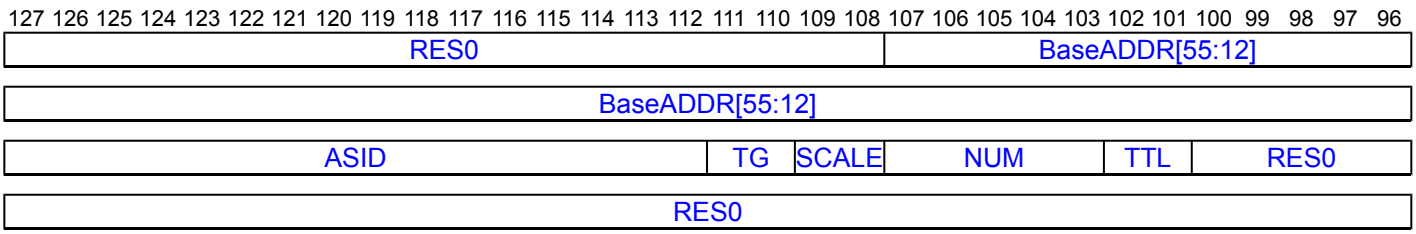
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE2, TLBIP RVAE2NXS are UNDEFINED.

Attributes

TLBIP RVAE2, TLBIP RVAE2NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.

- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAE2IS, TLBIP RVAE2ISNXS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBIP RVAE2IS, TLBIP RVAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

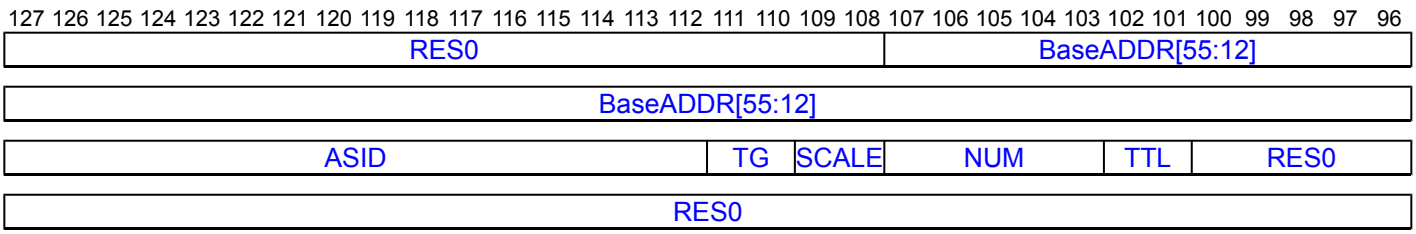
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE2IS, TLBIP RVAE2ISNXS are UNDEFINED.

Attributes

TLBIP RVAE2IS, TLBIP RVAE2ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.

- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVAE2OS, TLBIP RVAE2OSNXS, TLB Range Invalidate by VA, EL2, Outer Shareable

The TLBIP RVAE2OS, TLBIP RVAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

TLBIP RVAE3, TLBIP RVAE3NXS, TLB Range Invalidate by VA, EL3

The TLBIP RVAE3, TLBIP RVAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

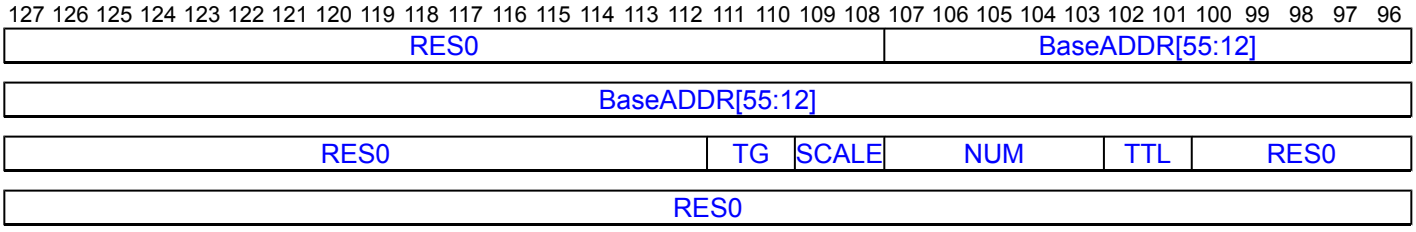
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE3, TLBIP RVAE3NXS are UNDEFINED.

Attributes

TLBIP RVAE3, TLBIP RVAE3NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

TLBIP RVAE3IS, TLBIP RVAE3ISNXS, TLB Range Invalidate by VA, EL3, Inner Shareable

The TLBIP RVAE3IS, TLBIP RVAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

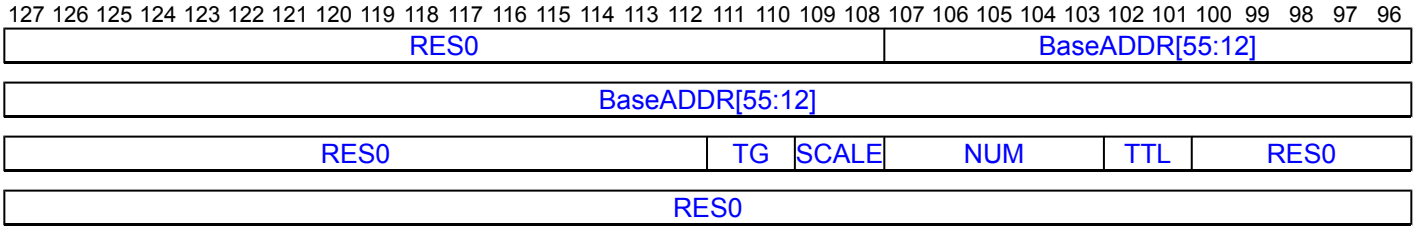
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE3IS, TLBIP RVAE3ISNXS are UNDEFINED.

Attributes

TLBIP RVAE3IS, TLBIP RVAE3ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

TLBIP RVAE3OS, TLBIP RVAE3OSNXS, TLB Range Invalidate by VA, EL3, Outer Shareable

The TLBIP RVAE3OS, TLBIP RVAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

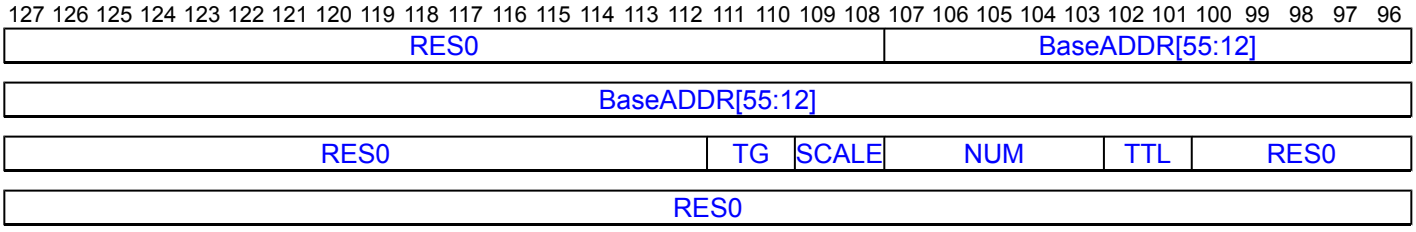
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE3OS, TLBIP RVAE3OSNXS are UNDEFINED.

Attributes

TLBIP RVAE3OS, TLBIP RVAE3OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

TLBIP RVALE1, TLBIP RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

The TLBIP RVALE1, TLBIP RVALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

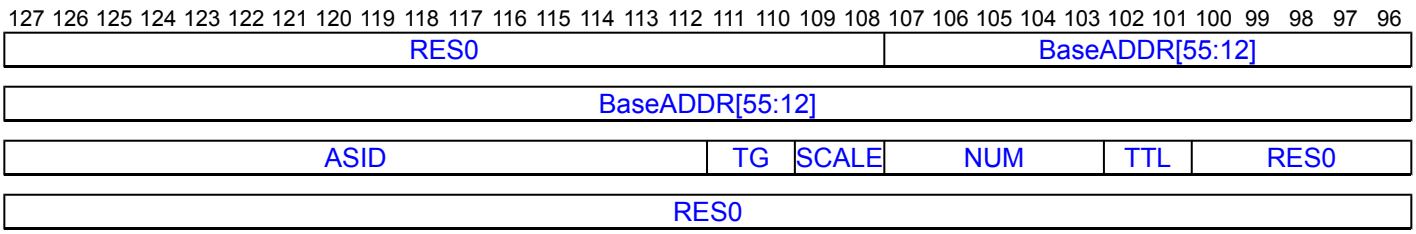
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE1, TLBIP RVALE1NXS are UNDEFINED.

Attributes

TLBIP RVALE1, TLBIP RVALE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

TLBIP RVALE1IS, TLBIP RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

The TLBIP RVALE1IS, TLBIP RVALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

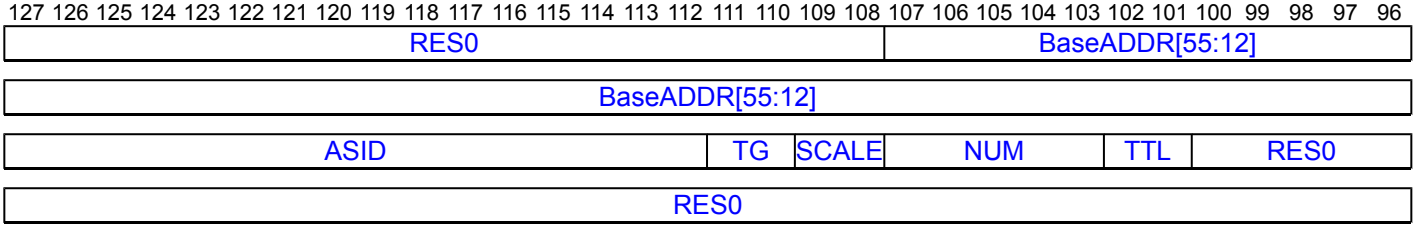
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE1IS, TLBIP RVALE1ISNXS are UNDEFINED.

Attributes

TLBIP RVALE1IS, TLBIP RVALE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVALE1OS, TLBIP RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBIP RVALE1OS, TLBIP RVALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

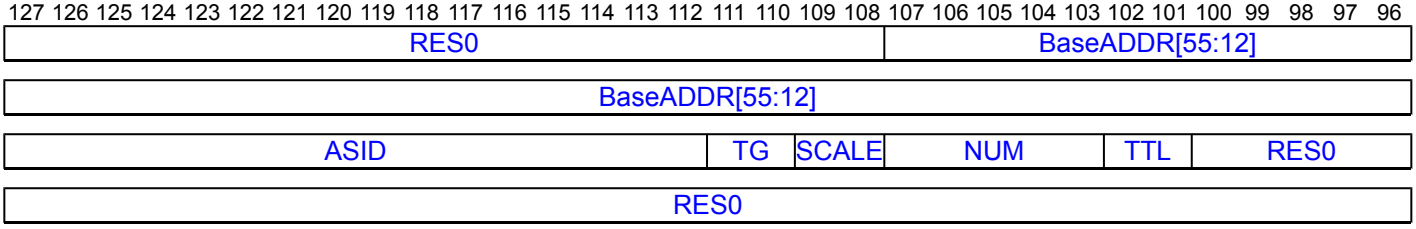
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE1OS, TLBIP RVALE1OSNXS are UNDEFINED.

Attributes

TLBIP RVALE1OS, TLBIP RVALE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVALE2, TLBIP RVALE2NXS, TLB Range Invalidate by VA, Last level, EL2

The TLBIP RVALE2, TLBIP RVALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

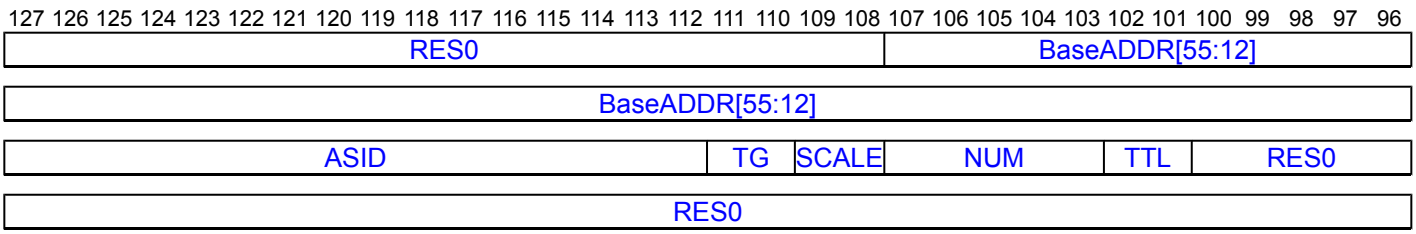
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE2, TLBIP RVALE2NXS are UNDEFINED.

Attributes

TLBIP RVALE2, TLBIP RVALE2NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

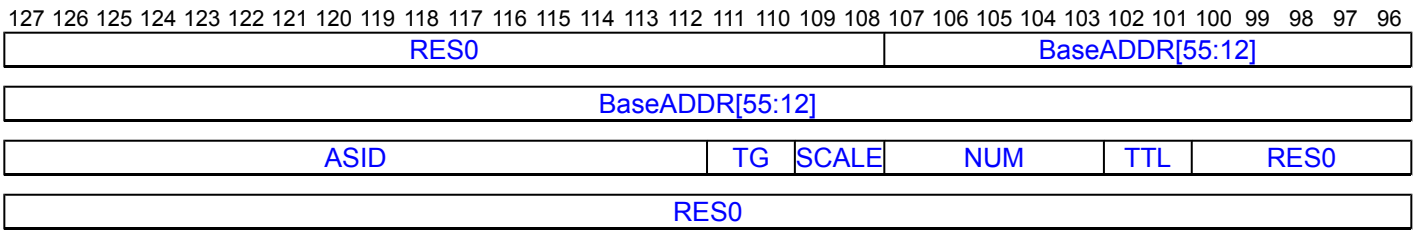
Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.

- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP RVALE2OS, TLBIP RVALE2OSNXS, TLB Range Invalidate by VA, Last level, EL2, Outer Shareable

The TLBIP RVALE2OS, TLBIP RVALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, if TTL is `0b00`.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE2OS, TLBIP RVALE2OSNXS are UNDEFINED.

Attributes

TLBIP RVALE2OS, TLBIP RVALE2OSNXS is a 128-bit System instruction.

TLBIP RVALE3OS, TLBIP RVALE3OSNXS, TLB Range Invalidate by VA, Last level, EL3, Outer Shareable

The TLBIP RVALE3OS, TLBIP RVALE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL is `0b00`.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

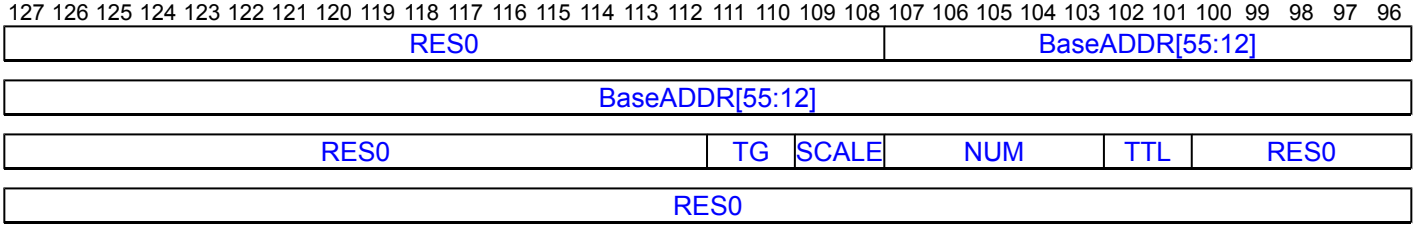
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE3OS, TLBIP RVALE3OSNXS are UNDEFINED.

Attributes

TLBIP RVALE3OS, TLBIP RVALE3OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:0]

Reserved, RES0.

TLBIP VAAE1, TLBIP VAAE1NXS, TLB Invalidate Pair by VA, All ASID, EL1

The TLBIP VAAE1, TLBIP VAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

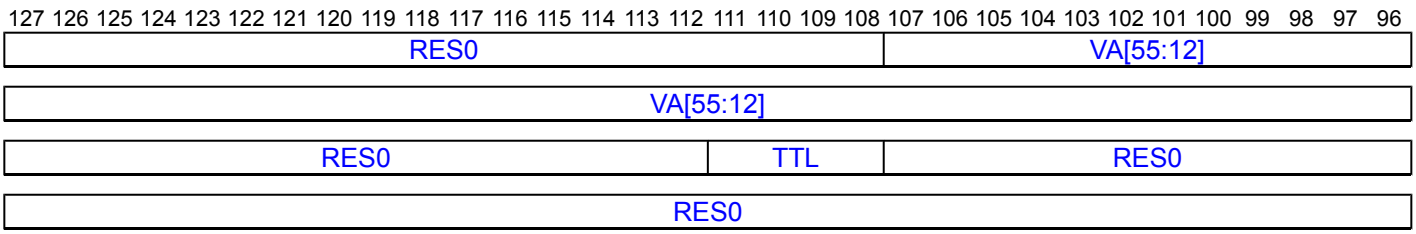
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAAE1, TLBIP VAAE1NXS are UNDEFINED.

Attributes

TLBIP VAAE1, TLBIP VAAE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAAE1IS, TLBIP VAAE1ISNXS, TLB Invalidate Pair by VA, All ASID, EL1, Inner Shareable

The TLBIP VAAE1IS, TLBIP VAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

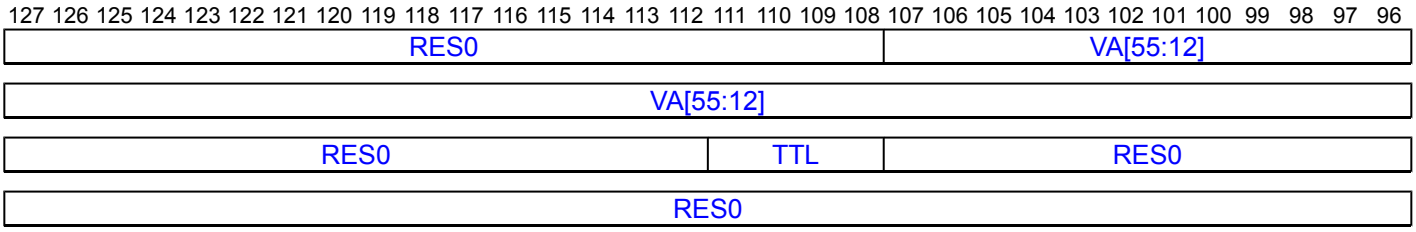
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAAE1IS, TLBIP VAAE1ISNXS are UNDEFINED.

Attributes

TLBIP VAAE1IS, TLBIP VAAE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAAE1OS, TLBIP VAAE1OSNXS, TLB Invalidate Pair by VA, All ASID, EL1, Outer Shareable

The TLBIP VAAE1OS, TLBIP VAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

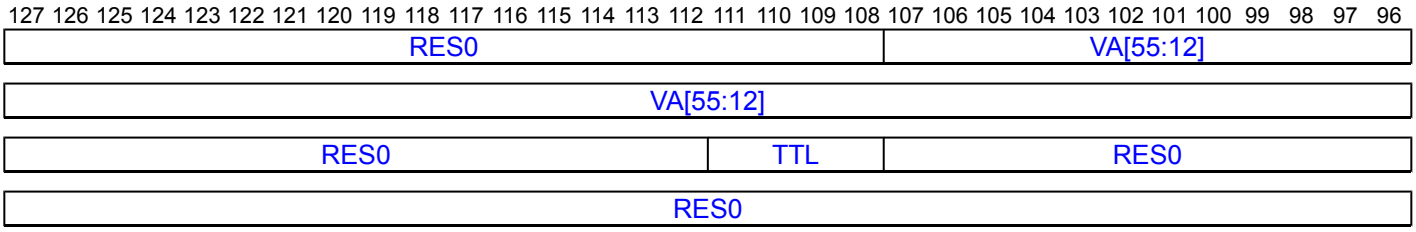
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAAE1OS, TLBIP VAAE1OSNXS are UNDEFINED.

Attributes

TLBIP VAAE1OS, TLBIP VAAE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAALE1, TLBIP VAALE1NXS, TLB Invalidate Pair by VA, All ASID, Last level, EL1

The TLBIP VAALE1, TLBIP VAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

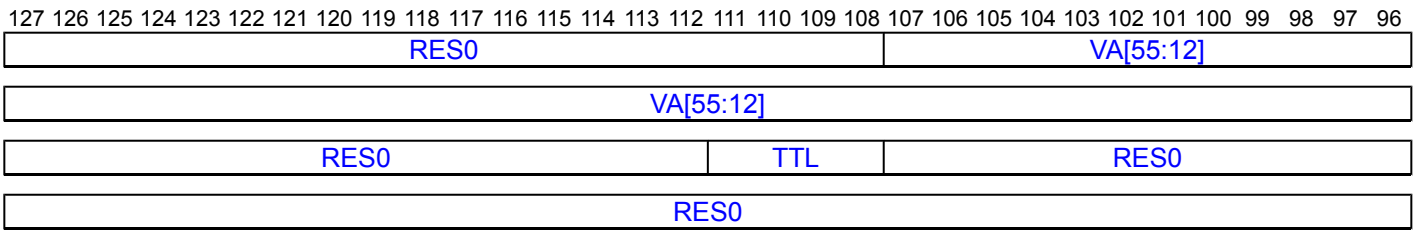
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAALE1, TLBIP VAALE1NXS are UNDEFINED.

Attributes

TLBIP VAALE1, TLBIP VAALE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAALE1IS, TLBIP VAALE1ISNXS, TLB Invalidate Pair by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBIP VAALE1IS, TLBIP VAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

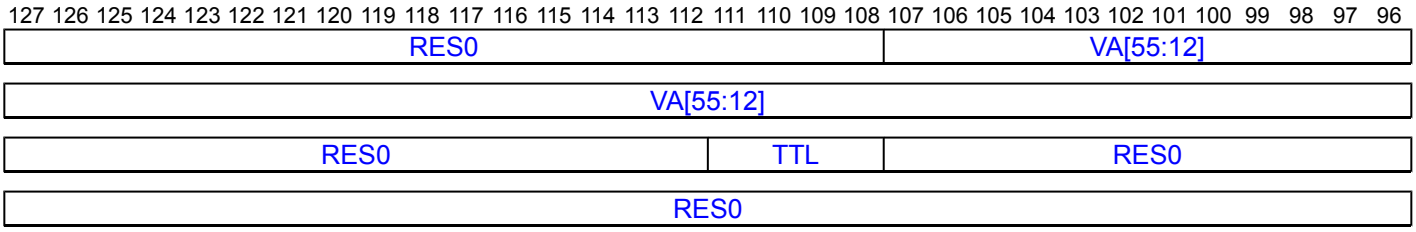
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAALE1IS, TLBIP VAALE1ISNXS are UNDEFINED.

Attributes

TLBIP VAALE1IS, TLBIP VAALE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAALE1OS, TLBIP VAALE1OSNXS, TLB Invalidate Pair by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBIP VAALE1OS, TLBIP VAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

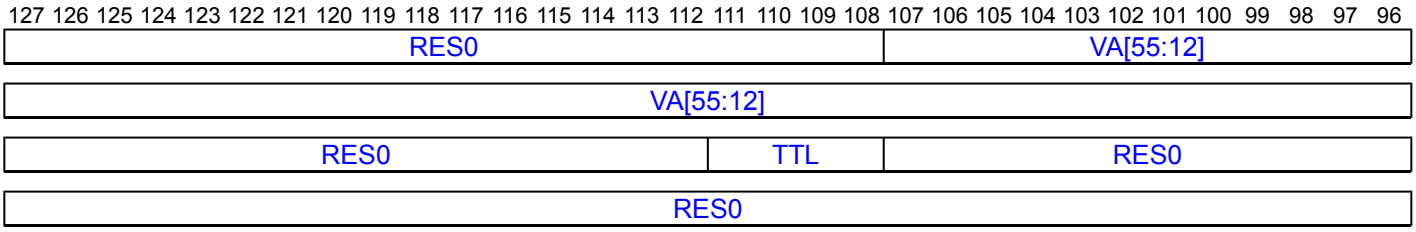
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAALE1OS, TLBIP VAALE1OSNXS are UNDEFINED.

Attributes

TLBIP VAALE1OS, TLBIP VAALE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAE1, TLBIP VAE1NXS, TLB Invalidate Pair by VA, EL1

The TLBIP VAE1, TLBIP VAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

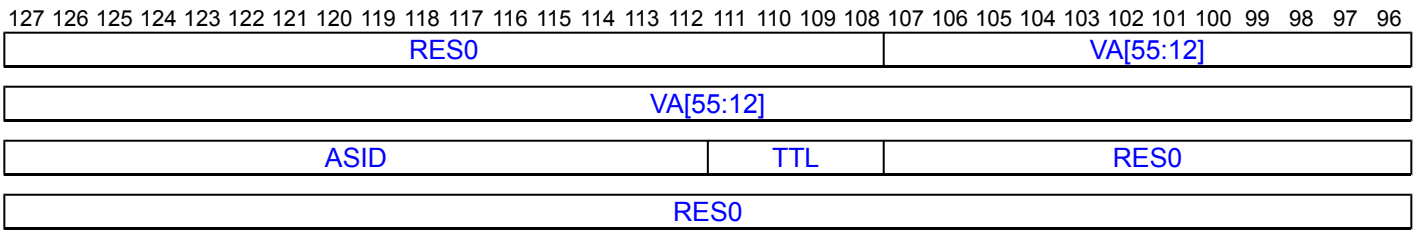
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE1, TLBIP VAE1NXS are UNDEFINED.

Attributes

TLBIP VAE1, TLBIP VAE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

Executing TLBIP VAE1, TLBIP VAE1NXS

TLBIP VAE1IS, TLBIP VAE1ISNXS, TLB Invalidate Pair by VA, EL1, Inner Shareable

The TLBIP VAE1IS, TLBIP VAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

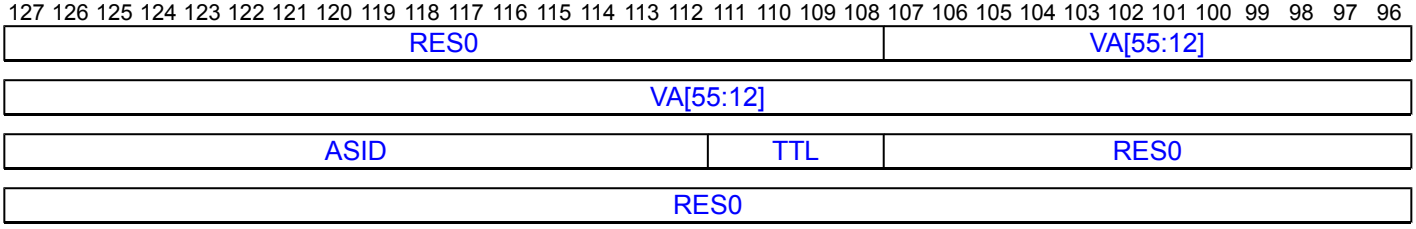
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE1IS, TLBIP VAE1ISNXS are UNDEFINED.

Attributes

TLBIP VAE1IS, TLBIP VAE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

TLBIP VAE1OS, TLBIP VAE1OSNXS, TLB Invalidate Pair by VA, EL1, Outer Shareable

The TLBIP VAE1OS, TLBIP VAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

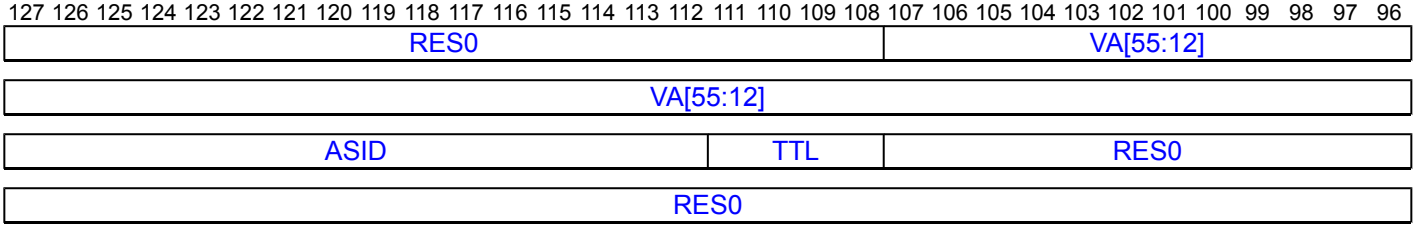
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE1OS, TLBIP VAE1OSNXS are UNDEFINED.

Attributes

TLBIP VAE1OS, TLBIP VAE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

TLBIP VAE2, TLBIP VAE2NXS, TLB Invalidate Pair by VA, EL2

The TLBIP VAE2, TLBIP VAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

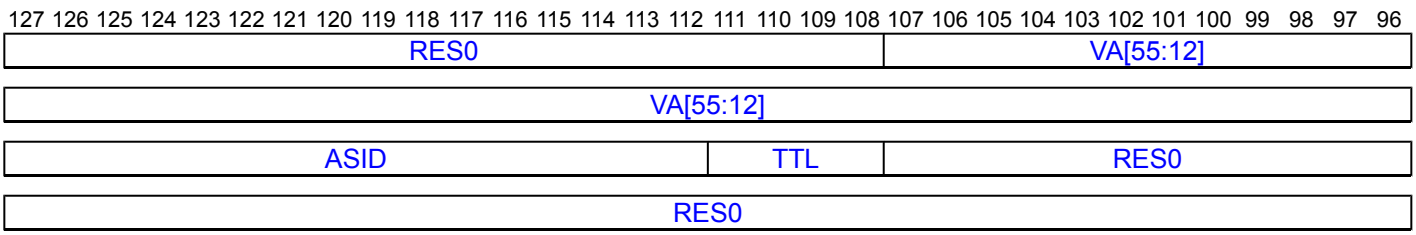
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE2, TLBIP VAE2NXS are UNDEFINED.

Attributes

TLBIP VAE2, TLBIP VAE2NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAE2IS, TLBIP VAE2ISNXS, TLB Invalidate Pair by VA, EL2, Inner Shareable

The TLBIP VAE2IS, TLBIP VAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

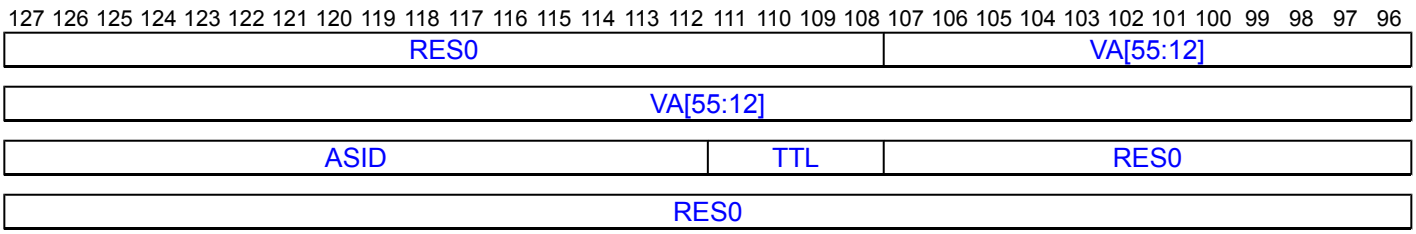
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE2IS, TLBIP VAE2ISNXS are UNDEFINED.

Attributes

TLBIP VAE2IS, TLBIP VAE2ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

TLBIP VAE2OS, TLBIP VAE2OSNXS, TLB Invalidate Pair by VA, EL2, Outer Shareable

The TLBIP VAE2OS, TLBIP VAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

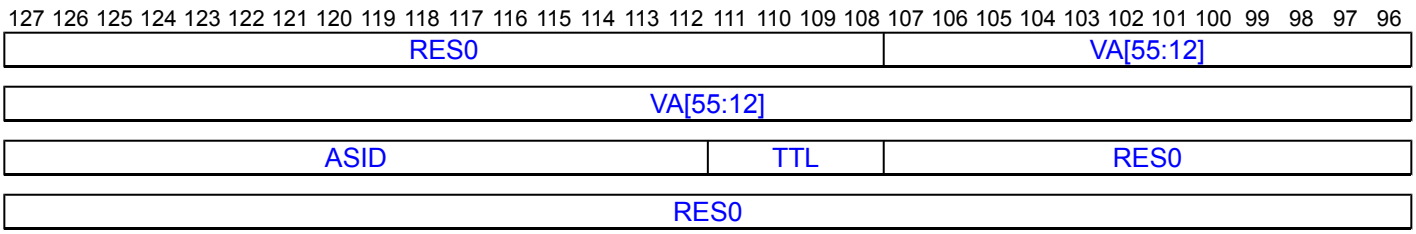
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE2OS, TLBIP VAE2OSNXS are UNDEFINED.

Attributes

TLBIP VAE2OS, TLBIP VAE2OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VAE3, TLBIP VAE3NXS, TLB Invalidate Pair by VA, EL3

The TLBIP VAE3, TLBIP VAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

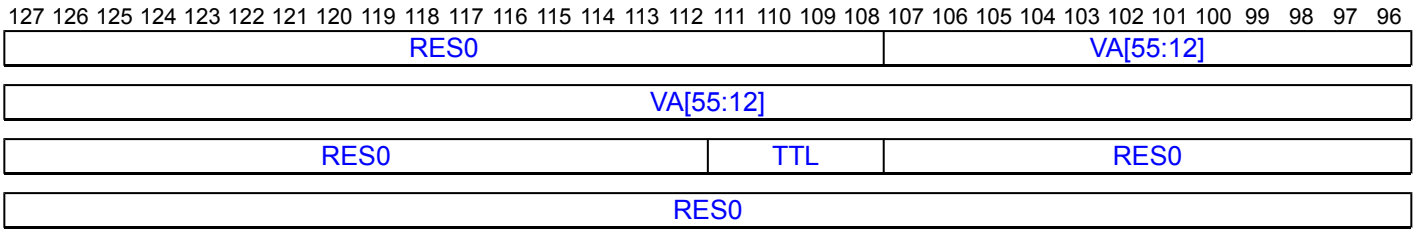
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE3, TLBIP VAE3NXS are UNDEFINED.

Attributes

TLBIP VAE3, TLBIP VAE3NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

TLBIP VAE3IS, TLBIP VAE3ISNXS, TLB Invalidate Pair by VA, EL3, Inner Shareable

The TLBIP VAE3IS, TLBIP VAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

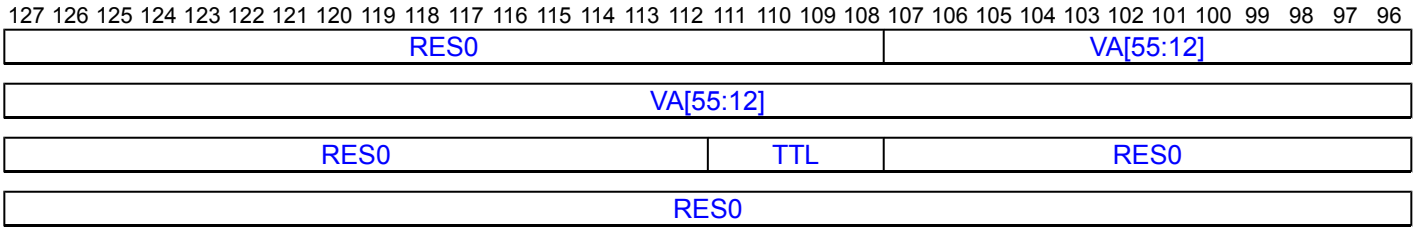
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE3IS, TLBIP VAE3ISNXS are UNDEFINED.

Attributes

TLBIP VAE3IS, TLBIP VAE3ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

TLBIP VALE1, TLBIP VALE1NXS, TLB Invalidate Pair by VA, Last level, EL1

The TLBIP VALE1, TLBIP VALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

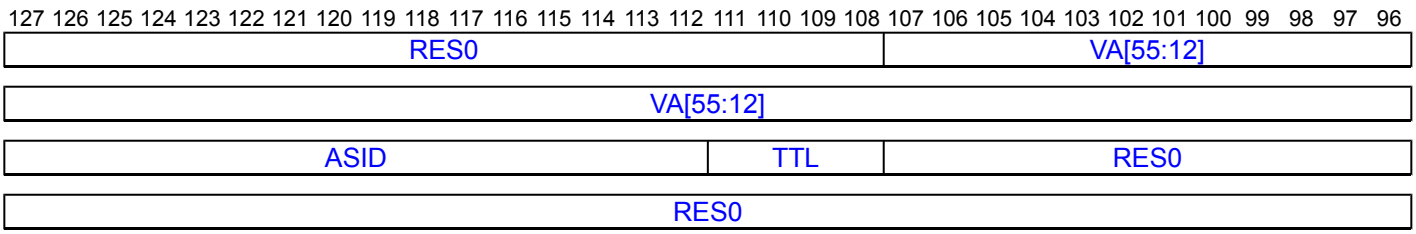
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE1, TLBIP VALE1NXS are UNDEFINED.

Attributes

TLBIP VALE1, TLBIP VALE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VALE1IS, TLBIP VALE1ISNXS, TLB Invalidate Pair by VA, Last level, EL1, Inner Shareable

The TLBIP VALE1IS, TLBIP VALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

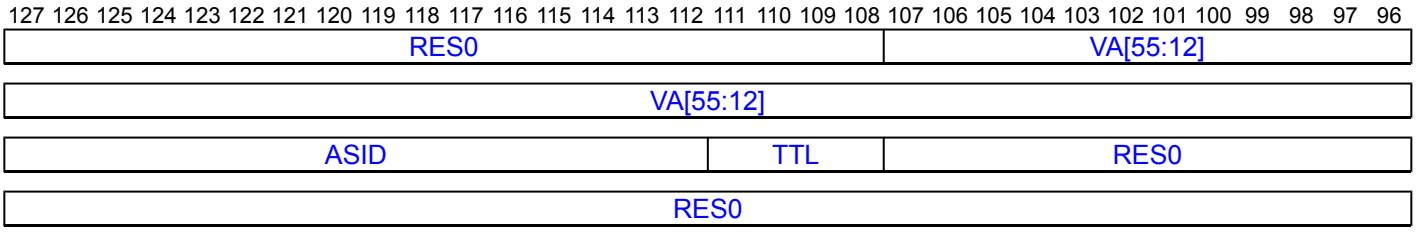
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE1IS, TLBIP VALE1ISNXS are UNDEFINED.

Attributes

TLBIP VALE1IS, TLBIP VALE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VALE1OS, TLBIP VALE1OSNXS, TLB Invalidate Pair by VA, Last level, EL1, Outer Shareable

The TLBIP VALE1OS, TLBIP VALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

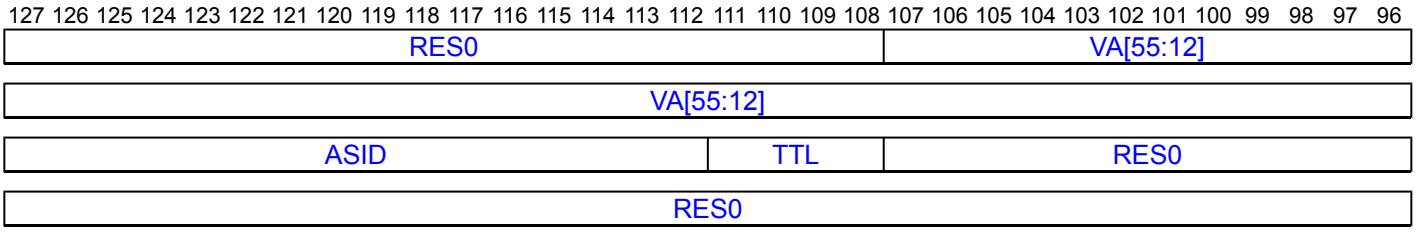
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE1OS, TLBIP VALE1OSNXS are UNDEFINED.

Attributes

TLBIP VALE1OS, TLBIP VALE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VALE2, TLBIP VALE2NXS, TLB Invalidate Pair by VA, Last level, EL2

The TLBIP VALE2, TLBIP VALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

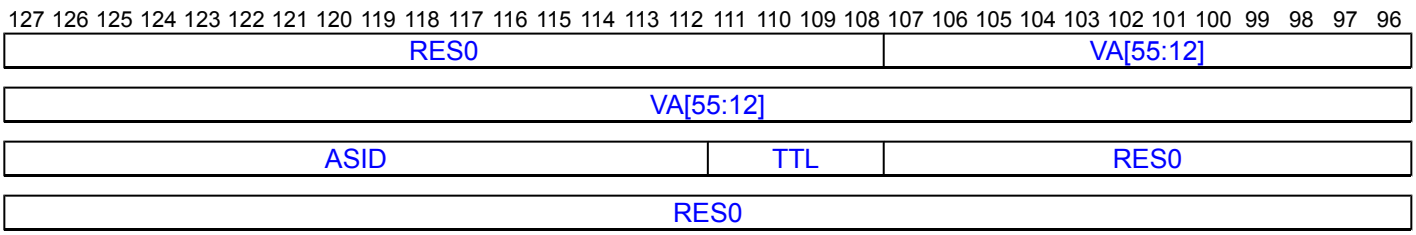
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE2, TLBIP VALE2NXS are UNDEFINED.

Attributes

TLBIP VALE2, TLBIP VALE2NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VALE2IS, TLBIP VALE2ISNXS, TLB Invalidate Pair by VA, Last level, EL2, Inner Shareable

The TLBIP VALE2IS, TLBIP VALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

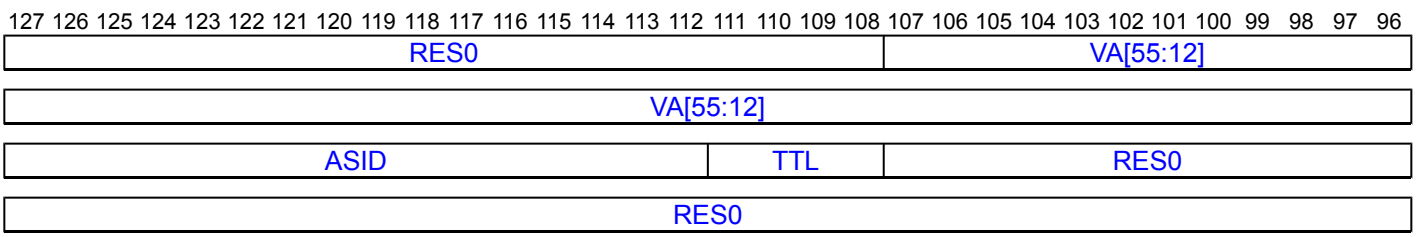
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE2IS, TLBIP VALE2ISNXS are UNDEFINED.

Attributes

TLBIP VALE2IS, TLBIP VALE2ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

TLBIP VALE2OS, TLBIP VALE2OSNXS, TLB Invalidate Pair by VA, Last level, EL2, Outer Shareable

The TLBIP VALE2OS, TLBIP VALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry.
  - A 64-bit stage 1 translation table entry, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

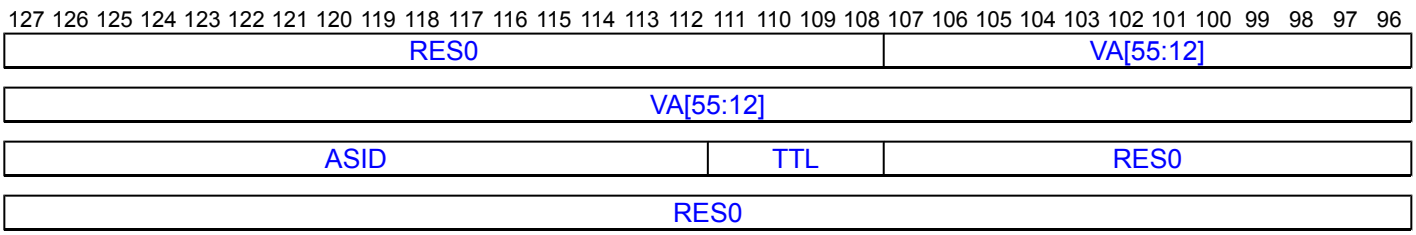
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE2OS, TLBIP VALE2OSNXS are UNDEFINED.

Attributes

TLBIP VALE2OS, TLBIP VALE2OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:0]

Reserved, RES0.

TLBIP VALE3, TLBIP VALE3NXS, TLB Invalidate Pair by VA, Last level, EL3

The TLBIP VALE3, TLBIP VALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is `0b00`.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

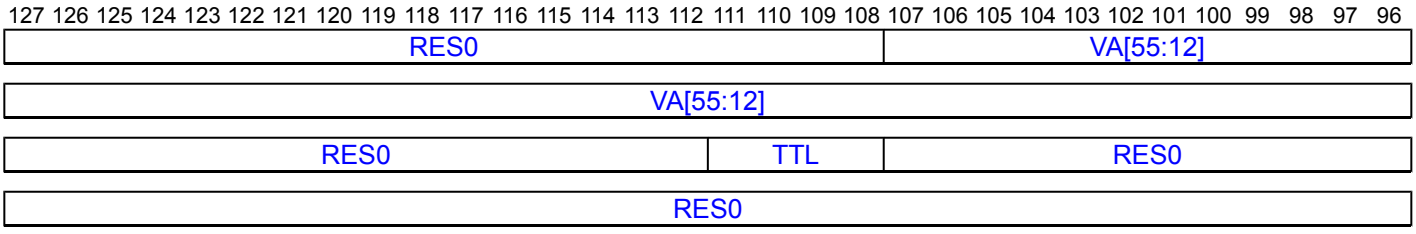
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE3, TLBIP VALE3NXS are UNDEFINED.

Attributes

TLBIP VALE3, TLBIP VALE3NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

TPIDR2_EL0, EL0 Read/Write Software Thread ID Register 2

The TPIDR2_EL0 characteristics are:

Purpose

Provides a location where SME-aware software executing at EL0 can store thread identifying information, for context management purposes.

The PE makes no use of this register.

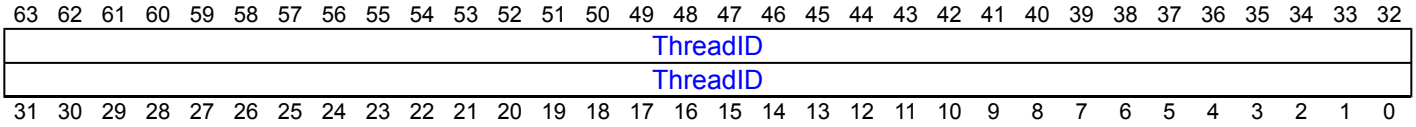
Configuration

This register is present only when FEAT_SME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPIDR2_EL0 are UNDEFINED.

Attributes

TPIDR2_EL0 is a 64-bit register.

Field descriptions



ThreadID, bits [63:0]

Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDR2_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, TPIDR2_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0000	0b101

```
if !(IsFeatureImplemented(FEAT_SME) && IsFeatureImplemented(FEAT_AA64)) then
