1. About the models

Programmers View (PV) models of processors and devices work at a level where functional behavior is equivalent to what a programmer would see using the hardware.

They sacrifice timing accuracy to achieve fast simulation execution speeds. You can use the PV models for confirming software functionality, but you must not rely on the accuracy of cycle counts, low-level component interactions, or other hardware-specific behavior.

1.1 Model capabilities

Fast Models attempt to accurately model the hardware, but compromises exist between speed of execution, accuracy, and other criteria. A processor model might not match the hardware under certain conditions.

Fast Models can:

- Accurately model instructions.
- Correctly execute architecturally-correct code.
- Model some unpredictable behavior.

Fast Models cannot:

- Validate the hardware.
- Model all unpredictable behavior.
- Model cycle counting.
- Model timing-sensitive behavior.
- Model SMP instruction scheduling.
- Measure software performance.
- Model bus traffic.

Related information

Caches in Fast Models on page 27

1.2 Running Arm Software Test Libraries (STL) on Fast Models

Fast Models does not support running the entire STL.

The reasons are:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- Some micro-architectural features implemented in the RTL are not implemented in the Fast Model and therefore the model's behavior might deviate from the RTL.
- Some peripheral support must be included to enable parts of the STL. For example SBIST controller support is available in the RTL but not in the Fast Model.

Fast Models can be used for integration of the STL into your software stack, but running the STL might not perform accurate measurement and validation.

Arm Software Test Libraries

1.3 Quality level definitions

The documentation for each model of Arm® IP includes one or more quality level statements to indicate how complete the model's implementation is for each supported revision of the IP.

Table 1-1: Quality level definitions

Quality level	Definition
Alpha support	The model implementation is at an early stage and is likely to change in future releases. There might be significant defects or limitations in the model.
Preliminary support	The model implementation is complete or almost complete. Testing is nearly to the level of a fully-supported model. However, changes might still occur and there are likely to be known defects present.
Full support	Also called Release quality. Support is complete and the model has been tested as fully as possible. The modeled IP has reached its LAC milestone.

1.4 Fast Models accuracy

Fast Models aim to be accurate from the point of view of the program running on the processors. This section describes areas where Fast Models differ from hardware.

Software is able to detect differences between hardware and the model, but these differences generally depend on behavior that is not precisely specified. For example, it is possible to detect differences in the exact timings of instructions and bus transactions, effects of speculative prefetch and cache victim selection.

Certain classes of behavior are specified as unpredictable and these cases are detectable by software. A program that relies on such behavior, even unintentionally, is not guaranteed to work reliably on any device, or on a Fast Model. Programs that exploit this behavior might execute differently between the hardware and the model.

Fast Models do not attempt to accurately model bus transactions. PVBus provides the infrastructure to ensure that the program gets the correct results.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

1.4.1 Timing accuracy of Fast Models

Fast Models do not model instruction timing accurately. The simulation as a whole has a very accurate concept of timing, but the Code Translation (CT) processors do not claim to dispatch instructions with device-like timing.

In general, a processor issues a set of instructions, called a quantum, at the same point in simulation time, and then waits for some amount of time before executing the next quantum.

Timing is arranged so that on average the processor executes one instruction per clock cycle, although Timing Annotation can cause the cycle count and instruction count to differ.

The consequences of this are:

- The perceived performance of software running on the model differs from real-world software. In particular, memory accesses and arithmetic operations all take a significant amount of time.
- A program might be able to detect the quantized execution behavior of a processor, for example by polling a high-resolution timer.
- All instructions in a quantum are effectively atomic.

Note

This might mask some race-condition bugs in software.

The following conditions can cause the processor to yield to another thread before a quantum expires:

- Non-DMI memory transactions
- Signal changes
- WFE and WFI instructions
- Barrier instructions
- Yield instructions
- Generic Timer accesses

1.4.2 Bus traffic in Fast Models

PVBus can simulate the behavior of individual bus transactions passing through a hierarchy of bus fabric, but it uses the following techniques to optimize this process:

- PVBus generally decodes the path between a bus master and bus slave the first time a transaction is issued. All subsequent transactions to the same address are automatically sent to the same slave, without passing through the intervening fabric.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- For accesses to normal memory, the master can cache a pointer to the host storage that holds the data contents of the memory. The master can read and write directly to this memory without generating bus transactions.
- For instruction-fetch, and for operations such as repeated DMA from framebuffer memory, PVBus provides an optimization called snooping, which informs the master if anyone else could have modified the contents of memory. If no changes have occurred, the master can avoid the need to re-read memory contents.

If a piece of bus fabric wants to intercept and log all bus transactions, it can defeat these optimizations by claiming to be a slave device. It can then log all transactions and can reissue identical transactions on its own master port. However, doing this slows all bus transactions and significantly impacts simulation performance.

Note

If direct accesses to memory by the CT engine are intercepted by the fabric, the processor is forced to single step. Execution is much slower than normal operation with translated code.

The bus traffic generated by a processor is not representative of real traffic:

Timing differences

Reordering and buffering of memory accesses, out-of-order execution, speculative prefetch, and drain-buffers can cause timing differences. They are not modeled, since they are not visible to the programmer except in situations where a cluster program contains race conditions that violate serial-consistency expectations.

Bus contention

Fast Models do not model the time taken for a bus transaction, so they cannot model the effects of multiple transactions contending for bus availability.

Size of access

Fast Models do not attempt to generate the same types of burst transaction from the processor for accesses to multiple consecutive locations. PVBus only supports burst transactions of type INCR.

Instruction fetch

The behavior of the instruction prefetch unit of a processor is not modeled to match the hardware implementation.

Behavioral differences

In some software, the trace of instruction execution depends on timing effects. For example, if a loop polls a device waiting for a 10ms time-out, the number of iterations of the polling loop depends on the rate of instruction execution.

Other differences

- PVBus does not support any type of write strobes.
- PVBus does not support Quality of Service (QoS) or region values.
- Transactions cannot cross a 4KB boundary.
- Barriers and DVM messages are not transmitted on the PVBus.

Instruction prefetch in Fast Models on page 27

1.4.3 Instruction prefetch in Fast Models

The CT engine in the processor models relies on Fast Models PVBus optimizations. It only performs code-translation if it has been able to prefetch and snoop the underlying memory. It then need not issue bus transactions until the snoop handling detects an external modification to memory.

If the CT engine cannot get prefetch access to memory, it drops to single-stepping. This single-stepping is very slow (~1000x slower than translated code execution).

Real processors attempt to prefetch instructions ahead of execution and predict branch destinations to keep the prefetch queue full. The instruction prefetch behavior of a processor can be observed by a program that writes into its own prefetch queue (without using explicit barriers). The architecture does not define the results.

The CT engine processes code in blocks. The effect is as if the processor filled its prefetch queue with a block of instructions, then executed the block to completion. As a result, this virtual prefetch queue is sometimes larger and sometimes smaller than the corresponding hardware. In the current implementation, the virtual prefetch queue can follow small forward branches.

With an L1 instruction cache turned on, the instruction blocksize is limited to a single cache-line. The processor ensures that a line is present in the cache at the point where it starts executing instructions from that line.

In real hardware, the effects of the instruction prefetch queue are to cause additional fetch transactions. Some of these are redundant because of incorrect branch prediction. This causes extra cache and bus pressure.

1.4.4 Out-of-order execution and write-buffers in Fast Models

Hardware memory is Weakly Ordered, but Fast Models memory is Strongly Ordered.

The CT implementation executes instructions sequentially. One instruction is retired before the next starts to execute. In a real processor, multiple memory accesses can be outstanding, and can complete in a different order from their program order. Writes can also be delayed in a write-buffer.

The programmer-visible effects of these behaviors are defined in the architecture as the Weakly Ordered memory model, which the programmer must be aware of when writing lock-free cluster code.

Within Fast Models, memory accesses happen in program order, effectively as if all memory is Strongly Ordered.

Non-Confidential

1.4.5 Caches in Fast Models

Fast Models with cache-state modeling enabled can replicate some, but not all, types of failure-case.

The effects of caches are programmer-visible because they can cause a single memory location to exist as multiple inconsistent copies. If caches are not correctly maintained, reads can observe stale copies of locations, and flushes/cleans can cause writes to be lost.

There are three ways in which incorrect cache maintenance can be programmer-visible:

From the D-side interface of a single processor

The only way of detecting the presence of caches is to create aliases in the memory map, so that the same range of physical addresses can be observed as both cached and non-cached memory.

From the D-side of a single processor to its I-side

Stale instruction data can be fetched when new instructions have been written by the D-side. This can either be because of deliberate self-modifying code, or as a consequence of incorrect OS demand paging.

Between one processor and another device

For example, another processor in a non-coherent MP system, or an external DMA device.

Fast Models with cache-state modeling enabled can replicate all of these failure cases. However, they do not attempt to reproduce the following effects of caches:

- Changes to timing behavior of a program because of cache hits/misses (because the timing of memory accesses is not modeled).
- Ordering of line-fill and eviction operations.
- Cache usage statistics (because the models do not generate accurate bus traffic).
- Device-accurate allocation of cache victim lines (which is not possible without accurate bus traffic modeling).
- Write-streaming behavior where a cache spots patterns of writes to consecutive addresses and automatically turns off the write-allocation policy.

It is not possible to insert devices between the processor and its L1 caches. In particular, you cannot model L1 traffic, although you can tell the model not to model the state of L1 caches.

1.4.6 Global exclusive monitor in Fast Models

A monitor for cacheable nonshared and shared memory is always implemented, but the implementation differs depending on whether `cache-state-modelled` is `true` or `false`.

- When `cache-state-modelled` is `true`, caches are modeled, so exclusiveness is handled by the cache coherency protocol. Each line in a coherent cache records whether it is exclusive. When another core writes to an exclusive line, it is invalidated in other caches.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- When `cache-state-modelled` is `false`, the cache state is not modeled, so there are no cache lines or coherency. To provide the same functionality from a software perspective, an exclusive monitor is instantiated internally to maintain coherency.

The RAMDevice component and PVBus to AMBAPV bridges do not contain global monitors. As a result, exclusive stores that reach a RAMDevice fail unless they go through an exclusive monitor. Some platforms might need a global monitor outside of the cache coherency domains. These platforms must include a system-level monitor in the same place in the bus hierarchy as in the hardware. See the FVP_VE and FVP_Base example platforms for examples of how to use the PVBusExclusiveMonitor component.

1.5 Processor implementation

This section outlines the differences between the code translation models and the hardware.

1.5.1 Caches in PV models

Some processor models have PV-accurate caches, but others do not model Level 1 or Level 2 caches.

Cores that have PV-accurate cache implementation provide a functionally-accurate model. For more information, see the processor component descriptions.

Other PV models do not model Level 1 or Level 2 caches. The system coprocessor registers related to cache operations permit cache-aware software to work, but in most cases they only check register access permissions.

The registers affected on all code translation processor models are:

- Invalidate and/or Clean Entire ICache/DCache.
- Invalidate and/or Clean ICache/DCache by MVA.
- Invalidate and/or Clean ICache/DCache by Index.
- Invalidate and/or Clean Both Caches.
- Cache Dirty Status.
- Data Write Barrier.
- Data Memory Barrier.
- Prefetch ICache Line.
- ICache/DCache lockdown.
- ICache/DCache master valid.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

1.5.1.1 Functional caches in Fast Models

Fast Models implement two types of cache model:

Register model

Provides all the cache control registers so that cache operations succeed, but does not model the state of the cache. All accesses go to memory.

Functional model

Tracks cache state and its contents at each level of the memory hierarchy. Incorrect cache management might return incorrect data, as it would on real hardware.

Fast Models provide:

- System IPs that support caches.
- Register models of caches on all processors that support caches and also the PL310 cache controller (PL310_L2CC).
- Functional models of caches integrated into Cortex cores.

Note

For cache-state modeling to work, all components within the coherency domain must have consistent cache-state modeling settings. Support for cache state modeling beyond the CPUs is deprecated and will be removed in a future release. When support is removed from the interconnects, this means that cache state modeling can only be enabled if the coherency boundary is before the interconnect, for example at the cluster boundary.

For an Arm®v8-A core with an L2 cache, the configuration parameters are:

`icache-state_modelled`

Set whether L1 I-cache has stateful implementation. Instructions at L2 or L3 are not cached in Fast Models.

`dcache-state_modelled`

Set whether D-cache has stateful implementation at L1, L2, and L3.

1.5.1.2 Performance impact of functional caches in Fast Models

Enabling functional cache modeling is likely to reduce performance.

Enable the L1 and L2 functional caches together. For consistent system operation, Arm recommends that you either disable functional behavior completely or enable it for both I and D L1 caches and the L2 cache.

Cache enablement must be system wide. If you enable cache state modeling in any component then you must enable it in all components in the system, including all cores (L1 and L2) and any external cache controller (such as the PL310_L2CC) and any interconnect that has caches.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

If platform memory is being modeled outside of the Fast Models environment, for example in a SystemC environment, use of functional cache modeling might improve performance if there is no other fast route to memory.

1.5.2 GICv3 in PV models

The PV models implement the Generic Interrupt Controller architecture version 3 (GICv3).

The GICv3 architecture defines two parts:

- The core interface (integrated into the core)
- The Interrupt Redistribution Infrastructure (IRI)

You can configure all Arm®v8-A cores to include a GICv3 interface. You can integrate a separate GIC_IRI component into your platforms. Communication between the core and the IRI is over an architected packet interface. An internal communication protocol represents the packets that pass over this interface.

You can configure the GICv3 models in some platforms to act as though they were GICv2 or GICv2-M models. Even in this mode, you need a GIC_IRI component and a supported core. Configure them to comply with the same standard.

Models have the following limitations:

- Support for the GITS_CTLR.Quiescent bit is not complete.
- Support for ITS save/restore is not complete. Configuration stays within the model and it does not use allocated memory.
- GICD_CTLR.RWP does not perform adequately. This difference is only an issue if you use the distributor in systems with delaying interface between the distributor and the cores. Do not use this version of the model for simulation of the GIC in a setup where interfaces are not instantly reactive.

Set the environment variable `FASTSIM_GIC_MEMORY_MAP` to 1 to print to `stderr` the memory map of certain models that are included in the platform being run. This functionality is available for all GICv3 and later models.

1.5.3 GICv4 in PV models

GICv4 is an extension of the GICv3 architecture. It allows the direct injection of LPIs into a virtualized system through the `virtual-lpi-support` parameter of the `GIC_IRI` or `GIC_IRI_Filter` component.

In addition to requiring the presence of an ITS that is configured as shown in GIC_IRI, GICv4 requires you to enable the virtual LPIs feature and to configure a virtual PE table using the parameters shown in this example:

```
    "virtual-lpi-support"=true,
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

```
    "GITS_BASER4-type"=2 //Type 2 is Virtual PEs.
                         //Such a table is needed for GICv4 functionality.
```

1.5.4 CP14 Debug coprocessor

Some models fully implement the CP14 Debug coprocessor registers. Other models only implement the DSCR register. This register reads as 0 and ignores writes.

External debugging must be used to debug systems containing PV models.

1.5.5 TLBs in PV models

The PV models implement Translation Lookaside Buffers (TLBs) and model most aspects of TLB behavior.

Note

If the `device-accurate-tlb` parameter is set to `false`, the simulation uses a different number of TLBs if this improves simulation performance. The simulation is architecturally accurate, but not device accurate. Architectural accuracy is almost always sufficient. Set `device-accurate-tlb` to `true` if you require device accuracy.

These TLB registers do not have working implementations:

- Primary memory remap register.
- Normal memory remap register.

In addition, the simulation does not distinguish peripheral accesses from data accesses, so it ignores configuration of the peripheral port memory remap register.

Note

The models do not implement device-accurate MicroTLBs, or system coprocessor registers related to MicroTLB state.

1.5.6 Memory access in PV models

PV models use a PVBusMaster subcomponent to communicate with slaves in a System Canvas-generated system. This provides efficient access to memory-like slaves and relatively efficient access to device-like slaves.

Memory access in PV models differs from real hardware to enable fast modeling of the processor:

- All memory accesses are performed in programmer view order.
- Unaligned accesses, where permitted, are always performed as byte transfers.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

In addition, some PV models do not use all the transaction states available in a PVBus transaction. The Privileged and Instruction flags are set correctly for Arm®v7 processors but might not be set correctly in earlier architectures. However all memory accesses are atomic so `SWP` instructions behave as expected.

1.5.6.1 I-side access in PV models

PV models cache translations of instructions fetched from memory-like slaves. The models might not perform further access to those slaves for significant periods. A slave can force the model to reread the memory by declaring that the memory has changed.

PV models do not model a prefetch queue but the code translation mechanism effectively acts as a prefetch queue of variable depth. Arm recommends that you follow the standards in the Arm® architecture specifications for dealing with prefetch issues, such as self modifying code, and use appropriate cache flushing and synchronization barriers.

Translation of instructions only occurs for memory-like slaves, which are those declared by devices as having type `pv::ACCESSMODE_MEMORY`. Instructions fetched from device-like slaves are repeatedly fetched, decoded, and executed, significantly slowing down model performance.

1.5.6.2 D-side access in PV models

PV models cache references to the underlying memory of memory-like slaves, and might not perform further accesses to those slaves over the bus for significant periods.

Slaves declared as type `pv::ACCESSMODE_MEMORY` provide the fastest possible memory access for PV processors.

Slaves declared as type `pv::ACCESSMODE_DEVICE` are normally used for peripheral access.

1.5.7 Timing in PV models

Programmers View (PV) models are loosely timed.

- Caches and write buffers are not modeled, so all memory access timing is effectively zero wait state.
- All instructions execute, in aggregate, in one cycle of the component master clock input.
- Interrupts are not taken at every instruction boundary.
- Some sequences of instructions are executed atomically, ahead of the master clock of a component, so that system time does not advance during execution. This difference in behavior can affect sequential access of device registers, where devices are expecting time to move on between accesses.
- DMA to and from Tightly Coupled Memory (TCM) is atomic.

1.5.8 Iris interactions with processor behavior

Architecturally, M series processors have different reset behavior to that of A and R series processors.

For both hardware and model processors, a reset consists of asserting, and then deasserting the reset pin. However:

A and R series

Asserting reset causes the processor to stop executing instructions and on deasserting reset, the processor begins fetching and executing instructions from a defined address.

M series

The architecture documentation specifies that on asserting the reset pin, the processor stops executing instructions. On deasserting the reset pin, the VTOR is given its reset value, SP_main is read from address VTOR+0, and the PC is read from address VTOR+4. See the Reset behavior section and the Vector Table Offset Register, VTOR section in the ARMv7-M Architecture Reference Manual. Also, the processor begins fetching and executing instructions.

The reset behavior on M series processors interacts differently with Iris debugging functionality compared to A and R series processors:

A and R series

After the reset pin of the processor is asserted, a new application can be loaded using the `image_loadFile()` call in Iris. This loads an application into memory, and sets the PC if a start address is specified in the application. When reset is deasserted, the processor begins fetching and executing from the start address as expected. Similarly, if a debugger asserts reset on the processor, it can modify memory with a sequence of `memory_write()` calls, update the PC with a `resource_write()` call, and when reset is deasserted, the processor begins to fetch and execute from the PC.

M series:

These techniques do not work because after reset is deasserted, the processor updates SP_main and the PC, overwriting the settings made by the Iris calls.

For these techniques to be possible, the M series processor models differ slightly from the architectural reset behavior. When reset is asserted, the M series makes note of whether the PC or SP is modified before reset is next deasserted. If there are any Iris writes to the PC or SP registers, either directly through `resource_write()` or indirectly through `image_loadFile()`, this is tracked. When reset is deasserted, if the PC has been modified using Iris, the PC retains the value written to it, otherwise it reads it from address VTOR+4. Similarly, if the SP has been modified using Iris, SP_main retains the value written to it, otherwise it reads it from address VTOR+0.

1.6 syncLevel definitions

Definitions for the possible syncLevel values.

syncLevel 0

The simulator runs as fast as possible. It does not permit inspection of the processor registers while the simulation is running, and does not stop synchronously when requested to do so.

After enabling or disabling a trace source, it is undefined how many instructions are executed before the change takes effect.

Quantum end detection guarantees that a quantum is not overshot indefinitely. Quantum end detection applies to, but is not limited to, backward branches, indirect jumps, exceptions, and atomic operation retries. In addition to temporal quantum end detection, some events may end a quantum, like executing a barrier, entering a low power state, or accessing a peripheral. Target software and simulation controllers must not rely on a specific scheduling pattern based on these quantum end check points.

Use cases: normal fast simulation and normal debugging when no watchpoint is set.

syncLevel 1

The simulation runs slightly slower than syncLevel 0. Iris can read the up-to-date values of the processor registers, including PC and instruction count. You cannot stop the simulation synchronously.

After enabling or disabling a trace source, it is undefined how many instructions will be executed before the change takes effect.

Quantum end detection is as for syncLevel 0.

Use cases: external breakpoints that block the simulation, inspect state of processor or memory from within a peripheral or memory access.

syncLevel 2

As for syncLevel 1, except that you can stop the simulation synchronously from within all `LD` or `ST` and similar instructions. The simulation stops immediately after the current `LD` or `ST` instruction has been completely executed (post instruction).

After enabling or disabling a trace source, it is likely, but not guaranteed, that the change will be visible sooner than with syncLevel 0 or 1.

Quantum end detection is as for syncLevel 1, plus it includes the end of `LD` or `ST` instructions.

Use cases: Watchpoints, external breakpoints, stopping from within `LD` or `ST`-related MTI callbacks.

syncLevel 3

As for syncLevel 2, except that you can stop the simulation synchronously from within any instruction. The simulation stops immediately after the current instruction has been completely executed (post instruction).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

After enabling or disabling a trace source, the change is visible at the next instruction that is executed.

Quantum end detection is as for syncLevel 2. This allows switching between syncLevels 2 and 3 without changing the simulation scheduling.

Use cases: a Stop from within arbitrary MTI callbacks such as the `INST` callback. This syncLevel is a fallback for all use cases that do not fall into syncLevels 0-2.

Related information

Simulation accuracy API in Iris User Guide

1.7 Controlling and observing the syncLevel

CADI watchpoints automatically register and unregister for their required syncLevel (`POST_INSN_IO`). All other use cases must explicitly register and unregister for the syncLevel they require.

Users of syncLevel write to a set of non-architectural processor registers in the CADI and SCADI interface to register and unregister for specific syncLevels. Processor registers are more suitable than CADI parameters for exposing an interface that has side effects on writes and where values might change spontaneously.

This is the exposed interface to control and observe the value of syncLevel. All these registers are in the CADI/SCADI register group `Simulation` for each CT processor that contains non-architectural, simulator-specific registers. All are 32-bit integer registers. Users of syncLevel write to these registers to register and unregister for the syncLevel they require:

`syncLevelSyncStateRegister`
: Users write to this register for `SYNC_STATE`. Write-only.

`syncLevelSyncStateUnregister`
: Users write this to unregister for `SYNC_STATE`. Write-only.

`syncLevelPostInsnIORegister`
: Users write to this register for `POST_INSN_LDST`. Write-only.

`syncLevelPostInsnIOUnregister`
: Users write this to unregister for `POST_INSN_LDST`. Write-only.

`syncLevelPostInsnAllRegister`
: Users write this to register for `POST_INSN_ALL`. Write-only.

`syncLevelPostInsnAllUnregister`
: Users write this to unregister for `POST_INSN_ALL`. Write-only.

These registers are only for debugging and visibility in the debugger, and syncLevel users do not usually access them at all:

syncLevelPostInsnIOCount

User counter. Read/write (use as read-only).

syncLevelPostInsnAllCount

User counter. Read/write (use as read-only).

minSyncLevel

Same as the `min_sync_level` parameter, described below. Read/write.

The `syncLevelxxxRegister` and `syncLevelxxxUnregister` registers are for syncLevel users to register and unregister themselves, by writing the value 0 to them. Changes to the syncLevel become effective at the next stop event checkpoint. In addition, syncLevel users can write to these registers any time before the simulation is running, for example from the `init()` simulation phase. The change takes effect immediately when the simulation is run.

The other registers are only present to make the debugging of these mechanisms and their users easier. The `syncLevel` register enables you to see what kind of performance you can expect from the model. You must treat access to these other registers as read-only. You can write to them, however, to permit debugging the syncLevel mechanisms.

These registers are not memory (or CPnn-) mapped anywhere, and are not accessible to target programs.

In addition to this debug register interface, there is a CADI parameter that can influence the syncLevel:

```
min_sync_level (default=0, type=int, runtime=true)
```

This parameter enables you to control the minimum syncLevel by the CADI parameter interface. This is not intended to be the primary interface to control the syncLevel because it does not enable multiple independent syncLevel users to indicate their requirements to the simulator. It is primarily for debugging purposes and for situations where a single global syncLevel setting is sufficient.

You can change this parameter at runtime, and changes become effective at the next stop event checkpoint. Reading this parameter value returns the `min_sync_level`, not the current syncLevel. This parameter is only an additional way of controlling the syncLevel and controls the same mechanisms as the register interface.

1.8 User mode networking

User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts.

This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running. Fast Models supports the following kinds of Ethernet device models:

SMSC_91C111

This is paired with an external HostBridge component. The user mode networking specification is set on the external HostBridge.

VirtioNetMMIO

This has a built-in HostBridge sub-component. The user mode networking specification is set on the internal HostBridge.

Note

- You can use TCP and UDP over IP, but not ICMP (ping).
- User mode networking does not support forwarding UDP ports on the host to the model.
- You can only use DHCP within the private network.
- You can only make inward connections by mapping TCP ports on the host to the model. This is common to all implementations that provide host connectivity using NAT.
- Operations that require privileged source ports, for example NFS in its default configuration, do not work.
- If setup fails, or the parameter syntax is incorrect, there is no error reporting.

To enable user mode networking, run the model with the following parameters:

SMSC_91C111

```
-C motherboard.hostbridge.userNetworking=true
-C motherboard.smsc_91c111.enabled=true
```

VirtioNetMMIO

```
-C motherboard.virtio_net.hostbridge.userNetworking=true
-C motherboard.virtio_net.enabled=true
```

To map a host TCP port to a model port, run the model with the `userNetPorts` parameter. This parameter allows services to appear to be listening on privileged ports in the model but be mapped to unprivileged ports on the host. The syntax is a comma-separated list of items in the form:

```
[host-ip:]hostport=[model-ip:]modelport
```

For example, to map port 8022 on the host to port 22 on the model, use this parameter:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

SMSC_91C111

```
-C motherboard.hostbridge.userNetPorts=8022=22
```

VirtioNetMMIO

```
-C motherboard.virtio_net.hostbridge.userNetPorts=8022=22
```

Either or both of a host IP address and model IP address can optionally be specified on either side of the assignment to select a specific interface on which the mapping will occur. For example:

```
127.0.0.1:8022=127.0.0.1:22
```

The default is to accept connections on any interface.

1.9 TAP/TUN networking

This section describes Fast Models support for TAP/TUN networking.

1.9.1 TAP/TUN networking limitations

TAP/TUN networking on Fast Models has these limitations.

- It is only supported on Linux, not on Windows.
- If the host uses Dynamic DNS, it inserts records into DNS. If you manage this host with DHCP, installing TAP networking can cause failure to register in the DNS. After the physical device attaches to the bridge device, the DHCP client reruns, but the DHCP request does not have the correct hostname.
- Most WiFi adaptors do not implement the required support for TAP networking to work.

1.9.2 Setting up a network connection for Red Hat Enterprise Linux

This section describes how to set up a network connection.

Before you begin

Ensure that the `brctl` utility is on your system. This utility is part of the standard Linux bridge utilities, `bridge-utils`, which are in the Linux distribution.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

About this task

Note

- Perform this procedure once for each host machine.
- The setup and configuration instructions assume that your network provides IP addresses by DHCP. Otherwise, consult your network administrator.

Procedure

1. In a shell, change to the `FastModelsPortfolio_<X.Y>/ModelNetworking` directory.
2. Run the following script from this directory, because it does not work correctly if run from any other location:

   32-bit operating system

   Run `add_adapter_32.sh` as root. For example, `sudo ./add_adapter_32.sh`.

   64-bit operating system

   Run `add_adapter_64.sh` as root. For example, `sudo ./add_adapter_64.sh`.
3. The prompt appears: **Specify the TAP device prefix:(ARM)**. Select **Enter** to accept the default.
4. The prompt appears: **Specify the user list**. Enter a space-separated list of all users who are to use the model on the network, then select **Enter**. All entries in the list must be the names of existing user accounts on the host.
5. The prompt appears: **Enter the network adapter which connects to the network:(eth0)**. Select **Enter** to accept the default, or input the name of a network adapter that connects to your network.
6. The prompt appears: **Enter a name for the network bridge to create:(armbr0)**. Select **Enter** to accept the default, or input a name for the network bridge. You must not have an existing network interface on your system with the selected name.
7. The prompt appears: **Enter the location to write the init script to:(/etc/init.d/FMNetwork)**. Select **Enter** to accept the default, or input another path with a new filename in an existing directory.
8. The prompt appears: **WARNING: the script creates a bridge which includes the local network adapter and tap devices. You may suffer temporary network loss. Do you want to proceed? (Yes or No)**. Verify all values input so far, and enter **Yes** if you want to proceed. If you enter **No**, no changes are made to your system.
9. A prompt appears to inform you of the changes that the script is to make to your system. Input **Yes** if you are happy to accept these changes, or input **No** to leave your system unchanged.

   Note

   After entering **Yes**, you might temporarily lose network connectivity. Also, the IP address of the system might change.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Next steps

The network bridge is disabled after the host system is reset. To configure the host system to support bridged networking, you might have to create links to the `init` script (FMNetwork). The script suggests some appropriate links for Red Hat Enterprise Linux.

The default firewall configuration on Red Hat Enterprise Linux blocks packet transmission across the TAP networking bridge device. You can disable the firewall. If the context makes this unwise, then add firewall rules to allow transmission. These `iptables` commands configure the firewall to allow packets across the bridge device:

```
iptables -I FORWARD -m physdev --physdev-is-bridged -j ACCEPT
service iptables save
service iptables restart
```

1.9.3 Setting up a network connection for Ubuntu Linux

This section describes how to set up a network connection.

About this task

To use TAP networking with Fast Models on Ubuntu, set up a TAP device manually by following these steps. This guide uses a network interface `eth0` and a username `fmuser`. Replace these values as appropriate.

Note

Typographic errors when modifying the network configuration can cause failure to connect to the network. We recommend performing these steps on a machine that you have physical access to.

Procedure

1. If it is not present, add `eth0` to the interfaces file `/etc/network/interfaces`. This step stops network-manager from managing `eth0`. It can result in network-manager indicating there is no network connection even if there is. You must have root privileges for this step.
   Use one of the following ways:
   - For an interface using DHCP, add:

     ```
     auto eth0
     iface eth0 inet dhcp
     ```

   - To configure a static IP address, add the static information, for example:

     ```
     auto eth0
     iface eth0 inet static
     address 192.168.0.2
     netmask 255.255.255.0
     gateway 192.168.0.1
     ```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

The network notifier applet launches the GUI tool network-manager. It automatically configures network devices that `/etc/network/interfaces` does not manage, and sets up devices in a way that is incompatible with bridging. This step ensures that network-manager does not manage the network interface that you want to bridge to. If you are unsure how to configure your network interface, ask your network administrator.

2. Install the bridge-utils package:

```
sudo apt-get install bridge-utils
```

This step provides the `brctl` command for creating and managing the network bridge.

3. Create a bridge device by adding this entry to `/etc/network/interfaces`:

```
auto armbr0
iface armbr0 inet dhcp
pre-up ifconfig eth0 0.0.0.0 promisc
post-down ifconfig eth0 0.0.0.0 -promisc
```

The pre-up and post-down lines give commands to execute before bringing up `armbr0` and after bringing it down. These commands put `eth0` into promiscuous mode at pre-up and take it out of promiscuous mode at post-down. Promiscuous mode makes sure that the hardware does not filter out packets for the virtual ethernet device.

This step creates a bridge device that is called `armbr0` from Fast Models TAP devices to the physical network.

4. Create the TAP devices. TAP devices need permission for specific users, so create one for each user who is to run the model with the virtual ethernet device.
For example, to create a TAP device called `ARMfmuser` for the user `fmuser`, add the following lines to the `armbr0` section of `/etc/network/interfaces`.

```
pre-up ip tuntap add dev ARMfmuser mode tap user fmuser
pre-up ifconfig ARMfmuser 0.0.0.0 promisc
post-down ip tuntap del dev ARMfmuser mode tap
```

This step creates a TAP device for each user.

5. Create a bridge between the TAP devices and the network interface `eth0` by adding a `bridge_ports` line to the `armbr0` section of `/etc/network/interfaces`. For example, for a TAP device that is named `ARMfmuser`, add the following line:

```
bridge_ports eth0 ARMfmuser
```

6. The added `/etc/network/interfaces` code now looks like this:

```
auto armbr0
iface armbr0 inet dhcp
pre-up ifconfig eth0 0.0.0.0 promisc
post-down ifconfig eth0 0.0.0.0 -promisc
pre-up ip tuntap add dev ARMfmuser mode tap user fmuser
pre-up ifconfig ARMfmuser 0.0.0.0 promisc
post-down ip tuntap del dev ARMfmuser mode tap
bridge_ports eth0 ARMfmuser
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

7. Restart network services by either restarting the computer or by running the following commands:

   ```
   sudo ifdown eth0 && sudo ifup eth0
   sudo ifup armbr0
   sudo service network-manager restart
   ```

   Note

   `armbr0` must be explicitly started.

   This step disconnects and reconnects all network interfaces.

1.9.4 Configuring the networking environment for Linux

This section describes how to set the parameters to make a network connection.

Before you begin

Use System Canvas or a related Fast Models tool to load a project or model, and then select a component.

About this task

Note

Firewall software might block network traffic in the network bridge, and result in a networking failure. If the model does not work after configuration, check the firewall settings.

Procedure

Set the parameters on the `HostBridge` and `SMSC_91C111` components, or on the `VirtioNetMMIO` component and its `HostBridge` subcomponent. For example:

SMSC_91C111:

```
hostbridge.interfaceName=ARM<username>
smsc_91c111.enabled=1
```

VirtioNetMMIO:

```
virtio_net.hostbridge.interfaceName=ARM<username>
virtio_net.enabled=1
```

`ARM<username>` is an adapter that is built into the network bridge.

1.9.5 Solutions to networking issues on Linux

This section describes how to solve networking issues.

The model networking works after initial setup, but stops working after reboot

Set the correct access permissions for the `/dev/net/tun` device, by executing `chmod 666 /dev/net/tun` as root. To preserve the change across reboots, modify the udev rules of the TAP device by opening `/etc/udev/rules.d/50-udev.rules` as root, and finding the line:

```
KERNEL=="tun", NAME="net/%k"
```

If it does not have `MODE="0666"` at the end of the line, append `MODE="0666"`:

```
KERNEL=="tun", NAME="net/%k", MODE="0666"
```

Model networking installs correctly, but when a model starts up, the model cannot receive packets

Disable the firewall on the host machine, or add the TAP device to `trusted devices`.

Note

Refer to the vendor's documentation manual.

1.9.6 Disabling and re-enabling networking for Linux

This section describes how to disable and re-enable networking with an `init` script.

About this task

Caution

These operations remove/restore TAP devices and the network bridge. There is a temporary loss of network connectivity and your IP address might change.

Procedure

1. To disable networking without uninstalling it, invoke the installed `init` script (by default, `/etc/init.d/FMNetwork`) as root with the parameter `stop`:

   ```
   sudo /etc/init.d/FMNetwork stop
   ```

2. To re-enable networking, invoke the `init` script as root with the parameter `start`:

   ```
   sudo /etc/init.d/FMNetwork start
   ```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

1.9.7 Uninstalling networking for Linux

This section describes the steps to uninstall a network.

Procedure

1. In a shell, change to the `/FastModelsPortfolio_X.Y/ModelNetworking/` directory.
2. Run `uninstall.sh` as root, passing the location of the `init` script (FMNetwork):

   ```
   sudo ./uninstall.sh /etc/init.d/FMNetwork
   ```

   You must run this script from the directory in which it is installed, because it does not work correctly if run from any other location.

   Caution

   There is a temporary loss of network connectivity and your IP address might change.

Next steps

The uninstall script removes everything that can be safely removed. It does not remove:

- symlinks to the `init` script. You must remove any symlinks that you have created.
- `/sbin/brctl`. Removing this is optional.

1.10 Using parameters to set port values

Some processor and peripheral component ports are almost always static in value when used as part of a typical platform. For example, the reset vector base address register address (RVBARADDR) port in processor components.

To facilitate easy configuration of platform models, the IP models for these components can provide a shadow parameter for these ports. This parameter can be used to change the value that is used by the model. In these cases, the following rules apply:

- If a port is driven in the platform model, then the parameter value is ignored.
- If a port is not driven in the platform model, then the parameter value is sampled at both simulator reset, and at every subsequent simulation reset of the specific IP model.

Note

Simulator reset corresponds with the LISA `reset()` behavior and the SystemC `start_of_simulation()` callback.

- All ports and parameters that are sampled at reset are sampled when the simulation reset signal concerned is deasserted.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- If a port is not driven in the platform model, and a parameter has not been set, then the default value for the parameter is used.

In some IP models, the value of some ports can only be set by using a parameter. That is, the parameter is provided instead of the port.

1.11 PVBus C++ transaction and Tx_Result classes

This section describes the C++ transaction and `Tx_Result` classes.

1.11.1 Class pv::TransactionGenerator

This class provides efficient mechanisms for bus masters to generate transactions that are transmitted over the `pvbus_m` port of the associated PVBusMaster subcomponent.

You can produce pv::TransactionGenerator objects by invoking the `createTransactionGenerator()` method on the control port of a PVBusMaster component.

```
class pv::TransactionGenerator
{
    // Tidy up when TransactionGenerator is deleted.
    ~TransactionGenerator()

    // Control AXI-specific signal generation for future transactions.
    // Privileged processing mode.
    void setPrivileged(bool priv = true);

    // Instruction access (vs data).
    void setInstruction(bool instr = true);

    // Normal-world access (vs secure).
    void setNonSecure(bool ns = true);

    // Locked atomic access.
    void setLocked(bool locked = true);

    // Exclusive atomic access.
    void setExclusive(bool excl = true);

    // Generate transactions.
    // Generate a read transaction.
    bool read(bus_addr_t, pv::AccessWidth width, uint32_t *data);

    // Generate a write transaction.
    bool write(bus_addr_t, pv::AccessWidth width, uint32_t const *data);

    // Generate read transactions.
    bool read8(bus_addr_t, uint8_t *data);
    bool read16(bus_addr_t, uint16_t *data);
    bool read32(bus_addr_t, uint32_t *data);
    bool read64(bus_addr_t, uint64_t *data);

    // Generate write transactions.
    bool write8(bus_addr_t, uint8_t const *data);
    bool write16(bus_addr_t, uint16_t const *data);
    bool write32(bus_addr_t, uint32_t const *data);
    bool write64(bus_addr_t, uint64_t const *data);
};
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

1.11.2 TransactionGenerator efficiency considerations

TransactionGenerators are most efficient for multiple accesses to one 4KB page.

Each TransactionGenerator caches connection information internally. This improves efficiency for multiple accesses to a single 4KB page. If a component requires repeated access data from different pages, for example when streaming from one location to another, we recommend you create a TransactionGenerator for each location.

You can dynamically create and destroy TransactionGenerators, but it is better to allocate them once at initialization and destroy them at shutdown. See the example in `$PVLIB_HOME/examples/LISA/BusComponents/DmaTransfer.lisa`.

1.11.3 Enum pv::AccessWidth

This enum selects the required bus width for a transaction.

Defined values are:

- `pv::ACCESS_8_BITS`
- `pv::ACCESS_16_BITS`
- `pv::ACCESS_32_BITS`
- `pv::ACCESS_64_BITS`

1.11.4 Class pv::Transaction

This is a base class for read and write transactions that are visible in the `PVBusSlave` subcomponent. It contains functionality common to both types of transaction.

It provides an interface that permits bus slaves to access the details of the transaction. Do not instantiate these classes manually. The classes are generated internally by the `PVBus` infrastructure.

This base class provides access methods to get the transaction address, access width, and bus signals. It also provides a method to signal that the transaction has been aborted.

```
class pv::Transaction
{
    public:
    // Accessors
    bus_addr_t       getAddress() const;        // Transaction address
    bus_addr_t       getAddressEndIncl() const; // Address of last byte in the
 transaction
    bus_addr_range_t getAddressRange() const;   // The range of addresses that the
 transaction accesses
    void             setAddress(bus_addr_t);    // Transaction address.

    AccessWidth getAccessWidth() const;         // Request width in lg2 bytes
    int         getAccessByteWidth() const ;    // Request width in bytes
    int         getAccessBitWidth() const;      // Request width in bits
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

```
    bool        isAligned() const;              // Request address is aligned to
 request width boundary.

    bool       isPrivileged() const;            // Privileged process mode?
    bool       isInstruction() const;           // Instruction request vs data?
    bool       isNonSecure() const;             // Normal-world vs secure-world?
    PASpace_t  getPhysicalAddressSpace() const; // PhysicalAddressSpace of access
    bool       isLocked() const;                // Atomic locked access?
    bool       isExclusive() const;             // Atomic exclusive access?
    bool       isCacheMaintenance() const;      // Cache maintenance operation
    bool       isWithoutData() const;           // Transaction has no data payload
    uint64_t   getManagerID64() const;          // Transaction manager ID 64
    bool       hasSideEffect() const;           // The transaction has side effect?

    // Generate transaction returns
    Tx_Result  generateAbort();             // Cause the transaction to abort
    Tx_Result  generateSlaveAbort();        // Cause the transaction to abort
    Tx_Result  generateDecodeAbort();       // Cause the transaction to abort
    Tx_Result  generateExclusiveAbort();    // Cause the transaction to abort

    Tx_Result  resetOccurred();             // Indicate that a reset occurred
};
```

1.11.5 Class pv::ReadTransaction

This class extends the pv::Transaction class to provide methods for returning data from a bus read request.

```
class ReadTransaction : public Transaction
{
    public:
    /*! Return a 64-bit value on the bus. */
    Tx_Result setReturnData64(uint64_t);

    /*! Return a 32-bit value on the bus. */
    Tx_Result setReturnData32(uint32_t);

    /*! Return a 16-bit value on the bus. */
    Tx_Result setReturnData16(uint16_t);

    /*! Return an 8-bit value on the bus. */
    Tx_Result setReturnData8(uint8_t);

    /*! This method provides an alternative way of returning a Tx_Result
    * success value (instead of just using the value returned from
    * setReturnData<n>()).
    *
    * This method can only be called if one of the setReturnData<n>
    * methods has already been called for the current transaction.
    */
    Tx_Result readComplete();
};
```

1.11.6 Class pv::WriteTransaction

This class extends the pv::Transaction class to provide methods for returning data from a bus write request.

```
class WriteTransaction : public Transaction
{
```

```
    public:
    /*! Get bottom 64-bits of data from the bus. If the transaction width
    * is less than 64-bits, the data is extended as appropriate.
    */
    uint64_t getData64() const;

    /*! Get bottom 32-bits of data from the bus. If the transaction width
    * is less than 32-bits, the data is extended as appropriate.
    */
    uint32_t getData32() const;

    /*! Get bottom 16-bits of data from the bus. If the transaction width
    * is less than 16-bits, the data is extended as appropriate.
    */
    uint16_t getData16() const;

    /*! Get bottom 8-bits of data from the bus. If the transaction width
    * is less than 8-bits, the data is extended as appropriate.
    */
    uint8_t getData8() const;

    /*! Signal that the slave has handled the write successfully.
    */
    Tx_Result writeComplete();
};
```

1.12 Visualisation library

The Visualisation library does not model hardware directly but instead provides components, protocols, and a library. These permit a GUI display that lets you interact with the external I/O from the model platform.

The types of I/O handled include:

- LCD display, such as the output from the PL110_CLCD component display port.
- LEDs representing values from a ValueState port as either single lights, or as segmented alphanumeric displays.
- DIP switches, which can drive a ValueState port.
- Capture of keyboard and mouse input, using the KeyboardStatus and MouseStatus protocols to feed input to a PS2Keyboard or PS2Mouse component.
- Background graphics, custom rendered graphics, and clickable push buttons, permitting the UI to display a skin representing the physical appearance of the device being modeled.
- Status information such as processor instruction counters, with values taken from the InstructionCount port of a processor.

The Visualisation library provides a C++ API that enables you to write your own visualization components in LISA+. These custom components can display any combination of the supported I/O types.

You can add the prebuilt GUIPoll component to your custom component. The GUIPoll component provides a LISA visualization component with a periodic signal that keeps the display updated, even when the simulation is stopped.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

The Visualisation library supports one signaling protocol, the LCD protocol.

Visualisation library C++ classes on page 50

1.12.1 LISA visualisation models

The visualisation components provide a host window to display status information in addition to a frame buffer.

Each example platform model contains its own LISA visualisation model. You can use the model as the basis for your own visualization-containing components, such as the PL110_CLCD component. To use the visualisation components in your own system, copy the component LISA files from the relevant platform model directory, because they are not in the generic model library.

1.12.2 Visualisation library C++ classes

This section describes the C++ classes and structures in the Visualisation library.

1.12.2.1 C++ classes inclusion

To use these Visualisation library classes, begin your LISA component with the correct `#include` statement.

```
includes
{
#include "components/Visualisation.h"
}
```

1.12.2.2 Class Visualisation

The `Visualisation` class is the API for creating a custom LISA visualization component.

A component obtains an instance of this class by calling the global function `createVisualisation()`. The component can then use this instance to control the size and layout of the visualization window:

`Visualisation *createVisualisation()`

This function generates an instance of the Visualisation library. You can only call this function once, because SDL only supports opening a single display window. The Visualisation library is implemented using the Simple DirectMedia Layer (SDL) cross-platform rendering library.

The `Visualisation` class has the following methods:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

~Visualisation()

Destructor for the Visualisation library. You must only call this method when your simulation is shutting down, after all allocated resources (VisRenderRegions, VisPushButtonRegions, VisBitmaps) have been deleted.

void configureWindow(unsigned int width, unsigned int height, unsigned int bit_depth)

Sets the visualization window to the requested size and bit depth. Depending on the display capabilities, the window might actually get a different bit depth from the size you requested.

VisBitmap *loadImage(char const *filename)

Allocates a new VisBitmap object, initialized by loading a Microsoft Windows Bitmap (`.BMP`) from the given file.

VisBitmap *loadImageWithAlphaKey(char const *filename, unsigned int red, unsigned int green, unsigned int blue)

Allocates a VisBitmap object, as with `loadImage()`. All pixels of the color specified by `red`, `green`, `blue` are converted into a transparent alpha channel.

VisBitmap *cropImage(VisBitmap *source, int x, int y, unsigned int width, unsigned int height)

Allocates a new VisBitmap object, by cropping a region from the source bitmap.

void releaseImage(VisBitmap *)

Releases the resources held by the given VisBitmap. The underlying bitmap is only to be unloaded if it is not in use.

void setBackground(VisBitmap *background, int x, int y)

Sets the background image for the visualization window. This takes a copy of the data referenced by the VisBitmap, so it is safe for the client to call `releaseImage(background)` immediately after calling `setBackground()`. The background is not displayed until the first call to `poll()`.

VisRenderRegion *createRenderRegion()

Allocates a new VisRenderRegion object that can be used to display arbitrary graphics, including LCD contents, in a rectangular region.

VisPushButtonRegion *createPushButtonRegion()

Allocates a new VisPushButtonRegion, which can be placed at a location on the display to provide a clickable push button.

bool poll(VisEvent *event)

Permits the Visualisation library to poll for GUI events. The client passes a reference to a VisEvent structure, which receives details of a single mouse/keyboard event.

The method returns false if no events have occurred.

Your LISA visualization implementations must call this periodically by using a GUIPoll component. On each `gui_callback()` event, you must ensure that the visualization component repeatedly calls `poll()` until it returns false.

void lockMouse(VisRegion *region)

Locks the mouse to the visualization window and hides the mouse pointer.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`void unlockMouse()`

Unlocks and redisplays the mouse pointer.

`bool hasQuit()`

Returns true if the user has clicked on the close icon of the visualization window.

1.12.2.3 Class VisRegion

This class is the common base class for VisPushButtonRegion and VisRenderRegion, representing a region of the visualization display.

`~VisRegion()`

Permits clients to delete a VisPushButtonRegion when it is no longer required.

`void setId(void *id)`

Permits a client-defined identifier to be associated with the region.

`void *getId()`

Returns the client-defined identifier.

`void setVisible(bool vis)`

Specifies whether the region is to be displayed on the screen. This is currently ignored by the SDL implementation.

`void setLocation(intx, int y, unsigned int width, unsigned int height)`

Sets the location of this region relative to the visualization window.

1.12.2.4 Class VisPushButtonRegion : public VisRegion

This class defines a region of the visualization window that represents a clickable button.

Optionally, the button can provide different VisBitmap representations for a button-up and a button-down graphic, and a graphic to use when the mouse pointer rolls over the button.

In addition to the public method defined in VisRegion, this class defines these methods:

- `void setButtonUpImage(VisBitmap*bmpUp) : void`
- `setButtonDownImage(VisBitmap*bmpDown) : void`
- `setButtonRollOverImage(VisBitmap*bmpRollover)`

  These methods set the graphics to be used for each of the button states. If any image is not specified or is set to NULL, then the corresponding area of the visualization background image is used.

  The VisPushButtonRegion takes a copy of the VisBitmap, so the client can safely call `Visualisation::releaseBitmap()` on its copy.

- `void setKeyCode(intcode)`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

This method sets the code for the keypress event that is generated when the button is pressed or released.

1.12.2.5 Class VisRenderRegion : public VisRegion

This class defines a region of the visualization window that can render client-drawn graphics, including a representation of the contents of an LCD.

In addition to the public method defined in VisRegion, the class defines these methods:

`VisRasterLayout const *lock()`
: Locks the region for client rendering. While the buffer is locked, the client can modify the pixel data for the buffer. You must not call the methods `writeText()` and `renderBitmap()` while the buffer is locked.

`void unlock()`
: Releases the lock on the render buffer, permitting the buffer to be updated on screen.

`void update(int left, int top, unsigned int width, unsigned int height)`
: Causes the specified rectangle to be drawn to the GUI.

`int writeText(const char *text, int x, int y)`
: Renders the given ASCII text onto an unlocked VisRenderRegion. The return value is the x co-ordinate of the end of the string. The default font is 8 pixels high, and cannot be changed.

`void renderBitmap(VisBitmap *bitmap, int x, int y)`
: Draws a bitmap onto an unlocked VisRenderRegion.

1.12.2.6 Struct VisRasterLayout

This struct defines the layout of the pixel data in a frame-buffer.

The `lock()` method of the LCD protocol expects to be given a pointer to this structure. You can generate a suitable instance by calling `VisRasterRegion::lock()`.

The structure contains these fields:

`uint8_t* buffer`
: This points to the buffer for the rasterized pixel data. The controller can write pixels into this buffer, but must stay within the bounds specified by the width and height.

`uint32_t pitch`
: The number of bytes between consecutive raster lines in the pixel data. This can be greater than the number of bytes per line.

`uint32_t width`
: The width, in pixels, of the render area. This value can be less than the width requested by the LCD controller when it called `lock()`.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`uint32_t height`

The height, in pixels, of the render area. This value can be less than the height requested by the LCD controller when it called `lock()`.

`VisPixelFormat format`

This structure defines the format of the pixel data in the raster buffer.

`bool changed`

This is set to true if the pixel format or buffer size has changed since the previous call to `lock()`.

Pixel data is represented as a one-dimensional array of bytes. The top-left pixel is pointed to by the buffer member. Each pixel takes up a number of bytes, given by `format.pbytes`.

The pixel at location (x, y) is stored in the memory bytes starting at:

```
buffer[y * pitch + x * format.pbytes]
```

1.12.2.7 Struct VisPixelFormat

This struct specifies the format of pixel data within the buffer.

The members are:

`uint32_trbits, gbits, bbits`

The number of bits per color channel.

`uint32_t roff, goff, boff`

The offset within the pixel data value for the red/green/blue channels.

`uint32_t pbytes`

The size of a single pixel, in bytes.

`format.pbytes` specifies the number of bytes that make up the data for a single pixel. These bytes represent a single pixel value, stored in host-endian order. The pixel value contains a number of the form:

```
(R<<format.roff) +(G<<format.goff) + (B<<format.boff)
```

where (`R`,`G`,`B`) represents the values of the color channels for the pixel, containing values from 0 up to `(1<<format.rbits)`, `(1<<format.gbits)`, `(1<<format.bbits)`.

2. Protocols

Components communicate through connected ports. Ports have protocols that define the function calls for different connections.

2.1 AMBAPV protocol

Defined in `$PVLIB_HOME/LISA/AMBAPVProtocol.lisa`.

About AMBAPV protocol

The AMBAPV protocol defines behaviors for single read and single write transactions. This covers Arm AMBA AXI5, AXI4, AXI3, AHB, and APB bus protocol families, at the PV level.

In addition, the AMBAPV protocol supports AMBA protocol additional control information:

- Protection units.
- Exclusive access and locked access mechanisms.
- System-level caches.
- Atomic accesses, including exclusive accesses, locked accesses, and atomic transactions.

It always returns the original data at the target address.

The generic payload data is formatted as an array of bytes in order of ascending bus address. This means that irrespective of the host machine endianness or modeled bus width:

- A little endian master must write the bytes of a word in increasing significance as the array index increases.
- A big endian master must write the bytes of a word in decreasing significance as the array index increases.

A master or slave whose endianness does not match the endianness of the host machine must endian swap any access to the payload data that is wider than one byte. The same byte ordering rule applies to memory accesses using DMI pointers.

`AMBAPV` provides the following behaviors:

`atomic_compare()`

```
optional slave behavior atomic_compare(int socket_id,
                             const sc_dt::uint64 & addr,
                             unsigned char * data,
                             unsigned int length,
                             unsigned int size,
                             amba_pv::amba_pv_control * ctrl,
                             sc_core::sc_time & t) : amba_pv::amba_pv_resp_t;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

This optional slave behavior completes an AtomicCompare transaction with the specified compare value and swap value. If the compare value equals the values at the given address, the swap value is written to the addressed location.

atomic_load()

```
optional slave behavior atomic_load(int socket_id,
                          const sc_dt::uint64 & addr,
                          unsigned char * data,
                          unsigned int length,
                          unsigned int size,
                          amba_pv::amba_pv_control * ctrl,
                          amba_pv::amba_pv_atomic_subop_t subop,
                          amba_pv::amba_pv_atomic_endianness_t endianness,
                          sc_core::sc_time & t) : amba_pv::amba_pv_resp_t;
```

This optional slave behavior complete an AtomicLoad transaction with the specified data. The data is used by the atomic transaction in the specified endianness.

atomic_store()

```
optional slave behavior atomic_store(int socket_id,
                           const sc_dt::uint64 & addr,
                           unsigned char * data,
                           unsigned int length,
                           unsigned int size,
                           amba_pv::amba_pv_control * ctrl,
                           amba_pv::amba_pv_atomic_subop_t subop,
                           amba_pv::amba_pv_atomic_endianness_t endianness,
                           sc_core::sc_time & t) : amba_pv::amba_pv_resp_t;
```

This optional slave behavior complete an AtomicStore transaction with the specified data. The data is used by the atomic transaction in the specified endianness.

atomic_swap()

```
optional slave behavior atomic_swap(int socket_id,
                          const sc_dt::uint64 & addr,
                          unsigned char * data,
                          unsigned int length,
                          unsigned int size,
                          amba_pv::amba_pv_control * ctrl,
                          sc_core::sc_time & t) : amba_pv::amba_pv_resp_t;
```

This optional slave behavior completes an AtomicSwap transaction with the specified data, which is written to the specified address. The original data is returned.

b_transport()

```
optional slave behavior b_transport(int socket_id,
                          amba_pv::amba_pv_transaction & trans,
                          sc_core::sc_time & t) : void;
```

This is an optional slave behavior for blocking transport. It completes a single transaction using the blocking transport interface. The `amba_pv::amba_pv_extension` must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

debug_read()

```
optional slave behavior debug_read(int socket_id,
                         const sc_dt::uint64 & addr,
                         unsigned char * data,
                         unsigned int length,
                         amba_pv::amba_pv_control * ctrl) : unsigned int;
```

This optional slave behavior completes a debug read transaction from a given address without causing any side effects. Specify the number of bytes to read in the `length` parameter. The number of successfully read values is returned. Additional AMBA protocol control information can be specified in the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context. This behavior is empty by default and returns 0.

debug_write()

```
optional slave behavior debug_write(int socket_id,
                          const sc_dt::uint64 & addr,
                          unsigned char * data,
                          unsigned int length,
                          amba_pv::amba_pv_control * ctrl) : unsigned int;
```

This optional slave behavior completes a debug write transaction to a given address without causing any side effects. Specify the number of bytes to write in the `length` parameter. The number of successfully written values is returned. Additional AMBA protocol control information can be specified in the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context. This behavior is empty by default and returns 0.

get_direct_mem_ptr()

```
optional slave behavior get_direct_mem_ptr(int socket_id,
                                 amba_pv::amba_pv_transaction & trans,
                                 tlm::tlm_dmi & dmi_data) : bool;
```

This optional slave behavior requests a DMI access to a given address. It returns a reference to a DMI descriptor that contains the bounds of the granted DMI region. Returns `true` if a DMI region is granted, `false` otherwise.

invalidate_direct_mem_ptr()

```
optional master behavior invalidate_direct_mem_ptr(int socket_id,
                                        sc_dt::uint64 start_range,
                                        sc_dt::uint64 end_range) : void;
```

This optional master behavior invalidates a DMI request. It invalidates DMI pointers that were previously established for the given DMI region. The `socket_id` parameter is 0 in this context.

read()

```
optional slave behavior read(int socket_id,
                   const sc_dt::uint64 & addr,
                   unsigned char * data,
                   unsigned int size,
                   amba_pv::amba_pv_control * ctrl,
                   sc_core::sc_time & t) : amba_pv::amba_pv_resp_t;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

This optional slave behavior completes a single read transaction at the given address for the given size in bytes. Additional AMBA protocol control information can be specified using the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context.

transport_dbg()

```
optional slave behavior transport_dbg(int socket_id,
                            amba_pv::amba_pv_transaction & trans) : unsigned int;
```

This optional slave behavior implements the TLM debug transport interface. An `amba_pv::amba_pv_extension` object must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

write()

```
optional slave behavior write(int socket_id,
                    const sc_dt::uint64 & addr,
                    unsigned char * data,
                    unsigned int size,
                    amba_pv::amba_pv_control * ctrl,
                    unsigned char * strb,
                    sc_core::sc_time & t) : amba_pv::amba_pv_resp_t;
```

This optional slave behavior completes a single write transaction at the given address with specified data and write strobes. The size of the data is specified in bytes. Additional AMBA protocol control information can be specified using the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context.

2.2 AMBAPVACE protocol

Defined in `$PVLIB_HOME/LISA/AMBAPVACEProtocol.lisa`.

About AMBAPVACE protocol

This protocol defines behaviors for bus transactions. This covers Arm AMBA ACE and DVM bus protocol families, all at the PV level.

In addition, this protocol provides support for AMBA protocol additional extension information:

- Secure and privileged accesses.
- Atomic accesses.
- System-level caching and buffering control.
- Cache coherency transactions (ACE-Lite).
- Bi-directional cache coherency transactions (ACE).
- Distributed virtual memory transactions (DVM).

The generic payload data is in the format of an array of bytes in order of ascending bus address. This means that irrespective of the host machine endianness or modeled bus width:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- A little endian master must write the bytes of a word in increasing significance as the array index increases.
- A big endian master must write the bytes of a word in decreasing significance as the array index increases.

A master or slave whose endianness does not match the endianness of the host machine must endian swap any access to the payload data that is wider than one byte. The same byte ordering rule applies to memory accesses using DMI pointers.

Special considerations for ACE and cache coherent interconnects

An ACE interconnect model must be able to cope with concurrent transactions in accordance with the hazard avoidance and prioritization rules in the ACE specification. Any external bus request, downstream transaction or upstream snoop transaction, can potentially cause a transaction to stall and the calling thread to be blocked, resulting in any number of other threads being scheduled.

To maintain memory coherency, apply these rules for debug transactions:

debug reads
: The bus must return data that represents the values that the bus master expects to observe if it issues a bus read. This must not modify the state of any bus components.

debug writes
: These must modify the contents of all copies of the location being accessed, so that a subsequent read from this location returns the data in the debug-write request. The debug write must not modify any other state, such as cache tags, clean/dirty/shared/unique MOESI state.

The implications for a coherent interconnect are that incoming debug transactions must be broadcast back upstream as debug snoop transactions to all ports other than the one the request came in on. Incoming debug snoops must propagate upwards. Debug reads can terminate as soon as they hit a cache. Debug writes must continue until they propagate to all possible copies of the location, including downstream to main memory.

For cases where a debug transaction hazards with non-debug transactions that are in-flight, the debug transaction must observe a weak memory-order model. Any component that can block a thread whilst responsible for the payload of an in-flight transaction must take particular care. In these cases, the debug transaction must be hazarded against the in-flight payload to ensure that debug reads do not return stale data and debug writes do not cause cache incoherency.

Only use DMI when you can guarantee that subsequent transactions do not result in any state transitions. This means, in general, do not use DMI for ACE coherent cacheable transactions.

`AMBAPVACE` provides the following behaviors:

`b_snoop()`

```
optional master behavior b_snoop(int socket_id,
                        amba_pv::amba_pv_transaction & trans,
                        sc_core::sc_time & t) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

This master behavior implements an upstream snooping TLM blocking transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

b_transport()

```
slave behavior b_transport(int socket_id,
                           amba_pv::amba_pv_transaction & trans,
                           sc_core::sc_time & t) : void;
```

This slave behavior implements the TLM blocking transport interface. An `amba_pv::amba_pv_extension` object must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

get_direct_mem_ptr()

```
optional slave behavior get_direct_mem_ptr(int socket_id,
                                  amba_pv::amba_pv_transaction & trans,
                                  tlm::tlm_dmi & dmi_data) : bool;
```

This optional slave behavior is for requesting a DMI access to a given address. It returns a reference to a DMI descriptor that contains the bounds of the granted DMI region. Returns true if a DMI region is granted, false otherwise. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the socket_id parameter to 0 in this context.

invalidate_direct_mem_ptr()

```
optional master behavior invalidate_direct_mem_ptr(int socket_id,
                                         sc_dt::uint64 start_range,
                                         sc_dt::uint64 end_range) : void;
```

Use this optional master behavior to invalidate a DMI request. It invalidates DMI pointers that were previously established for the given DMI region. The `socket_id` parameter is 0 in this context.

snoop_dbg()

```
optional master behavior snoop_dbg(int socket_id,
                         amba_pv::amba_pv_transaction & trans) : unsigned int;
```

This optional master behavior implements an upstream snooping TLM debug transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

transport_dbg()

```
optional slave behavior transport_dbg(int socket_id,
                             amba_pv::amba_pv_transaction & trans) : unsigned int;
```

This optional slave behavior implements the TLM debug transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.3 AMBAPVSignal protocol

Defined in `$PVLIB_HOME/LISA/AMBAPVSignalProtocol.lisa`.

About AMBAPVSignal protocol

This protocol defines a single behavior to permit masters to change the state of signals such as interrupts. AMBA3 does not cover this behavior, but the AMBA-PV components do provide it.

`AMBAPVSignal` provides the following behaviors:

set_state()

```
slave behavior set_state(int export_id,
                         const bool & state) : void;
```

Transfers a signal state. The `export_id` parameter must be set to 0 in this context.

2.4 AMBAPVSignalState protocol

Defined in `$PVLIB_HOME/LISA/AMBAPVSignalProtocol.lisa`.

About AMBAPVSignalState protocol

This protocol defines two behaviors that permit a master to change the state of signals such as interrupts and to retrieve the state of such signals from slaves. This behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

`AMBAPVSignalState` provides the following behaviors:

get_state()

```
slave behavior get_state(int export_id,
                         tlm::tlm_tag<bool> * t) : bool;
```

Retrieves a signal state. The `export_id` parameter must be set to 0, and the `t` parameter must be set to `NULL`, in this context.

set_state()

```
slave behavior set_state(int export_id,
                         const bool & state) : void;
```

Transfers a signal state. The `export_id` parameter must be set to 0 in this context.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.5 AMBAPVValue protocol

Defined in `$PVLIB_HOME/LISA/AMBAPVValueProtocol.lisa`.

About AMBAPVValue protocol

This protocol models propagation of 32-bit integer values between components.

Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

`AMBAPVValue` provides the following behaviors:

`set_state()`

```
slave behavior set_state(int export_id,
                         const uint32_t & value) : void;
```

Transfers a value. The `export_id` parameter must be set to 0 in this context.

2.6 AMBAPVValue64 protocol

Defined in `$PVLIB_HOME/LISA/AMBAPVValue64Protocol.lisa`.

About AMBAPVValue64 protocol

This protocol models propagation of 64-bit integer values between components.

Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

`AMBAPVValue64` provides the following behaviors:

`set_state()`

```
slave behavior set_state(int export_id,
                         const uint64_t & value) : void;
```

Transfers a value. The `export_id` parameter must be set to 0 in this context.

2.7 AMBAPVValueState protocol

Defined in `$PVLIB_HOME/LISA/AMBAPVValueProtocol.lisa`.

About AMBAPVValueState protocol

This protocol permits propagation of 32-bit integer values between components and their retrieval from slaves.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

`AMBAPVValueState` provides the following behaviors:

`get_state()`

```
slave behavior get_state(int export_id,
                         tlm::tlm_tag<uint32_t> * t) : uint32_t;
```

Retrieves a value. The `export_id` parameter must be set to 0 and the `t` parameter must be set to `NULL`, in this context.

`set_state()`

```
slave behavior set_state(int export_id,
                         const uint32_t & value) : void;
```

Transfers a value. The `export_id` parameter must be set to 0 in this context.

2.8 AMBAPVValueState64 protocol

Defined in `$PVLIB_HOME/LISA/AMBAPVValue64Protocol.lisa`.

About AMBAPVValueState64 protocol

This protocol permits propagation of 64-bit integer values between components and their retrieval from slaves.

Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

`AMBAPVValueState64` provides the following behaviors:

`get_state()`

```
slave behavior get_state(int export_id,
                         tlm::tlm_tag<uint64_t> * t) : uint64_t;
```

Retrieves a value. The `export_id` parameter must be set to 0, and the `t` parameter must be set to `NULL`, in this context.

`set_state()`

```
slave behavior set_state(int export_id,
                         const uint64_t & value) : void;
```

Transfers a value. The `export_id` parameter must be set to 0 in this context.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.9 AsyncSignalCallback protocol

Defined in `$PVLIB_HOME/LISA/AsyncSignalCallbackProtocol.lisa`.

About AsyncSignalCallback protocol

This protocol is used to get callbacks from the AsyncSignal component. The component usually implements internal slave ports of this protocol and connects them to the `AsyncSignal.async_callback` master port.

`AsyncSignalCallback` provides the following behaviors:

signal()

```
slave behavior signal() : void;
```

Called from the AsyncSignal component. Only ever called on the simulation thread.

This is called asynchronously after a non-simulation thread has called `AsyncSignal.async_control.signal()`.

2.10 AsyncSignalControl protocol

Defined in `$PVLIB_HOME/LISA/AsyncSignalControlProtocol.lisa`.

About AsyncSignalControl protocol

Non-simulation threads use this protocol to cause events on the simulation thread through the AsyncSignal component.

`AsyncSignalControl` provides the following behaviors:

signal()

```
slave behavior signal() : void;
```

Cause event on the simulation thread. Usually called by non-simulation threads.

Calling this behavior causes the `AsyncSignal.async_callback.signal()` function to be called asynchronously later. It is safe to call this function from any thread.

2.11 AudioControl protocol

Defined in `$PVLIB_HOME/LISA/AudioControlProtocol.lisa`.

About AudioControl protocol

This protocol has get and release audio buffer behaviors.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`AudioControl` provides the following behaviors:

getPVAudioBuffer()

```
slave behavior getPVAudioBuffer(uint32_t depth) : PVAudioBuffer*;
```

Get an underlying host buffer for audio output.

releasePVAudioBuffer()

```
slave behavior releasePVAudioBuffer(PVAudioBuffer* buf) : void;
```

Release an underlying host buffer.

2.12 CADIDisassemblerProtocol protocol

Defined in `$PVLIB_HOME/LISA/CADIDisassemblerProtocol.lisa`.

About CADIDisassemblerProtocol protocol

To support disassembly, implement all of these functions. None of them is optional.

These functions are in a different port, of type CADIDisassemblerProtocol. They can have any name and only need to be implemented to expose disassembly in the debugger. The functionality of this port is then exposed by `CADIProtocol::CADIGetDisassembler()`.

See CADIProtocol protocol for information on how to use this port and `CADIDisassemblerAdapter`.

`CADIDisassemblerProtocol` provides the following behaviors:

GetAddressForSourceReference()

```
slave behavior GetAddressForSourceReference(const char *sourceFile, uint32_t
 sourceLine, eslapi::CADIAddr_t &address) : eslapi::CADIDisassemblerStatus;
```

Get the first address for the given source line and file.

GetCurrentMode()

```
slave behavior GetCurrentMode() : uint32_t;
```

Get the most suitable mode of disassembly, based on the current state of the variables of the component.

If modes are not supported by this target, return 0. If modes are supported, return `0 < x <= GetModeCount()`.

GetDisassembly()

```
slave behavior GetDisassembly(eslapi::CADIDisassemblerCB *callback_,
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

```
                                const eslapi::CADIAddr_t &address,
                                eslapi::CADIAddr_t &nextAddr,
                                const uint32_t mode,
                                uint32_t desiredCount) :
 eslapi::CADIDisassemblerStatus;
```

The main disassembler function for standard type disassembly.

The component must call `callback_` for all disassembler lines for the specified `address` and `desiredCount`, and must finally set `nextAddr` to the next disassembled address at that point after the requested block.

GetInstructionType()

```
slave behavior GetInstructionType(const eslapi::CADIAddr_t
 &address, eslapi::CADIDisassemblerInstructionType &insn_type) :
 eslapi::CADIDisassemblerStatus;
```

Query if an instruction is a call instruction.

Components must set `insn_type = eslapi::CADI_DISASSEMBLER_INSTRUCTION_TYPE_NOCALL` and return `eslapi::CADI_DISASSEMBLER_STATUS_OK`.

GetModeCount()

```
slave behavior GetModeCount() : uint32_t;
```

Return the number of supported disassembler modes. At least one mode must be returned.

GetModeNames()

```
slave behavior GetModeNames(eslapi::CADIDisassemblerCB *callback_) : void;
```

Query the names of all supported modes.

Triggers callbacks to `CADIDisassemblerCB::ReceiveModeName()`, once for every mode. A component that only supports one mode calls, for example, `callback_->ReceiveModeName(0, "Normal");` only once. This is similar for multiple modes with different names and Ids.

GetSourceReferenceForAddress()

```
slave behavior GetSourceReferenceForAddress(eslapi::CADIDisassemblerCB *callback_,
 const eslapi::CADIAddr_t &address) : eslapi::CADIDisassemblerStatus;
```

Retrieves source-level information. Triggers a call of `CADIDisassemblerCB::ReceiveSourceReference()`.

GetType()

```
slave behavior GetType() : eslapi::CADIDisassemblerType;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Distinguish between different types of disassembly. Components must always return `eslapi::CADI_DISASSEMBLER_TYPE_STANDARD`.

2.13 CADIProtocol protocol

Defined in `$PVLIB_HOME/LISA/CADIProtocol.lisa`.

About CADIProtocol protocol

This protocol supports debugging.

By default, LISA components do not support breakpoints. To add breakpoint support:

- Define an internal slave port of this type, whose name must be `cadi_port`
- Implement all of the following functions:

```
optional slave behavior CADIBptGetList(uint32_t, uint32_t, uint32_t *,
 eslapi::CADIBptDescription_t *):eslapi::CADIReturn_t;
optional slave behavior CADIBptRead(eslapi::CADIBptNumber_t,
 eslapi::CADIBptRequest_t *):eslapi::CADIReturn_t;
optional slave behavior CADIBptSet(eslapi::CADIBptRequest_t *,
 eslapi::CADIBptNumber_t *):eslapi::CADIReturn_t;
optional slave behavior
 CADIBptClear(eslapi::CADIBptNumber_t):eslapi::CADIReturn_t;
optional slave behavior CADIBptConfigure(eslapi::CADIBptNumber_t,
 eslapi::CADIBptConfigure_t):eslapi::CADIReturn_t;
optional slave behavior CADIModifyTargetFeatures(eslapi::CADITargetFeatures_t
 *):eslapi::CADIReturn_t;
```

In addition to implementing these functions, when an enabled breakpoint is hit, the component must:

- Call `simBreakpointHit(bptNumber)` for each breakpoint that was hit (one or more, usually just one).
- Call `simHalt()` once, after all `simBreakpointHit()` calls. The `simHalt()` call must be the last call in the sequence.

`CADIProtocol` provides the following behaviors:

CADIBptClear()

```
optional slave behavior CADIBptClear(eslapi::CADIBptNumber_t) :
 eslapi::CADIReturn_t;
```

Clear the breakpoint specified by `CADIBptNumber_t`.

CADIBptConfigure()

```
optional slave behavior CADIBptConfigure(eslapi::CADIBptNumber_t,
 eslapi::CADIBptConfigure_t) : eslapi::CADIReturn_t;
```

Re-configure an existing breakpoint.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

CADIBptGetList()

```
optional slave behavior CADIBptGetList(uint32_t, uint32_t, uint32_t *,
 eslapi::CADIBptDescription_t *) : eslapi::CADIReturn_t;
```

Provides a list of current breakpoints. The component must maintain and keep track of all existing breakpoints.

CADIBptRead()

```
optional slave behavior CADIBptRead(eslapi::CADIBptNumber_t,
 eslapi::CADIBptRequest_t *) : eslapi::CADIReturn_t;
```

Provides a `CADIBptRequest_t` object for the breakpoint with number `CADIBptNumber_t`

CADIBptSet()

```
optional slave behavior CADIBptSet(eslapi::CADIBptRequest_t *,
 eslapi::CADIBptNumber_t *) : eslapi::CADIReturn_t;
```

Create a new breakpoint. The breakpoint number is returned.

CADIExecSingleStep()

```
optional slave behavior CADIExecSingleStep(uint32_t instructionCount, int8_t
 stepCycle, int8_t stepOver) : eslapi::CADIReturn_t;
```

Single stepping needs support from the individual model. Run and stop are always handled globally. This behavior implements instruction stepping. It must set up an internal state that stops the simulation when the requested number of instructions is executed completely, exactly like a breakpoint. It must call `simRun()` from within `CADIExecSingleStep()` after setting up this stepping state, and later it must call `simHalt()` when the execution of the required number of instructions finishes.

CADIGetCycleCount()

```
optional slave behavior CADIGetCycleCount(uint64_t &instructionCount, bool
 systemCycles) : eslapi::CADIReturn_t;
```

Get cycle count. By implementing this function, the component can enable the cycle count display.

Note

Fast Models systems are not cycle accurate, so you usually only implement an instruction counter, if at all.

CADIGetDisassembler()

```
optional slave behavior CADIGetDisassembler() : eslapi::CADIDisassembler*;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

To provide disassembly, a component must implement the `CADIGetDisassembler()` behavior and return a `CADIDisassembler` interface implementation. This automatically follows the `CADI::CADIGetDisassembler()` and the `CADI::ObtainInterface("eslapi.CADIDisassembler2")` functions.

To do this, instantiate a `CADIDisassemblerAdapter` object in `behavior init()` and return its address in the `CADIGetDisassembler()` function. This object must point to an internal slave port that implements the `CADIDisassemblerProtocol` protocol.

Skeleton code for implementing disassembly:

```
component FOO
{
    behavior init()
    {
        disassemblerAdapter = new
 CADIDisassemblerAdapter(disassPort.getAbstractInterface());
        // ...
    }
    internal slave port <CADIProtocol> cadi_port
    {
        slave behavior CADIGetDisassembler():eslapi::CADIDisassembler*
        {
            return disassemblerAdapter;
        }
        // ...
    }
    internal slave port<CADIDisassemblerProtocol> disassPort
    {
        // ...
    }
}
```

CADIGetInstructionCount()

```
optional slave behavior CADIGetInstructionCount(uint64_t &instructionCount) :
 eslapi::CADIReturn_t;
```

Get the instruction count. By implementing this function, the component can enable the instruction count display.

CADIModifyTargetFeatures()

```
optional slave behavior CADIModifyTargetFeatures(eslapi::CADITargetFeatures_t *) :
 eslapi::CADIReturn_t;
```

Allows you to override the default `CADITargetFeatures_t` that System Generator provides for this component just before it is returned to the debugger.

Note that this method is not part of the CADI specification.

Specifically, a component that wants to support any kind of breakpoint must override the `handledBreakpoints` and `nrBreakpointsAvailable` fields of `CADITargetFeatures_t`.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

For example, to support virtually infinite code and register breakpoints:

```
targetFeatures->handledBreakpoints = CADI_TARGET_FEATURE_BPT_PROGRAM |
 CADI_TARGET_FEATURE_BPT_REGISTER;

targetFeatures->nrBreakpointsAvailable = 0x7fffffff;
```

callbackModeChange()

```
optional slave behavior callbackModeChange(uint32_t newMode, eslapi::CADIBptNumber_t
 bptNumber) : void;
```

Forwards all `modeChange()` callbacks to the target component. The target should generally ignore all of these except when implementing `CADIExecSingleStep()`.

This function is for debugging purposes only. Do not implement it. The function must not alter the state of any component in any way.

2.14 CCI500_AddressDecoderProtocol protocol

Defined in `$PVLIB_HOME/LISA/CCI500_AddressDecoderProtocol.lisa`.

About CCI500_AddressDecoderProtocol

CCI-5x0 allows a customer-supplied decode policy to route transactions across the downstream ports of the interconnect. This can be done by connecting a valid `address_decoder` to the `address_decoder` port on the CCI-5x0.

This protocol is used for `address_decoder` ports in both CCI500 and CCI550.

`decode_by_4KiB_addr` is the main behavior that needs to be implemented which the CCI-5x0 model uses to figure out the downstream port that a transaction needs to be routed to.

If you wish to abort a transaction then return `PVBUSMAPPER_ABORT` to `decode_by_4KiB_addr`.

Limitations

- In the RTL, the customer can stripe across several ports at a granularity less than 4 KiB in order to load balance across a memory controller's ports (or multiple memory controllers).
- In the model, we do not support sub-4KiB decode/striping. This is not anticipated to be a problem as there is little point in striping to modelled memory controllers.
- In the RTL, it is a requirement that the decode be static after reset. However, in the model then you can change it any time up until the first transaction, after that point then you must keep the decode static until the next reset.
- The decode *may* depend on `upstream_port_index_` only to the extent that a particular `upstream_port_index_` might not be allowed to communicate with a particular downstream port. However, having an address map that depends on the `upstream_port_index_` will mostly likely produce coherency issues.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`CCI500_AddressDecoderProtocol` provides the following behaviors:

configuration()

```
optional slave behavior configuration(const CCI5x0_AddressDecoderConfiguration&) :
 void;
```

If the slave implements this then the configuration will be told to the address decoder at reset time.

This is useful if the configuration of the system can be changed at init time and can avoid replicating the parameters from the CCI-5x0 to the decoder.

decode_by_4KiB_addr()

```
slave behavior decode_by_4KiB_addr( unsigned upstream_port_index_,
                                    bool     is_read_or_cmo_,
                                    uint64_t address_,
                                    bool     ns_ ) : unsigned;
```

Note

The implementation of this must not cause any thread switch during its execution.

get_squash_record()

```
optional slave behavior get_squash_record( unsigned downstream_port_index_,
                                           unsigned* out_lsb_bitpos_,
                                           unsigned*
 out_number_of_bits_to_squash_ ) : void;
```

This is used to get the output address transformation to make on the specified `downstream_port_index_`. The implementation will read all the squash records for each of the downstream ports the first time it receives a transaction.

```
addr[*out_lsb_bitpos_ + out_number_of_bits_to_squash_ : *out_lsb_bitpos_]
```

will be sliced out of any address going to the specified port.

If you do not wish to perform any slicing, return 0 for `out_number_of_bits_to_squash_`

reset()

```
optional slave behavior reset() : void;
```

This is called when CCI-500 is reset.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.15 CCIInterconnectControl protocol

Defined in `$PVLIB_HOME/LISA/PVCache.lisa`.

About CCIInterconnectControl

Internal only. Used only for the CCI400 model The CCIRegisters component uses it to grab the control interface from the CCIInterconnect component. The control interface allows us to read/write various configuration options that the determine where snoops should be sent etc.

`CCIInterconnectControl` provides the following behaviors:

getControlIf()

```
slave behavior getControlIf() : CCIInterconnect::control_if*;
```

Get CCIInterconnect `control_if` pointer.

2.16 ClockRateControl protocol

Defined in `$PVLIB_HOME/LISA/ClockRateControlProtocol.lisa`.

About ClockRateControl protocol

Allow systems to dynamically modify the multiply/divide ratio of a ClockDivider component.

If a ClockDivider's ratio is changed, the frequency of its `clk_out` signal is immediately recalculated, along with any clocks derived from that signal.

Any active ClockTimers will automatically compute the number of ticks elapsed so far at the old clock rate, and continue counting down at the new rate. This may introduce a slight rounding error of a fraction of a tick.

`ClockRateControl` provides the following behaviors:

set()

```
peer behavior set(uint32_t mul, uint32_t div) : void;
```

Set clock rate using 32-bit values. The new clock rate = mul / div.

set64()

```
peer behavior set64(uint64_t mul, uint64_t div) : void;
```

Set clock rate using 64-bit values. The new clock rate = mul / div.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.17 ClockSignal protocol

Defined in `$PVLIB_HOME/LISA/ClockSignalProtocol.lisa`.

About ClockSignal protocol

A ClockSignal port represents a timebase of a given frequency. This is an opaque port type. It contains no user-accessible behavior.

ClockSignal output ports are provided on the following library components:

MasterClock

Produces a clock signal at a base clock rate, which can nominally be considered to be 1Hz.

ClockDivider

Can be used to take an input ClockSignal from a MasterClock or from another ClockDivider and generate an output that is related to the input signal by a given ratio.

ClockSignals can be used as input to CpuComponents, to define the core clock rate. They can also be used to drive the clock port of a `ClockTimer` component, which can be used to generate events in the scheduler.

Note

A ClockSignal does not actually define a fixed square-wave signal. It merely defines a frequency that can be used by counter timers.

Here is an example system using ClockSignals:

```
composition {
  masterclock : MasterClock;
  div_24MHz : ClockDivider(div = 1, mul = 24000000);
  timer : ClockTimer;
}
master port<TimerControl> timer_control;
slave port<TimerCallback> timer_callback {
  behavior signal() : uint32_t {
    // handle timed event here
    // ...
    return 10; // reschedule in 10 ticks of input clock.
  }
}
behavior start_timer() {
  timer_control.set(10);  // start timer counting 10 ticks.
}
connection {
  masterclock.clk_out  => div_24MHz.clk_in;
  div_24MHz.clk_out    => timer.clk_in;
  self.timer_control   => timer.timer_control;
  timer.timer_callback => self.timer_callback;
}
```

`ClockSignal` provides the following behaviors:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

currentTicks()

```
peer behavior currentTicks() : uint64_t;
```

Private internal method used between Scheduler components.

getClock()

```
peer behavior getClock() : sg::FrequencySource*;
```

Private internal method used between Scheduler components.

rateInHz()

```
peer behavior rateInHz() : double;
```

Private internal method used between Scheduler components.

setClock()

```
peer behavior setClock(sg::FrequencySource*) : void;
```

Private internal method used between Scheduler components.

2.18 CompoundPortLisa protocol

Defined in `$PVLIB_HOME/LISA/CompoundPort.lisa`.

`CompoundPortLisa` provides the following behaviors:

connectFromExternalSlavePort()

```
slave behavior connectFromExternalSlavePort     (const std::string & name,
                                                      sg::Port *) : void;
```

connectToExternalMasterPort()

```
slave behavior connectToExternalMasterPort      (const std::string & name,
                                                      sg::Port *) : void;
```

disconnectFromExternalSlavePort()

```
slave behavior disconnectFromExternalSlavePort  (const std::string & name,
                                                      sg::Port *) : void;
```

disconnectToExternalMasterPort()

```
slave behavior disconnectToExternalMasterPort   (const std::string & name,
                                                      sg::Port *) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.19 CoprocBusProtocol protocol

Defined in `$PVLIB_HOME/LISA/CoprocBusProtocol.lisa`.

About CoprocBusProtocol protocol

This protocol connects a coprocessor implementation with a CPU component, for instance ARMCortexM33CT.

A coprocessor must derive from the coprocessor callback interface, `Coprocessor`. It can implement the CDP, MCR, MRC, STC, LDC, MCRR, and MRRC instructions.

A coprocessor must be registered with a specific coprocessor number, by calling the `addCoprocessor()` method. You can only register an external coprocessor that is not already present in the CPU. If no coprocessor has been registered with the coprocessor number encoded in an instruction, the CPU raises a NOCP fault.

To register coprocessor instruction implementations with the CPU, you must initialize the function pointers. For example, the following code passes the function pointers to the Coprocessor constructor. This code was taken from the `$PVLIB_HOME/examples/LISA/FVP_Coproc_Demo/` example.

Registering a coprocessor

```
...
   class TestValCoprocessor : public Coprocessor
   {
   public:
       protocol_CoprocBusProtocol * coproc_bus;
       uint32_t coproc_number;
       uint32_t cp_reg[2][NUM_CP_REG] = {{0}}; // [0][NUM_CP_REG] --> Secure, [1]
[NUM_CP_REG] --> Non-Secure
       TestValCoprocessor()
       : Coprocessor(this, test_CDP, nullptr, test_MCR, nullptr, test_MRC, nullptr,
 test_LDC, nullptr, test_STC, nullptr, test_MCRR, nullptr, test_MRRC, nullptr)
       , coproc_bus(nullptr)
       , coproc_number(0)
       {

...
   };

   PARAMETER { description("coprocessors number"), type(uint32_t), default(0x2),
 min(0x0), max(16) } coprocessor_number; // CP num
   TestValCoprocessor test_cp;
}

behaviour init
{
...
   if (coproc_bus.addCoprocessor.implemented())
   {
       coproc_bus.addCoprocessor(&test_cp, coprocessor_number);
   }
}
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Coprocessor callback functions

A coprocessor can implement callback functions with these signatures.

Each function returns a CoprocState value to indicate the new transaction state of the coprocessor.

`CDP()`

Perform a coprocessor data processing operation.

```
CoprocState CDP(void* context, uint32_t inst)
```

Parameters:

context
Context that was registered with the coprocessor interface.

inst
The coprocessor instruction being executed.

`MCR()`

Perform a move to coprocessor register operation.

```
CoprocState MCR(void* context, uint32_t inst, uint32_t data)
```

Parameters:

context
Context that was registered with the coprocessor interface.

inst
The coprocessor instruction being executed.

data
Register contents.

`MRC()`

Perform a move from coprocessor register operation.

```
CoprocState MRC(void* context, uint32_t inst, uint32_t* data)
```

Parameters:

context
Context that was registered with the coprocessor interface.

inst
The coprocessor instruction being executed.

data
Pointer to word to fill with coprocessor register contents.

`LDC()`

Perform a load coprocessor register from memory operation.

```
CoprocState LDC(void* context, uint32_t inst, uint32_t data, CoprocState state)
```

Parameters:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

context
Context that was registered with the coprocessor interface.

inst
The coprocessor instruction being executed.

data
Contents of current memory location to load into register.

state
Current state in a sequence of transactions.

`STC()`

Perform a store coprocessor register to memory operation.

```
CoprocState STC(void* context, uint32_t inst, uint32_t data, CoprocState state)
```

Parameters:

context
Context that was registered with the coprocessor interface.

inst
The coprocessor instruction being executed.

data
Pointer to word to fill with coprocessor register contents to be transferred to memory.

state
Current state in a sequence of transactions.

`MCRR()`

Perform a move to two coprocessor registers operation.

```
CoprocState MCRR(void* context, uint32_t inst, uint32_t data1, uint32_t data2)
```

Parameters:

context
Context that was registered with the coprocessor interface.

inst
The coprocessor instruction being executed.

data1
First data word to load to a coprocessor register.

data2
Second data word to load to a coprocessor register.

`MRRC()`

Perform a move from two coprocessor registers operation.

```
CoprocState MRRC(void* context, uint32_t inst, uint32_t* data1, uint32_t* data2)
```

Parameters:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

context

Context that was registered with the coprocessor interface.

inst

The coprocessor instruction being executed.

data1

Pointer to first word to fill with coprocessor register contents.

data2

Pointer to second word to fill with coprocessor register contents.

CoprocState values

A CoprocState enum value is returned by coprocessor callback functions to indicate the new transaction state of the coprocessor. It is also used as a parameter for LDC and STC callback functions.

Value	State label	Description
0	CoprocOk	Complete/Ok.
1	CoprocUndef	Undefined operation.
2	CoprocAbort	Data abort.
4	CoprocFirst	A parameter value for LDC and STC callback functions to indicate that this is the first data transfer in a sequence.
5	CoprocNext	A parameter value for LDC and STC callback functions to indicate that this is a subsequent data transfer in a sequence.
12	CoprocNop	Treat as a **NOP**.

`CoprocBusProtocol` provides the following behaviors:

`accessIsNonSecure()`

```
peer behavior accessIsNonSecure(void) : bool;
```

Checks the security state of the CPU, either true for non-secure, or false for secure.

`accessIsPriv()`

```
peer behavior accessIsPriv(void) : bool;
```

Checks whether the CPU state is privileged (true) or unprivileged (false).

`addCoprocessor()`

```
peer behavior addCoprocessor(Coprocessor*, int num) : void;
```

Registers the coprocessor with the CPU. `num` identifies which coprocessor to register it as.

`removeCoprocessor()`

```
peer behavior removeCoprocessor(Coprocessor*, int num) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Unregisters the coprocessor from the CPU.

2.20 CounterInterface protocol

Defined in `$PVLIB_HOME/LISA/CounterInterface.lisa`.

About CounterInterface protocol

Counter Interface protocol for communicating between counter interfaces and SoC-level memory mapped counter implementations.

`CounterInterface` provides the following behaviors:

eventUpdate()

```
slave behavior eventUpdate() : void;
```

Callback into event clients. May be called at any time. It is the client's responsibility to interrogate the physical counter to determine if its event should have been fired.

getCounterValue()

```
master behavior getCounterValue() : uint64_t;
```

Get the absolute value of the physical timer.

requestEventUpdate()

```
master behavior requestEventUpdate(uint64_t at) : void;
```

Request an eventUpdate at a particular time.

requestSignalUpdate()

```
master behavior requestSignalUpdate(uint64_t at) : void;
```

Request a signalUpdate at a particular time.

setEnabled()

```
slave behavior setEnabled(bool _bool_0) : void;
```

Communicate to the client if the counter module is enabled or not.

signalUpdate()

```
slave behavior signalUpdate() : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Callback into counter clients. May be called at any time. It is the client's responsibility to interrogate the physical counter to determine if its timers should be signaled in response to the callback.

2.21 DVMMessage protocol

Defined in `$PVLIB_HOME/LISA/DVMProtocol.lisa`.

`DVMMessage` provides the following behaviors:

send()

```
slave behavior send(DVM::Message*) : DVM::error_response_t;
```

Send DVM message.

2.22 EventBus protocol

Defined in `$PVLIB_HOME/LISA/EventBus.lisa`.

`EventBus` provides the following behaviors:

publishEventSource()

```
peer behavior publishEventSource(uint32_t index, sg::EventSourceBase *src) : void;
```

2.23 Feature protocol

Defined in `$PVLIB_HOME/LISA/Feature.lisa`.

`Feature` provides the following behaviors:

setFeature()

```
slave behavior setFeature(const char *featureName, const char *valueStr) : bool;
```

Set feature `featureName` to `valueStr`.

The encoding of `valueStr` is specific for each feature, but:

- For boolean features, use 0/1.
- For integer features, accept any base in C syntax, for example: 256, `0x100`, 0400.

Returns true on success, false on error or if the feature is not supported.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.24 FlashLoaderPort protocol

Defined in `$PVLIB_HOME/LISA/FlashLoaderPort.lisa`.

About FlashLoaderPort

This protocol initializes the flash contents at model startup and saves flash contents to a file when the model terminates.

`FlashLoaderPort` provides the following behaviors:

`loadFlashFile()`

```
slave behavior loadFlashFile(flash_loader::FlashLoader *loader) : uint32_t;
```

Initiate loading of the flash contents.

`saveFlashFile()`

```
slave behavior saveFlashFile(flash_loader::FlashLoader *loader) : uint32_t;
```

Save the flash contents to a file.

2.25 FrameTracingProtocol protocol

Defined in `$PVLIB_HOME/LISA/FrameTracingProtocol.lisa`.

About FrameTracingProtocol protocol

Port type used to connect to a FrameTracingComponent.

`FrameTracingProtocol` provides the following behaviors:

`beginFrame()`

```
slave behavior beginFrame(uint32_t width, uint32_t height, uint32_t bpp) : uint8_t*;
```

Request a memory buffer from the downstream FrameTracingComponent to write a frame. The returned buffer should be large enough to store `width` * `height` pixels of `bpp` bits each. The minimal expected returned buffer size is `width` * `height` * ((`bpp` + 7) / 8) bytes. A call to this method should be followed by a call to `endFrame()`.

Note

In case of an error, for example repeatedly calling `beginFrame()` before the matching `endFrame()`, this method returns a null pointer. If so, no data should be written there and there is no need to call `endFrame()`.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

endFrame()

```
slave behavior endFrame() : void;
```

Notify the downstream FrameTracingComponent that the buffer provided by `beginFrame()` is now blitted with a frame and can be processed.

2.26 GICv3Comms protocol

Defined in `$PVLIB_HOME/LISA/GICv3Comms.lisa`.

About GICv3Comms protocol

Link for internal communications between GICv3 components.

The master is towards the top level, the slave is towards the CPU interface.

`GICv3Comms` provides the following behaviors:

sendTowardsCPU()

```
slave behavior sendTowardsCPU(uint8_t len, const uint8_t* data) : void;
```

Sends byte stream towards the core.

sendTowardsTopLevel()

```
master behavior sendTowardsTopLevel(uint8_t len, const uint8_t* data) : void;
```

Sends byte stream from the core.

setAXIManagerID()

```
master behavior setAXIManagerID(uint64_t manager_id) : void;
```

Sets the ManagerID associated with the stream from the core.

2.27 GUIPollCallback protocol

Defined in `$PVLIB_HOME/LISA/GUIPollCallbackPort.lisa`.

About GUIPollCallback protocol

Callback signal generated by a GUIPoll component. It allows a Visualisation component to continue to poll the GUI's event queue while the simulation is paused.

See the GUIPoll component for advice about using this protocol.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`GUIPollCallback` provides the following behaviors:

gui_callback()

```
slave behavior gui_callback() : void;
```

Client callback invocation, called at a period configured by the GUIPoll component.

Note

This callback should only be used for updating a visualisation GUI. It should never be used for simulation events. See GUIPoll for more information.

2.28 ICS307Configuration protocol

Defined in `$PVLIB_HOME/LISA/ICS307ConfigurationPort.lisa`.

About ICS307Configuration protocol

This protocol sets the divider ratio of an ICS307 component at runtime. The output clock rate alters accordingly and any dependent components react to the clock rate change according to their defined behavior.

`ICS307Configuration` provides the following behaviors:

setConfiguration()

```
peer behavior setConfiguration(uint32_t vdw, uint32_t rdw, uint32_t od) : void;
```

Set the parameters for deriving the clock divider ratio.

vdw
: Range: 0-255.

rdw
: Range: 0-255.

od
: Range: 0-7.

2.29 InstructionCount protocol

Defined in `$PVLIB_HOME/LISA/InstructionCountProtocol.lisa`.

`InstructionCount` provides the following behaviors:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

getRunState()

```
master behavior getRunState() : uint32_t;
```

Obtain the power/run status of the processor.

Value	State label	Description
0	UNKNOWN	Run status unknown, that is, simulation has not started
1	RUNNING	Processor running, is not idle and is executing instructions
2	HALTED	External halt signal asserted
3	STANDBY_WFE	Last instruction executed was WFE and standby mode has been entered
4	STANDBY_WFI	Last instruction executed was WFI and standby mode has been entered
5	IN_RESET	External reset signal asserted
6	DORMANT	Partial processor power down
7	SHUTDOWN	Complete processor power down

getValue()

```
master behavior getValue() : uint64_t;
```

Obtain the number of instructions executed by the processor.

2.30 KeyboardStatus protocol

Defined in `$PVLIB_HOME/LISA/KeyboardStatusProtocol.lisa`.

About KeyboardStatus protocol

This protocol passes keyboard events to a component such as the PS2Keyboard component.

Events are only sent when the visualization window is in focus. Keyboard combinations that are filtered by the host OS such as Ctrl+Alt+Del are not detected by the visualization.

See `$PVLIB_HOME/include/components/KeyCode.h` for a list of `ATKeyCode` values.

`KeyboardStatus` provides the following behaviors:

keyDown()

```
slave behavior keyDown(ATKeyCode code) : void;
```

Sent when a key on the host keyboard is pressed.

keyUp()

```
slave behavior keyUp(ATKeyCode code) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Sent when a key on the host keyboard is released.

2.31 LCD protocol

Defined in `$PVLIB_HOME/LISA/LCDPort.lisa`.

About LCD protocol

This Visualisation Library signaling protocol provides the interface between an LCD controller peripheral, for example the PL110, and a visualization component. This permits the LCD controller to render the framebuffer contents into a region of the visualization GUI.

LISA visualization components can provide any number of LCD ports. The implementations of these behaviors can delegate the calls to appropriate methods on the VisRenderRegion class.

`LCD` provides the following behaviors:

lock()

```
slave behavior lock() : const VisRasterLayout*;
```

Lock the raster region, ready for rendering onto.

setPreferredLayout()

```
slave behavior setPreferredLayout(unsigned int width, unsigned int height, unsigned
 int depth) : void;
```

Set the preferred pixel size and bitdepth of the LCD panel.

unlock()

```
slave behavior unlock() : void;
```

Unlock the raster region, ready to update.

update()

```
slave behavior update(int x, int y, unsigned int w, unsigned int h) : void;
```

Update part of the render region onto the screen.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.32 LCDLayoutInfo protocol

Defined in `$PVLIB_HOME/examples/LISA/Common/LISA/LCDLayoutInfoProtocol.lisa`.

About LCDLayoutInfo protocol

This protocol has the behavior setLayoutInfo.

`LCDLayoutInfo` provides the following behaviors:

setLayoutInfo()

```
slave behavior setLayoutInfo(int x, int y, uint32_t w, uint32_t h) : void;
```

Sets the width and height of the touchscreen.

2.33 MMC_Protocol protocol

Defined in `$PVLIB_HOME/LISA/MMC_Protocol.lisa`.

About MMC_Protocol

This protocol describes an abstract, untimed interface between an MMC controller and an MMC or SD card.

The protocol contains methods that must be implemented by the master (controller) or by the slave (card). This protocol is used by the reference PL180 MCI and MMC models. For further information on the protocol implementation, see the source file `$PVLIB_HOME/LISA/MMC_Protocol.lisa`.

Use of this protocol assumes knowledge of the MultiMediaCard specification, available from the MultiMediaCard Association.

`MMC_Protocol` provides the following behaviors:

Rx()

```
master behavior Rx(const uint8_t *block, uint32_t len) : bool;
```

Read behaviours, from the card to the controller.

After the controller has issued a block or multiple block read command, the card calls the controller's `Rx()` method, with the first block. When the controller has consumed the block, that is, when it is able to accept another block, it should inform the slave with an `Rx_rdy()` call.

The slave might not provide a block immediately. It might wait until the controller is ready and the simulated transfer rate limits have been satisfied. This is important to avoid swamping the simulation with a large transfer at the expense of all other simulation activity.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

The master might signal that it was not able to accept the given block, by returning false from `Rx()`. This is effectively a protocol error, and the card may retransmit the block later, or fail.

Rx_rdy()

```
slave behavior Rx_rdy(void) : void;
```

Tx()

```
master behavior Tx(uint8_t *block, uint32_t len) : bool;
```

Write behaviours, from the controller to the card.

To minimize the number of times written data are copied, the following protocol is somewhat counter-intuitive. The basic premise is that an MMC controller usually contains a small data FIFO, which is filled either by the simulated CPU, or more frequently by DMA. The DMA typically occurs word by word. An efficient approach is therefore to construct the controller such that it can write directly into a buffer of stored card data.

When the write command is issued, the card calls the master with a pointer to the block that needs to be written. The master can then fill the block, calling `Tx_done()` when the block has been transferred. The card is again responsible for throttling to a simulated transfer rate, and will respond at some time in the future by providing another block to be written by calling the controller's `Tx()` function.

This approach has some drawbacks:

- Some timing and controller behavioral accuracy is sacrificed
- The controller might need to buffer data before a block is provided, if it cannot prevent data coming into its FIFO.

Tx_done()

```
slave behavior Tx_done(void) : void;
```

cmd()

```
slave behavior cmd(mmc_cmd_t cmd, uint32_t arg, void *resp) : mmc_resp_t;
```

The controller can send the slave a command, with an optional 32-bit argument.

The master must send in a void pointer to 128 bits of data.

The slave responds with a response type, and fills in up to 128 bits with data.

The master can check that the response type matches expectations, but this should not be necessary.

CRC is not implemented and start/stop bits are unnecessary at this level.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Note

This behavior is not re-entrant by current design.

cmd_name()

```
slave behavior cmd_name(mmc_cmd_t cmd) : const char*;
```

The slave implements this behavior to return a string for a given command. This is not strictly part of the MMC protocol.

2.34 MMU_400_BASE_IDENTIFY protocol

Defined in `$PVLIB_HOME/LISA/SMMU_400_BASE.lisa`.

`MMU_400_BASE_IDENTIFY` provides the following behaviors:

identify()

```
slave behavior identify(
        const pv::TransactionAttributes*  attributes_,
        bool                              is_read_,
        unsigned*                         stream_id_,
        unsigned*                         ssd_or_ssd_index_
        ) : void;
```

The way that the MMU-400 is configured to generate the `StreamID` and `SSD_Index` is complicated and must be done by implementing this function. This knowledge is specific to the SoC and to the devices generating the transactions and so it is not easily parameterisable.

2.35 MMU_400_Internals protocol

Defined in `$PVLIB_HOME/LISA/SMMU_400_BASE.lisa`.

About MMU_400_Internals protocol

This protocol is for probing the internals of the MMU_400. It has no correspondence in hardware. It is only intended for testing and informational purposes.

`MMU_400_Internals` provides the following behaviors:

getMMU_400()

```
slave behavior getMMU_400() : MMU_400::mmu_400_if*;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.36 MMU_500_BASE_IDENTIFY protocol

Defined in `$PVLIB_HOME/LISA/SMMU_500_BASE.lisa`.

`MMU_500_BASE_IDENTIFY` provides the following behaviors:

identify()

```
slave behavior identify(
        const pv::TransactionAttributes*  attributes_,
        bool                              is_read_,
        unsigned                          tbu_number_,
        unsigned*                         stream_id_,
        unsigned*                         ssd_or_ssd_index_
        ) : void;
```

The way that the MMU-500 is configured to generate the StreamID and SSD_Index or SSD is complicated and must be done by implementing this function. This knowledge is specific to the SoC and to the devices generating the transactions and so it is not easily parameterisable.

Note that the LACr0/r1 RTL encodes the TBU number into the bits [14:10] of the StreamId and the SSD_Index, if being used. The bottom 10 bits are determined from the incoming transaction. In the LACr0/r1 RTL, each TBU can have fewer than 10 bits of `StreamId`/`SSD_Index`, in which case they are zero-extended before being placed into bits[9:0].

The width of the TBU ID busses is invisible to the programmer and does not have an effect in the model except that this `identify()` function must obey the SoC's configuration.

For LACr0/r1, the caller automatically puts the TBU number in the ids itself. The callee is also allowed to do this, but the result is checked by an `assert()`, otherwise just leave these bits as zero.

For EAC, no such check is made and the platform must supply all 15 bits.

If you are supplying an SSD directly, and set the parameter `use_ssd_determination_table` to false so that SMMU_IDR1.SSDTP == 0, then the constants generated by `components/SMMU.h:ssd_secure()` and `ssd_non_secure()` should be used to return the SSD in `*ssd_or_ssd_index_`.

2.37 MMU_500_Internals protocol

Defined in `$PVLIB_HOME/LISA/SMMU_500_BASE.lisa`.

About MMU_500_Internals protocol

This protocol is for probing the internals of the MMU_500. It has no correspondence in hardware. It is only intended for testing and informational purposes.

`MMU_500_Internals` provides the following behaviors:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

getMMU_500()

```
slave behavior getMMU_500() : MMU_500::mmu_500_if*;
```

2.38 MouseStatus protocol

Defined in `$PVLIB_HOME/LISA/MouseStatusProtocol.lisa`.

About MouseStatus protocol

This protocol passes mouse movement and button events to another component such as the PS2Mouse component.

Events are only sent when the visualization window is in focus.

`MouseStatus` provides the following behaviors:

mouseButton()

```
slave behavior mouseButton(uint8_t button, bool down) : void;
```

This is sent when a button on the host mouse is pressed or released.

`button` indicates which button has been pressed or released and is typically 0, 1, or 2 but can be anything up to 7 depending on the OS and attached mouse.

`down` is true if a button is pressed and false if released.

mouseMove()

```
slave behavior mouseMove(int dx, int dy) : void;
```

This is sent when the host mouse is moved. Mouse movement events are always relative.

2.39 PASSwitchControl protocol

Defined in `$PVLIB_HOME/LISA/PASSwitch.lisa`.

About PASSwitchControl protocol

Allow transactions from the RME world (realm/pas/secure/non_secure) to be routed separately.

Transactions for the RME PAS worlds are, by default, routed through the manager port `pvbus_m[PAS-value]`, where `PAS-value` is:

0

Secure

1
Non-secure

2
Root

3
Realm

The control port allows each PAS world to be one of the following:

- Routed to any of the four manager ports `pvbus_m[0]...pvbus_m[3]`
- Ignored
- Aborted

`PASSwitchControl` provides the following behaviors:

routeAccessesForRmeWorlds()

```
slave behavior routeAccessesForRmeWorlds(
                      pv::PASSwitch_RouteOption route_secure,
                      pv::PASSwitch_RouteOption route_non_secure,
                      pv::PASSwitch_RouteOption route_root,
                      pv::PASSwitch_RouteOption route_realm,
                      pv::PASSwitch_RouteOption route_system_agent,
                      pv::PASSwitch_RouteOption route_non_secure_protected) : void;
```

The arguments to the control port behavior `routeAccessesForRmeWorlds()` select how the chosen transactions are routed. They can have the following values:

PORT_IGNORE
Transactions are ignored. Reads return 0.

PORT_ABORT
Cause transactions to generate an abort.

PORT_0
Route transactions to `pvbus_m[0]`.

PORT_1
Route transactions to `pvbus_m[1]`.

PORT_2
Route transactions to `pvbus_m[2]`.

PORT_3
Route transactions to `pvbus_m[3]`.

PORT_4
Route transactions to `pvbus_m[4]`.

PORT_5
Route transactions to `pvbus_m[5]`.

Initial routing is configured using these PASSwitch parameters:

- `secure_port_index`
- `non_secure_port_index`
- `root_port_index`
- `realm_port_index`

Both default and explicit parameter values are overridden by runtime calls to `routeAccessesForRmeWorlds()` on the control port.

2.40 PCIDevice2ClientProtocol protocol

Defined in `$PVLIB_HOME/LISA/PCIDevice2ClientProtocol.lisa`.

About PCIDevice2ClientProtocol protocol

This is a private protocol between PCIDevice and its wrapped client device.

`PCIDevice2ClientProtocol` provides the following behaviors:

`check_if_msix_is_enabled()`

```
optional master behavior check_if_msix_is_enabled() : bool;
```

A request from the client device to know whether MSI-X interrupt generation capability is enabled for the endpoint.

`generate_MSI_X()`

```
master behavior generate_MSI_X(
        unsigned                    vector_index_,
        ) : int;
```

A request from the client device to map an MSI vector address to an address and data. Returns false if no MSI should be generated.

Return values:

-1
: Abort

0
: Suppressed

1
: OK

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

get_PRI_client_interface()

```
slave behavior get_PRI_client_interface() : pcie_client_device_pri_if*;
```

If the device has PRI capability, it can adjust how the ATC makes PRI requests by implementing this interface.

get_transaction_monitor_control_if()

```
optional master behavior get_transaction_monitor_control_if(
        pcie::pcie_transaction_monitor_client_if* client_if_
        ) : pcie::pcie_transaction_monitor_control_if*;
```

A protocol which a client device can use to get the transaction monitor control interface implemented by the endpoint. The client device does this by requesting the interface using `get_transaction_monitor_control_if()`. While requesting, the client device can pass a pointer to its own interface, which then provides an interface from the endpoint to the client.

identify()

```
optional slave behavior identify(const pv::RemapRequest& req_, uint32_t*
 substreamid_) : void;
```

If the client can produce substreamids, it must use this behavior to fill `substreamid_`. If no substreamid is present on the request represented by `req_` then it should be assigned to `~0u`.

log_error()

```
optional master behavior log_error(
        pcie_service::ErrorMessage::ErrorCode_t error_code_,
        pcie_service::pcie_aer_error_type_t error_type_) : void;
```

A request to log a client device error with a specific error message.

2.41 PCIeATC_get_if protocol

Defined in `$PVLIB_HOME/LISA/PCIeATC.lisa`.

`PCIeATC_get_if` provides the following behaviors:

get_if()

```
slave behavior get_if() : pcie_atc_if*;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.42 PChannel protocol

Defined in `$PVLIB_HOME/LISA/PChannelProtocol.lisa`.

About PChannel protocol

Communicates power state changes between a power controller and a device.

You can use PChannels to replace `STANDBYWFI` and `STANDBYWFE` signaling.

For example, using `STANDBYWFI` or `STANDBYWFE`:

- Core drives STANDBYWFI signal HIGH.
- Power controller performs logic x.

Equivalent behavior using PChannels:

- Core calls `pactive(OFF)`.
- Power controller calls `prequest(OFF)` to change the core to OFF.
- Power controller performs logic x.
- To wake up the core, the power controller calls `prequest(ON)`.

Examples

- For a LISA+ example that uses PChannel, see `$PVLIB_HOME/examples/LISA/VP_PChannel/`.
- For a SystemC example that uses PChannel, see `$PVLIB_HOME/examples/SystemCExport/EVS_Components/EVS_PChannel/`.

`PChannel` provides the following behaviors:

pactive()

```
master behavior pactive (uint32_t pstate) : void;
```

This master behavior is implemented by a power controller. A device calls this method to give a hint to the power controller that it can change to a particular power state. A power controller can then take appropriate action, typically communicating with the device by calling `device.prequest(new_power_state)`.

The power state is type `uint32_t` because it is the responsibility of the system using PChannels to enumerate the power states that it supports. For example, Armv8-A cores use the following enumeration for power states:

```
enum { OFF = 0,
       OFF_EMU,
       MEM_RET,
       MEM_RET_EMU,
       LOGIC_RET,
       FULL_RET,
       MEM_OFF,
       FUNC_RET,
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

```
        ON,
        WARM_RST,
        DBG_RECOV }
```

prequest()

```
slave behavior prequest (uint32_t pstate) : sg::PChannel::presp_t;
```

This slave behavior is implemented by a device, for instance a core. A power controller typically calls this method and checks for the response from the device, which can either be `ACCEPT` or `DENY`.

The `sg::PChannel::presp_t` enumeration provides two values, `ACCEPT` and `DENY`. It is returned by the `prequest()` method, depending on the state requested and the current state of the core.

2.43 PL080_DMAC_DmaPortProtocol protocol

Defined in `$PVLIB_HOME/LISA/PL080_DMAC_DmaPortProtocol.lisa`.

About PL080_DMAC_DmaPortProtocol protocol

The DmaPortProtocol is used to communicate handshake signals between the PL080_DMAC controller and other peripherals in the system.

Depending on the PL080_DMAC configuration, the `PL080_RES_CLR` signal might not be used.

`PL080_DMAC_DmaPortProtocol` provides the following behaviors:

request()

```
slave behavior request(uint32_t request) : void;
```

Passes requests from a peripheral to the DMA controller. The request is a bitfield with the low four bits defined. The request is level-sensitive and latched internally by the DMA controller. It is sampled and interpreted in a manner dependent on the target channel and configured flow control. It can have one of the following values:

1

`PL080_REQ_BURST`. Burst transfer request.

2

`PL080_REQ_SINGLE`. Single transfer request.

4

`PL080_REQ_LBURST`. Last burst request.

8

`PL080_REQ_LSINGLE`. Last single request.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

response()

```
master behavior response(uint32_t response) : void;
```

Passes responses from the DMA controller to the peripherals. The response is a bitfield with the low two bits defined. It is transient rather than level-sensitive:

1
: `PL080_RES_TC`. Terminal count response.

2
: `PL080_RES_CLR`. Clear request response.

2.44 PL330_DMAC_DmaPortProtocol protocol

Defined in `$PVLIB_HOME/LISA/PL330_DMAC_DmaPortProtocol.lisa`.

About PL330_DMAC_DmaPortProtocol protocol

The DmaPortProtocol is used to communicate handshake signals between the PL330_DMAC controller and other peripherals in the system.

Depending on the PL330_DMAC configuration, the PL330_RES_CLR signal may not be used.

`PL330_DMAC_DmaPortProtocol` provides the following behaviors:

request()

```
slave behavior request(uint32_t request) : void;
```

Requests from the external peripheral to the DMA controller. These are level-sensitive and are sampled by the DMA controller at specific points during the handshake. See the PL330_DMAC.lisa implementation for more details.

response()

```
master behavior response(uint32_t response) : void;
```

Responses from the DMA controller to the external component. These are transient.

2.45 PMUEvent protocol

Defined in `$PVLIB_HOME/LISA/CCIRegisters.lisa`.

`PMUEvent` provides the following behaviors:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

fire()

```
peer behavior fire() : void;
```

Trigger a PMU event.

2.46 PS2Data protocol

Defined in `$PVLIB_HOME/LISA/PS2DataProtocol.lisa`.

About PS2Data protocol

This protocol is for communication between the Keyboard/Mouse Interface (KMI) and a PS/2-like device.

For efficiency, the interface is a parallel byte interface rather than a serial clock/data interface.

`PS2Data` provides the following behaviors:

getData()

```
slave behavior getData () : uint8_t;
```

Used by the PS/2 device to get command data from the KMI.

putData()

```
slave behavior putData (uint8_t data) : void;
```

Used by the PS/2 device to send device data to the KMI.

setClockData()

```
master behavior setClockData (enum ps2clockdata_state) : void;
```

Used by the KMI to simulate forcing the state of the data/clock lines, to indicate whether it:

- Is able to receive data
- Wants to send a command
- Is inhibiting communication

Non-Confidential

2.47 PVBus protocol

Defined in `$PVLIB_HOME/LISA/PVBusProtocol.lisa`.

About PVBus protocol

PVBus is used to provide bus connections for PV core models, or for any user-defined bus masters, to a tree of bus decoders and bus slave devices.

The bus protocol is designed to allow efficient calling through the bus decode tree, but it also implements back doors that allow bus masters to cache the decode results and access devices directly.

A bus slave component must instantiate a PVBusSlave subcomponent to provide an end point for the bus. The PVBusSlave component encapsulates all the complexity of handling the internal PVBus protocol. The PVBusSlave can be configured to handle all incoming transactions, see the example below, or as a bridge to the public PVDevice protocol.

Example of using PVBus for efficient access to memory-like storage:

```
  component MemorySlave      //  A component containing 64 MB of fast RAM
  {
      slave port<PVBus> pvbus_s;

      master port <PVBusSlaveControl> bus_slave_control;

      composition
      {
          bus_slave : PVBusSlave(size = 0x04000000);
      }
      connection
      {
          self.pvbus_s => bus_slave.pvbus_s;
          self.bus_slave_control => bus_slave.control;
      }
      behavior init()
      {
          bus_slave_control.setAccess(0, 0x04000000, pv::ACCESSTYPE_RW,
pv::ACCESSMODE_MEMORY);
          composition.init();
      }
   }
```

Note

The following behaviors described as internal are implemented internally by PVBusMaster and PVBusSlave. Devices should not implement them.

`PVBus` provides the following behaviors:

aceSnoopRequest()

```
optional master behavior aceSnoopRequest( ACE::SnoopRequest* ) : void;
```

Internal behavior to support a coherency request from downstream.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

busMapChanged()

```
optional master behavior busMapChanged(pv::bus_addr_t base, pv::bus_addr_t size) :
 void;
```

Internal behavior used to handle cached bus decodings.

debugACESnoopRequest()

```
optional master behavior debugACESnoopRequest( ACE::SnoopRequest* ) : void;
```

Internal behavior to support a coherency request from downstream.

debugRead()

```
slave behavior debugRead(pv::ReadTransaction tx) : pv::Tx_Result;
```

Device access behavior for the PVBus protocol.

Note

Use of this behavior is deprecated. Use a PVBusMaster and PVBusSlave to send and receive PVBus transactions.

---

debugWrite()

```
slave behavior debugWrite(pv::WriteTransaction tx) : pv::Tx_Result;
```

Device access behavior for the PVBus protocol.

Note

Use of this behavior is deprecated. Use a PVBusMaster and PVBusSlave to send and receive PVBus transactions.

---

discoverDownstreamChildDVMNodes()

```
optional slave behavior discoverDownstreamChildDVMNodes(DVM::DownstreamVisitor *) :
 void;
```

Internal behavior to support DVM message passing.

Allow a PVBus master to probe a bus port for any slaves that can propagate DVM messages.

Bus routing fabric should forward the discovery request to all slaves.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

discoverUpstreamParentDVMNodes()

```
optional master behavior discoverUpstreamParentDVMNodes(DVM::UpstreamVisitor *) :
 void;
```

Internal behavior to allow a PVBus slave to probe a bus port for any masters that can respond to DVM messages.

doReadAccess()

```
optional slave behavior doReadAccess  (pv::ReadRequest *) : pv::Tx_Result;
```

Internal behavior to support PVBus re-entrant channels.

doWriteAccess()

```
optional slave behavior doWriteAccess (pv::WriteRequest *) : pv::Tx_Result;
```

Internal behavior to support PVBus re-entrant channels.

read()

```
slave behavior read(pv::ReadTransaction tx) : pv::Tx_Result;
```

Device access behavior for the PVBus protocol.

Note

Use of this behavior is deprecated. Use a PVBusMaster and PVBusSlave to send and receive PVBus transactions.

write()

```
slave behavior write(pv::WriteTransaction tx) : pv::Tx_Result;
```

Device access behavior for the PVBus protocol.

Note

Use of this behavior is deprecated. Use a PVBusMaster and PVBusSlave to send and receive PVBus transactions.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.48 PVBus2PCI2PCIDeviceProtocol protocol

Defined in `$PVLIB_HOME/LISA/PVBus2PCI2PCIDeviceProtocol.lisa`.

About PVBus2PCI2PCIDeviceProtocol protocol

This is the protocol between the PVBus2PCI and PCIDevice components.

It is used to aggregate the many connections between the two.

`PVBus2PCI2PCIDeviceProtocol` provides the following behaviors:

get_device_assignment_info()

```
optional slave behavior get_device_assignment_info(sg::device_assignment_info_t&
 da_info_) : void;
```

get_port_info()

```
slave behavior get_port_info(sg::port_info_t& out_) : void;
```

PCIDevice fills `out_` with its information.

get_selective_reg_block_info()

```
optional slave behavior get_selective_reg_block_info() :
 sg::ide::selective_stream_ide_reg_block_info_t;
```

A method to get the Selective Stream register block information. The information is used at the rootport to check the transactions attributes with respect to rootport DA conditions.

get_send_error_to_rcec_if()

```
optional slave behavior get_send_error_to_rcec_if(
        std::vector<uint32_t>& rciep_device_function_table,
        uint32_t& bdf) : pcie::send_error_to_rcec_if*;
```

A method to check whether a downstream device is an RCEC device or not.

If so, get the pointer to pvbus2pci to RCEC if, which can be used to route error messages received in PVBus2PCI/RC towards RCECs.

It also captures RCEC associated RCiEP's device-function information to check whether the device-function passed to RCEC points to a valid RCiEP.

If not implemented or returns nullptr then the device is not an RCEC.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Note

This is called during the reset phase, so the endPoint must cope if its own reset phase has not yet been called.

The first argument indicates the vector of device_function_info of RCEC associated RCiEPs. The second argument is the BDF of the downstream RCEC device. This is an optional behaviour.

`respond_if_address_is_captured()`

```
optional master behavior respond_if_address_is_captured(pv::bus_addr_t address) :
 bool;
```

A method implemented in bridge-type devices to query whether a given address will be routed downstream to it.

`set_bus_properties()`

```
optional slave behavior set_bus_properties(sg::pcie_bus_properties_t&) : void;
```

The properties of the bus can change dynamically and multiple calls to this behaviour should be expected.

2.49 PVBusBridgeControl protocol

Defined in `$PVLIB_HOME/LISA/PVBusBridgeControlProtocol.lisa`.

About PVBusBridgeControl protocol

Allow a component to control its PVBusBridge subcomponent.

`PVBusBridgeControl` provides the following behaviors:

`configure()`

```
slave behavior configure(pv::slave_config_t*) : void;
```

Allow configuration of the transactions that are accepted by a `PVBusBridge`. By default the bridge accepts read and write transactions.

The `slave_config_t` class provides the following methods to extend the set of accepted transactions:

- `acceptACE_CleanShared_CleanInvalid_MakeInvalid()`
- `acceptACE_CleanUnique_MakeUnique()`
- `acceptEvict()`
- `acceptMemoryBarriers()`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- `acceptPrefetchOnly()`
- `acceptExclusiveTransactions()`

revokePrefetch()

```
slave behavior revokePrefetch(pv::bus_addr_t base, pv::bus_addr_t top) : void;
```

Invalidates a DMI access range. `base` and `top` are included in the range.

2.50 PVBusCacheControl protocol

Defined in `$PVLIB_HOME/LISA/PVBusCache.lisa`.

About PVBusCacheControl protocol

This protocol defines behaviors that are private, subject to change, and should not be used outside of the PVBusCache component.

`PVBusCacheControl` provides the following behaviors:

createTransactionGenerator()

```
slave behavior createTransactionGenerator(unsigned output_port) :
 pv::TransactionGenerator*;
```

Get a transaction generator on the given output port.

getLineContentsForRead()

```
slave behavior getLineContentsForRead(unsigned line_index) : const char*;
```

Get temporary read access to the line data managed by `PVBusCache`. The line must have already been initialised by calling `getLineContentsForWrite`.

getLineContentsForWrite()

```
slave behavior getLineContentsForWrite(unsigned line_index) : char*;
```

Get temporary write access to the line data managed by `PVBusCache`. Allocates new storage for lines as needed.

invalidateLineHit()

```
slave behavior invalidateLineHit(unsigned hit_line_index,
                                     pv::CacheRevocation revoke_type) : void;
```

Revoke a line that has been marked as hitting.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

passThroughRead()

```
slave behavior passThroughRead(unsigned output_port,
                                   pv::ReadTransaction tx) : pv::Tx_Result;
```

Pass through an unmodified read request. If a burst transaction spans more than one line, this only handles one line's worth of the burst.

passThroughWrite()

```
slave behavior passThroughWrite(unsigned output_port,
                                    pv::WriteTransaction tx) : pv::Tx_Result;
```

Pass through an unmodified write request. If a burst transaction spans more than one line, this only handles one line's worth of the burst.

readFromLine()

```
slave behavior readFromLine(pv::ReadTransaction tx,
                                unsigned hit_line_index) : pv::Tx_Result;
```

Mark the current read transaction as hitting a cache line. All future transactions with the same attributes may be handled efficiently by `PVBusCache`, rather than being sent to the device `cacheRead()` or `cacheWrite()` handlers.

revokeRoutingDecisions()

```
slave behavior revokeRoutingDecisions() : void;
```

Revoke all responses given by the `routeTransaction()` callback.

setTimingAnnotationConfig()

```
slave behavior setTimingAnnotationConfig(pv::PVBusCacheTAConfig cfg) : void;
```

Set the timing annotation parameters.

writeToLine()

```
slave behavior writeToLine(pv::WriteTransaction tx,
                               unsigned hit_line_index) : pv::Tx_Result;
```

Mark the current write transaction as hitting a cache line. All future transactions with the same attributes may be handled efficiently by `PVBusCache`, rather than being sent to the device `cacheRead()` or `cacheWrite()` handlers.

writeToLineAndPassThrough()

```
slave behavior writeToLineAndPassThrough(pv::WriteTransaction tx,
                                             unsigned hit_line_index,
                                             unsigned output_port) : pv::Tx_Result;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Write the transaction data into a cache line, but also pass it through to a slave port. If a burst transaction spans more than one line, this only handles one line's worth of the burst.

2.51 PVBusCacheDevice protocol

Defined in `$PVLIB_HOME/LISA/PVBusCache.lisa`.

About PVBusCacheDevice protocol

This protocol defines behaviors that are private, subject to change, and should not be used outside of the `PVBusCache` component.

`PVBusCacheDevice` provides the following behaviors:

cacheRead()

```
slave behavior cacheRead(unsigned             in_port,
                         pv::ReadTransaction tx) : pv::Tx_Result;
```

Handle a read request to the cache. For burst transactions, the cache can return after handling one line's worth of transaction data, and it is called back for the first beat on the next cache line.

cacheWrite()

```
slave behavior cacheWrite(unsigned             in_port,
                          pv::WriteTransaction tx) : pv::Tx_Result;
```

Handle a write request to the cache.

routeTransaction()

```
slave behavior routeTransaction(unsigned        in_port,
                                pv::Transaction tx) : pv::CacheRoutingDecision;
```

Determine whether this transaction is cacheable. If not, decide which output port should forward the transaction.

2.52 PVBusMapperControl protocol

Defined in `$PVLIB_HOME/LISA/PVBusMapperControlProtocol.lisa`.

About PVBusMapperControl protocol

Control protocol for use with `PVBusMapper` and `PVBusModifier`.

`PVBusMapperControl` provides the following behaviors:

allBusMapChanging()

```
master behavior allBusMapChanging() : void;
```

Something connected to the control port can generate an event to the upstream that indicates the bus map is changing and asks for all requests to be remapped again.

getDVMNodesCanSendTo()

```
master behavior getDVMNodesCanSendTo(
        std::vector<pv::DVMNodeRecord>&  upstream_nodes_,
        std::vector<pv::DVMNodeRecord>&  downstream_nodes_
        ) : bool;
```

To send DVM messages, you must have a description of where to send them.

You can ask `PVBusMapper()` to give you a vector of records containing all upstream and downstream nodes. This records set is only available after first reset. You pass in a vector that you want to be filled with the appropriate nodes.

It returns true if the lists are valid, even if `empty()`, otherwise it returns false and you should try again later. When the lists become valid, the expectation is that they remain valid and there is no need to call it again.

The `PVBusMapper` will always discover upstream and downstream DVM nodes. However, there may be a logical inconsistency if you use these records to send DVM messages if you are not handling DVM messages being send to you.

You may send a DVMMessage using the records returned.

It is expected that if you receive a DVM message and are forwarding it to other DVM nodes, you must take care not to forward it to the DVM node that gave you it. For this purpose, use the `getPortIndex()` and `getArcWithinPort()` methods and compare the results to the `port_index_` and `arc_within_port_` given to you by the `handle*DVMMessage()` calls.

getMyArcIdentifier()

```
master behavior getMyArcIdentifier() : void*;
```

Return the arc identifier, `arc_within_port_`, that will be seen by a DVM node if we send a DVM message from this node.

handleDownstreamDVMMessageFromUpstream()

```
optional slave behavior handleDownstreamDVMMessageFromUpstream(
        unsigned             upstream_port_index_,
        void*                arc_within_port_,
        DVM::Message*        message_
        ) : DVM::error_response_t;
```

If parameter `handling_of_dvm_messages_from_upstream` is set to `handle`, this behaviour is called when a DVM message from upstream is received.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

You are given the `port_index_` that the DVM message came from and an opaque pointer to the upstream master within that connection. This pointer is the same one returned in the `DVMNodeRecord` obtained from `getDVMNodesCanSendTo()`.

Note

Do not alter `message_` and forward it. You must first copy it and then forward the copy. The message might be in use by multiple components so altering it will also alter their version.

Note

This is a message received from upstream, so it is a downstream DVM message.

handleSnoopRequest()

```
optional slave behavior handleSnoopRequest(ACE::SnoopRequest* req_, bool debug_) :
 void;
```

Handle snoop requests. The `*SnoopRequest()` control port behaviors allow a PVBusMapper to act as an intermediary for snoop transactions on the bus.

If the `handling_of_upstream_snoop_requests` parameter is set to `handle`, this behavior is called when snoop transactions from any downstream port are received.

Note

The snoop transaction is not automatically forwarded upstream but can be sent upstream using the `injectSnoopRequest()` behavior.

handleUpstreamDVMMessageFromDownstream()

```
optional slave behavior handleUpstreamDVMMessageFromDownstream(
        unsigned              downstream_port_index_,
        void*                 arc_within_port_,
        DVM::Message*         message_
        ) : DVM::error_response_t;
```

If parameter `handling_of_dvm_messages_from_downstream` is set to `handle`, this behaviour is called when a DVM message from downstream is received.

You are given the `port_index_` that the DVM message came from and an opaque pointer to the upstream master within that connection. This pointer is the same one returned in the `DVMNodeRecord` obtained from `getDVMNodesCanSendTo()`.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Note

Do not alter `message_` and forward it. You must first copy it and then forward the copy. The message might be in use by multiple components so altering it will also alter their version.

Note

This is a message received from downstream and so it is an upstream DVM message.

injectSnoopRequest()

```
master behavior          injectSnoopRequest(ACE::SnoopRequest* req_, bool debug_) :
 void;
```

Issue a snoop transaction upstream.

printDVMNodes()

```
master behavior printDVMNodes(std::ostream&, const std::string& indent_) : void;
```

Print to the stream a text description of the nodes that it has currently found.

remap()

```
slave behavior remap(
        pv::RemapRequest& req_
        ) : unsigned;
```

Return the port that this transaction should be filtered to, based on the attributes and the address information held in the `RemapRequest` object. You may also indicate a remapping of the attributes and address in this call.

You may tag this decision with zero, one, or more objects of a type derived from `RemapDecisionGroup`. This allows you to revoke all decisions tagged with the same `RemapDecisionGroup` object. This object is allocated and owned by the component implementing the `remap()` function. See the `RemapDecisionGroup` class for more details.

The remapper must be consistent with respect to its decisions and so they must be statically determined.

The return value is a port number of `pvbus_m`, or either of the special values:

PVBUSMAPPER_ABORT

Abort all accesses

PVBUSMAPPER_IGNORE

Treat all accesses as Read-As-Zero, Writes Ignored (**RAZ/WI**)

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Any other value is considered an error.

reset()

```
master behavior reset() : void;
```

Signal a reset of the bus mapper bus interfaces. This is equivalent to an assert of the reset signal.

sendAllBusMapChangingToUpstreamPort()

```
master behavior sendAllBusMapChangingToUpstreamPort(
        unsigned upstream_port_index_
        ) : void;
```

Something connected to the control port can generate an event to an upstream port that indicates a bus map range is changing and asks for matching requests to be remapped again.

2.53 PVBusOverTLMControl protocol

Defined in `$PVLIB_HOME/examples/SystemCExport/Bridges/PVBus2AMBAPVACE.lisa`.

About PVBusOverTLMControl protocol

This version of the PVBus to AMBA-PV bridge enables you to pass back all the coherency information from ACP.

Note

This version makes use of a private and undocumented API that is not intended to be supported and will change in future releases.

`PVBusOverTLMControl` provides the following behaviors:

routeAccesses()

```
slave behavior routeAccesses(BUS_RouteOption destination) : bool;
```

2.54 PVBusRouterControl protocol

Defined in `$PVLIB_HOME/LISA/PVBusRouter.lisa`.

About PVBusRouterControl protocol

Allow the construction of arbitrary routing decisions.

`PVBusRouterControl` provides the following behaviors:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

filter()

```
slave behavior filter(
        const pv::TransactionAttributes*  attributes_,
        pv::bus_addr_t                    page_base_,
        bool                              is_read_
        ) : unsigned;
```

Return the port that this transaction should be filtered to, based on the attributes and the `page_base_`, which is the address aligned to 4 KiB.

The filter must be consistent with respect to its filtering decisions and so they must be statically determined.

The return value is a port number of `pvbus_m`, or either of the special values:

PVBUSROUTER_ABORT
: Abort all accesses

PVBUSROUTER_IGNORE
: Treat all accesses as Read-As-Zero, Writes Ignored (**RAZ/WI**)

Any other value is considered an error.

2.55 PVBusSlaveControl protocol

Defined in `$PVLIB_HOME/LISA/PVBusSlaveControlProtocol.lisa`.

About PVBusSlaveControl

Allow a component to configure its PVBusSlave subcomponent.

This gives it control over mapping regions of device memory to be RAM, ROM, or device memory.

The PVBusSlave automatically routes incoming bus accesses according to this configuration. Accesses to device memory, or writes to ROM memory, are routed to the device port, which the component should use to provide implementations of the `read()` and `write()` behaviors.

`PVBusSlaveControl` provides the following behaviors:

closeRegionIterHandle()

```
slave behavior closeRegionIterHandle(uint32_t iter_handle) : void;
```

A caller may close an iterator opened by `getRegionIterHandle()` at any time using `closeRegionIterHandle()`. This deallocates the iterator and further uses of the handle are invalid.

configure()

```
slave behavior configure(pv::slave_config_t*) : void;
```

Allow configuration of the transactions that are accepted by a PVBusSlave. By default the slave accepts read and write transactions.

The `slave_config_t` class provides the following methods to extend the set of accepted transactions:

- `acceptACE_CleanShared_CleanInvalid_MakeInvalid()`
- `acceptACE_CleanUnique_MakeUnique()`
- `acceptEvict()`
- `acceptMemoryBarriers()`
- `acceptPrefetchOnly()`
- `acceptExclusiveTransactions()`

getNextRegionInfo()

```
slave behavior getNextRegionInfo(uint32_t iter_handle,
                                 pv::PVBusSlaveRegionInfo *info) : bool;
```

After calling `getRegionIterHandle()`, the caller may repeatedly call `getNextRegionInfo()` with the provided `iter_handle`. If a region is found, the behavior returns true and the `info` struct is written to if the pointer is non-null. The region's data may be accessed using `getReadStorage()` or `getWriteStorage()`.

Regions may be returned in any order, and may be of any size or alignment, but no two regions overlap.

An implementation may decide not to report regions that have been allocated, but filled entirely with the default fill pattern, or regions allocated, but containing only the data they had at simulation start.

On reaching the last region, the iterator is automatically closed. If the handle is invalid or there are no further regions, the behavior returns false.

getReadStorage()

```
slave behavior getReadStorage(pv::bus_addr_t address,
                              pv::bus_addr_t *limit) : const uint8_t*;
```

Get read access to the underlying memory storage provided by the PVBusSlave. The parameters are:

`address`
: Byte address to request access to.

`limit`
: Returns the address limit for the contiguous region.

The returned pointer can be used to directly access all memory locations from `address` to `limit-1`. The returned pointer is only guaranteed to remain valid until the next bus access or simulation cycle.

Modifying memory using `getWriteStorage()` does not inform any of the global exclusive monitors of the update.

getRegionIterHandle()

```
slave behavior getRegionIterHandle() : uint32_t;
```

An iterator-like API that allows a PVBusSlave that provides storage to report all the regions of the address space that have backing store.

The iteration begins by calling `getRegionIterHandle()`. This allocates an iterator and if successful, returns a non-zero `iter_handle` to identify it.

getWriteStorage()

```
slave behavior getWriteStorage(pv::bus_addr_t address,
                               pv::bus_addr_t *limit) : uint8_t*;
```

Get write access to the underlying memory storage provided by the PVBusSlave. The parameters are:

address
: Byte address to request access to.

limit
: Returns the address limit for the contiguous region.

The returned pointer can be used to directly access all memory locations from `address` to `limit-1`. The returned pointer is only guaranteed to remain valid until the next bus access or simulation cycle.

Modifying memory using `getWriteStorage()` does not inform any of the global exclusive monitors of the update.

provideReadStorage()

```
optional slave behavior provideReadStorage(pv::bus_addr_t device_base,
                                           pv::bus_addr_t device_limit,
                                           const uint8_t *storage) : void;
```

Allows a device to provide its own memory region to implement memory storage. For example, a device may want to ensure that the underlying memory is implemented in one contiguous region, or is allocated from a special region, for example video memory or memory-mapped memory.

The caller must allow the PVBusSlave to take ownership of all accesses to this memory. In other words, the caller must call `getWriteStorage()` before modifying the contents of this memory region.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`device_base` and `device_limit` must be 4 KB-aligned.

Read latency for the range, which is used when Timing Annotation is enabled, is set from the PVBusSlave `read_latency` parameter.

provideReadStorageEx()

```
slave behavior provideReadStorageEx(pv::bus_addr_t device_base,
                                        pv::bus_addr_t device_limit,
                                        const uint8_t *storage,
                                        double read_latency) : void;
```

This behavior is the same as `provideReadStorage()` but with an additional parameter to specify an average latency per byte, which is used when Timing Annotation is enabled.

provideReadWriteStorage()

```
optional slave behavior provideReadWriteStorage(
                                       pv::bus_addr_t device_base,
                                       pv::bus_addr_t device_limit,
                                       uint8_t *storage) : void;
```

Allows a device to provide its own memory region to implement memory storage. For example, a device may want to ensure that the underlying memory is implemented in one contiguous region, or is allocated from a special region, for example video memory or memory-mapped memory.

The caller must allow the PVBusSlave to take ownership of all accesses to this memory. In other words, the caller must call `getWriteStorage()` before modifying the contents of this memory region.

`device_base` and `device_limit` must be 4 KB-aligned.

Read and write latencies for the range, which are used when Timing Annotation is enabled, are set from the PVBusSlave `read_latency` and `write_latency` parameters.

provideReadWriteStorageEx()

```
slave behavior provideReadWriteStorageEx(
                                       pv::bus_addr_t device_base,
                                       pv::bus_addr_t device_limit,
                                       uint8_t *storage,
                                       double read_latency,
                                       double write_latency) : void;
```

This behavior is the same as `provideReadWriteStorage()` but with an additional parameter to specify an average latency per byte, which is used when Timing Annotation is enabled.

provideWriteStorage()

```
optional slave behavior provideWriteStorage(pv::bus_addr_t device_base,
                                                pv::bus_addr_t device_limit,
                                                uint8_t *storage) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Allows a device to provide its own memory region to implement memory storage. For example, a device may want to ensure that the underlying memory is implemented in one contiguous region, or is allocated from a special region, for example video memory or memory-mapped memory.

The caller must allow the PVBusSlave to take ownership of all accesses to this memory. In other words, the caller must call `getWriteStorage()` before modifying the contents of this memory region.

`device_base` and `device_limit` must be 4 KB-aligned.

Write latency for the range, which is used when Timing Annotation is enabled, is set from the PVBusSlave `write_latency` parameter.

provideWriteStorageEx()

```
slave behavior provideWriteStorageEx(pv::bus_addr_t device_base,
                                     pv::bus_addr_t device_limit,
                                     uint8_t *storage,
                                     double write_latency) : void;
```

This behavior is the same as `provideWriteStorage()` but with an additional parameter to specify an average latency per byte, which is used when Timing Annotation is enabled.

reset()

```
slave behavior reset() : void;
```

Signal a reset of the bus slave interface.

This is equivalent to an assert of the reset signal.

setAccess()

```
slave behavior setAccess(pv::bus_addr_t base,
                         pv::bus_addr_t top,
                         pv::accessType type,
                         pv::accessMode mode) : void;
```

Define how accesses are routed for a given range of device addresses. The parameters are:

base

Start address of the range to be configured, 4 KB-aligned.

top

End address, 4 KB-aligned.

type

Type of access to configure. Possible values:

- `ACCESSTYPE_READ`
- `ACCESSTYPE_WRITE`
- `ACCESSTYPE_RW`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

mode

The new mode for accesses.

The following access modes control how to treat accesses of the selected type, within the chosen range:

ACCESSMODE_MEMORY

Access data storage, which is managed by the PVBusSlave.

ACCESSMODE_DEVICE

Route request to the device port on the slave.

ACCESSMODE_ABORT

Generate an abort on the transaction.

ACCESSMODE_IGNORE

Ignore the transaction. Reads return 0.

setFillPattern()

```
slave behavior setFillPattern (uint32_t fill1, uint32_t fill2) : void;
```

Set the default fill pattern for RAM or ROM regions. This should be called before any memory accesses occur, and allows memory to be prefilled with an alternating two-word pattern.

2.56 PVC2C protocol

Defined in `$PVLIB_HOME/LISA/PVC2CProtocol.lisa`.

About PVC2C protocol

PVC2C protocol models chip-to-chip connections. The data transfer in PVC2C is unidirectional, which is similar to CXS. Therefore, there is a dedicated interface for each transmitter and receiver.

`PVC2C` provides the following behaviors:

discover_pvc2c_chips()

```
slave behavior discover_pvc2c_chips(pvc2c::pvc2c_discovery_req_t*) : void;
```

get_haid()

```
slave behavior get_haid() : pvc2c::haid_t;
```

get_pvc2c_properties()

```
slave behavior get_pvc2c_properties() : pvc2c::pvc2c_port_properties_t;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.57 PVCacheDebugRam protocol

Defined in `$PVLIB_HOME/LISA/PVCache_DebugRamProtocol.lisa`.

`PVCacheDebugRam` provides the following behaviors:

getAttribute()

```
slave behavior getAttribute(pv::PVCache_DebugRamPort::Attribute attribute, unsigned
 index) : uint64_t;
```

Get an attribute value from the cache.

This interface exposes certain numeric attributes of the cache. The parameters are:

attribute
: Selects the attribute value to return. Must be one of the A_* enum constants specified in `PVCache_DebugRamPort.h`.

index
: Currently unused and must be set to 0. It is intended to expose arrays of attributes, for example per-set/way attributes.

This behavior returns a numeric attribute value. It returns 0 for unknown or unsupported attributes or for index out of range.

getConfig()

```
slave behavior getConfig(pv::PVCache_DebugConfig& config) : void;
```

Obtain cache configuration, mainly geometry for now.

getDeferredActions()

```
slave behavior getDeferredActions() : sg_deferred_actions::deferred_actions_t*;
```

Get a handle to the `deferred_actions_t` object used by the implementation of the cache system.

The cache system has the ability to defer internal events until a re-entrant safe point by pushing them onto a `deferred_actions_t` object.

This method gets a handle to the object for validation purposes.

peekLine()

```
slave behavior peekLine(const pv::PVCache_DebugFilter& filter,
 pv::PVCache_DebugLine& buffer) : bool;
```

Peek the cache line location, tag, and content. The parameters are:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

filter

Reference to a cache lookup filter. Filters can be constructed for lookup by address, index, set/way, and so on.

buffer

Reference to a buffer for the returned cache line location, tag, and content. If `buffer` is constructed with a zero length cache line, the cache line content is not returned.

If cache lookup is by address and fails to hit, the `location` member of `buffer` is updated with the first way in the cache where the cache line could have been.

This behavior returns the cache lookup/hit status. If false, the tag and the content in the buffer are not updated.

For lookup by index or set/way, if the selected line is within the boundary of the cache, the routine returns true and the `tag.valid` data member in `buffer` indicates whether the cache line, tag, and content members contain valid data.

For lookup by address, the return status indicates a hit or miss in the cache. A miss does not cause any further transactions downstream or allocation into the cache.

pokeLine()

```
slave behavior pokeLine(const pv::PVCache_DebugFilter& filter, const
 pv::PVCache_DebugLine& buffer) : bool;
```

Poke the cache line tag and content data.

The cache may not be able to accept all cache line tag modifications and may ignore some or all such modifications. But overwriting cache line content is always supported by the cache.

The parameters are:

filter

Reference to a cache lookup filter. Filters can be constructed for lookup by address, index, set/way and so on.

buffer

Reference to a buffer with cache line tag and content data to set. The cache line location member in `buffer` is ignored. If `buffer` is constructed with a zero length cache line, the cache line content is not set.

This behavior returns the cache lookup/hit status. For lookup by index or set/way, if the selected line is within the boundary of the cache, the routine returns true and the cache line state data inside the cache is modified.

For lookup by address, the return status indicates a hit or miss in the cache. A miss does not cause any further transactions downstream, allocation into the cache, or modification of cache line state.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.58 PVCacheMaintenance protocol

Defined in `$PVLIB_HOME/LISA/PVCacheMaintenance.lisa`.

`PVCacheMaintenance` provides the following behaviors:

cacheSizeOverride()

```
slave behavior cacheSizeOverride( unsigned cache_line_size_in_bytes_,
                                  unsigned number_of_sets_,
                                  unsigned number_of_ways_ ) : void;
```

Private internal functionality of the cache implementation. Do not use.

Override the cache size. All the contents of the cache will be lost at this point. If any lines have been allocated then ACE state may be corrupted across the system. The caller is responsible for ensuring that no transactions are in flight when calling this.

clean_all()

```
slave behavior clean_all() : void;
```

Clean the entire cache, flushing all dirty lines.

clean_and_invalidate_all()

```
optional slave behavior clean_and_invalidate_all() : void;
```

Clean and invalidate the entire cache, evicting all lines without cleaning.

clean_and_invalidate_by_addr()

```
optional slave behavior clean_and_invalidate_by_addr(
        pv::bus_addr_t addr, bool is_non_secure) : void;
```

Clean and invalidate by PA. This should be used in preference to `clean_by_addr()` followed by `invalidate_by_addr()` as a write could occur between the two and then the `invalidate_by_addr()` would invalidate dirty data.

clean_and_invalidate_by_addr_by_pas()

```
optional slave behavior clean_and_invalidate_by_addr_by_pas(
        pv::bus_addr_t addr, pv::PASpace_t pas) : void;
```

clean_and_invalidate_by_set_way()

```
optional slave behavior clean_and_invalidate_by_set_way(
        uint32_t set, uint32_t way, bool is_non_secure) : void;
```

Clean and invalidate by set/way. Secure evicts any, non-secure only evicts non-secure entries.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

clean_and_invalidate_by_set_way_by_pas()

```
optional slave behavior clean_and_invalidate_by_set_way_by_pas(
        uint32_t set, uint32_t way, pv::PASpace_t pas) : void;
```

clean_by_addr()

```
slave behavior clean_by_addr(pv::bus_addr_t addr, bool is_non_secure) : void;
```

Clean by PA, evicting the lines that match.

clean_by_addr_by_pas()

```
optional slave behavior clean_by_addr_by_pas(
        pv::bus_addr_t addr, pv::PASpace_t pas) : void;
```

clean_by_set_way()

```
slave behavior clean_by_set_way(uint32_t set, uint32_t way, bool is_non_secure) :
 void;
```

Clean by set/way. Secure evicts any, non-secure only evicts non-secure entries.

clean_by_set_way_by_pas()

```
optional slave behavior clean_by_set_way_by_pas(
        uint32_t set, uint32_t way, pv::PASpace_t pas) : void;
```

enableLocalDVMMessageProcessing()

```
slave behavior  enableLocalDVMMessageProcessing( bool on_ ) : void;
```

Enable or disable whether the current cache handles DVM messages locally.

When the cache was created, there may have been the option of telling it to startup to ignore_local_dvm_messages or not. This now makes that a dynamic behaviour.

enableUpstreamAcceptsDVM()

```
slave behavior  enableUpstreamAcceptsDVM( unsigned upstream_port_, bool on_ ) :
 void;
```

Enable or disable which of the upstream ports are currently accepting DVM snoop requests.

This is used to override the local cache behavior.

enableUpstreamAcceptsSnoopRequests()

```
slave behavior  enableUpstreamAcceptsSnoopRequests( unsigned upstream_port_, bool
 on_ ) : void;
```

Enable or disable which of the upstream ports are currently accepting ACE snoop requests.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

This is used to override the local cache behavior.

find_in_cache()

```
slave behavior find_in_cache(
        const pv::MemoryAttributes &memory_attributes_,
        pv::bus_addr_t              address_
        ) : bool;
```

Test whether this layer of cache contains a given line.

Note

The security world is encoded in the `memory_attributes_` parameter. The exclusive, cache maintenance, and debug flags are ignored.

getCacheStateModelled()

```
slave behavior  getCacheStateModelled() : bool;
```

Get the current value of “cache state modelled”.

getEnabled()

```
slave behavior  getEnabled(bool is_non_secure) : bool;
```

Get the enabled state.

getLockDown()

```
slave behavior  getLockDown() : uint32_t;
```

Get a bit array controlling which cache ways are locked down.

invalidate_all()

```
slave behavior invalidate_all() : void;
```

Invalidate the entire cache, evicting all lines without cleaning.

invalidate_by_addr()

```
slave behavior invalidate_by_addr(pv::bus_addr_t addr, bool is_non_secure) : void;
```

Invalidate by PA, evicting the lines that match.

invalidate_by_addr_by_pas()

```
optional slave behavior invalidate_by_addr_by_pas(
        pv::bus_addr_t addr, pv::PASpace_t pas) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

invalidate_by_set_way()

```
slave behavior invalidate_by_set_way(uint32_t set, uint32_t way, bool
 is_non_secure) : void;
```

Invalidate by set/way. Secure evicts any, non-secure only evicts non-secure entries.

invalidate_by_set_way_by_pas()

```
optional slave behavior invalidate_by_set_way_by_pas(
        uint32_t set, uint32_t way, pv::PASpace_t pas) : void;
```

preload()

```
slave behavior preload(
        const pv::MemoryAttributes &memory_attributes_,
        pv::bus_addr_t                address_,
        bool                          make_unique_,
        sg::ticks_t&                  local_time_
        ) : pv::Tx_Result;
```

Preload a line into this layer of the cache.

If you ask for it to be unique, it performs all the cache coherency operations to make it unique to that cache, assuming it is shared. This means that a write to that cache does not have to perform extra coherency operations, assuming it is still unique in the cache at that point. This is intended as a primitive to model preload for read and preload for write.

Note

The security world is encoded in the `memory_attributes_` parameter. The exclusive, cache maintenance, and debug flags are ignored.

setBitmapOfDownstreamPortsThatIsDomainBoundaryForReallyNonShared()

```
optional slave behavior
 setBitmapOfDownstreamPortsThatIsDomainBoundaryForReallyNonShared(uint64_t) : void;
```

Override the `bitmap_of_downstream_ports_that_is_the_domain_boundary_for_really_non_shared` parameter.

This bitmap is used to indicate whether an nsh request treated as sh should be recovered back to nsh when it goes out to the downstream.

setBitmapOfUpstreamPortsThatTreatNonSharedAsShared()

```
optional slave behavior setBitmapOfUpstreamPortsThatTreatNonSharedAsShared(uint64_t
 bitmap_of_upstream_ports_that_treat_nsh_as_sh) : void;
```

Override the `bitmap_of_upstream_ports_that_treat_non_shared_as_shared` parameter.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

This bitmap is used to indicate that a non-shared request is treated as shared within the cluster or cache.

setCacheStateModelled()

```
slave behavior  setCacheStateModelled(bool modelled) : void;
```

Set the “cache state modelled” state.

setEnabled()

```
slave behavior  setEnabled(bool enabled, bool is_non_secure) : void;
```

Set the enabled state.

setIsInner()

```
slave behavior setIsInner(bool is_inner) : void;
```

Set the domain for the cache as inner or outer.

setLockDown()

```
slave behavior setLockDown(uint32_t lock) : void;
```

Set a bit array controlling which cache ways are locked down.

setNoDistinctionBetweenIshAndOsh()

```
slave behavior setNoDistinctionBetweenIshAndOsh(bool
 no_distinction_between_ish_and_osh_) : void;
```

Reconfigure whether the cache treats the distinction between Inner-Shareability and Outer-Shareability as meaningful when matching attributes.

Note

The Outer/Inner Shareability distinction is preserved on the bus.

Note

The caller is responsible for ensuring that no transactions are in flight when calling this behaviour.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.59 PVDevice protocol

Defined in `$PVLIB_HOME/LISA/PVDeviceProtocol.lisa`.

About PVDevice protocol

Simple bus protocol that allows a LISA component to handle bus read/write transactions using a PVBusSlave subcomponent.

Examples of usage:

```
component SimpleSlave
{
    composition
    {
        bus_slave : PVBusSlave(size = 0x1000);
    }
    connection
    {
        self.pvbus_s => bus_slave.pvbus_s;
        bus_slave.device => self.device;
    }

    slave port <PVBus> pvbus_s;

    internal slave port<PVDevice> device
    {
        behavior read(pv::ReadTransaction tx) : pv::Tx_Result
        {
            switch(tx.getAddress() & ~3)
            {
            case 0:  return tx.setReturnData32(0x12345678);
            default: return tx.generateAbort();
            }
        }
        behavior write(pv::WriteTransaction tx) : pv::Tx_Result
        {
            uint32_t data = tx.getData32();
            tx.writeComplete();
        }
        behavior debugRead(pv::ReadTransaction tx) : pv::Tx_Result
        {
            return device.read(tx);
        }
        behavior debugWrite(pv::WriteTransaction tx) : pv::Tx_Result
        {
            return device.write(tx);
        }
    }
}
```

`PVDevice` provides the following behaviors:

debugRead()

```
slave behavior debugRead(pv::ReadTransaction tx) : pv::Tx_Result;
```

Enable the device to handle a debug read transaction.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

debugWrite()

```
slave behavior debugWrite(pv::WriteTransaction tx) : pv::Tx_Result;
```

Enable the device to handle a debug write transaction.

read()

```
slave behavior read(pv::ReadTransaction tx) : pv::Tx_Result;
```

Enable the device to handle a bus read transaction.

revokePrefetch()

```
master behavior revokePrefetch(pv::RevokeTransaction* tx,
 pv::range_t<pv::bus_addr_t> range) : void;
```

Allow the slave to revoke any prefetch information given to the master.

This revokes both read and write prefetches for the range given. The revoke transactions can be obtained using `tx.getPayload()->getRevokeTransaction()`.

See the equivalent behaviour in `PVBus.h` for more information.

write()

```
slave behavior write(pv::WriteTransaction tx) : pv::Tx_Result;
```

Enable the device to handle a bus write transaction.

2.60 PVTransactionMaster protocol

Defined in `$PVLIB_HOME/LISA/PVTransactionMasterProtocol.lisa`.

About PVTransactionMaster protocol

This protocol exists to allow bus masters to instantiate `TransactionGenerator` objects on the control port of a PVBusMaster subcomponent.

Any number of `TransactionGenerator` objects can be created from a single PVBusMaster.

They should be allocated at startup, because allocating a new `TransactionGenerator` for each transaction is expensive.

It is most efficient to have one `TransactionGenerator` for each data stream that is being accessed. For example, to get maximum efficiency from the PVBus system, a DMA memory transfer should use one generator for the reads and one for the writes.

The `TransactionGenerator` class is defined in `$PVLIB_HOME/include/pv/PVBusMaster.h`.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`PVTransactionMaster` provides the following behaviors:

createRandomContextTransactionGenerator()

```
slave behavior createRandomContextTransactionGenerator() :
 pv::RandomContextTransactionGenerator*;
```

Return a new instance of a `RandomContextTransactionGenerator` object.

createStreamingTransactionGenerator()

```
slave behavior createStreamingTransactionGenerator() :
 pv::StreamingTransactionGenerator*;
```

Return a new instance of a `StreamingTransactionGenerator` object.

createTransactionGenerator()

```
slave behavior createTransactionGenerator() : pv::TransactionGenerator*;
```

Return a new instance of a `TransactionGenerator` object.

reset()

```
slave behavior reset() : void;
```

Signal a reset of the bus master interface. This is equivalent to a deassert of the reset signal.

2.61 PVWriteBuffer_BarrierPort protocol

Defined in `$PVLIB_HOME/LISA/PVWriteBuffer.lisa`.

`PVWriteBuffer_BarrierPort` provides the following behaviors:

CleanByAddr()

```
slave behavior CleanByAddr(bus_addr_t addr, bool ns) : void;
```

CleanByAddrNSNSE()

```
slave behavior CleanByAddrNSNSE(bus_addr_t addr, bool ns, bool nse) : void;
```

CleanByAddrPAs()

```
slave behavior CleanByAddrPAs(bus_addr_t addr, pv::PASpace_t pas) : void;
```

notify()

```
slave behavior notify(PVWriteBufferComponentBarrier_t type) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.62 PVWriteBuffer_SErrorPort protocol

Defined in `$PVLIB_HOME/LISA/PVWriteBuffer.lisa`.

`PVWriteBuffer_SErrorPort` provides the following behaviors:

notify()

```
slave behavior notify(const Tx_Result& result,
                      bus_addr_t address,
                      const Payload& payload,
                      const uint8_t* faultp,
                      PASpace_t pas) : void;
```

2.63 PVWriteBuffer_VmidBarrierPort protocol

Defined in `$PVLIB_HOME/LISA/PVWriteBuffer.lisa`.

`PVWriteBuffer_VmidBarrierPort` provides the following behaviors:

notify()

```
slave behavior notify(PVWriteBufferComponentBarrier_t type, unsigned vmid) : void;
```

2.64 SC_ClockRateControl protocol

Defined in `$PVLIB_HOME/examples/SystemCExport/Common/Protocols/LISA/SC_ClockRateControlProtocol.lisa`.

About SC_ClockRateControl protocol

Allow systems to dynamically modify the multiply/divide ratio of a ClockDivider component.

If a ClockDivider's ratio is changed, the frequency of its `clk_out` signal is immediately recalculated, along with any clocks derived from that signal.

Any active ClockTimers will automatically compute the number of ticks elapsed so far at the old clock rate, and continue counting down at the new rate. This may introduce a slight rounding error of a fraction of a tick.

`SC_ClockRateControl` provides the following behaviors:

set64_m()

```
master behavior set64_m(uint64_t mul, uint64_t div) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Set clock rate. New clock rate = mul / div.

set64_s()

```
slave behavior set64_s(uint64_t mul, uint64_t div) : void;
```

Set clock rate. New clock rate = mul / div.

set_m()

```
master behavior set_m(uint32_t mul, uint32_t div) : void;
```

Set clock rate. New clock rate = mul / div.

set_s()

```
slave behavior set_s(uint32_t mul, uint32_t div) : void;
```

Set clock rate. New clock rate = mul / div.

2.65 SC_ClockSignal protocol

Defined in `$PVLIB_HOME/examples/SystemCExport/Common/Protocols/LISA/SC_ClockSignalProtocol.lisa`.

About SC_ClockSignal protocol

SystemC export equivalent of the LISA+ ClockSignal protocol.

A ClockSignal port represents a timebase of a given frequency. This is an opaque port type. It contains no user-accessible behavior.

ClockSignal output ports are provided on the following library components:

MasterClock
: Produces a clock signal at a base clock rate, which can nominally be considered to be 1Hz.

ClockDivider
: Can be used to take an input ClockSignal from a MasterClock or from another ClockDivider and generate an output that is related to the input signal by a given ratio.

ClockSignals can be used as input to CpuComponents, to define the core clock rate. They can also be used to drive the clock port of a ClockTimer component, which can be used to generate events in the scheduler.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Note

A ClockSignal does not actually define a fixed square-wave signal. It merely defines a frequency that can be used by counter timers.

Example system using ClockSignal

```
composition {
  masterclock : MasterClock;
  div_24MHz : ClockDivider(div = 1, mul = 24000000);
  timer : ClockTimer;
}
master port<TimerControl> timer_control;
slave port<TimerCallback> timer_callback {
  behavior signal() : uint32_t {
    // handle timed event here
    // ...
    // reschedule in 10 ticks of input clock
  }
}
behavior start_timer() {
    // start timer counting 10 ticks
}
connection {
  masterclock.clk_out  => div_24MHz.clk_in;
  div_24MHz.clk_out    => timer.clk_in;
  self.timer_control   => timer.timer_control;
  timer.timer_callback => self.timer_callback;
}
```

`SC_ClockSignal` provides the following behaviors:

`current_ticks_m()`

```
master behavior current_ticks_m() : uint64_t;
```

Private internal method used between Scheduler components.

`current_ticks_s()`

```
slave behavior current_ticks_s() : uint64_t;
```

Private internal method used between Scheduler components.

`get_clock_m()`

```
master behavior get_clock_m() : sg::FrequencySource*;
```

Private internal method used between Scheduler components.

`get_clock_s()`

```
slave behavior get_clock_s() : sg::FrequencySource*;
```

Private internal method used between Scheduler components.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`rate_in_hz_m()`

```
master behavior rate_in_hz_m() : double;
```

Private internal method used between Scheduler components.

`rate_in_hz_s()`

```
slave behavior rate_in_hz_s() : double;
```

Private internal method used between Scheduler components.

`set_clock_m()`

```
master behavior set_clock_m(sg::FrequencySource* _sg_frequencysource_0) : void;
```

Private internal method used between Scheduler components.

`set_clock_s()`

```
slave behavior set_clock_s(sg::FrequencySource* _sg_frequencysource_0) : void;
```

Private internal method used between Scheduler components.

2.66 SC_VirtualEthernet protocol

Defined in `$PVLIB_HOME/examples/SystemCExport/Common/Protocols/LISA/SC_VirtualEthernetProtocol.lisa`.

About SC_VirtualEthernet protocol

SystemC equivalent of VirtualEthernet protocol.

`SC_VirtualEthernet` provides the following behaviors:

`send_to_master_m()`

```
master behavior send_to_master_m(EthernetFrame* frame) : void;
```

`send_to_slave_s()`

```
slave behavior send_to_slave_s(EthernetFrame* frame) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.67 SMMUv3AEMIdentifyProtocol protocol

Defined in `$PVLIB_HOME/LISA/SMMUv3AEMIdentifyProtocol.lisa`.

About SMMUv3AEMIdentifyProtocol protocol

Architecturally, a transaction comes into the SMMU model with the following side band signals:

- Security State Determination (SSD):

  0

  Transaction belongs to a device controlled by the secure world

  1

  Transaction belongs to a device controlled by the non-secure world

  2

  Transaction belongs to a device controlled by the root world

  3

  Transaction belongs to a device controlled by the realm world

- StreamID
- SubStreamID and SubStreamID valid

How these are transported in the system is SoC-dependent.

The SMMU model requires that the SoC provides a way of determining this information by providing the `identify()` behaviour.

`SMMUv3AEMIdentifyProtocol` provides the following behaviors:

identify()

```
slave behavior identify(
        unsigned                            tbu_number_,
        const pv::TransactionAttributes*    attributes_,
        bool*                               out_ssd_ns_,
        unsigned*                           out_streamid_,
        unsigned*                           out_substreamid_ // ~0u if no substreamid
        ) : void;
```

identify_2()

```
optional slave behavior identify_2(
        unsigned                                          tbu_number_,
        const pv::TransactionAttributes*                  attributes_,
        unsigned*                                         out_ssd_,     // 0 -- s, 1
 -- ns, 2 -- rt, 3 -- rl
        uint64_t*                                         out_streamid_,    // ~0ull
 if NoStreamID
        unsigned*                                         out_substreamid_, // ~0u if
 no substreamid
        // Added between 11.16 and 11.17
        SMMUv3AEM::smmuv3aem_identify_protocol_extra_t* out_extra_ // For NoStreamID
 only
        ) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.68 SchedulerInterfaceControl protocol

Defined in `$PVLIB_HOME/LISA/SchedulerInterfaceControlProtocol.lisa`.

About SchedulerInterfaceControl protocol

This protocol is used to access the Fast Models scheduler.

`SchedulerInterfaceControl` provides the following behaviors:

`waitTicks()`

```
slave behavior waitTicks(uint64_t ticks) : void;
```

Let the time of the calling thread advance by `ticks`, relative to `clk_in`.

2.69 SchedulerThreadControl protocol

Defined in `$PVLIB_HOME/LISA/SchedulerThreadControlProtocol.lisa`.

About SchedulerThreadControl protocol

This protocol is used to control the behavior of the SchedulerThread component and also to run the actual thread code.

`SchedulerThreadControl` provides the following behaviors:

`setupThread()`

```
slave behavior setupThread(unsigned index, void *args, const
 sg::SchedulerThreadParameters *parameters) : void;
```

Set up a new thread.

This function must only be called if more than one thread should be handled through this `SchedulerThread` instance. A default thread is always started with `index=0` and `args=0`.

Calling this function may or may not yield to other threads, not necessarily the newly-created thread.

Specifying `parameters = 0` has the same semantics as specifying a default constructed `SchedulerThreadParameters()`. The instance pointed to by `parameters` is not used after `setupThread()` returns.

`threadProc()`

```
master behavior threadProc(unsigned index, void *args) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Actual thread function. The `index` and `args` parameters are set to 0, 0 for the default thread and are specified in the `setupThread(index args)` call for all additional threads.

`waitTicks()`

```
slave behavior waitTicks(uint64_t ticks) : void;
```

Let the time of this thread advance by `ticks`, relative to `clk_in`.

This is the same as `SchedulerInterfaceControl.waitTicks()`.

2.70 SchedulerThreadEventControl protocol

Defined in `$PVLIB_HOME/LISA/SchedulerThreadEventControlProtocol.lisa`.

About SchedulerThreadEventControl protocol

This protocol is used to control the behavior of the `ThreadSignal` component.

`SchedulerThreadEventControl` provides the following behaviors:

`notify()`

```
slave behavior notify() : void;
```

Unblock any Fast Models threads waiting on this event.

Ignored if no threads are waiting. The event is not buffered until another thread tries to wait.

`wait()`

```
slave behavior wait() : void;
```

Block the current Fast Models thread, for example the `SchedulerThread` instance, until anything calls `notify()`.

2.71 SerialData protocol

Defined in `$PVLIB_HOME/LISA/SerialData.lisa`.

About SerialData protocol

This protocol is implemented as a parallel interface for efficiency. All communication is driven by the master port.

`SerialData` provides the following behaviors:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`dataReceive()`

```
peer behavior dataReceive() : uint16_t;
```

Used by the master to receive data from the slave.

Table 2-3: Bits for `dataReceive()`

Bits	Function
15:13	Reserved
12	Set when no data available for reading
11	Reserved
10	Break error
9:8	Reserved
7:0	Receive data

`dataTransmit()`

```
peer behavior dataTransmit(uint16_t data) : void;
```

Used by the master to send data to the slave.

Table 2-4: Bits for `dataTransmit()`

Bits	Function
15:8	Reserved
7:0	Transmit data

`signalsGet()`

```
peer behavior signalsGet() : uint8_t;
```

Used by the master to get the current signal status.

Table 2-5: Bits for `signalsGet()`

Bits	Function
7:4	Reserved
3	DCD
2	DSR
1	CTS
0	RI

`signalsSet()`

```
peer behavior signalsSet(uint8_t signal) : void;
```

Used by the master to set the current signal status.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Table 2-6: Bits for `signalsSet()`

Bits	Function
7	Out1
6	Out2

2.72 Signal protocol

Defined in `$PVLIB_HOME/LISA/SignalProtocol.lisa`.

About Signal protocol

The Signal protocol provides a single method that allows a master to set or clear a signal. This can be used for any level-sensitive signalling

The `sg::Signal::State` enumeration provides two values:

```
sg::Signal::Set
sg::Signal::Clear
```

`Signal` provides the following behaviors:

`setValue()`

```
peer behavior setValue(sg::Signal::State) : void;
```

Set signal value. Allowed values:

- `sg::Signal::Set`
- `sg::Signal::Clear`

2.73 StateSignal protocol

Defined in `$PVLIB_HOME/LISA/SignalProtocol.lisa`.

About StateSignal protocol

The StateSignal protocol provides one method that allows a master to set or clear a signal and another allowing the master to retrieve the current state from a slave. This can be used for any level-sensitive signalling

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

The `sg::Signal::State` enumeration provides two values:

```
sg::Signal::Set
sg::Signal::Clear
```

`StateSignal` provides the following behaviors:

getValue()

```
peer behavior getValue() : sg::Signal::State;
```

Returns the state of the signal.

setValue()

```
peer behavior setValue(sg::Signal::State) : void;
```

Set the signal value. Allowed values:

- `sg::Signal::Set`
- `sg::Signal::Clear`

2.74 SystemCCoprocBusProtocol protocol

Defined in `$PVLIB_HOME/examples/SystemCExport/Common/Protocols/LISA/SystemCCoprocBusProtocol.lisa`.

`SystemCCoprocBusProtocol` provides the following behaviors:

accessIsNonSecure()

```
slave behavior accessIsNonSecure(void) : bool;
```

accessIsPriv()

```
slave behavior accessIsPriv(void) : bool;
```

addCoprocessor()

```
slave behavior addCoprocessor(Coprocessor*, int num) : void;
```

removeCoprocessor()

```
slave behavior removeCoprocessor(Coprocessor*, int num) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.75 SystemCPChannel protocol

Defined in `$PVLIB_HOME/examples/SystemCExport/Common/Protocols/LISA/SystemCPChannelProtocol.lisa`.

About SystemCPChannel protocol

Protocol used to communicate power state changes between a power controller and a device.

The `sg::PChannel::presp_t` enumeration provides two values:

- `sg::PChannel::ACCEPT`
- `sg::PChannel::DENY`

`SystemCPChannel` provides the following behaviors:

pactive()

```
master behavior pactive (uint32_t pstate) : void;
```

To be implemented by a power controller.

prequest()

```
slave behavior prequest (uint32_t pstate) : pchannel::presp_t;
```

To be implemented by a device.

2.76 SystemCoherencyInterface protocol

Defined in `$PVLIB_HOME/LISA/SystemCoherencyInterface.lisa`.

`SystemCoherencyInterface` provides the following behaviors:

doDownstreamAction()

```
optional slave behavior doDownstreamAction(const
 SystemCoherency::DownstreamAction&) : bool;
```

doUpstreamAction()

```
optional master behavior doUpstreamAction(const SystemCoherency::UpstreamAction&) :
 bool;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.77 TZFilterControl protocol

Defined in `$PVLIB_HOME/LISA/TZFilterUnit.lisa`.

About TZFilterControl protocol

This protocol controls the communication between filter units and control registers in the APB control block.

`TZFilterControl` provides the following behaviors:

checkPermission()

```
optional slave behavior checkPermission(const pv::TransactionAttributes*
 attributes_,
                                    pv::bus_addr_t page_base_,
                                    bool is_read_,
                                    pv::RemapRequest& req_,
                                    bool & abort_on_error_) : bool;
```

Check the permission of the transactions filtered by the filter unit, using the information in the APB control block.

isEnabled()

```
slave behavior isEnabled() : bool;
```

Check if the filter unit is enabled or not. The APB control block controls the unit.

isSecureSlave()

```
optional slave behavior isSecureSlave() : bool;
```

Check if the connected slave is secure or not.

setConfig()

```
optional master behavior setConfig(bool rd_spec_enable, bool wr_spec_enable,
 uint32_t action) : void;
```

Pass the configurations to the filter.

2.78 TZSwitchControl protocol

Defined in `$PVLIB_HOME/LISA/TZSwitch.lisa`.

About TZSwitchControl protocol

Allow secure and normal TrustZone bus signals to be routed separately.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Transactions received on the TZSwitch `pvbus_input` slave port are routed according to a configuration that is set up using parameters and/or the control port. Separate rules can be given for secure and for normal transactions.

Transactions can be routed to one of the two master ports, `pvbus_port_a` or `pvbus_port_b`, can be ignored, or can generate aborts.

`TZSwitchControl` provides the following behaviors:

routeAccesses()

```
slave behavior routeAccesses(TZSwitch_InputFilter input,
                              TZSwitch_RouteOption destination) : void;
```

This behavior takes two arguments:

- `input` selects which types of signals are reconfigured:

  TZINPUT_SECURE

  Change the routing for secure transactions

  TZINPUT_NORMAL

  Change the routing for normal transactions

  TZINPUT_ANY

  Change the routing for all transactions

- `destination` selects how the chosen transactions are routed:

  TZROUTE_IGNORE

  Transactions are ignored. Reads return 0.

  TZROUTE_TO_PORT_A

  Route transactions to `pvbus_port_a`.

  TZROUTE_TO_PORT_B

  Route transactions to `pvbus_port_b`.

  TZROUTE_ABORT

  Cause transactions to generate an abort.

Initial routing is configured using TZSwitch parameters `secure` and `normal` based on the following values:

0

Ignore

1

Port A

2

Port B

3

Abort

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Both default and explicit parameter values are overridden by any runtime calls to `routeAccesses()` on the control port.

2.79 TimerCallback protocol

Defined in `$PVLIB_HOME/LISA/TimerCallbackProtocol.lisa`.

About TimerCallback protocol

When a ClockTimer reaches zero, it invokes the `signal()` behavior on its `timer_callback` port. This allows a component to process a timed callback by implementing this behavior on a slave port. The slave can also return a non-zero value to retrigger the timer.

`TimerCallback` provides the following behaviors:

signal()

```
peer behavior signal() : uint32_t;
```

Invoked when a clock timer reaches zero. If a non-zero value is returned, the clock restarts its countdown from the returned value.

2.80 TimerCallback64 protocol

Defined in `$PVLIB_HOME/LISA/TimerCallbackProtocol64.lisa`.

About TimerCallback64 protocol

When a ClockTimer reaches zero, it invokes the `signal()` behavior on its `timer_callback` port. This allows a component to process a timed callback by implementing this behavior on a slave port. The slave can also return a non-zero value to retrigger the timer.

`TimerCallback64` provides the following behaviors:

signal()

```
peer behavior signal() : uint64_t;
```

Invoked when a clock timer reaches zero. If a non-zero value is returned, the clock restarts its countdown from the returned value.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.81 TimerControl protocol

Defined in `$PVLIB_HOME/LISA/TimerControlProtocol.lisa`.

About TimerControl protocol

This protocol controls the actions of the component. It permits a timer to be set to schedule a callback after a given number of ticks at the rate of the clock input.

If a timer is set while it is counting, it starts counting the new number of ticks without sending the original callback. Canceling a timer when it is not active has no effect.

`TimerControl` provides the following behaviors:

cancel()

```
slave behavior cancel() : void;
```

Cancel the countdown on the active ClockTimer, preventing the callback from being invoked.

isSet()

```
slave behavior isSet() : bool;
```

Test whether the timer is currently actively counting.

remaining()

```
slave behavior remaining() : uint32_t;
```

Return how many ticks remain before the timer's callback event will be signalled.

set()

```
slave behavior set(uint32_t ticks) : void;
```

Start the timer counting for the given number of ticks of its input clock. When the timer reaches zero, the scheduler invokes the `signal()` behaviour on its callback port, see TimerCallback protocol.

2.82 TimerControl64 protocol

Defined in `$PVLIB_HOME/LISA/TimerControlProtocol64.lisa`.

About TimerControl64 protocol

This protocol controls the actions of the component. It permits a timer to be set to schedule a callback after a given number of ticks at the rate of the clock input.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

If a timer is set while it is counting, it starts counting the new number of ticks without sending the original callback. Canceling a timer when it is not active has no effect.

`TimerControl64` provides the following behaviors:

cancel()

```
slave behavior cancel() : void;
```

Cancel the countdown on the active ClockTimer64, preventing the callback from being invoked.

isSet()

```
slave behavior isSet() : bool;
```

Test whether the timer is currently actively counting.

remaining()

```
slave behavior remaining() : uint64_t;
```

Return how many ticks remain before the timer's callback event will be signalled.

set()

```
slave behavior set(uint64_t ticks) : void;
```

Start the timer counting for the given number of ticks of its input clock. When the timer reaches zero, the scheduler invokes the `signal` behaviour on its callback port, see TimerCallback64 protocol.

2.83 VECBProtocol protocol

Defined in `$PVLIB_HOME/examples/LISA/Common/LISA/VECBProtocol.lisa`.

`VECBProtocol` provides the following behaviors:

read()

```
slave behavior read(const uint8_t function, const uint16_t device, uint32_t *
 data) : bool;
```

write()

```
slave behavior write(const uint8_t function, const uint16_t device, const uint32_t
 data) : bool;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.84 VGICComponentTraceExport protocol

Defined in `$PVLIB_HOME/LISA/VGIC_Component.lisa`.

About VGICComponentTraceExport protocol

This protocol is a workaround for a LISA problem where the CADI interface of the VGIC_Component is not exported, but we want to export the trace sources. The trace sources can be artificially exported onto another `sg::ComponentTrace` by using this interface and not exported to the VGIC_Component CADI interface.

To use the VGIC_Component's `export_trace` port, you must set the parameter `export_trace_to_cadi` to false, otherwise the model aborts at run time.

`VGICComponentTraceExport` provides the following behaviors:

exportTrace()

```
optional slave behavior exportTrace(/*sg::ComponentTrace*/void*) : void;
```

2.85 VGICReportingProtocol protocol

Defined in `$PVLIB_HOME/LISA/VGIC_Component.lisa`.

`VGICReportingProtocol` provides the following behaviors:

logErrors()

```
optional slave behavior logErrors( const char* buffer_ ) : void;
```

logFatal()

```
optional slave behavior logFatal( const char* buffer_ ) : void;
```

logWarnings()

```
optional slave behavior logWarnings( const char* buffer_ ) : void;
```

setEnables()

```
optional master behavior setEnables( uint32_t new_enable_ ) : uint32_t;
```

Enable outputs on the behaviours above, returns the old value.

bit[0]

Log warnings enabled.

bit[1]

Log errors enabled.

Non-Confidential

bit[2]

Log fatal enabled.

2.86 Value protocol

Defined in `$PVLIB_HOME/LISA/ValueProtocol.lisa`.

About Value protocol

The Value protocol allows a master to send a 32-bit unsigned value to a slave.

`Value` provides the following behaviors:

`setValue()`

```
optional peer behavior setValue(uint32_t /*value*/) : void;
```

Sets a 32-bit value for the signal.

2.87 ValueState protocol

Defined in `$PVLIB_HOME/LISA/ValueProtocol.lisa`.

About ValueState protocol

The ValueState protocol allows a master to retrieve the current value from a slave.

`ValueState` provides the following behaviors:

`getValue()`

```
peer behavior getValue() : uint32_t;
```

Returns a 32-bit value for the signal.

`setValue()`

```
peer behavior setValue(uint32_t value) : void;
```

Sets a 32-bit value for the signal.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

2.88 ValueState_64 protocol

Defined in `$PVLIB_HOME/LISA/Value64Protocol.lisa`.

About ValueState_64 protocol

The `ValueState_64` protocol allows a master to retrieve the current value from a slave.

`ValueState_64` provides the following behaviors:

`getValue()`

```
peer behavior getValue() : uint64_t;
```

Returns a 64-bit value for the signal.

`setValue()`

```
peer behavior setValue(uint64_t value) : void;
```

Sets a 64-bit value for the signal.

2.89 Value_64 protocol

Defined in `$PVLIB_HOME/LISA/Value64Protocol.lisa`.

About Value_64 protocol

The `Value_64` protocol allows a master to send a 64-bit unsigned value to a slave.

`Value_64` provides the following behaviors:

`setValue()`

```
optional peer behavior setValue(uint64_t /*value*/) : void;
```

Sets a 64-bit value for the signal.

2.90 VirtualEthernet protocol

Defined in `$PVLIB_HOME/LISA/VirtualEthernetProtocol.lisa`.

About VirtualEthernet protocol

The Ethernet frame class encapsulates an Ethernet frame in a broken-up format that is more accessible by components. For information on the class definition, see the `EthernetFrame.h` header file located in `$PVLIB_HOME/include/components/VirtualEthernet/Protocol/`.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`VirtualEthernet` provides the following behaviors:

sendToMaster()

```
master behavior sendToMaster(EthernetFrame* frame) : void;
```

Send an Ethernet frame to the master port.

sendToSlave()

```
slave behavior sendToSlave(EthernetFrame* frame) : void;
```

Send an Ethernet frame to the slave port.

2.91 VisEventRecorderProtocol protocol

Defined in `$PVLIB_HOME/LISA/VisEventRecorderProtocol.lisa`.

About VisEventRecorderProtocol

The VisEventRecorderProtocol is used to play back and record events in the visualisation component of a platform system. The main purpose is for recording GUI benchmarks and regression tests for operating systems. A master port of this protocol is in the Visualisation component and a slave port is in the VisEventRecorder component.

`VisEventRecorderProtocol` provides the following behaviors:

getEvent()

```
slave behavior getEvent(VisEvent *event) : bool;
```

`processEvents()` is called to notify the master component, for example Visualisation, that new events are available.

The new events are retrieved by `getEvent()` from within `processEvents()`.

The slave component decides whether playback is enabled or disabled.

Playback events:

- Return true and fill `event` with the next event if there is one
- Return false if there is no event

It is safe to call this behavior from outside of `processEvents()`. If so, it always returns false.

processEvents()

```
master behavior processEvents() : void;
```

The slave component calls this behavior in the master component to notify the master component that new events are now available and must be processed.

The new events should be retrieved using `getEvent()` from within `processEvents()`.

putEvent()

```
slave behavior putEvent(const VisEvent *event) : void;
```

Record events call this behavior:

- Regardless of whether recording is enabled or disabled
- Even for events that just came from `getEvent()`

The slave component decides whether recording is enabled or disabled.

registerVisRegion()

```
slave behavior registerVisRegion(VisRegion *region, const char *regionName) : void;
```

Called on initialisation. Associates names with `VisRegion` pointers.

The slave component does not access the `VisRegion` objects.

All `VisRegion` objects, usually `VisRenderRegion` and `VisPushButtonRegion`, should be registered, but at least the ones where `VisEvent::region` is used in the event loop.

Use the instance name for the region in the visualisation component as the name. For example `registerVisRegion(myRegion, "myRegion");`

2.92 v7_VGIC_Configuration_Protocol protocol

Defined in `$PVLIB_HOME/LISA/v7_VGIC_Configuration_Protocol.lisa`.

`v7_VGIC_Configuration_Protocol` provides the following behaviors:

getNumberOfCores()

```
slave behavior getNumberOfCores() : unsigned;
```

setManagerIdToCoreNumberMapping()

```
slave behavior setManagerIdToCoreNumberMapping(
        uint64_t manager_id_,
        uint64_t manager_id_mask_,
        unsigned cpu_interface_number_,
        unsigned inout_cluster_number_,
        unsigned inout_cpu_number_in_cluster_
        ) : bool;
```

Non-Confidential

2.93 v8EmbeddedCrossTrigger_controlprotocol protocol

Defined in `$PVLIB_HOME/LISA/v8EmbeddedCrossTrigger.lisa`.

About v8EmbeddedCrossTrigger_controlprotocol protocol

This protocol connects the Cross Trigger Interface (CTI) in processor components to platform-level Cross Trigger Matrix (CTM) components.

This opaque protocol is not exportable across a SystemC interface.

`v8EmbeddedCrossTrigger_controlprotocol` provides the following behaviors:

getComponentIdByte()

```
master behavior getComponentIdByte(unsigned pidn) : uint8_t;
```

getPeripheralIdByte()

```
master behavior getPeripheralIdByte(unsigned pidn) : uint8_t;
```

init()

```
slave behavior init (unsigned number_of_triggers, unsigned intack_mask, unsigned
 number_of_claim_bits, bool has_software_lock, bool has_CTIDEVCTL) : void;
```

initDelayedSysReg()

```
optional slave behavior initDelayedSysReg(SynchronizeSysRegHelper*, bool, bool ) :
 void;
```

isOSUnlockCatchEnabled()

```
optional slave behavior isOSUnlockCatchEnabled() : bool;
```

isResetCatchEnabled()

```
optional slave behavior isResetCatchEnabled() : bool;
```

reg_read()

```
slave behavior reg_read(bool is_memory_mapped, uint32_t addr, bool is_non_secure) :
 uint32_t;
```

reg_write()

```
slave behavior reg_write(bool is_memory_mapped, uint32_t addr, bool is_non_secure,
 uint32_t data) : void;
```

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

reset()

```
optional slave behavior reset() : void;
```

setValue_inputTrigger()

```
slave behavior setValue_inputTrigger(unsigned index, sg::Signal::State state) :
 void;
```

setValue_outputTrigger()

```
master behavior setValue_outputTrigger(unsigned index, sg::Signal::State state) :
 void;
```

3. Components

This chapter describes all model components in Fast Models, organized by component type.

For each component, the documentation includes notes about using the model, describes any deviations in the model from the Technical Reference Manual (TRM), and describes the ports and parameters.

3.1 Component differences

This topic lists the new and changed components in this release.

Differences between 11.29.27 and 11.30.27

The following components were added:

Component	Quality level
ARMC1NanoCT	Preliminary support
ARMC1NanoCT_C1ProCT	C1-Nano r0p0=Preliminary support, C1-Pro r0p0=Preliminary support
ARMC1NanoCT_C1ProCT_C1UltraCT	C1-Nano r0p0=Preliminary support, C1-Pro r0p0=Preliminary support, C1-Ultra r0p0=Preliminary support
ARMC1NanoCT_C1UltraCT	C1-Nano r0p0=Preliminary support, C1-Ultra r0p0=Preliminary support
ARMC1PremiumCT	Preliminary support
ARMC1ProCT	Preliminary support
ARMC1ProCT_C1UltraCT	C1-Pro r0p0=Preliminary support, C1-Ultra r0p0=Preliminary support
ARMC1UltraCT	Preliminary support
BMU	Alpha support
CCSM_F1	N/A
CFM	N/A
CFMM	N/A
CMM	N/A
DMS_SUPER_CSR	Alpha support
DTS	Alpha support
DVFSM	N/A
GICv5	Alpha support
Generic_PLL	N/A
InterruptCombiner	Alpha support
LabellerManagerIdExtendedIdUserFlag	N/A
MMU_L1	Full support
Mali_C10	Full support
Mali_C720AE	Alpha support
Mali_Cxx_streaming_sink	Full support

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Component	Quality level
Mali_G1	Full support
PartialWriteDetector	Full support
RAM_ECC_Checker	Alpha support
UART_MUX	Alpha support
UFS	N/A
V76	Full support

The following components were removed:

Component
ARMCortexA15x1CT
ARMCortexA17x1CT
ARMCortexA5CT
ARMCortexA5MPx1CT
ARMCortexA7x1CT
ARMCortexA8CT
ARMCortexA9MPx1CT
ARMCortexA9UPCT
LabellerMasterIdExtendedIdUserFlag
Mali_C5x_streaming_sink
Mali_C7x_streaming_sink

The following components were changed:

Component	Has the IP revision changed?	Has the quality level changed?	Have ports been added or removed?	Have parameters been added or removed?
AEMvACT	No	No	No	Yes

3.2 AEMv8RMPCT

Defined in `LISA/AEMv8RMPCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see Quality level definitions.

About AEMv8RMPCT

AEMv8RMPCT CPU component.

Iris and MTI instances for AEMv8RMPCT

This model has the following Iris instances:

Name	Instance type
`AEMv8RMPCT`	Cluster_ARMAEMv8-R_MP
`AEMv8RMPCT.AMU`	PVBusLogger
`AEMv8RMPCT.AMU.mapper`	PVBusMapper
`AEMv8RMPCT.DAP`	PVBusLogger
`AEMv8RMPCT.DAP.mapper`	PVBusMapper
`AEMv8RMPCT.MMAP`	PVBusLogger
`AEMv8RMPCT.MMAP.mapper`	PVBusMapper
`AEMv8RMPCT.RAS`	PVBusLogger
`AEMv8RMPCT.RAS.mapper`	PVBusMapper
`AEMv8RMPCT.acp_mapper`	PVBusMapper
`AEMv8RMPCT.cpu0`	ARMAEMv8-R_MP
`AEMv8RMPCT.cpu0.UTLB`	TLB
`AEMv8RMPCT.cpu0.debug_rom`	debug_rom
`AEMv8RMPCT.cpu0.dtlb`	TLB
`AEMv8RMPCT.cpu0.l1dcache`	PVCache
`AEMv8RMPCT.cpu0.l1dcache.upstream[0]`	PVBusSlave
`AEMv8RMPCT.cpu0.l1icache`	PVCache
`AEMv8RMPCT.cpu0.l1icache.upstream[0]`	PVBusSlave
`AEMv8RMPCT.ext_bus`	PVBusLogger
`AEMv8RMPCT.ext_bus.mapper`	PVBusMapper
`AEMv8RMPCT.gic_cpuif_decoder_cluster`	GICv3CPUInterfaceDecoder
`AEMv8RMPCT.global_debug_rom`	debug_rom
`AEMv8RMPCT.l2_cache`	PVCache
`AEMv8RMPCT.l2_cache.upstream[Z]` (where *Z* = 0–16)	PVBusSlave
`AEMv8RMPCT.l2_flusher`	AsyncCacheFlushUnit

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
AEMv8RMPCT.secondary_debug_rom	debug_rom

This model has the following MTI trace components:

Name	Component type
AEMv8RMPCT.AMU	PVBusLogger
AEMv8RMPCT.AMU.mapper	PVBusMapper
AEMv8RMPCT.DAP	PVBusLogger
AEMv8RMPCT.DAP.mapper	PVBusMapper
AEMv8RMPCT.MMAP	PVBusLogger
AEMv8RMPCT.MMAP.mapper	PVBusMapper
AEMv8RMPCT.RAS	PVBusLogger
AEMv8RMPCT.RAS.mapper	PVBusMapper
AEMv8RMPCT.acp_mapper	PVBusMapper
AEMv8RMPCT.cpu0	ARM_AEMv8-R_MP
AEMv8RMPCT.cpu0.UTLB	TLB
AEMv8RMPCT.cpu0.l1dcache	PVCache
AEMv8RMPCT.cpu0.l1dcache.upstream[0]	PVBusSlave
AEMv8RMPCT.cpu0.l1icache	PVCache
AEMv8RMPCT.cpu0.l1icache.upstream[0]	PVBusSlave
AEMv8RMPCT.ext_bus	PVBusLogger
AEMv8RMPCT.ext_bus.mapper	PVBusMapper
AEMv8RMPCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
AEMv8RMPCT.l2_cache	PVCache
AEMv8RMPCT.l2_cache.upstream[Z] (where Z = 0–16)	PVBusSlave
AEMv8RMPCT.l2_flusher	AsyncCacheFlushUnit

Ports for AEMv8RMPCT

Port	Direction	Protocol	Description
broadcastcachemaint	slave	Signal	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	slave	Signal	Enable broadcasting of Inner Shareable transactions.
broadcastouter	slave	Signal	Enable broadcasting of Outer Shareable transactions.
cache_validation_control	slave	Value	This signal provides default exception handling state.
cfgend	slave	Signal	This signal if for EE bit initialisation
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	slave	Value	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
CNTHPIRQ	master	Signal	Timer signals to SOC
CNTHPSIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC.
CNTPNSIRQ	master	Signal	Timer signals to SOC
CNTPSIRQ	master	Signal	Timer signals to SOC
cntvalueb	slave	CounterInterface	Interface to SoC level counter module
CNTVIRQ	master	Signal	Timer signals to SOC
commirq	master	Signal	Interrupt signal from debug communication channel.
cp15sdisable	slave	Signal	This signal disables write access to some system control processor registers
cpuporeset	slave	Signal	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti0extin	slave	Signal	-
cti0extout	master	Signal	-
cti1extin	slave	Signal	-
cti1extout	master	Signal	-
cti2extin	slave	Signal	-
cti2extout	master	Signal	-
cti3extin	slave	Signal	-
cti3extout	master	Signal	-
cti	master	v8EmbeddedCrossTrigger_controlprotocol	-
ctidbgirq	master	Signal	-
dbgen	slave	Signal	-
dbgnopwrdwn	master	Signal	These signals relate to core power down.
dbgpwrdwnack	master	Signal	Debug power down acknowledge.
dbgpwrdwnreq	slave	Signal	Debug power down request.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
ext_slave_s	slave	PVBus	External Slave port. Equivalent to AXIS port.
external_trace_reset	slave	Signal	ETMv4 External Trace Reset signal.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
flash_m	master	PVBus	Flash Port
gicv3_ redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
hiden	slave	Signal	External debug interface.
hniden	slave	Signal	External debug interface.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
irqs	slave	Signal	These signals drive the CPU's interrupt controller interrupt lines.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`l2reset`	slave	Signal	This signal resets timer and interrupt controller and l2cache
`llpp_m`	master	PVBus	LLPP (Low-Latency Peripheral Port).
`memorymapped_debug_s`	slave	PVBus	External debug interface.
`niden`	slave	Signal	External debug interface.
`periphbase`	slave	Value_64	This port sets the base address of private peripheral region
`pmuirq`	master	Signal	Interrupt signal from performance monitoring unit.
`presetdbg`	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
`pvbus_m0`	master	PVBus	The core will generate bus requests on this port.
`rei`	slave	Signal	Per core RAM Error Interrupt.
`reset`	slave	Signal	-
`romaddr`	slave	Value_64	Debug ROM base address.
`romaddrv`	slave	Signal	Debug ROM base address valid.
`rvbar`	slave	Value_64	Reset vector base address.
`sei`	slave	Signal	Per core System Error physical pins
`smpnamp`	master	Signal	This signals AMP or SMP mode for each core
`spiden`	slave	Signal	Secure invasive debug enable.
`spniden`	slave	Signal	Secure non-invasive debug enable.
`standbywfe`	master	Signal	This signal indicates if a core is in WFE state
`standbywfi`	master	Signal	This signal indicates if a core is in WFI state
`teinit`	slave	Signal	This signal provides default exception handling state.
`ticks`	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
`trace_unit_reset`	slave	Signal	ETMv4 Trace Unit Reset signal.
`vcpumntirq`	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
`vinithi`	slave	Signal	This signal controls of the location of the exception vectors at reset.
`virtio_s`	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
`vsei`	slave	Signal	Per core virtual System Error physical pins.

Parameters for AEMv8RMPCT

`cpuX.CFGEND`

Type: `bool`

Default value: false

`cpuX.CP15SDISABLE`

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`cpuX.MPIDR-override`

Type: `uint64_t`

Default value: 0

`cpuX.RVBAR`

Type: `uint64_t`

Default value: 0

`cpuX.SMPnAMP`

Type: `bool`

Default value: false

`cpuX.TEINIT`

Type: `bool`

Default value: false

`cpuX.VINITHI`

Type: `bool`

Default value: false

`cpuX.ase-present`

Type: `bool`

Default value: true

`cpuX.dcache-size`

Type: `uint32_t`

Default value: `0x8000`

`cpuX.etm-present`

Type: `bool`

Default value: true

`cpuX.icache-size`

Type: `uint32_t`

Default value: `0x8000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`cpuX.llpp.base`

Type: `uint64_t`

Default value: `0x0`

`cpuX.llpp.size`

Equivalent to CFGLLPPSIZE.

Type: `uint32_t`

Default value: `0x0`

`cpuX.min_sync_level`

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint32_t`

Default value: 0

`cpuX.semihosting-A32_HLT`

Type: `uint32_t`

Default value: `0xF000`

`cpuX.semihosting-A64_HLT`

Type: `uint32_t`

Default value: `0xF000`

`cpuX.semihosting-ARM_SVC`

Type: `uint32_t`

Default value: `0x123456`

`cpuX.semihosting-T32_HLT`

Type: `uint32_t`

Default value: `0x3C`

`cpuX.semihosting-Thumb_SVC`

Type: `uint32_t`

Default value: `0xAB`

`cpuX.semihosting-cmd_line`

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: “”

cpuX.semihosting-enable

Type: `bool`

Default value: true

cpuX.semihosting-heap_base

Type: `uint32_t`

Default value: `0x0`

cpuX.semihosting-heap_limit

Type: `uint32_t`

Default value: `0x0F000000`

cpuX.semihosting-stack_base

Type: `uint32_t`

Default value: `0x10000000`

cpuX.semihosting-stack_limit

Type: `uint32_t`

Default value: `0x0F000000`

cpuX.vfp-enable_at_reset

Type: `bool`

Default value: false

cpuX.vfp-present

Type: `bool`

Default value: true

cpuX.CONFIG64

Type: `bool`

Default value: true

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

Type: `uint32_t`

Default value: `0x0`

DBGROMADDR

Type: `uint64_t`

Default value: `0x22000000`

DBGROMADDRV

Type: `bool`

Default value: true

GICDISABLE

Type: `bool`

Default value: true

NUM_CORES

Number of cores implemented.

Type: `uint32_t`

Default value: 1

PA_SIZE

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 40

PERIPHBASE

Type: `uint64_t`

Default value: `0x13080000`

VMSA_supported

Type: `bool`

Default value: true

auxilliary_feature_register0

Value for AFR0 ID register.

Type: `uint32_t`

Default value: `0x0`

dcache-state_modelled

Type: `bool`

Default value: false

disable_sve_plugin

Type: `bool`

Default value: false

enable_tlb_contig_check

Type: `bool`

Default value: false

enhanced_pac2_level

Type: `uint32_t`

Default value: 0

error_record_feature_register

Type: `string`

Default value: “”

gic.GICC-offset

Type: `int`

Default value: `0x2000`

`gic.GICD-offset`

Type: `int`

Default value: `0x1000`

`gic.GICH-offset`

Type: `int`

Default value: `0x4000`

`gic.GICH-other-CPU-offset`

Type: `int`

Default value: `0x4000`

`gic.GICV-offset`

Type: `int`

Default value: `0x6000`

`gic.PERIPH-size`

Type: `int`

Default value: `0x8000`

`gicv3.STATUSR-implemented`

Type: `bool`

Default value: true

`gicv3.cpuintf-mmap-access-level`

Allowed values are: 0-mmap access is supported for GICC,GICH,GICV registers. 1-mmap access is supported only for GICV registers. 2-mmap access is not supported.

Type: `uint32_t`

Default value: 0

`gicv3.gicv2-only`

Type: `bool`

Default value: false

`gicv3.priority-bits`

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 8

`gicv3.virtual-priority-bits`

Type: `uint32_t`

Default value: 8

`hardware_translation_table_update_implemented`

Type: `uint32_t`

Default value: 1

`has-gicv4.1`

When true, GICv4.1 functionality is enabled. When false, GICv3 features are implemented instead.

Type: `bool`

Default value: false

`has_16bit_vmids`

Type: `uint32_t`

Default value: 1

`has_aarch64`

Type: `bool`

Default value: false

`has_ccidx`

Type: `bool`

Default value: false

`has_e0pd`

Type: `uint32_t`

Default value: 0

`has_enhanced_pac`

Type: `bool`

Default value: false

`has_flash`

Equivalent to CFGFLASHIMP.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

has_fp16

Type: `uint32_t`

Default value: 1

has_no_os_double_lock

Type: `uint32_t`

Default value: 0

has_pl2

Type: `bool`

Default value: true

has_prediction_invalidation_instructions

Type: `uint32_t`

Default value: 1

has_restriction_on_speculative_data_loaded

Type: `uint32_t`

Default value: 1

has_self_hosted_trace_extension

Type: `uint32_t`

Default value: 1

has_speculation_barrier_inst

Type: `uint32_t`

Default value: 1

has_v8_5_debug_over_power_down

Type: `uint32_t`

Default value: 0

icache-state_modelled

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`internal_vgic`

Type: `bool`

Default value: true

`memory.transmit_vmid_in_user_flags`

Type: `bool`

Default value: false

`non_secure_vgic_alias_when_ns_only`

If ! has_el3 and only non-secure side exists, then the normal position of the VGIC is a secure alias. If this parameter is non-zero then in addition a non-secure alias of the VGIC will be placed at this position (aligned to 32 KB).

Type: `uint64_t`

Default value: 0

`number_of_error_records`

Type: `uint32_t`

Default value: 0

`page_based_hardware_attributes`

Type: `uint32_t`

Default value: 0

`pseudo_fault_generation_feature_register`

Type: `string`

Default value: “”

`pstate_ssbs_type`

Type: `uint32_t`

Default value: 0

`restriction_on_speculative_execution`

Type: `uint32_t`

Default value: 0

Non-Confidential

`rmr_always_implemented`

Type: `bool`

Default value: false

`warn_unpredictable_in_v7`

Type: `bool`

Default value: true

3.3 AEMvACT

Defined in `LISA/AEMvACT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see Quality level definitions.

Changes in 11.30.27

The following parameters were added:

- `DCZID-TBS-log2-allocation-tags-block-size`
- `VAL_disable_s1poe2_scr_el3_traps`
- `abort_s1poe2_fetch_from_device_memory`
- `amu_aux_counter_mask`
- `bti_support_level`
- `cache_mlb_with_default_id`

About AEMvACT

ARM AEM A-Profile(MP) CPU component - number of cores configurable at runtime.

Iris and MTI instances for AEMvACT

This model has the following Iris instances:

Name	Instance type
`AEMvACT`	Cluster_ARM_AEM-A_MP
`AEMvACT.AMU`	PVBusLogger
`AEMvACT.AMU.mapper`	PVBusMapper
`AEMvACT.DAP`	PVBusLogger
`AEMvACT.DAP.mapper`	PVBusMapper
`AEMvACT.DSU`	DSU
`AEMvACT.DSU.mpam_busslave`	PVBusSlave
`AEMvACT.MMAP`	PVBusLogger
`AEMvACT.MMAP.mapper`	PVBusMapper
`AEMvACT.RAS`	PVBusLogger
`AEMvACT.RAS.mapper`	PVBusMapper
`AEMvACT.acp_mapper`	PVBusMapper
`AEMvACT.cpu0`	ARM_AEM-A_MP
`AEMvACT.cpu0.UTLB`	TLB
`AEMvACT.cpu0.debug_rom`	debug_rom
`AEMvACT.cpu0.dtlb`	TLB
`AEMvACT.cpu0.l1dcache`	PVCache
`AEMvACT.cpu0.l1dcache.upstream[0]`	PVBusSlave
`AEMvACT.cpu0.l1icache`	PVCache
`AEMvACT.cpu0.l1icache.upstream[0]`	PVBusSlave
`AEMvACT.ext_bus`	PVBusLogger
`AEMvACT.ext_bus.mapper`	PVBusMapper
`AEMvACT.gic_cpuif_decoder_cluster`	GICv3CPUInterfaceDecoder
`AEMvACT.global_debug_rom`	debug_rom
`AEMvACT.l2_cache`	PVCache
`AEMvACT.l2_cache.upstream[Y]` (where Y = 0–16)	PVBusSlave
`AEMvACT.l2_flusher`	AsyncCacheFlushUnit
`AEMvACT.secondary_debug_rom`	debug_rom

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

This model has the following MTI trace components:

Name	Component type
AEMvACT.AMU	PVBusLogger
AEMvACT.AMU.mapper	PVBusMapper
AEMvACT.DAP	PVBusLogger
AEMvACT.DAP.mapper	PVBusMapper
AEMvACT.DSU	DSU
AEMvACT.DSU.mpam_busslave	PVBusSlave
AEMvACT.MMAP	PVBusLogger
AEMvACT.MMAP.mapper	PVBusMapper
AEMvACT.RAS	PVBusLogger
AEMvACT.RAS.mapper	PVBusMapper
AEMvACT.acp_mapper	PVBusMapper
AEMvACT.cpu0	ARM_AEM-A_MP
AEMvACT.cpu0.UTLB	TLB
AEMvACT.cpu0.l1dcache	PVCache
AEMvACT.cpu0.l1dcache.upstream[0]	PVBusSlave
AEMvACT.cpu0.l1icache	PVCache
AEMvACT.cpu0.l1icache.upstream[0]	PVBusSlave
AEMvACT.ext_bus	PVBusLogger
AEMvACT.ext_bus.mapper	PVBusMapper
AEMvACT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
AEMvACT.l2_cache	PVCache
AEMvACT.l2_cache.upstream[Y] (where Y = 0–16)	PVBusSlave
AEMvACT.l2_flusher	AsyncCacheFlushUnit

Ports for AEMvACT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastinner	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
cfgend	slave	Signal	This signal if for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	master	Signal	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	slave	Signal	Signals the clearing of an external global exclusive monitor

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`clusterid`	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
`CNTHPIRQ`	master	Signal	Timer signals to SOC.
`CNTHPSIRQ`	master	Signal	Timer signals to SOC.
`CNTHVIRQ`	master	Signal	Timer signals to SOC.
`CNTHVSIRQ`	master	Signal	Timer signals to SOC.
`CNTPNSIRQ`	master	Signal	Timer signals to SOC.
`CNTPSIRQ`	master	Signal	Timer signals to SOC.
`cntvalueb`	slave	CounterInterface	Interface to SoC level counter module.
`CNTVIRQ`	master	Signal	Timer signals to SOC.
`commirq`	master	Signal	Interrupt signal from debug communications channel.
`config64`	slave	Signal	Register width after reset.
`cp15sdisable`	slave	Signal	This signal disables write access to some system control processor registers.
`cpuporeset`	slave	Signal	CPU power on reset. Initializes all the processor logic, including debug logic.
`CRITICALIRQ`	master	Signal	RAS Critical Error Interrupt.
`cryptodisable`	slave	Signal	Disable cryptography extensions after reset.
`cti0extin`	slave	Signal	CTI trace inputs for core 0.
`cti0extout`	master	Signal	CTI trace outputs for core 0.
`cti1extin`	slave	Signal	CTI trace inputs for core 1.
`cti1extout`	master	Signal	CTI trace outputs for core 1.
`cti2extin`	slave	Signal	CTI trace inputs for core 2.
`cti2extout`	master	Signal	CTI trace outputs for core 2.
`cti3extin`	slave	Signal	CTI trace inputs for core 3.
`cti3extout`	master	Signal	CTI trace outputs for core 3.
`cti4extin`	slave	Signal	CTI trace inputs for core 4.
`cti4extout`	master	Signal	CTI trace outputs for core 4.
`cti5extin`	slave	Signal	CTI trace inputs for core 5.
`cti5extout`	master	Signal	CTI trace outputs for core 5.
`cti6extin`	slave	Signal	CTI trace inputs for core 6.
`cti6extout`	master	Signal	CTI trace outputs for core 6.
`cti7extin`	slave	Signal	CTI trace inputs for core 7.
`cti7extout`	master	Signal	CTI trace outputs for core 7.
`cti`	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
`ctidbgirq`	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	Debug no power down request.
dbgpwrdwnack	master	Signal	Debug power down acknowledge.
dbgpwrdwnreq	slave	Signal	Debug power down request.
dbgpwrupreq	master	Signal	Debug power up request.
dev_debug_s	slave	PVBus	External debug interface.
ERRORIRQ	master	Signal	RAS Error Recovery Interrupt.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
external_trace_reset	slave	Signal	ETMv4 External Trace Reset signal.
FAULTIRQ	master	Signal	RAS Fault Handling Interrupt
fiq_nmi	slave	Signal	-
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicv3_ redistributor_s	slave	GICv3Comms	GICv3 cpu interface ports.
hacdbsirq	master	Signal	Interrupt signal from the HACDBS unit.
irq_nmi	slave	Signal	-
irq	slave	Signal	This signal drives the CPUs interrupt handling.
irqs	slave	Signal	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	slave	Signal	This signal resets timer and interrupt controller.
memorymapped_amu_s	slave	PVBus	External interface for amu.
memorymapped_debug_s	slave	PVBus	External debug interface.
niden	slave	Signal	External debug interface.
periphbase	slave	Value_64	This port sets the base address of private peripheral region.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
pmusnapshotacks	master	Signal	-
pmusnapshotreqs	slave	Signal	-
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
rei	slave	Signal	Individual processor RAM Error Interrupt signal input.
reset	slave	Signal	Raising this signal will put the core into reset mode.
rlpiden	slave	Signal	External debug interface.
romaddr	slave	Value_64	Debug ROM base address.
romaddrv	slave	Signal	Debug ROM base address valid.
rtpiden	slave	Signal	External debug interface.
rvbar	slave	Value_64	Reset vector base address.
sei	slave	Signal	Per core System Error physical pins.
smpnamp	master	Signal	This signals AMP or SMP mode for each core.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`spiden`	slave	Signal	External debug interface.
`spniden`	slave	Signal	External debug interface.
`standbywfe`	master	Signal	This signal indicates if a core is in WFE state.
`standbywfi`	master	Signal	This signal indicates if a core is in WFI state.
`standbywfil2`	master	Signal	This signal indicated all cores and L2 are in a power down state
`teinit`	slave	Signal	This signal provides default exception handling state.
`ticks`	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
`trace_unit_reset`	slave	Signal	ETMv4 Trace Unit Reset signal.
`trbirq`	master	Signal	Interrupt signal from the trace buffer unit.
`vcpumntirq`	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
`vfiq`	slave	Signal	Virtual FIQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
`vinithi`	slave	Signal	This signal controls of the location of the exception vectors at reset.
`virq`	slave	Signal	Virtual IRQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
`virtio_s`	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
`vsei`	slave	Signal	Processor Virtual System Error Interrupt request.

Parameters for AEMvACT

`cpuX.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`cpuX.CONFIG64`

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type: `bool`

Default value: true

`cpuX.CP15SDISABLE`

Initialize to disable access to some CP15 registers.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

cpuX.CP15SDISABLE2

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

Type: `bool`

Default value: false

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

cpuX.DCZID-log2-block-size

Log2 of the block size in words cleared by DC ZVA instruction (as read from DCZID_EL0).

Type: `uint8_t`

Default value: 8

cpuX.DCZVA_single_write

Execute the DCZVA as a single write.

Type: `bool`

Default value: false

cpuX.MPIDR-override

Override of MPIDR value. If nonzero will override the MT, cluster and CPU ID bits in MPIDR.

Type: `uint64_t`

Default value: `0x0`

cpuX.RVBAR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

cpuX.RVBAR32

Reset vector address in AARCH32 when VINITHI is not set and ignore_rvbar_in_aarch32 is set.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x0`

`cpuX.SMPnAMP`

Enable broadcast messages necessary for correct SMP operation at reset.

Type: `bool`

Default value: true

`cpuX.TEINIT`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`cpuX.VINITHI`

Reset value of SCTLR.V.

Type: `bool`

Default value: false

`cpuX.aarch32_reset_from_impdef_addr`

If PE resets into AArch32, Whether execution starts from IMPDEF address or hi/low vector.

Type: `bool`

Default value: true

`cpuX.ase-present`

Set whether the model has been built with NEON support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`cpuX.clock_divider`

Clock divider ratio for asymmetric MP clocking.

Type: `uint32_t`

Default value: `0x1`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.clock_multiplier

Clock divider ratio for asymmetric MP clocking.

Type: `uint32_t`

Default value: `0x1`

cpuX.crypto_aes

AES instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 2, AES and PMULL instructions implemented (FEAT_AES, FEAT_PMULL).

Type: `uint8_t`

Default value: 2

cpuX.crypto_sha1

SHA-1 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA1 instructions implemented (FEAT_SHA1).

Type: `uint8_t`

Default value: 1

cpuX.crypto_sha256

SHA-256 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA256 instructions implemented (FEAT_SHA256).

Type: `uint8_t`

Default value: 1

cpuX.crypto_sha3

Implement ARMv8.4 SHA-3 instructions (requires CryptoPlugin to be loaded) (FEAT_SHA3).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

cpuX.crypto_sha512

Implement ARMv8.4 SHA-512 instructions (requires CryptoPlugin to be loaded) (FEAT_SHA512).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.crypto_sm3

Implement ARMv8.4 SM-3 instructions (requires CryptoPlugin to be loaded) (FEAT_SM3).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

cpuX.crypto_sm4

Implement ARMv8.4 SM-4 instructions (requires CryptoPlugin to be loaded) (FEAT_SM4).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

cpuX.cti-intack_mask

Set bits represent that the corresponding trigger requires software acknowledge via CTIINTACK.

Type: `uint8_t`

Default value: 1

cpuX.cti-number_of_claim_bits

Number of implemented bits in CTICLAIMSET.

Type: `uint8_t`

Default value: 0

cpuX.cti-number_of_triggers

Number of cti event triggers (default: 8, valid values: {3-32}).

Type: `uint8_t`

Default value: 8

cpuX.enable_crc32

CRC32 instructions supported. 0, not implemented. 1, CRC32 instructions implemented (FEAT_CRC32).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

cpuX.etm-present

Set whether the model has ETM support.

Type: `bool`

Default value: true

cpuX.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: false

cpuX.force-fpsid-value

Value to override the FPSID value to.

Type: `uint32_t`

Default value: `0x0`

cpuX.has_hcptr_tase

If false, HCPTR.TASE is **RES0**.

Type: `bool`

Default value: true

cpuX.highest-index-of-context-breakpoints

Highest index of breakpoints that are context aware.

Type: `uint8_t`

Default value: 15

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

`cpuX.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`cpuX.number-of-breakpoints`

Number of breakpoints.

Type: `uint8_t`

Default value: 16

`cpuX.number-of-context-breakpoints`

Number of breakpoints that are context aware.

Type: `uint8_t`

Default value: 16

`cpuX.number-of-watchpoints`

Number of watchpoints.

Type: `uint8_t`

Default value: 16

`cpuX.operation_bandwidth`

Operation width for ARMv8.4 PMU extension.

Type: `uint8_t`

Default value: 1

`cpuX.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`cpuX.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000`

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

cpuX.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

cpuX.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

cpuX.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

cpuX.semihosting-prefix

Prefix semihosting output with target instance name.

Type: `bool`

Default value: false

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

cpuX.semihosting-stderr_istty

Result for semihost istty call when argument is stderr.

Type: `bool`

Default value: true

cpuX.semihosting-stdin_istty

Result for semihost istty call when argument is stdin.

Type: `bool`

Default value: true

cpuX.semihosting-stdout_istty

Result for semihost istty call when argument is stdout.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

`cpuX.semihosting-use_stderr`

Send stderr from the simulated process to host stderr.

Type: `bool`

Default value: false

`cpuX.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`cpuX.unpredictable_WPMASKANDBAS`

Constrained unpredictable handling of watchpoints when mask and BAS fields specified. 0, IGNOREMASK. 1, IGNOREBAS (default). 2, REPEATBAS8. 3, REPEATBAS.

Type: `uint8_t`

Default value: 1

`cpuX.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`cpuX.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`cpuX.vfp-traps`

Implement support for trapping floating-point exceptions.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.vfp-traps-show-all

Report all trapped floating-point exceptions in the syndrome when a combination occurs.

Type: `bool`

Default value: false

cpuX.wfet_early_or_delayed_timeout

WFET early or delayed timeout beyond the threshold value of CNTVCT_EL0 in percentage.

Type: `int8_t`

Default value: 0

cpuX.wfit_early_or_delayed_timeout

WFIT early or delayed timeout beyond the threshold value of CNTVCT_EL0 in percentage.

Type: `int8_t`

Default value: 0

ADFSR-AIFSR-implemented

ADFSR and AIFSR are implemented.

Type: `bool`

Default value: false

AIDR

Value of AIDR_EL1 register.

Type: `uint64_t`

Default value: `0x0`

AMIIDR

Value of AMU Implementation Identification Register.

Type: `uint64_t`

Default value: `0x43b`

AMPIDR

Value of AMU Peripheral Identification Register.

Type: `uint64_t`

Default value: `0x4000bb000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

BPIMVA_causes_translation_lookup

Do a translation when BPIMVA instruction is executed (which may cause a translation fault).

Type: `bool`

Default value: false

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: true

CCSIDR-L1D_override

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

Type: `uint64_t`

Default value: `0x0`

CCSIDR-L1I_override

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

CCSIDR-L2_override

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

Type: `uint64_t`

Default value: `0x0`

CCSIDR-L3_override

If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).

Type: `uint64_t`

Default value: `0x0`

CLUSTER_ID

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

CTIPIDR

If non-zero, override the CTI Peripheral Identification Register.

Type: `uint64_t`

Default value: `0x0`

CTR-L1Ip-override

If non-zero, override the L1Ip bits in CTR/CTR_EL0 system register. This does not change the behaviour of the cache, only what is present in the CTR register.

Type: `uint8_t`

Default value: 0

DBGBCR_BT_applies_RES0_before_valid_check

If true, **RES0** behaviour is applied to DBGBCR(_EL1).BT before checking for reserved values for this field.

Type: `bool`

Default value: true

DBGPIDR

If non-zero, override the Debug Peripheral Identification Register.

Type: `uint64_t`

Default value: `0x0`

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: `0x0`

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`DCZID-TBS-log2-allocation-tags-block-size`

Log2 of the block size in words written by a DC ZGBVA or DC GBVA instruction (for FEAT_MTETC).

Type: `uint8_t`

Default value: 9

`ERRIIDR`

Value of RAS Implementation Identification Register.

Type: `uint64_t`

Default value: `0xd800143b`

`ERRPIDR`

Value of RAS Peripheral Identification Register.

Type: `uint64_t`

Default value: `0x4100bbd80`

`ERXMISC0_mask`

Write Mask for ERXMISC0 RAS Register.

Type: `uint64_t`

Default value: `0x0`

`GICDISABLE`

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

`GMID-log2-block-size`

Log2 of the block size in words accessed by STGM/LDGM/STZGM instructions.

Type: `uint8_t`

Default value: 4

`ISV_set_to_0_for_stage2_synch_external_abort`

Whether ESR_EL2.ISV is set to 0 on stage 2 synchronous external aborts.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

MIDR
Value of MIDR_EL1 register.

Type: `uint32_t`

Default value: `0x410fd0f0`

NUM_CORES
Number of cores per cluster.

Type: `uint8_t`

Default value: 1

PA_SIZE
Physical address range supported For ARMv8.0 and ARMv8.1 this is limited to 48 bits (FEAT_LPA).

Type: `uint8_t`

Default value: 40

PERIPHBASE
Base address of peripheral memory space.

Type: `uint64_t`

Default value: `0x13080000`

PMCEID0
Performance Monitor Common Event ID Reg 0 value - 64 bit.

Type: `uint64_t`

Default value: `0xffffffff`

PMCEID1
Performance Monitor Common Event ID Reg 1 value - 64 bit.

Type: `uint64_t`

Default value: `0xffffffff`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`PMSIDR.ArchInst`

Defines whether architecture instruction sampling is implemented or not, if not only micro op sampling is implemented. Model only supports architecture instruction sampling, but allows ID register field to be configured.

Type: `bool`

Default value: true

`PMSIDR.CRR`

Defines whether call return branch records (FEAT_SPE_CRR) is implemented or not.

Type: `bool`

Default value: false

`PMSIDR.LDS`

Defines whether data source for sampled load instruction is implemented or not. Model does not implement loaded data source, but allows ID register field to be configured.

Type: `bool`

Default value: false

`PMUPIDR`

If non-zero, override the PMU Peripheral Identification Register.

Type: `uint64_t`

Default value: `0x0`

`VAL_disable_s1poe2_scr_el3_traps`

Disable traps from SCR_EL3 for FEAT_S1POE2, FEAT_TPS and FEAT_TPSP. WARNING: this is a temporary parameter to aid with software support for these traps. It will be removed in the future.

Type: `bool`

Default value: false

`abort_execution_from_device_memory`

Execution from device memory generates a prefetch abort.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

abort_s1poe2_fetch_from_device_memory

Abort S1POE2 table fetches from device memory.

Type: `bool`

Default value: false

advsimd_bf16_support_level

Implement BFloat16 operations from ARMv8.6. AArch64 Advanced SIMD and FP BFloat16 instructions are automatically enabled when has_arm_v8-6 is true.- 0, Not implemented.- 1, AArch64 Advanced SIMD and FP BFloat16 instructions only (FEAT_BF16).- 2, AArch32 Advanced SIMD and VFP BFloat16 instructions only (FEAT_AA32BF16).- 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP BFloat16 instructions.

Type: `uint8_t`

Default value: 0

advsimd_i8mm_support_level

Implement Int8 matrix multiply operations from ARMv8.6. AArch64 Advanced SIMD and FP Int8 matrix multiply instructions are automatically enabled when has_arm_v8-6 is true.- 0, Not implemented.- 1, AArch64 Advanced SIMD and FP Int8 matrix multiply instructions only (FEAT_I8MM).- 2, AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions only (FEAT_AA32I8MM).- 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions (FEAT_I8MM, FEAT_AA32I8MM).

Type: `uint8_t`

Default value: 0

advsimd_overread

AdvSIMD element load operations access all bytes of a 16-byte aligned window, even in Device memory.

Type: `bool`

Default value: false

align_pc_on_branch_to_unaligned_pc_aarch32

Force PC align for branches to an unaligned PC counter in A32 state.

Type: `bool`

Default value: false

align_pc_on_debug_exit_to_aarch32

Exit to AARCH32 state from debug state forces pc bit0 to 0.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

align_pc_on_illegal_exception_return_to_aarch32

Align PC when performing an illegal exception return from AArch64 to AArch32.

Type: `bool`

Default value: true

allow_s1_dbm_update_on_s2_mmu_fault

Whether s1 dirty bit update is done when s2 of ipa (not s1 ttw) generates mmu fault.

Type: `bool`

Default value: true

amair_reg_rw_mask

RW mask for implementation-defined registers.

Type: `uint64_t`

Default value: `0x0`

amu_aux_counter_mask

If ARMv8.4 is implemented, each bit of the field, 0 to 15, when 1 indicates that the corresponding virtual offset register, AMEVCNTR1<n>_EL0/AMEVTYPER1<n>_EL0, is implemented.

Type: `uint16_t`

Default value: `0x0`

amu_aux_type_fixed

Lists which AMU auxiliary registers that are fixed and to which event type. The JSON schema is: {fixed_aux_reg:evt_type, ...}. For example {"0":`0x300`} would make auxiliary register 0 fixed to event type `0x300`.

Type: `string`

Default value: N/A

amu_aux_voffset_mask

If ARMv8.6 is implemented, each bit of the field, 0 to 15, when 1 indicates that the corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2, is implemented.

Type: `uint16_t`

Default value: `0x0`

amu_has_external_interface

Implement external memory-mapped access to system register of activity monitor unit from ARMv8.4 (FEAT_AMU_EXT).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

amu_has_sysreg_interface

Implement system register access to activity monitor unit from ARMv8.4.

Type: `bool`

Default value: true

amu_mmap_address

AMU base address for each core on system bus. 0 means the AMU is not mapped, otherwise the address must be 4KB aligned. JSON schema for the parameter value is: {"format":"all_addrs_are_absolute_wrt_systembus", "cores": [{"amu":`0x0`},{"amu":`0x0`},{"amu":`0x0`},{"amu":`0x0`}]}.

Type: `string`

Default value: N/A

amu_num_auxiliary_counters

Number of AMU auxiliary counters implemented.

Type: `uint8_t`

Default value: 0

amu_reset_domain

Reset domain for activity monitor unit. 0, COLD_RESET. 1, WARM_RESET. 2, NONE.

Type: `uint8_t`

Default value: 0

amu_version

Selects the activity monitor version implemented - 1, AMUv1 for Armv8.4 is implemented.- 2, AMUv1 for Armv8.6 is implemented (FEAT_AMUv1p1).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

apsr_read_restrict

At EL0, unknown bits of APSR are RAZ.

Type: `bool`

Default value: false

arm_v8_7_accelerator_support_level

Implements accelerator support instructions: 0, Not implemented 1, FEAT_LS64 implemented 2, FEAT_LS64_V implemented 3, FEAT_LS64_ACCDATA implemented 4, FEAT_LS64WB implemented.

Type: `uint8_t`

Default value: 0

atomic_memtype_fault_prio_less_than_gpc_fault

If true, unsupported atomic/exclusive memtype faults are lower priority than GPC faults.

Type: `bool`

Default value: false

atomic_memtype_fault_priority

This parameter describes the priority of unsupported atomic/exclusive memtype fault w.r.t alignment and permission fault. 0, BEFORE_ALIGN_MEM_FAULT. 1, AFTER_ALIGN_BEFORE_PERM_FAULT. 2, AFTER_PERM_FAULT.

Type: `uint8_t`

Default value: 0

auxilliary_feature_register0

Value of AFR0 ID register.

Type: `uint32_t`

Default value: `0x0`

branch-predictor-clear-policy

Set branch prediction policy as defined for MMFR1[31:28]. This does not change the behaviour of the branch predictor, only what is reported in MMFR1.BPred.

Type: `uint8_t`

Default value: 2

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`branch-predictor-supported-ops`

Set branch prediction policy as defined for MMFR3[11:8]. This does not change the behaviour of the branch predictor, only what is reported in MMFR3.BPMaint.

Type: `uint8_t`

Default value: 1

`brbe_disable_recording`

If BRBE is implemented and this is set to true, disable BRBE recording. All registers will be functional, but no branches will be recorded. This will improve model performance for workloads that enable BRBE, but don't care about the information stored in it. (FEAT_BRBE).

Type: `bool`

Default value: false

`brbe_log2_num_records`

Log2 of number of BRB records supported. 3 -> 8 records, ... 6 -> 64 records.

Type: `uint8_t`

Default value: 6

`brbinf_type_override_on_impdef_trap_to_el3`

If true, force BRBINF.TYPE=`0x23` (trap) when ESR.EC=`0x1f` (implementation defined exception to EL3) (FEAT_BRBE).

Type: `bool`

Default value: false

`bti_support_level`

Support branch target identification: 0 - None. 1 - Support FEAT_BTI (mandatory from ARMv8.5). 2 - Support FEAT_BTIE.

Type: `uint8_t`

Default value: 0

`cache-log2linelen`

Log2 of the cache line length in bytes.

Type: `uint8_t`

Default value: 6

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`cache_maintenance_hits_watchpoints`

DCIMVA operations executed in AArch32 modes hit watchpoints.

Type: `bool`

Default value: false

`cache_mlb_with_default_id`

If true, incomplete mlb fetches that ends up with entries with default MPAM ids will still be cached.

Type: `bool`

Default value: false

`changing_block_size_without_bbm_support`

Changing block size without break-before-make support level(OPTIONAL from Armv8.3): 0, Unsupported, 1, Level 1 support (FEAT_BBML1), 2, Level 2 support (FEAT_BBML2), 3, Level 3 support (FEAT_BBML3).

Type: `uint8_t`

Default value: 0

`check_memory_attributes`

Detect and report TLB use of conflicting memory attributes for views of the same physical address.

Type: `bool`

Default value: false

`checked_pointer_arithmetic_support_level`

Specify the Checked Pointer Arithmetic support level: 0, not implemented. 1, FEAT_CPA is implemented. 2, FEAT_CPA2 is implemented.

Type: `uint8_t`

Default value: 0

`clean_invalidate_cache_on_warm_reset`

Clean and invalidate caches on warm reset.

Type: `bool`

Default value: false

`clear_IT_when_IL_set`

Clear IT bits when performing a *legal* exception return to AArch32 when IL is set.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

clear_IT_when_IL_set_explicitly

Apart from clear_IT_when_IL_set, also clear IT bits when loading CPSR from SPSR/memory and IL == 1 in the value being loaded.

Type: `bool`

Default value: false

clear_ec_in_debug_state

When ARMv8.8 debug extension is implemented, whether EDESR.EC bit is set/cleared on entering debug state due to pending exception catch caused by EDESR.EC=1.

Type: `bool`

Default value: false

clear_reg_top_eret

Behaviour of the upper 32-bits of the Xn registers when changing between AArch32 state and AArch64 state. 0, upper 32-bits preserved for all registers. 1, upper 32-bits set to 0 for all accessible registers. 2, upper 32-bits set to 0 for a random selection of accessible registers. 3, upper-32-bits set to 0 for registers touched in AArch32.

Type: `uint8_t`

Default value: 1

clear_reg_top_set

Whether to clear upper 32-bits of the Xn register when corresponding AArch32 register is set via CADI/Iris.

Type: `bool`

Default value: true

configure_pmu_events_with_json

"Configure v8.6 and newer PMU events. Note : This param has high priority and overrides the setting of "has_*_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["EVENT_NAME_1","EVENT_NAME_2"]}".

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

configure_v8_6_pmu_events_with_json

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.6 PMU events. Note : This param has high priority and overrides the setting of "has_v8_6_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["BR_INDNR_RETIRED", "BR_IND_RETIRED", "BR_RETURN_SKIP_RETIRED", "BR_RETURN_ANY_RETIRED", "BR_INDNR_SKIP_RETIRED", "BR_INDNR_TAKEN_RETIRED", "BR_IND_SKIP_RETIRED", "BR_IND_TAKEN_RETIRED", "BR_IMMED_SKIP_RETIRED", "BR_IMMED_TAKEN_RETIRED", "BR_SKIP_RETIRED"]}".

Type: `string`

Default value: N/A

configure_v8_8_pmu_events_with_json

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.8 PMU events. Note : This param has high priority and overrides the setting of "has_v8_8_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["BR_HINT_COND_RETIRED", "BR_COND_TAKEN_RETIRED", "BR_UNCOND_RETIRED", "BR_COND_RETIRED", "BRNL_TAKEN_RETIRED", "BRNL_IND_TAKEN_RETIRED", "BRNL_INDNR_TAKEN_RETIRED", "BRNL_IMMED_TAKEN_RETIRED", "BL_TAKEN_RETIRED", "BL_IND_TAKEN_RETIRED", "BL_IMMED_TAKEN_RETIRED"]}".

Type: `string`

Default value: N/A

configure_v8_9_pmu_events_with_json

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.9 PMU events. Note : This param has high priority and overrides the setting of "has_v8_9_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["ASE_SVE_RETIRED", "ASE_RETIRED", "VFP_RETIRED", "SVE_RETIRED", "CRYPTO_RETIRED", "SIMD_INST_RETIRED", "ASE_INST_RETIRED", "SVE_INST_RETIRED", "ASE_SVE_INST_RETIRED", "LD_ANY_RETIRED", "ST_ANY_RETIRED", "LDST_ANY_RETIRED", "DP_RETIRED"]}".

Type: `string`

Default value: N/A

core_cache_protection

core_cache_protection can change ERR0FR, ERR0PFGF and ERR0PFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: -1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpacr_trcdis_behaviour

Behaviour of CPACR.TRCDIS/NSACR.NSTRCDIS when there is no CP14 ETM interface. 0, **RAZ/WI**. 2, implemented.

Type: `uint8_t`

Default value: 2

cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

cpuselr_el3_sync_immediate

Adjust when the patching selection register synchronises - either immediately (true - default), or awaiting for barrier event.

Type: `bool`

Default value: true

cpy_mops_option

Set option for Armv8.8 CPY(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B.

Type: `uint8_t`

Default value: 0

cpyf_mops_option

Set option for Armv8.8 CPYF(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cycle_counter_freeze_on_spe_event

If true, pmu cycle counter does not count when pmcr_el0.dp=1 and pmu event counters are frozen by pmcr_el0.fzs. (FEAT_SPE_DPFZS).

Type: `bool`

Default value: false

d128_disabled_ps_resvd_size

Physical size treated when TCR.(I)PS is programmed with value seven and D128 is disabled via TCR. 0, 48 bits. 1, 52 bits. 2, 56.

Type: `uint8_t`

Default value: 2

data_abort_on_gcs_access_to_non_normal_memory

If true, a GCS data access to non-normal memory results in a data abort for unsupported access.

Type: `bool`

Default value: false

dbg-bcr-reserved-behavior

This is the behavior of the reserved values of the BT field in DBGBCRPossible values are: - 0 = Disabled.- 1 = BT[2] is ignored..

Type: `uint8_t`

Default value: 1

dbg_rom_dap_addr

Debug ROM dap base address.

Type: `uint64_t`

Default value: `0x0`

dbgitr_buffer_size

Number of instructions which can be buffered before EDSCR.ITE is cleared.

Type: `uint32_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`dbgxvr_ress_is_stateful`

Whether DBGWVR/DBGBVR.RESS returns last written value. if set to false, RESS returns sign extended value.

Type: `bool`

Default value: false

`dc_fault_unaligned_s1_device_s2_fwb`

Whether takes an Alignment Fault caused by the memory type on a DC {ZVA,GZVA,GVA} if the stage 1 memory type is any Device memory type.

Type: `bool`

Default value: false

`dcache-hit_latency`

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-maintenance_latency`

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-miss_latency`

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-prefetch_enabled`

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-read_bus_width_in_bytes

L1 D-Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x8`

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-state_modelled

Set whether D-cache has stateful implementation.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

dcache-ways

L1 D-Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 2

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-write_bus_width_in_bytes

L1 D-Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x8`

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcimva_requires_s2_write_permissions

Data-cache invalidate by MVA operations require stage 2 write permission (virtualised AArch32 guest).

Type: `bool`

Default value: false

dczva_reports_lowest_addr_on_tag_check_fail

Whether DC ZVA reports lowest address in FAR on tag check fail.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

dczva_wp_far_behaviour

Set option for address stored in FAR/EDWARD after watchpoints hit by DC ZVA. - FAR recorded matches lowest watchpointed address accessed by the instruction - FAR recorded matches lowest address accessed by the instruction within same translation granule as watchpointed address - FAR recorded matches highest address accessed by the instruction within same translation granule as watchpointed address.

Type: `uint8_t`

Default value: 0

debug_auth_signals_sampled_at_reset

Debug authentication signals can be configured as either sampled at reset only or at any time for External Root Debug.

Type: `bool`

Default value: false

debug_components_dap_address

Debug components ROM,ED,CTI,PMU,TRACE and TRBU base address for each core on debug bus. The "rom" field in the "cores" array are only allowed when 'debug_rom_is_flat' is false. JSON schema for the parameter value is: {"format":"all_addrs_are_absolute_wrt_debugbus", "cores": [{"rom":`0x0`, "ed":`0x0`, "cti":`0x0`, "pmu":`0x0`, "etm":`0x0`, "trbu":`0x0`}, {"rom":`0x0`, "ed":`0x0`, "cti":`0x0`, "pmu":`0x0`, "etm":`0x0`, "trbu":`0x0`}, {"rom":`0x0`, "ed":`0x0`, "cti":`0x0`, "pmu":`0x0`, "etm":`0x0`, "trbu":`0x0`}, {"rom":`0x0`, "ed":`0x0`, "cti":`0x0`, "pmu":`0x0`, "etm":`0x0`, "trbu":`0x0`}]}.

Type: `string`

Default value: N/A

debug_components_mmap_address

Debug components ROM,ED,CTI,PMU,TRACE and TRBU base address for each core on system bus. The "rom" field in the "cores" array are only allowed when 'debug_rom_is_flat' is false. JSON schema for the parameter value is: {"format":"all_addrs_are_absolute_wrt_systembus", "cores": [{"rom":`0x0`, "ed":`0x0`, "cti":`0x0`, "pmu":`0x0`, "etm":`0x0`, "trbu":`0x0`}, {"rom":`0x0`, "ed":`0x0`, "cti":`0x0`, "pmu":`0x0`, "etm":`0x0`, "trbu":`0x0`}, {"rom":`0x0`, "ed":`0x0`, "cti":`0x0`, "pmu":`0x0`, "etm":`0x0`, "trbu":`0x0`}, {"rom":`0x0`, "ed":`0x0`, "cti":`0x0`, "pmu":`0x0`, "etm":`0x0`, "trbu":`0x0`}]}.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

debug_entry_is_context_sync

If true, Entry in debug state is Context sync. Exiting debug state is a context synchronising operation, but entering is not. However some cpu implementation can consider also the Entry in Debug state as a CSE.

Type: `bool`

Default value: false

debug_rom_is_class_9

If true, present a debug ROM table as a class 9 device. Otherwise, use a class 1 ROM table.

Type: `bool`

Default value: false

debug_rom_is_flat

If true, present a debug ROM table recommended by ARMv8 Debug Architecture. Otherwise, use nested ROM tables.

Type: `bool`

Default value: false

delay_serror

Add a propagation delay of serror signal into the core.

Type: `uint32_t`

Default value: `0x0`

delayed_dbgreg_between_secure_views

If delayed_dbgreg is enabled, whether the secure and nonsecure external views require explicit synchronization.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

delayed_pmureg_between_secure_views

If delayed_pmureg is enabled, whether the secure and nonsecure external views require explicit synchronization.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`dfr1_reads_actual_bp_wp_ctx_cmp`

If true, the register ID_AA64DFR1_EL1/EDDFR1 reports the actual number of BRPs, WRPs and CTX_CMPs even when the number of bp/wp/ctx_cmp is less than 16.

Type: `bool`

Default value: false

`dic-spi_count`

Number of shared peripheral interrupts implemented.

Type: `uint8_t`

Default value: 64

`disable_sve_plugin`

If true, SVE will not be implemented in this processor even if the plugin is loaded (FEAT_SVE).

Type: `bool`

Default value: false

`disable_unknown_update_event_on_reset`

Disables SYSREG_UPDATE event notification on reset for the registers whose bitfields are all reserved or resets to architecturally unknown value.

Type: `bool`

Default value: false

`dsb_accumulate_threshold`

Limit the maximum number of observable DSB side effects which can be queued (e.g. TLBI), after which DSB sync will be done automatically.

Type: `uint32_t`

Default value: `0x100`

`e2h_forces_interrupt_overrides`

If true, HCR_EL2.xMO are treated as 1 else as programmed.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

early_implicit_error_sync_event_behaviour

Set option for Early Implicit Error Synchronization event (FEAT_IESB)`0x0` - Behavior is not described ID_AA64MMFR4_EL1.EIESB = `0x00`x1 - Implicit Error synchronization event is inserted before an exception is taken to EL3 (depending on SCR_EL3.NMEA) ID_AA64MMFR4_EL1.EIESB = `0x10`x2 - Implicit Error synchronization event is inserted before an exception is taken to ELx (depending on SCR_EL3.NMEA and SCTLR2_ELx.NMEA) ID_AA64MMFR4_EL1.EIESB = `0x20`xF - Implicit Error synchronization event is inserted after an exception is taken ID_AA64MMFR4_EL1.EIESB = `0xF`.

Type: `uint8_t`

Default value: 0

ecv_support_level

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

Type: `uint8_t`

Default value: 0

eddfr1_reads_idreg_mask

Mask to configure each bitfield for EDDFR1 register, whether to be read from corresponding bitfield in AA64DFR1 register. Note: Only those bitfield which supports ‘same as ID register or res0' functionality can be configured.

Type: `uint64_t`

Default value: `0xffffffffffffffff`

eddfr2_reads_idreg_mask

Mask to configure each bitfield for EDDFR2 register, whether to be read from corresponding bitfield in ID_AA64DFR2 register. Note: Only those bitfield which supports ‘same as ID register or res0' functionality can be configured.

Type: `uint64_t`

Default value: `0xffffffffffffffff`

eddfr_reads_idreg_mask

Mask to configure each bitfield for EDDFR register, whether to be read from corresponding bitfield in AA64DFR register. Note: Only those bitfield which supports ‘same as ID register or res0' functionality can be configured.

Type: `uint64_t`

Default value: `0xffffffffffffffff`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

edpfr_ras_unknown_bits_read_as_0

If true then **UNKNOWN** bits in RAS field in EDPFR are read as 0.

Type: `bool`

Default value: false

edxfr_reads_idreg

Whether EDDFR,EDDFR1 and EDDFR2 reads corresponding bitfield value from ID_AA64DFR reg. Also, when this parameter is enabled, bitfields of these registers are configurable through 'eddfr*_reads_idreg_mask' parameter.

Type: `bool`

Default value: false

el0_can_access_imp_def_functionality

If not made UNDEF by imp_def_functionality_behaviour, EL0 can access **IMPLEMENTATION DEFINED** registers and system instructions.

Type: `bool`

Default value: false

el0_el1_only_non_secure

Secure/non-secure state if EL2 and EL3 are not implemented. 0, secure. 1, non-secure.

Type: `bool`

Default value: false

el3_trap_priority_when_secure_debug_disabled

Undef when secure debug is disabled (EDSCR.SDD == 1) && boolean IMPLEMENTATION_DEFINED ‘EL3 trap priority when SDD == 1'.

Type: `bool`

Default value: false

enable-gicv5

if enable-gicv5 is set, then GICv5 is Supported.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

enable_address_contig_check

Check the input address range for the table entries that have the contiguous hint bit set.

Type: `bool`

Default value: false

enable_debug_access_trace

If true, enables traces on debug access. Currently enables following traces on debug :: MMU_TRANS.

Type: `bool`

Default value: false

enable_debug_auth_signals_config

Debug Authentication Signals DBGEN, SPIDEN (and if RME is enabled RLPIDEN and RTPIDEN)are configurable (default) or not configurable, (hardwired to 1). This parameter is theInteger representation of a bitmap to enable configuration of these signals, with:- BIT[0] = DBGEN- BIT[1] = SPIDEN- BIT[2] = RLPIDEN- BIT[3] = RTPIDEN.

Type: `uint8_t`

Default value: 15

enable_mpam_mvms_mlb_cache

If true, MPAMv2_VID MLB entries for MVMS (VPARTID/VPMG \342\206\222 MITT base) are always cached until invalidation, otherwise not cached.

Type: `bool`

Default value: true

enable_mpam_vid_pid_mlb_cache

If true, MPAMv2_VID MLB entries for VPARTID/VPMG \342\206\222 physical PARTID/PMG are always cached until invalidation, otherwise not cached.

Type: `bool`

Default value: true

enable_tlb_contig_check

Perform extra pagetable walks to check translation table entries that have the contiguous hint bit set. Ignored if FEAT_BBML3 is implemented.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

enhanced_pac2_level

Implements Enhanced PAC2 from ARMv8.6 (FEAT_PAuth2), and PAC enhancements from ARMv9.5 (FEAT_PAuth_LR). options 0-3 of this feature are mandatory for ARMv8.6 but can be cherrypicked to a ARMv8.3(or greater) implementation. FEAT_FPACCOMBINE is mandatory in the presence of Future Architecture Technologies (FAT). 0: No EnhancedPAC2, 1: EnhancedPAC2 Only (FEAT_PAuth2), 2: EnhancedPAC2 with FPAC (FEAT_FPAC), 3: EnhancedPAC2 with FPACCombined (FEAT_FPACCOMBINE), 4: EnhancedPAC2 with LR signing (FEAT_PAuth_LR).

Type: `uint8_t`

Default value: 0

error_record_feature_register

RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":`0x0`, "IMPDEF_3_2":`0x0`, "UI":`0x0`, "FI":`0x0`, "UE":`0x0`, "CFI":`0x0`, "CEC":`0x0`, "RP":`0x0`, "DUI":`0x0`, "CEO":`0x0`, "CI":`0x0`, "TS":`0x0`, "INJ":`0x0`, "FRX":`0x0`, "UC":`0x0`, "UEU":`0x0`, "UER":`0x0`, "UEO":`0x0`, "DE":`0x0`, "CE":`0x0`, "Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values between `0x0` - `0x3`. CFI and DUI have valid values `0x0`, `0x2` and `0x3`. CEC has valid values `0x0`,`0x2` or `0x4`. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values `0x0` or `0x1`. CI and TS has valid values of `0x0`, `0x1` and `0x2`. Visibility has valid values "Core" or "Cluster".

Type: `string`

Default value: N/A

error_record_feature_register_json_file

File path to the RAS feature register values as JSON. The file uses the same format as the error_record_feature_register parameter value.

Type: `string`

Default value: N/A

erxpfgctl_res0_stateful_mask

Mask for stateful bits for ERXPFGCTL which are **RES0**.

Type: `uint64_t`

Default value: `0x0`

esr_write_update_res0

If true, and RASv2 is enabled, then ESR_ELx.WU field is **RES0** for errors on both loads and stores (FEAT_RASv2).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ete.ASYNC_PACKETS_WHEN_VIEWINST_OFF`

Generate the non-periodic alignment synchronisation packet generation when trace unit is operative.

Type: `bool`

Default value: false

`ete.ATBTRIG`

ATB trigger support.

Type: `bool`

Default value: true

`ete.CCITMIN`

Minimum cycle count value.

Type: `uint16_t`

Default value: `0x4`

`ete.CCSIZE`

Cycle counter size.

Type: `uint8_t`

Default value: 12

`ete.CLAIMTAGS`

Number of claim tags.

Type: `uint8_t`

Default value: 8

`ete.COMMOPT`

Commit mode.

Type: `bool`

Default value: true

`ete.COMMTRANS`

Commit transaction mode.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`ete.DEBUG`

DEBUG.

Type: `uint8_t`

Default value: 2

`ete.DESIGNER`

DESIGNER value.

Type: `uint8_t`

Default value: 65

`ete.ETE_REVISION`

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 0

`ete.EXCEPTION_WITH_CONTEXT`

Whether EXCEPTION_WITH_CONTEXT packet is supported.

Type: `bool`

Default value: true

`ete.EXPLICITLY_COMMIT_P0_ELEMS`

Whether to unilaterally explicitly emit a commit after a P0 packet.

Type: `bool`

Default value: false

`ete.IMPDEFEXCEPPERCENTAGE`

Percentage of IMPDEF exceptions inserted in instruction blocks.

Type: `uint8_t`

Default value: 0

`ete.IMPDEF_TRACE_ON`

Whether trace is flushed and trace on packet generated by events described by bitmap value. bit 0 - PE entering low power state, bit 1 - PE entering debug state.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

ete.IMPRECISE_FILTERING

Number of instruction blocks traced on a transition in the filtering.

Type: `uint8_t`

Default value: 0

ete.LPOVERRIDE

Low power override.

Type: `bool`

Default value: true

ete.MAXSPEC

Maximum speculation depth.

Type: `uint32_t`

Default value: `0x0`

ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

ete.NOOVERFLOW

No overflow.

Type: `bool`

Default value: false

ete.NUMACPAIRS

Number of instruction address comparators pairs.

Type: `uint8_t`

Default value: 4

ete.NUMCIDC

Number of context ID comparators.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

`ete.NUMCNTR`

Number of counters.

Type: `uint8_t`

Default value: 2

`ete.NUMEXTINSEL`

Number of external input selectors.

Type: `uint8_t`

Default value: 4

`ete.NUMPC`

Number of PE comparators.

Type: `uint8_t`

Default value: 0

`ete.NUMSEQSTATE`

Number of sequencer states.

Type: `uint8_t`

Default value: 4

`ete.NUMSSCC`

Number of single shot comparators.

Type: `uint8_t`

Default value: 1

`ete.NUMVMIDC`

Number of virtual ID comparators.

Type: `uint8_t`

Default value: 1

`ete.NumberOfETEEvents`

Number of trace events.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 2

`ete.NumberOfRSPairs`
Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

`ete.PIDR_CMOD`
TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

`ete.PIDR_DESIGNER`
TRCPIDR DESIGNER value.

Type: `uint16_t`

Default value: `0x0`

`ete.PIDR_PART`
TRCPIDR PART number value.

Type: `uint16_t`

Default value: `0x0`

`ete.PIDR_REVAND`
TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

`ete.PIDR_REVISION`
TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

`ete.QFILT`
Q filtering.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`ete.QSUP`

Q support.

Type: `uint8_t`

Default value: 0

`ete.Q_CADENCE`

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

`ete.RAZWI_REG_SEL_TOP_BIT`

Implement Resource Selectors or Resource Selector Pairs bits as **RAZ/WI**.

Type: `bool`

Default value: false

`ete.REGS_WRITE_IGNORE_WHEN_ENABLED`

Whether direct and external writes to registers except TRCPRGCTLR, TRCCLAIMSET and TRCCLAIMCLR are ignored when not in Idle state.

Type: `bool`

Default value: false

`ete.REG_ACCESS_ONLY_MODE`

If enabled, all traces are disabled. Plugin only allows register acceses.

Type: `bool`

Default value: false

`ete.RES0_STATEFUL`

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ete.RETSTACK`
Return stack depth.

Type: `uint8_t`

Default value: 3

`ete.REVISION`
TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

`ete.SIM_OVERFLOW_GRANULARITY`
Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

`ete.SIM_OVERFLOW_PERCENTAGE`
Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

`ete.SOURCE_ADDRESS`
Allow generation of source address elements.

Type: `bool`

Default value: false

`ete.STALLCTRL`
Stall control.

Type: `bool`

Default value: true

`ete.SYSSTALL`
System stall.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ete.TRACEIDSIZE`

Trace ID size.

Type: `uint8_t`

Default value: 7

`ete.TRACE_OUTPUT`

File to which to write trace byte stream.

Type: `string`

Default value: N/A

`ete.TRACE_OUTPUT_ENABLE`

ETE Trace output enable: 1=enable, 0=disable.

Type: `bool`

Default value: false

`ete.TRCRSRTA_FORCED_EXCEP`

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

`ete.TSMARK`

Whether timestamp markers are supported.

Type: `bool`

Default value: false

`ete.TSSIZE`

Timestamp size.

Type: `uint8_t`

Default value: 8

`ete.WFXMODE`

WFX mode.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ets_level`

Level of Enhanced Translation Synchronization support. 0: FEAT_ETS2 not supported, 1: FEAT_ETS2 not supported, 2: FEAT_ETS2 supported, 3: FEAT_ETS3 supported.

Type: `uint8_t`

Default value: 0

`exception_catch_before_software_step`

Exception catch priority for the exception trapping form of exception catch (Armv8.2 or later, or exception_catch_type=0). If true, the exception catch debug event has higher prority than software step and halting step.

Type: `bool`

Default value: true

`exception_catch_type`

Type of exception catch (ARMv8.0 - ARMv8.1 only). 0, exception trapping. 1, non-exception trapping, higher priority than step. 2, non-exception trapping, lower priority than step.

Type: `uint8_t`

Default value: 0

`exclusive_monitor_clear_on_atomic_from_same_master`

Exclusive monitors in the cluster will be cleared by a atomic by the same master to the monitored address.

Type: `bool`

Default value: true

`exclusive_monitor_clear_on_store_from_same_master`

Exclusive monitors in the cluster will be cleared by a store by the same master to the monitored address.

Type: `bool`

Default value: true

`exclusive_monitor_clear_on_strex_address_mismatch`

Exclusive monitors in the cluster will be cleared when a strex fails because the address does not match.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

exclusive_monitor_clear_on_strex_success

Exclusive monitors in the cluster will be cleared when a strex succeeds.

Type: `bool`

Default value: true

exercise_stxr_fail

Controls the rejection of exclusive store instructions. 0: exclusive store instructions should behave as normal, 1: Reject a pseudo-random majority of exclusive store instructions, 2: Always fail exclusive store instructions.

Type: `uint8_t`

Default value: 0

ext_abort_device_GRE_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

ext_abort_device_GRE_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

ext_abort_device_GRE_read_is_critical

Critical reporting of device-GRE read external aborts.

Type: `bool`

Default value: false

ext_abort_device_GRE_read_is_sync

Synchronous reporting of device-GRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.

Type: `uint8_t`

Default value: 2

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ext_abort_device_GRE_read_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

`ext_abort_device_GRE_read_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

`ext_abort_device_GRE_write_is_critical`

Critical reporting of device-GRE write external aborts.

Type: `bool`

Default value: false

`ext_abort_device_GRE_write_is_sync`

Synchronous reporting of device-GRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.

Type: `uint8_t`

Default value: 2

`ext_abort_device_GRE_write_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

`ext_abort_device_GRE_write_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ext_abort_device_nGRE_prefetch_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

`ext_abort_device_nGRE_prefetch_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

`ext_abort_device_nGRE_read_is_critical`

Critical reporting of device-nGRE read external aborts.

Type: `bool`

Default value: false

`ext_abort_device_nGRE_read_is_sync`

Synchronous reporting of device-nGRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.

Type: `uint8_t`

Default value: 2

`ext_abort_device_nGRE_read_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

`ext_abort_device_nGRE_read_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ext_abort_device_nGRE_write_is_critical`

Critical reporting of device-nGRE write external aborts.

Type: `bool`

Default value: false

`ext_abort_device_nGRE_write_is_sync`

Synchronous reporting of device-nGRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.

Type: `uint8_t`

Default value: 2

`ext_abort_device_nGRE_write_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

`ext_abort_device_nGRE_write_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

`ext_abort_device_prefetch_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

`ext_abort_device_prefetch_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ext_abort_device_read_acquire_is_sync`
Synchronous reporting of device read with acquire external aborts.

Type: `bool`

Default value: false

`ext_abort_device_read_is_critical`
Critical reporting of device-nGnRE read external aborts.

Type: `bool`

Default value: false

`ext_abort_device_read_is_sync`
Synchronous reporting of device-nGnRE read external aborts.

Type: `bool`

Default value: true

`ext_abort_device_read_ras_index`
External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Type: `uint16_t`

Default value: `0x0`

`ext_abort_device_read_ras_type`
External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

`ext_abort_device_write_is_critical`
Critical reporting of device-nGnRE write external aborts.

Type: `bool`

Default value: false

`ext_abort_device_write_is_sync`
Synchronous reporting of device-nGnRE write external aborts.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`ext_abort_device_write_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Type: `uint16_t`

Default value: `0x0`

`ext_abort_device_write_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

`ext_abort_fill_data`

Returned data, if external aborts are asynchronous.

Type: `uint64_t`

Default value: `0xfdfdfdfcfcfdfdfd`

`ext_abort_normal_cacheable_read_is_critical`

Critical reporting of normal write-back cacheable-read external aborts.

Type: `bool`

Default value: false

`ext_abort_normal_cacheable_read_is_sync`

Synchronous reporting of normal write-back cacheable-read external aborts.

Type: `bool`

Default value: true

`ext_abort_normal_cacheable_read_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Type: `uint16_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ext_abort_normal_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

ext_abort_normal_cacheable_write_is_critical

Critical reporting of normal write-back cacheable write external aborts.

Type: `bool`

Default value: false

ext_abort_normal_cacheable_write_is_sync

Synchronous reporting of normal write-back cacheable write external aborts.

Type: `bool`

Default value: false

ext_abort_normal_cacheable_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Type: `uint16_t`

Default value: `0x0`

ext_abort_normal_cacheable_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

ext_abort_normal_noncacheable_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ext_abort_normal_noncacheable_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

ext_abort_normal_noncacheable_read_is_critical

Critical reporting of normal noncacheable-read external aborts.

Type: `bool`

Default value: false

ext_abort_normal_noncacheable_read_is_sync

Synchronous reporting of normal noncacheable-read external aborts.

Type: `bool`

Default value: true

ext_abort_normal_noncacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Type: `uint16_t`

Default value: `0x0`

ext_abort_normal_noncacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

ext_abort_normal_noncacheable_write_is_critical

Critical reporting of normal noncacheable write external aborts.

Type: `bool`

Default value: false

ext_abort_normal_noncacheable_write_is_sync

Synchronous reporting of normal noncacheable write external aborts.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`ext_abort_normal_noncacheable_write_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Type: `uint16_t`

Default value: `0x0`

`ext_abort_normal_noncacheable_write_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

`ext_abort_normal_wt_cacheable_prefetch_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

`ext_abort_normal_wt_cacheable_prefetch_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

`ext_abort_normal_wt_cacheable_read_is_critical`

Critical reporting of normal write-through cacheable-read external aborts.

Type: `bool`

Default value: false

`ext_abort_normal_wt_cacheable_read_is_sync`

Synchronous reporting of normal write-through read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_read_is_sync.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 2

ext_abort_normal_wt_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

ext_abort_normal_wt_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

ext_abort_normal_wt_cacheable_write_is_critical

Critical reporting of normal write-through write external aborts.

Type: `bool`

Default value: false

ext_abort_normal_wt_cacheable_write_is_sync

Synchronous reporting of normal write-through write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_write_is_sync.

Type: `uint8_t`

Default value: 2

ext_abort_normal_wt_cacheable_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

ext_abort_normal_wt_cacheable_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Non-Confidential

Type: `int8_t`

Default value: -1

`ext_abort_prefetch_device_GRE_read_is_critical`

Critical reporting of external aborts generated by device-GRE instruction fetches.

Type: `bool`

Default value: false

`ext_abort_prefetch_device_GRE_read_is_sync`

Behaviour of external aborts generated by device-GRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type: `uint8_t`

Default value: 2

`ext_abort_prefetch_device_nGRE_read_is_critical`

Critical reporting of external aborts generated by device-nGRE instruction fetches.

Type: `bool`

Default value: false

`ext_abort_prefetch_device_nGRE_read_is_sync`

Behaviour of external aborts generated by device-nGRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type: `uint8_t`

Default value: 2

`ext_abort_prefetch_device_read_is_critical`

Critical reporting of external aborts generated by device-nGnRE instruction fetches.

Type: `bool`

Default value: false

`ext_abort_prefetch_device_read_is_sync`

Behaviour of external aborts generated by device-nGnRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type: `uint8_t`

Default value: 2

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ext_abort_prefetch_is_critical

Critical reporting of external aborts generated by normal writeback cacheable instruction fetches.

Type: `bool`

Default value: false

ext_abort_prefetch_is_sync

Behaviour of external aborts generated by normal writeback cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort.

Type: `bool`

Default value: true

ext_abort_prefetch_noncacheable_read_is_critical

Critical reporting of external aborts generated by normal noncacheable instruction fetches.

Type: `bool`

Default value: false

ext_abort_prefetch_noncacheable_read_is_sync

Behaviour of external aborts generated by normal noncacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type: `uint8_t`

Default value: 2

ext_abort_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Type: `uint16_t`

Default value: `0x0`

ext_abort_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ext_abort_prefetch_so_read_is_critical

Critical reporting of external aborts generated by device-nGnRnE instruction fetches.

Type: `bool`

Default value: false

ext_abort_prefetch_so_read_is_sync

Behaviour of external aborts generated by device=nGnRnE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type: `uint8_t`

Default value: 2

ext_abort_prefetch_wt_cacheable_read_is_critical

Critical reporting of external aborts generated by normal writethrough cacheable instruction fetches.

Type: `bool`

Default value: false

ext_abort_prefetch_wt_cacheable_read_is_sync

Behaviour of external aborts generated by normal writethrough cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type: `uint8_t`

Default value: 2

ext_abort_so_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

ext_abort_so_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ext_abort_so_read_is_critical`

Critical reporting of device-nGnRnE read external aborts.

Type: `bool`

Default value: false

`ext_abort_so_read_is_sync`

Synchronous reporting of device-nGnRnE read external aborts.

Type: `bool`

Default value: true

`ext_abort_so_read_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Type: `uint16_t`

Default value: `0x0`

`ext_abort_so_read_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

`ext_abort_so_write_is_critical`

Critical reporting of device-nGnRnE write external aborts.

Type: `bool`

Default value: false

`ext_abort_so_write_is_sync`

Synchronous reporting of device-nGnRnE write external aborts.

Type: `bool`

Default value: true

`ext_abort_so_write_ras_index`

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0x0`

ext_abort_so_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

ext_abort_ttw_cacheable_read_is_critical

Critical reporting of TTW cacheable read external aborts.

Type: `bool`

Default value: false

ext_abort_ttw_cacheable_read_is_sync

Synchronous reporting of TTW cacheable read external aborts.

Type: `bool`

Default value: true

ext_abort_ttw_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Type: `uint16_t`

Default value: `0x0`

ext_abort_ttw_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

ext_abort_ttw_noncacheable_read_is_critical

Critical reporting of TTW noncacheable read external aborts.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ext_abort_ttw_noncacheable_read_is_sync

Synchronous reporting of TTW noncacheable read external aborts.

Type: `bool`

Default value: true

ext_abort_ttw_noncacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

Type: `uint16_t`

Default value: `0x0`

ext_abort_ttw_noncacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 0

ext_abort_ttw_wt_cacheable_read_is_critical

Critical reporting of TTW write-through cacheable read external aborts.

Type: `bool`

Default value: false

ext_abort_ttw_wt_cacheable_read_is_sync

Synchronous reporting of TTW write-through cacheable read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_ttw_cacheable_read_is_sync.

Type: `uint8_t`

Default value: 2

ext_abort_ttw_wt_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records-1].

Type: `int16_t`

Default value: -1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ext_abort_ttw_wt_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `int8_t`

Default value: -1

external_debug_request_delay

Configure External Debug Request delay in CPU cycles.

Type: `uint32_t`

Default value: `0x0`

external_oslar_access_disabled_by_authentication

If true, external accesses to OSLAR, when external debugging is not enabled, will generate an error (FEAT_Debugv8p2).

Type: `bool`

Default value: false

far_unchanged_when_fnv_set

If true and ESR_ELx.FnV=1, FAR_ELx is not updated but PFAR_ELx/MFAR_ELx can be updated.

Type: `bool`

Default value: false

fault_on_misprogrammed_gpt_contig_region

Whether GPF faults occur when GPT contiguous entries are misprogrammed.

Type: `bool`

Default value: false

fault_on_nT_bit_set

Whether block translation table entries with the nT bit set should always fault. Only applies when changing_block_size_without_bbm_support_level is 1 or higher.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

fault_unalign_to_unsupported_access

If has_unaligned_single_copy_atomicity is true, whether unaligned A64 atomic, exclusive and acquire/release instructions to non iWB-oWB or the access crossing a 16-byte boundary generate fault. Bits 0,1,2,3 should be set accordingly to enable the fault behaviour. bit 0: atomic access should fault, bit 1: exclusive access should fault, bit 2: acquire/release should fault, bit 3: the access crossing a 16-byte boundary should fault.

Type: `uint8_t`

Default value: 8

fault_unaligned_s1_device_s2_fwb

Whether unaligned fault with stage1 Device memory and final memory attribute forced to normal by FWB. 0, No fault. 1, will fault. 2 No fault if final Shareability is NSH.

Type: `uint8_t`

Default value: 0

fgdt_index_width

Implemented FGDT Index width value, 0: 3 bits. 1: 4 bits. 2: 5 bits.

Type: `uint8_t`

Default value: 0

force_align_pc

UNPREDICTABLE branch to non-word-aligned address in ARM state is forced to be aligned.

Type: `bool`

Default value: false

force_deterministic_irg_tag_generation

Force the random tag generated by the IRG instruction when GCR_EL1.RRND=1 to equal RGSR_EL1.SEED[3:0] rather than a non-deterministic value.

Type: `bool`

Default value: false

force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

force_pstate_pm_in_debug_state

If true, PSTATE.PM is forced to 1 while entering in debug state (FEAT_EBEP).

Type: `bool`

Default value: false

force_sync_on_wfx

If true, the PE does a context synchronization before entering low power state(WFI/WFE).

Type: `bool`

Default value: false

force_wnr_read_unsupported_exclusive_or_atomic

DEPRECATED, please use force_wnr_read_unsupported_exclusive_or_atomic instead. Whether ESR_ELx.WnR is forced to 0 for unsupported atomic and exclusives.

Type: `bool`

Default value: false

force_wnr_unsupported_atomic_hwu

If not 0, force ESR_ELx.WnR to a specific value on Unsuported Atomic Hardware Update. Possible values: 0: Not forced. 1: Write. 2: Read.

Type: `uint8_t`

Default value: 0

force_wnr_unsupported_exclusive_or_atomic

If not 0, force ESR_ELx.WnR to a specific value on Unsupported Atomic or Exclusives. Possible values: 0: Not forced. 1: Write. 2: Read.

Type: `uint8_t`

Default value: 0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

fp8_support_level

0->No support for Advanced SIMD, SVE2 FP8 instructions 1->Support for FEAT_FP8 2->Support for FEAT_FP8FMA 3->Support for FEAT_FP8DOT4 4->Support for FEAT_FP8DOT2.

Type: `uint8_t`

Default value: 0

fpcr_short_vector_raz

FPSCR and FPCR fields LEN and STRIDE are hardwired to 0.

Type: `bool`

Default value: false

fpsr_res0_stateful_mask

Mask for stateful bits of FPSR which are **RES0**.

Type: `uint32_t`

Default value: `0x0`

fsr_ext_bit_update_kind

Set/Clear DFSR/IFSR EA bit on Synchronous/Async External Aborts. 0: Never Set, 1: Set on Synchronous Ext Aborts 2: Set on Asynchronous Ext Aborts 3: Set on both Sync and Async Ext Aborts.

Type: `uint8_t`

Default value: 3

gcs_data_check_overrides_data_abort

GCS Data check exceptions are taken before Data Aborts.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

gcs_overshoot_writes

Number of overshooting GCS records written after a writing a record.

Type: `uint64_t`

Default value: `0x0`

gcspr_sync_immediate

If true, writing to GCSPR_ELx registers has immediate effect regardless of has_delayed_sysreg flag.

Type: `bool`

Default value: false

gic.GICC-offset

Offset from PERIPHBASE for GICC registers.

Type: `uint32_t`

Default value: `0x2000`

gic.GICD-offset

Offset from PERIPHBASE for GICD registers. Will be ignored when GICv3 CPU interface is enabled, as distributor is then external to the cluster.

Type: `uint32_t`

Default value: `0x1000`

gic.GICH-offset

Offset from PERIPHBASE for GICH registers.

Type: `uint32_t`

Default value: `0x4000`

gic.GICH-other-CPU-offset

Offset from PERIPHBASE for GICH registers for accessing other CPUs in the cluster. Set to 0 to disable.

Type: `uint32_t`

Default value: `0x5000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

gic.GICV-alias

Offset from PERIPHBASE for alias of GICV registers. When gicv2-only, if zero no alias will be created; if gicv2-only=0, the param is deprecated, when zero or unset an alias is created in the place mandated by the architecture (GICV-base+`0xF000`).

Type: `uint32_t`

Default value: `0x0`

gic.GICV-offset

Offset from PERIPHBASE for GICV registers.

Type: `uint32_t`

Default value: `0x6000`

gic.PERIPH-size

Size of registers based at PERIPHBASE that are considered to be owned by the GIC. Any accesses in the range PERIPHBASE to PERIPHBASE+gic.PERIPH-size-1 that do not match GIC registers will be treated as **RAZ/WI**.

Type: `uint32_t`

Default value: `0x8000`

gicv3.A3-affinity-supported

Whether a non-zero value for affinity at level 3 is supported.

Type: `bool`

Default value: false

gicv3.BPR-min

The minimum value for the GICC_BPR register (non-secure version will be 1 + this value).

Type: `uint8_t`

Default value: 2

gicv3.EOI-check-CPUID

Check CPU ID specified for accesses to EOI registers (rather than just ending highest priority active interrupt).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

gicv3.EOI-check-ID

Check Interrupt ID specified for accesses to EOI registers (rather than just ending highest priority active interrupt).

Type: `bool`

Default value: false

gicv3.EOI-deactivate-any-interrupt

Allow an EOI to deactivate interrupts that aren't the highest priority active interrupt (EOI-ignore-out-of-order must be false otherwise this is ignored).

Type: `bool`

Default value: false

gicv3.EOI-ignore-out-of-order

Ignore EOI writes that cannot end the highest priority active interrupt.

Type: `bool`

Default value: true

gicv3.FIQEn-RAO

GICC_CTLR.FIQEn is read as one, write insensitive.

Type: `bool`

Default value: false

gicv3.IIDR_base

The base value for calculating the GICC_IIDR register value.

Type: `uint32_t`

Default value: `0x43b`

gicv3.LR-count

The number of implemented list registers.

Type: `uint8_t`

Default value: 16

gicv3.PMHE-RAO-WI

ICC_CTLR_EL*.PHME is read as one, write insensitive.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

gicv3.PMHE-RAZ-WI

ICC_CTLR_EL*.PHME is read as zero, write insensitive.

Type: `bool`

Default value: false

gicv3.PMHE-release-set-packet

if PHME is enabled, whether a SET packet is released by CPU Intf in Upstream Ack window.

Type: `bool`

Default value: false

gicv3.SRE-EL2-enable-RAO

When ICC_SRE_EL2.SRE is **RAO/WI**, makes ICC_SRE_EL2.Enable **RAO/WI**.

Type: `bool`

Default value: false

gicv3.SRE-EL3-enable-RAO

When ICC_SRE_EL3.SRE is **RAO/WI**, makes ICC_SRE_EL3.Enable **RAO/WI**.

Type: `bool`

Default value: false

gicv3.SRE-EL3-set-once

Restrict SRE EL3 to be set only once.

Type: `bool`

Default value: false

gicv3.SRE-enable-action-on-mmap

Allowed values are: 0-SRE one allows mmap access. 1-SRE one disables mmap access. 2-SRE one makes mmap access **RAZ-WI**.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

gicv3.STATUSR-implemented

If GICv3 CPU interface is being used, this determines whether the STATUS registers are implemented.

Type: `bool`

Default value: true

gicv3.VBPR-min

The minimum value for the GICV_BPR register (non-secure version will be 1 + this value).

Type: `uint8_t`

Default value: 2

gicv3.VFIQEn-RAO

ICH_VMCR_EL2.VFIQEn is read as one, write insensitive.

Type: `bool`

Default value: false

gicv3.cpuintf-mmap-access-level

Allowed values are: 0-mmap access is supported for GICC,GICH,GICV registers. 1-mmap access is supported only for GICV registers. 2-mmap access is not supported.

Type: `uint8_t`

Default value: 0

gicv3.dir-trap-support

The cpu supports separate trapping of ICC_DIR_EL1 to EL2.

Type: `bool`

Default value: true

gicv3.el3_trap_priority_when_secure_debug_disabled

Undef to access priorities group register when secure debug is disabled.

Type: `bool`

Default value: false

gicv3.extended-interrupt-range-support

Device has support for extended SPI/PPI ID ranges.

Type: `bool`

Default value: false

gicv3.gicv2-only

Limit the GIC implementation to GICv2 features only.

Type: `bool`

Default value: false

gicv3.idle-is-ff

For GICC/GICV RPR, when idle, return FF when true, minimum supported priority otherwise.

Type: `bool`

Default value: true

gicv3.ignore-DIR-write-when-EOImode-not-set

Ignore **UNPREDICTABLE** access to GICC_DIR register.

Type: `bool`

Default value: true

gicv3.interrupt-bypass-support

Interrupt bypass support, set to false for devices not supporting interrupt bypass.

Type: `bool`

Default value: true

gicv3.local-SEIs

Generate SEI to signal internal issues.

Type: `bool`

Default value: false

gicv3.local-VSEIs

Generate VSEI to signal internal issues.

Type: `bool`

Default value: false

gicv3.physical-ID-bits

Number of physical ID bits implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 16

`gicv3.priority-bits`

Number of priority bits implemented.

Type: `uint8_t`

Default value: 5

`gicv3.send-PMHE-command-only-when-priority-changes`

Send PMHE upstream command to distributor only when write to ICC_PMR_EL1 changes the priority.

Type: `bool`

Default value: false

`gicv3.sgi-range-selector-support`

Device has support for the Range Selector feature for SGI.

Type: `bool`

Default value: false

`gicv3.suppress-virtual-enables-comms`

In GICv3 only mode, prevents the GIC CPUIF from communicating UpstreamWrite/VirtualEnables to the IRI.

Type: `bool`

Default value: true

`gicv3.virtual-ID-bits`

Number of virtual ID bits implemented.

Type: `uint8_t`

Default value: 16

`gicv3.virtual-lpi-support`

When GICv3 is supported, indicates a cut down CPUIF interface with no support of VLPI (GICv3 only) when false.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

gicv3.virtual-priority-bits

Number of virtual priority bits implemented.

Type: `uint8_t`

Default value: 5

gicv3.without-DS-support

GICv3 CPU interfaces do not support disabling security in the distributor (GICD_CTLR.DS=1).

Type: `bool`

Default value: false

gicv4.mask-virtual-interrupt

If true, virtual interrupts can be masked from being reported to virtual CPU interface by setting ICH_HCR_EL2.DVIM 1. No control otherwise.

Type: `bool`

Default value: false

gicv5.config_file

File path for the GICv5 configuration yaml. The file lists the GICv5 params.

Type: `string`

Default value: N/A

gicv5.has_gcie_legacy

When set to true, FEAT_GCIE_LEGACY is supported.

Type: `bool`

Default value: false

gicv5.interrupt-bypass-support

Interrupt bypass support. when set to true, bypasses GICv5 CPU interface to signal interrupts to the PE.

Type: `bool`

Default value: false

global_debug_rom.ROMDEVID

Value of Debug Rom Device Identification Register.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

global_debug_rom.ROMPIDR

Value of Debug Rom Peripheral Identification Register.

Type: `uint64_t`

Default value: `0x4000bb000`

global_debug_rom.ROMPRIDR0

Value of Debug ROM Power RequestID Register.

Type: `uint8_t`

Default value: 1

gpccr_el3_gpcp_behaviour

Used to control impdef behaviour when GPCP=1 (0->Faults are always generated and reported, 1->Faults are not generated and reported), 2->Faults are generated and reported only for Arm recommended cases.

Type: `uint8_t`

Default value: 2

gpt_tlb_size

Number of separate GPT TLB entries.

Type: `uint32_t`

Default value: `0x0`

gpt_walkcache_size

Number of GPT walk cache entries.

Type: `uint32_t`

Default value: `0x0`

hardware_translation_table_update_implemented

Implement hardware translation table updates from ARMv8.1 (FEAT_HAFDBS).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.1 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

has-gicv4.1

GICv4.1 is enabled, and all the features with GICv4.1 are implemented (FEAT_GICv4p1).

Type: `bool`

Default value: false

has_128_bit_atomic_instructions

Implement 128-bit Atomic Instructions (FEAT_LSE128); mandatory in the presence of Future Architecture Technologies (FAT)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_128_bit_tt_descriptors

Implement 128-bit Translation Table Descriptors (FEAT_D128)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_16bit_asids

Enable 16-bit ASIDs; mandatory in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

has_16bit_vmids

Implement support for 16-bit VMIDs from ARMv8.1 (FEAT_VMID16).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.1 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_16k_granule

Implement the 16k LPAE translation granule.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

has_4k_granule

Implement the 4k LPAE translation granule.

Type: `bool`

Default value: true

has_52bit_address_with_16k

Implements Armv8.7 52-bit IPA/PA support for 16k (FEAT_LPA2).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_52bit_address_with_4k

Implements Armv8.7 52-bit IPA/PA support for 4k (FEAT_LPA2).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_56_bit_va

56-bit Physical Address, identified as (FEAT_LVA3)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_64bit_pmu_ext_access

Implement 64-bit pmu external interface access (FEAT_PMU_EXT64)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_64k_granule

Implement the 64k LPAE translation granule.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

has_aarch32_dbgdidr_etc

DBGDIDR, DBGDRAR, DBGDSAR exist even if EL1 doesn't implement AArch32.

Type: `bool`

Default value: true

has_aarch32_hpd

If true then hierarchical permission disable is supported in AArch32 (FEAT_AA32HPD).

Type: `bool`

Default value: false

has_aarch64

All implemented exception levels can run in AArch64.

Type: `bool`

Default value: true

has_actlr2

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

Type: `bool`

Default value: false

has_actlr_virtualisation

If true ACTLR_EL12 is implemented and ACTLR_EL1 supports virtualisation.

Type: `bool`

Default value: false

has_address_breakpoint_linking

Implement Address Breakpoint Linking Extension (FEAT_ABLE)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_amu

Implement activity monitor functionality from ARMv8.4 (FEAT_AMUv1).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_amu_ext64

Implement 64-bit external interface to the Activity Monitors (FEAT_AMU_EXT64).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_amu_extacr

If true then implement AMU external access control registers (FEAT_AMU_EXTACR).

Type: `bool`

Default value: false

has_arm_v8-1

Implement the ARMv8.1 Extension.

Type: `bool`

Default value: false

has_arm_v8-2

Implement the ARMv8.2 Extension.

Type: `bool`

Default value: false

has_arm_v8-3

Implement the ARMv8.3 Extension.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_arm_v8-4
Implement the ARMv8.4 Extension.

Type: `bool`

Default value: false

has_arm_v8-5
Implement the ARMv8.5 Extension.

Type: `bool`

Default value: false

has_arm_v8-6
Implement the ARMv8.6 Extension.

Type: `bool`

Default value: false

has_arm_v8-7
Implement the Armv8.7 Extension.

Type: `bool`

Default value: false

has_arm_v8-8
Implement the ARMv8.8 Extension.

Type: `bool`

Default value: false

has_arm_v8-9
Implement the ARMv8.9 Extension.

Type: `bool`

Default value: false

has_arm_v9-0
Implement the ARMv9.0 Extension.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`has_arm_v9-1`
Implement the ARMv9.1 Extension.

Type: `bool`

Default value: false

`has_arm_v9-2`
Implement the ARMv9.2 Extension.

Type: `bool`

Default value: false

`has_arm_v9-3`
Implement the ARMv9.3 Extension.

Type: `bool`

Default value: false

`has_arm_v9-4`
Implement the ARMv9.4 Extension.

Type: `bool`

Default value: false

`has_arm_v9-5`
Implement the ARMv9.5 Extension.

Type: `bool`

Default value: false

`has_arm_v9-6`
Implement the ARMv9.6 Extension.

Type: `bool`

Default value: false

`has_arm_v9-7`
Implement the ARMv9.7 Extension.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_asid2

If true then support for use of two concurrent ASIDs (FEAT_ASID2)values of this parameter are:- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_at_with_pan

Implement new AT instructions with PAN support (FEAT_PAN2).values of this parameter are:- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_ats1a

Support for ATS1ExR instructions (FEAT_ATS1A)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_attribute_index_enhancement

Memory Attribute Index Enhancement (FEAT_AIE)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_axflag_xaflag

Implement flag manipulation instructions (AXFlag, XAFlag) from ARMv8.5 (FEAT_FlagM2).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_axflag_xaflag_frint

Implement flag manipulation instructions (AXFlag, XAFlag) and floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. If this parameter is enabled, it also enables both has_axflag_xaflag and has_frint. If support for only one of the features is needed, please use the individual parameters and do not enable this one (FEAT_FlagM2, FEAT_FRINTTS).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

has_bc

Implement Armv8.8 Hinted Conditional Branch (FEAT_HBC)values of this parameter are:- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_branch_target_exception

Implement Branch target identification mechanism from ARMv8.5 (FEAT_BTI) (DEPRECATED: Use bti_support_level instead).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_brbe

If true, implements branch record buffer extension (FEAT_BRBE).

Type: `bool`

Default value: false

has_brbe_v1p1

If true, implements FEAT_BRBEv1p1.

Type: `bool`

Default value: false

has_ccidx

Implement the ARMv8.3 FEAT_CCSIDR Extension. Extending the ccsidr number of sets (FEAT_CCIDX).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.3 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_cfinv_rmif_setf

Implement flag manipulation (CFINV, RMIF, SETF8, SETF16) instructions from ARMv8.4 (FEAT_FlagM).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

has_cflt

Support for compare and fault instructions (FEAT_CFLT)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_chkfeat

Implement CHKFEAT instruction from ARMv9.4 (FEAT_CHK).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_clear_bhb

Implement Clear Branch History information instruction (FEAT_CLRBHB).values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_clear_other_speculation_by_context

Implement execution and data prediction invalidation from Armv8.9 (FEAT_SPECRES2).values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_cmh

Implement Coherency scalability hints (FEAT_CMH)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_cmo_wr_control

Whether stage1/2 CMO write perm control is supported (FEAT_CMOW)values of this parameter are:- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

`has_cmpbr`

Implement compare and branch instructions from ARMv9.6, optional in ARMv9.5 (FEAT_CMPBR)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

`has_coherent_icache`

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

Type: `bool`

Default value: false

`has_common_not_private_translations`

Implement the TTBRn_ELx.CnP (Common not Private) controls from ARMv8.2 (FEAT_TTCNP).values of this parameter are:- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_complex_number`

Implement ARMv8.3 complex number support, Multiply Accumulate and Add instructions (FEAT_FCMA).values of this parameter are:- 1, feature is implemented if ARMv8.3 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_const_pac`

Feature for singular selection of PAC field (FEAT_CONSTPACFIELD).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_cssc

Support for common short sequence compression instructions (FEAT_CSSC)values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_cvadp_support

Implement instruction to support cache clean by deep persistence (DC CVADP) from ARMv8.5, can be selected for core implemented on any arch version starting ARMv8.2 (FEAT_DPB, FEAT_DPB2).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_data_abort_syndrome_enhancements

Support for Data Abort syndrome information enhancements(FEAT_EAESR).values of this parameter are:- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_data_alignment_flag

Implement non-optimal misalignment flag for PMU/SPE from ARMv8.5values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_debug_rom

If true, a debug ROM will be generated describing the cluster's debug components.

Type: `bool`

Default value: true

has_delayed_brbe_records

If true, a synchronization barrier is required to update the BRB records (FEAT_BRBE).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`has_delayed_ctireg`

Delay the functional effect of CTI register writes until ISB or implicit barrier.

Type: `bool`

Default value: false

`has_delayed_dbgreg`

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: false

`has_delayed_mdscr_el1`

Delay the functional effect of MDSCR_EL1 register writes until ISB or implicit barrier.

Type: `bool`

Default value: false

`has_delayed_oslar_el1`

Delay the functional effect of OSLAR_EL1 register writes until ISB or implicit barrier.

Type: `bool`

Default value: false

`has_delayed_pmureg`

Delay the functional effect of PMU register writes until ISB or implicit barrier.

Type: `bool`

Default value: false

`has_delayed_sysreg`

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: false

`has_delayed_wfe_trap`

Implements Configurable Delayed WFE trapping from ARMv8.6 (FEAT_TWED).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

has_dgh

Implements Data Gathering Hint instruction from ARMv8.6 (FEAT_DGH).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_dot_product

Implement the dot product (UDOT, SDOT) instructions from ARMv8.4 (FEAT_DotProd).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_e0pd

Implement ARMv8.5 feature to prevent unprivileged access to one half of the memory (FEAT_E0PD).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_e2h_rao

Whether the implementation treats HCR_EL2.E2H as Read-As-One (**RAO**). 0 : FEAT_E2H0 implementedvalues of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.1 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_ebep

Implement Exception-Based Event Profiling from ARMv9.4 (FEAT_EBEP).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`has_ebf16`

Support for Extended BFloat16 Behaviours (FEAT_EBF16)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

`has_ecbhb`

Implement Exploitative Control using Branch History information between exception levels (FEAT_ECBHB).values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_edacr`

Implement EDACR register.

Type: `bool`

Default value: true

`has_edhsr`

Implement external debug halt status register (FEAT_EDHSR). 0: FEAT_EDHSR is not implemented unless architecturally required by another feature, 1: FEAT_EDHSR is implemented, 2: FEAT_EDHSR is implemented (extends EDHSR to include the VNCR, CM, and WnR fields), `0xF`: FEAT_EDHSR implementation is dependent on FEAT_SME.

Type: `uint8_t`

Default value: 15

`has_el2`

Implements EL2.

Type: `bool`

Default value: true

`has_el3`

Implements EL3.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`has_enhanced_pac`

If pointer authentication is enabled then implement enhanced PAC (FEAT_EPAC).

Type: `bool`

Default value: false

`has_enhanced_pan`

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_enhanced_software_step`

Implement Enhanced Software Step Extension (FEAT_STEP2).values of this parameter are:- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_ete`

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

`has_ets`

Whether Enhanced Translation Synchronization is supported. (NOTE: DEPRECATED: use ets_level instead).

Type: `bool`

Default value: false

`has_exception_trapping_form_of_vector_catch`

Implement the exception trapping form of vector catch debug event.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_extended_recp_estimate

Implements increased precision of reciprocal instructions (FEAT_RPRES).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_external_rndr

Implement external random number generator module. When enabling this with has_rndr enabled, the external random number generator will be used instead of internal random number generatorvalues of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_f16f32dot

Implement FEAT_F16F32DOT.

Type: `bool`

Default value: false

has_f16f32mm

Implement FEAT_F16F32MM.

Type: `bool`

Default value: false

has_f16mm

Implement FEAT_F16MM.

Type: `bool`

Default value: false

has_f8f16mm

Implement FEAT_F8F16MM and dependent features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_f8f32mm

Implement FEAT_F8F32MM and dependent features.

Type: `bool`

Default value: false

has_faminmax

Implement FEAT_FAMINMAX.

Type: `bool`

Default value: false

has_far_not_valid

Implements FnV bit in ESR_ELx and xFSR, FAR not valid for synchronous external aborts.

Type: `bool`

Default value: false

has_far_not_valid_dfsc

Implements FnV bit in ESR_ELx, FAR not valid for synchronous external aborts for Data Abort.

Type: `bool`

Default value: false

has_far_not_valid_ifsc

Implements FnV bit in ESR_ELx and xFSR, FAR not valid for synchronous external aborts for Instruction Abort.

Type: `bool`

Default value: false

has_fdit

Support higher exception levels to enforce data-independent timing (FEAT_FDIT).values of this parameter are:- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_feat_pops

Whether ARMv9.6 RAS support for clean-and-invalidate of data by virtual address to Point of Physical Storage (FEAT_PoPS)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_fgt

Implements Fine-grained Virtualization Traps extension from ARMv8.6 (FEAT_FGT).values of this parameter are:- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_fgt2

Implement additional FGT traps introduced in ARMv8.9 (FEAT_FGT2).values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_fgwte3

If true then Fine Grained Write EL3 is enabled (FEAT_FGWTE3).

Type: `bool`

Default value: false

has_fixed_function_instr_counter

Implement fixed-function instruction counter (FEAT_PMUv3_ICNTR)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_fp16

Implement the half-precision floating-point data processing instructions from ARMv8.2 (FEAT_FP16).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

has_fp16_fmlal

Implement the New Floating Point Multiplication Variant (FP16 FMLAL, FMLSL) instructions from ARMv8.4. Only supported if has_fp16=`0x1` (FEAT_FHM).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_fpmr

Implement FPMR (FEAT_FPMR).

Type: `bool`

Default value: false

has_fprcvt

Implement FEAT_FPRCVT FP convert instructions from ARMv9.6, optional in ARMv9.5 (FEAT_FPRCVT)values of this parameter are:- 1, feature is implemented if ARMv9.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_frint

Implement floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5 (FEAT_FRINTTS).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_gcs

Implement Guarded Control Stack Extension from ARMv9.4 (FEAT_GCS).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_generic_authentication

Implement ARMv8.3 generic authentication.values of this parameter are:- 1, feature is implemented if ARMv8.3 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

has_guest_translation_granule

Implement mechanism for guest translation granule identification from ARMv8.5, ID values determined by stage1 granule configuration parameters (FEAT_GTG).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_haft

Implement Hardware managed Access Flag for Table Descriptors (FEAT_HAFT)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_hardware_accelerator_for_cleaning_dirty_state

Whether hardware accelerator for cleaning Dirty state is supported (FEAT_HACDBS).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_hardware_dirty_state_tracking_structure

Whether hardware Dirty state tracking Structure is supported (FEAT_HDBSS).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_hardware_translation_table_update

Type of hardware translation table supported (when enabled by hardware_translation_table_update_implemented). 0, not implemented. 1, access bit updates implemented. 2, access bit updates and dirty bit mechanism implemented (FEAT_HAFDBS).

Type: `uint8_t`

Default value: 2

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_hcrx_el2

Implements new HCRX_EL2 id register from Armv8.7 (FEAT_HCX).values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_hpmn0

Allow hypervisor to set MDCR_EL2.HPMN to 0 (FEAT_HPMN0)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_id_reg_read

Implement read access to the ID registers (ESR_ELx.EC=`0x18`) (FEAT_IDST)values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_iesb

Implement support for implicit error sync event from ARMv8.2 (FEAT_IESB).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_itd

Implement the optional IT disable feature.

Type: `bool`

Default value: true

has_ite

Implement Instrumentation Trace Extension from ARMv9.4 (FEAT_ITE).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

has_jscvt

Implement ARMv8.3 javascript Floating-point to Integer conversion instruction (FEAT_JSCVT).values of this parameter are:- 1, feature is implemented if ARMv8.3 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_large_system_ext

Implement the ARMv8 Large System Extensions (FEAT_LSE).

Type: `bool`

Default value: false

has_large_ttbr_ba_without_lpa

When FEAT_LPA is not implemented, whether TTBR base address supports large values (52 bits) or not (48 bits).

Type: `bool`

Default value: true

has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_ldapur_stlur

Implement support for LDAPR and STLR instructions with immediate offsets from ARMv8.4 (FEAT_LRCPC2).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_ldm_stm_ordering_control

Implement the SCTLR_ELx.LSMAOE (Load/Store Multiple Atomicity and Ordering Enable) and SCTLR_ELx,nTLSMD (no Trap Load/Store Multiple to Device) controls from ARMv8.2

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

(FEAT_LSMAOC).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_lorrl

Support for Limited Order Regions in Realm PA space (FEAT_LORRL).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_lrcpc

If true then it support the RCpc feature from ARMv8.3 (FEAT_LRCPC).

Type: `bool`

Default value: false

has_lrcpc3

Implement Release Consistency processor consistent (RCpc) feature from Armv8.9 (FEAT_LRCPC3).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_lscp

Implement 128-bit Load acquire and store release pair single-copy atomic instructions (FEAT_LSCP)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_lsfe

Implement A64 base Atomic floating-point in-memory instructions (FEAT_LSFE)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.3 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

`has_lsui`

Implement additional load and store unprivileged instructions (FEAT_LSUI).values of this parameter are:- 1, feature is implemented if ARMv9.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_lut`

Implement FEAT_LUT.

Type: `bool`

Default value: false

`has_mbist_never1_ae25`

Implements the MBIST Never1 detection for AE25 class cpu.

Type: `bool`

Default value: false

`has_mismatch_and_range_breakpoints`

Implement Mismatch and Range Breakpoints (FEAT_BWE)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

`has_mismatch_watchpoints`

Implement Breakpoints and Watchpoints Enhancements (FEAT_BWE2).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

`has_mops_go_option`

Implement MTE Tag set only MOPS instructions (FEAT_MOPS_GO). 0, not implemented. 1, implemented using Option A. 2, implemented using Option B.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_mops_option

Implement Armv8.8 standard instructions for memory operations (FEAT_MOPS). 0, not implemented (unsupported if Armv8.8 is enabled). 1, implemented using Option A. 2, implemented using Option B.

Type: `uint8_t`

Default value: 0

has_mpam

Implement ARMv8.4 MPAM Registers and associated functionality (FEAT_MPAM).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_mpamv2

Implement MPAM architecture 2.0 (FEAT_MPAMv2).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_mpamv2_alt_id

Implement alternative identifier for MPAM architecture 2.0 (FEAT_MPAMv2_ALT_ID).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_mpamv2_instr_alt_id

Implement alternative identifier for instruction fetches when FEAT_MPAMv2_ALT_ID is enabled.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_mpamv2_vid

Implement identifier virtualization for MPAM architecture 2.0 (FEAT_MPAMv2_VID).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_mpmm

Implement max-power mitigation mechanism (MPMM).

Type: `bool`

Default value: false

has_mt_pmu_disable_feature

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, `0xF`: The feature is disabled and is represented by value `0xF` in ID_AA64DFR0_EL1.MTPMU.

Type: `uint8_t`

Default value: 0

has_mte_async_faults

Whether MTE asynchronous faults are supported (FEAT_MTE_ASYNC).

Type: `bool`

Default value: true

has_mte_eirg

Implement Enhanced Insert Random Tag (FEAT_MTE_EIRG)values of this parameter are:- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_mte_fgt

When FEAT_VMTE or FEAT_MTE2 are implemented, wheether FEAT_MTEFGT is implemented.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`has_mte_perm`

Implement tag access permission (FEAT_MTE_PERM).

Type: `bool`

Default value: false

`has_mte_tag_related_fault_high_prio_than_data`

For DC GZVA, Whether MMU faults generated by tag access has higher priority than faults due to data access.

Type: `bool`

Default value: false

`has_nested_virtualization`

Implement ARMv8.3 nested virtualization (FEAT_NV).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.3 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_nmi`

Implement AARCH64 Non-Maskable Interrupts (FEAT_NMI)values of this parameter are:- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_no_os_double_lock`

Do not implement the OS double-lock (FEAT_DoubleLock).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

`has_non_context_synchronizing_exception_controls`

Implement cosmetic controls for whether exception entry and exit are context synchronizing events (SCTLR_ELx.{EIS,EOS}) from ARMv8.5 (FEAT_ExS).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_nv1_raz

Whether the implementation treats HCR_EL2.NV1 as Read-As-Zero (**RAZ**), if has_e2h_rao = 1.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.3 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_nv_frac

Whether the NV_frac behavior is supported. (DEPRECATED: use nv_frac_support_level)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_occmo

Implement The DC CIVAOC instruction (FEAT_OCCMO)values of this parameter are:- 1, feature is implemented if ARMv9.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_par_bit10_razwi

Whether PAR_EL1[10] is **RAZ/WI**.

Type: `bool`

Default value: false

has_partial_delayed_mdscr_el1

has_delayed_oslar_el1 only apply to some bits of MDSCR_EL1 (MDE, KDE, TDCC, SS).

Type: `bool`

Default value: false

has_pauth_enhctl

Support for Enhanced PAC controls (FEAT_PAuth_EnhCtl)values of this parameter are:- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_pc_sample_based_profiling

If true, pc sample-based profiling is enabled (FEAT_PCSRv8, FEAT_PCSRv8p2).

Type: `bool`

Default value: true

has_pc_sample_profiling_enable

Whether PC Sample profiling enable is implemented (FEAT_PCSRv8p9).

Type: `bool`

Default value: false

has_pcdphint

Support for producer-consumer data placement hints instructions (FEAT_PCDPHINT)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_per_cluster_debug_auth_ports

If true then the debug authentication ports i.e. spniden, niden, rpliden, rtpiden, dbgen, spiden are available per cluster.

Type: `bool`

Default value: false

has_permission_indirection_s1

Implement the Permission Indirection Extension at stage 1 (FEAT_S1PIE)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_permission_indirection_s2

Implement the Permission Indirection Extension at stage 2 (FEAT_S2PIE)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_permission_overlay_s1

Implement the Permission Overlay Extension at stage 1 (FEAT_S1POE) (NOTE: DEPRECATED: Use s1poe_support_level instead)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_permission_overlay_s2

Implement the Permission Overlay Extension at stage 2 (FEAT_S2POE)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_plb_conflict_abort

Constrained unpredictable when PLB conflicts observed, True : PLB conflict abort reported.

Type: `bool`

Default value: false

has_pmss

Implement PMU Snapshot Extension from Armv8.9 (FEAT_PMUv3_SS).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_pmu

Implement the optional Performance Monitors Extension (FEAT_PMUv3). 0, Not Implemented. 1, Implemented. 2, PMU is IMPLEMENTATION_DEFINED, PMU version would be set to `0xF` and would behave as if no PMU is implemented.

Type: `uint8_t`

Default value: 1

has_pmu_edge_detection

Implement PMU Event edge detection (FEAT_PMUv3_EDGE)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

has_pmu_extpmn

Implement optional PMU extension feature to reserve event counters for external agents from ARMv9.5 (FEAT_PMUv3_EXTPMN). 0 not implemented, 1 implementedvalues of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_pmu_for_sme_extension

Implement PMUv3 for Scalable Matrix Extension (SME) from ARMv9.5 (FEAT_PMUv3_SME)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_pmu_threshold_linking_control

Implement PMU threshold linking control (FEAT_PMUv3_TH2)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_pointer_authentication

Implement ARMv8.3 pointer authentication (FEAT_PAuth).values of this parameter are:- 1, feature is implemented if ARMv8.3 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_prediction_invalidation_instructions

Implement execution and data prediction invalidation from ARMv8.5 (FEAT_SPECRES).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_prfm_slc

Implement PRFM with SLC hint (FEAT_PRFMSLC).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_pstate_dit

Implement timing insensitivity of data processing instructions from ARMv8.4 (FEAT_DIT).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_pstate_pan

Implement the PSTATE.PAN (Privileged Access Never) control from ARMv8.1 (FEAT_PAN)values of this parameter are:- 1, feature is implemented if ARMv8.1 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_pstate_uao

Implement the PSTATE.UAO (User Access Override) control from ARMv8.2 (FEAT_UAO).values of this parameter are:- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_qarma3_pac

Supports QARMA3 pointer authentication algorithm (FEAT_PACQARMA3).

Type: `bool`

Default value: false

has_ras

Implements the ARMv8 RAS Extension. 0 = NO_RAS, 1 = MINIMAL_RAS, 2 = FULL_RAS (FEAT_RAS).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_ras_aderr

Implement RAS Asynchronous Device Read Error from Armv8.9 (FEAT_ADERR).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_ras_anerr

Implement RAS Asynchronous Normal Read Error from Armv8.9 (FEAT_ANERR).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_ras_armv84_extension

Implement ARMv8.4 RAS Extension (FEAT_RASv1p1).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_ras_armv89_double_fault

Implement RAS Double Fault Extension from Armv8.9 (FEAT_DoubleFault2).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_ras_armv89_extension

Implement RAS extension from Armv8.9 (FEAT_RASv2).values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_ras_critical_error

[DEPRECATED: Set CI field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Critical Error is implemented or not. 0 - Feature Not Supported, 1 - Feature always enabled, 2 - Feature is controllable.

Type: `uint8_t`

Default value: 0

has_ras_delegated_serror_exceptions_for_el3

Implement Delegated SError exceptions for EL3 (FEAT_E3DSE).values of this parameter are:- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_ras_double_fault

Implement ARMv8.4 RAS Double Fault Extension (FEAT_DoubleFault).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_ras_fault_injection

[DEPRECATED: Set INJ field on first register in error_record_feature_register JSON instead] Implement ARMv8.4 Standard Fault Injection mechanism.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_ras_mmap_view

Implement memory mapped view of RAS Registers for cores.

Type: `bool`

Default value: false

has_ras_pfar

Implement RAS Physical Fault Address Registers from Armv8.9 (FEAT_PFAR).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`has_ras_timestamp`

[DEPRECATED: Set TS field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Timestamp register is implemented or not. 0 - No Timestamp is recorded, 1 - Generic Timer timestamp is recorded, 2 - IMP DEF timestamp is recorded.

Type: `uint8_t`

Default value: 0

`has_rassa_acr`

Implement RAS System Architecture v2 optional access control register (FEAT_RASSA_ACR).

Type: `bool`

Default value: false

`has_restriction_on_speculative_data_loaded`

Implements the ARMv8.5 security feature (Restrictions on the effects of speculation) (FEAT_CSV3).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_rme`

If true, implements full realm management extension (FEAT_RME). Note: This parameter is deprecated and will be removed in future releases, please use rme_support_level parameter.

Type: `bool`

Default value: false

`has_rme_gdi`

Support for RME granular data isolation (FEAT_RME_GDI))values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

`has_rme_gpc2`

If true then RME GPC2 extension is enabled (FEAT_RME_GPC2).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_rme_gpc3

If true then RME GPC3 extension is enabled (FEAT_RME_GPC3).

Type: `bool`

Default value: false

has_rndr

Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5 (FEAT_RNG).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_rndr_trap

Implement trapping for RNDR and RNDRSS random number registers from ARMv8.8. (FEAT_RNG_TRAP)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_rounding_doubling_multiply_add_subtract

Implement the rounding doubling multiply add and subtract instructions from ARMv8.1 (FEAT_RDM).values of this parameter are:- 1, feature is implemented if ARMv8.1 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_rprfm

Support for RPRFM hint instruction (FEAT_RPRFM).

Type: `bool`

Default value: false

has_sbistc_ae25

Implements the SBISTC for AE25 class cpu.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_scr2

Support for SCR2_EL3 register (FEAT_SCR2)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_sctlr2

Implement SCTLR2_ELx registers (FEAT_SCTLR2)values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_sebep

Implement Synchronous-Exception-Based Event Profiling from ARMv9.4 (FEAT_SEBEP).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_secure_el2

Implement support for Secure EL2 (FEAT_SEL2).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_self_hosted_trace_extension

Implement support for the Self-hosted Trace Extensions from ARMv8.4 (FEAT_TRF).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_small_page_table

Implement small page table support which increases the maximum value of TxSZ field from ARMv8.4 (FEAT_TTST). Note: will be unimplemented only if both has_small_page_table=`0x0` and has_secure_el2=`0x0`.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

has_software_lock

Implement software lock in memory-mapped CTI, PMU, and external debug interfaces.

Type: `bool`

Default value: true

has_spe_eft

Implement SPE extended operation type filtering from ARMv9.5 (FEAT_SPE_EFT)values of this parameter are:- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_spe_fds

Implement SPE filter by data source from ARMv8.9 (FEAT_SPE_FDS)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_spe_for_sme_extension

Implement support of SME to SPE from ARMv9.5 (FEAT_SPE_SME).values of this parameter are:- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_spe_fpf

Implement SPE operation type extension for ASIMD and FP from ARMv9.5 (FEAT_SPE_FPF)values of this parameter are:- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_spe_nvm

Implement Statistical Profiling physical address mode (FEAT_SPE_nVM)values of this parameter are:- 1, feature is implemented if ARMv9.6 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

has_speculation_barrier_inst

Implement speculation barrier instruction (SB) from ARMv8.5 (FEAT_SB).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_speculative_sei

If true, the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches.

Type: `bool`

Default value: false

has_srmask

Implement bitwise write masks for EL1 control registers (FEAT_SRMASK).values of this parameter are:- 1, feature is implemented if ARMv9.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_srmask2

Implement bitwise write masks for HCR(X)EL2 registers (FEAT_SRMASK2).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_stage2_ap_speculative_update

Speculative update of S2 AP bit on S1 TTW. 0 = No Update, 1 = Update, 2 = Update including for AT ops.

Type: `uint8_t`

Default value: 0

has_stage2_fwb

Implement HCR_EL2.FWB, stage 2 control of memory types and cacheability (FEAT_S2FWB)values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

has_stage2_xnx

Implement the extended XN[1:0] stage 2 control from ARMv8.2 (FEAT_XNX).values of this parameter are:- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_stage2_xnx_in_aarch32

Implement the extended XN[1:0] stage 2 control from ARMv8.2 for Aarch32 (FEAT_XNX).

Type: `bool`

Default value: true

has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type: `bool`

Default value: true

has_supersections

Whether VMSAv8-32 supersection to support more than 32-bit PA using short descriptor is implemented.

Type: `bool`

Default value: true

has_sve

Whether SVE is implemented (FEAT_SVE). Note: this is required to enable SME (FEAT_SME) with sve.has_sme=1. An SME only implementation can be enabled by setting both as well as sve.sme_only=1.

Type: `uint8_t`

Default value: 0

has_synchronous_load_atomics

Report asynchronous abort due to unsupported load atomics as synchronous (Cacheable).

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

`has_synchronous_load_atomics_noncacheable`

Report asynchronous abort due to unsupported load atomics as synchronous (Non-Cacheable).

Type: `bool`

Default value: true

`has_synchronous_store_atomics`

Report asynchronous abort due to unsupported store atomics as synchronous (Cacheable).

Type: `bool`

Default value: false

`has_synchronous_store_atomics_noncacheable`

Report asynchronous abort due to unsupported store atomics as synchronous (Non-Cacheable).

Type: `bool`

Default value: false

`has_sysinstr128`

Support for System Instructions that can take 128-bit inputs (FEAT_SYSINSTR128)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

`has_sysreg128`

Support for 128-bit System Registers (FEAT_SYSREG128)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

`has_tag_cache_operations`

Implement tag cache operations DC ZGBVA and DC GBVA (FEAT_MTETC).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_tcr2

Implement TCR2_ELx registers (FEAT_TCR2)values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_tev

Support for exception-like overlay management mechanism (FEAT_TEV)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if Future Architecture Technologies (FAT) is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_tidcp1

Implement Armv8.8 EL0 use of implementation defined functionality (FEAT_TIDCP1)values of this parameter are:- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_tlb_conflict_abort

Detected inconsistent TLB content generate aborts. Ignored if FEAT_BBML3 is implemented.

Type: `bool`

Default value: false

has_tlb_pa_caching

Whether intermediate caching of translation table walks might include NonCoherent caches of previous valid walks. 0, NonCoherent caches might be included. 1, No NonCoherent caches included (FEAT_nTLBPA).

Type: `bool`

Default value: false

has_tlbi_range

Implement support for TLB Range Maintenance instructions (TLBI RVAE1, etc) from ARMv8.4 (FEAT_TLBIRANGE).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

has_tlbi_to_outer_shareable

Implement support for TLB Maintenance instructions that extend to the Outer Shareable domain (TLBI VAE1OS, etc) from ARMv8.4 (FEAT_TLBIOS).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_tlbi_ttl

Implement support for the TTL level hint in by-address TLB Maintenance instructions from ARMv8.4 (FEAT_TTL).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_tlbid

Whether TLBIDomains are implemented in this model. (FEAT_TLBID)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_tlbiw

Implement TLBI instruction for stage2 dirty (FEAT_TLBIW).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_tme

If true, implements TME, the Transactional Memory Extension (FEAT_TME).

Type: `bool`

Default value: false

has_translation_hardening

Implement the Translation Hardening Extension (FEAT_THE)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

has_trbe

If true, implements the Trace Buffer Extension (FEAT_TRBE).

Type: `bool`

Default value: false

has_trbe_ext

Implements the Trace Buffer external mode extension (FEAT_TRBE_EXT).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_trc_ext

If true, Allow DAP accesses to Trace registers(FEAT_TRC_EXT).

Type: `bool`

Default value: true

has_uinj

Implement software injection of Undefined Instruction exceptions (FEAT_UINJ).values of this parameter are:- 1, feature is implemented if ARMv9.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_unaligned_single_copy_atomicity

Implement support for SCTLR_ELx.nAA from ARMv8.4, and A64 atomic, exclusive and acquire/release instructions accessing unaligned bytes inside a 16byte window will not generate alignment fault (FEAT_LSE2).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_unsupported_exclusive_fault

Report unsupported exclusive access with Unsupported Exclusive fault status (otherwise use external abort).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

has_v8_4_debug_extension

Implement ARMv8.4 debug extensions (FEAT_Debugv8p4)values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_4_pmu_extension

Implement PMU extension from ARMv8.4 (FEAT_PMUv3p4).values of this parameter are:- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_5_debug_over_power_down

Implement ARMv8.5 Debug over powerdown (FEAT_DoPD).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_v8_5_pmu_extension

Implement PMU extension from ARMv8.5 (FEAT_PMUv3p5).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_5_spe_extension

Implement SPE extension from ARMv8.5 (FEAT_SPEv1p1).values of this parameter are:- 1, feature is implemented if ARMv8.5 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_6_pmu_events

Implements PMU events from ARMv8.6values of this parameter are:- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

`has_v8_7_fp_enhancements`

Implements the Floating Point enhancements from Armv8.7 (introduces FPCR.FIZ/AH/NEP, etc. (FEAT_AFP).)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_v8_7_pmu_events`

Implement PMU events from ARMv8.7.values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_v8_7_pmu_extension`

Implement PMU extension from ARMv8.7 (FEAT_PMUv3p7).values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_v8_7_spe_extension`

Implement SPE extension from ARMv8.7 (FEAT_SPEv1p2)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

`has_v8_7_spe_inverted_filtering`

Where FEAT_SPEv1p2 is implemented, whether inverted filtering by events is implemented (represented by PMISDR.FnE).

Type: `bool`

Default value: true

`has_v8_7_spe_previous_branch_target`

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented (FEAT_SPE_PBT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

has_v8_8_debug_extension

Implement ARMv8.8 debug extensions (FEAT_Debugv8p8)values of this parameter are:- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_8_pmu_events

Implement PMU events from ARMv8.8 (FEAT_PMUv3).values of this parameter are:- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_8_pmu_extension

Implement PMU extension from ARMv8.8 (FEAT_PMUv3p8).values of this parameter are:- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_8_spe_extension

Implement SPE extension from ARMv8.8 (FEAT_SPEv1p3)values of this parameter are:- 1, feature is implemented if ARMv8.8 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_9_debug_extension

Implement ARMv8.9 debug extensions (FEAT_Debugv8p9)values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_9_pc_sample_based_profiling

Implement PC Sample-based Profiling from ARMv8.9 (FEAT_PCSRv8p9)values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

has_v8_9_pmu_events

Implement PMU events from ARMv8.9 (FEAT_PMUv3).values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_9_pmu_extension

Implement PMU extension from ARMv8.9 (FEAT_PMUv3p9).values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v8_9_spe_extension

Implement SPE extension from ARMv8.9 (FEAT_SPEv1p4)values of this parameter are:- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_v9_6_spe_extension

Implement FEAT_SPEv1p5 and FEAT_SPE_EXC from ARMv9.6.values of this parameter are:- 1, feature is implemented if ARMv9.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_vncr_el2

Implement support for nested virtualization enhancements from ARMv8.4 (FEAT_NV2).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.4 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

has_wfet_and_wfit

Implements WFE and WFI with Timeout from Armv8.7 (FEAT_WFxT)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

has_writebuffer

Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.

Type: `bool`

Default value: false

has_xs

Implements Armv8.7 XS, TLBInXS, DSBnXS instruction (FEAT_XS).values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

hcptr_tta_behaviour

Behaviour of HCPTR.TTA when there is no CP14 ETM interface. 0, **RAZ/WI**. 1, **RAO/WI**. 2, stateful.

Type: `uint8_t`

Default value: 2

hcr_el2_miocnce_is_rw

If true, HCR_EL2.MIOCNCE is treated as R/W instead of **RAZ/WI**; always set to false in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

hcr_swio_res1

Whether HCR.SWIO and/or HCR_EL2.SWIO are **RES1**.

Type: `bool`

Default value: false

hdbss_error_fault_type

Type of fault reported for HDBSS errors. 0 = precise exception, 1 = fault logged in HDBSSPROD_EL2.FSC (FEAT_HDBSS).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

hpfar_unknown_when_ipa_invalid

If true, HPFAR_EL2 is set to 0 when IPA is not valid for stage 2 faults.

Type: `bool`

Default value: false

hpfar_update_behaviour

Defines HPFAR_EL2 update condition.0: Always updated on faults taken to EL2.1: Only when IPA is valid.2: When IPA is valid or unknown.

Type: `uint8_t`

Default value: 0

hsr_uncond_cc

Condition codes reported in HSR as AL if it passes.

Type: `bool`

Default value: false

hvbar_reset_is_rvbar

If true then the reset value of HVBAR is RVBAR, if false the reset value is **UNKNOWN**.

Type: `bool`

Default value: false

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-log2linelen

If nonzero, Log2 of the instruction cache line length in bytes (valid values in range 4-8). Otherwise the value of cache-log2linelen is used.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-nprefetch

Number of next sequential instruction cache lines to prefetch. This is only used when icache-prefetch_enabled=true.

Type: `uint32_t`

Default value: `0x1`

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

icache-prefetch_level

0 based cache level at which instructions are pre-fetched. This is only used when icache-prefetch_enabled=true.

Type: `uint8_t`

Default value: 0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

icache-read_bus_width_in_bytes

L1 I-Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x8`

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

icache-state_modelled

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

icache-ways

L1 I-Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 2

id_spec_fpacc_raz

If true, implementation opts not to disclose the speculative use of pointers processed by a PAC authentication failure by having value 0 for Spec_FPACC bits of ID_AA64MMFR3_EL1 register.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

idte3_support_level

Support for trapping ID register accesses to EL3(FEAT_IDTE3): 0 - Not implemented. 1 - Implemented.

Type: `uint8_t`

Default value: 0

iesb_use_pre_cse_ctx

If true, read SCTLR_ELx.IESB and SCR_EL3.{NMEA,EA} before synchronizing registers. The pre-synchronization values will be used to determine whether to take an implicit ESB.

Type: `bool`

Default value: false

ignore_DBGPRCR_CWRR

Ignore writes to the deprecated DBGPRCR.CWRR bit.

Type: `bool`

Default value: false

ignore_access_flag_update_by_CMOs

If true, CMOs(cache maintainence operations) neither update the access flag nor generate access flag fault.

Type: `bool`

Default value: false

ignore_access_flag_update_by_at_ops

If true, AT operations do not update access flag.

Type: `bool`

Default value: false

ignore_data_abt_on_af_update_by_at_ops

If true, Data abort generated on AF update by AT operations are ignored. This parameter is only valid if ignore_access_flag_update_by_at_ops is false.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ignore_large_address_top_bits_in_page_walk`

Whether page table bits [15:12] are ignored if PA_SIZE < 52 and output address is configured < 52 with large page.

Type: `bool`

Default value: false

`ignore_tag_check_dcc_load_store_in_ma_mode_when_tco_is_disabled`

Constrained unpredictable behavior for reads/writes to external debug interface DTR regs in memory access mode when PSTATE.TCO is 0. If true, tag check is ignored else, tag check is performed if required.

Type: `bool`

Default value: false

`ignore_traps_to_dcc_regs_in_debug`

Whether traps get ignored for the following registers in debug state:AArch64: MDCCSR_EL0, OSDTREX_EL1, OSDTRTX_EL1, MDCCINT_EL1.AArch32: DBGDSCRint, DBGDIDR, DBGDSAR, DBGDRAR,, DBGDTRTXext, DBGDCCINT.

Type: `bool`

Default value: false

`illegal_state_exception_priority`

IMPDEF priority of Illegal State Exception. 0: After breakpoint exceptions 1: Before Instruction Abort.

Type: `uint8_t`

Default value: 0

`imp_def_functionality_behaviour`

Behaviour of **IMPLEMENTATION DEFINED** registers and system instructions. 0, UNDEF. 1, **RAZ/WI**.

Type: `uint8_t`

Default value: 0

`impdef_regs_and_unpred_from_implementation`

Configure implementation defined registers and unpredictable behaviour to match the specified implementation. Requires a license for the selected implementation model.User has to provide the default values for the published or configurable parameters through commandline arguments. Use ARM_Cortex-A<num> or ARM_<codename> for licensed pre-release cores.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

impdef_sysreg_json

Configure mask/reset for impdef registers in a JSON format.a string (max 1024 chars) or a filename, starting with '@' sign.is a list of objects, with following attributes:.

Type: `string`

Default value: "[]"

independent_cache_control_traps

Implement Independent Cache Control traps from ARMv8.5. 0, No support. 1, Supported but not for tlb maintenance instructions. 2, Full support. (FEAT_EVT).

Type: `uint8_t`

Default value: 0

insert_iesb_before_exception

If true then inserts an IESB before taking with Exception otherwise has no effect and IESB is taken after PState is changed due to the Exception.

Type: `bool`

Default value: false

instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

internal_vgic

Instantiate VGIC peripheral in this processor.

Type: `bool`

Default value: false

invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

irt_fetch_fault_on_data_check_report_type

Behaviour for IRT fetch faults on data permission checks (can only happen for non-standard data accesses): 0, report as data abort. 1, report as instruction abort.

Type: `bool`

Default value: false

is_debug_state_pmu_snapshot_allowed

If true, PMU snapshot is allowed in debug state.

Type: `bool`

Default value: true

is_first_pcsr_sample_ignored

If true, First read of PMPCSR register after reset returns `0xFFFFFFFF`.

Type: `bool`

Default value: false

is_mt_res0

If ARMv8.6 is not implemented, and PMUv3 is implemented, this parameter controls whether PMEVTYPER<n>.MT bit is **RES0** or RW. For other implementations, this parameter has no effect.

Type: `bool`

Default value: false

is_ras_irq_edge_triggered

If true, ras interrupt is edge-triggered. Otherwise, it's level-triggered.

Type: `bool`

Default value: true

is_serror_edge_triggered

If true, SError is edge-triggered. Otherwise, it's level-triggered.

Type: `bool`

Default value: true

is_tagged_nsh_treated_as_tagged

Whether a tagged NonShared memory attribute is treated as tagged or not.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

`is_uniprocessor`
Value for the U bit in MPIDR. true disables L1 cache coherency protocols.

Type: `bool`

Default value: false

`isb_is_branch`
If true, ISB is considered an immediate branch. This allows to count ISB as a branch in BRBE.

Type: `bool`

Default value: false

`ish_is_osh`
Whether Innershareable is same as OuterShareable.

Type: `bool`

Default value: false

`itd_conditional_instructions_are_32bit`
When SCTLR_ELx.ITD=1, an IT instruction plus a T16 instruction are considered a single 32bit conditional instruction.

Type: `bool`

Default value: false

`jidr_is_undef_at_el0`
If true, JIDR register access is UNDEF at EL0.

Type: `bool`

Default value: false

`jmcr_is_undef_at_el0`
If true, JMCR register access is UNDEF at EL0.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

joscr_is_undef_at_el0

If true, JOSCR register access is UNDEF at EL0.

Type: `bool`

Default value: false

l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x8`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 16

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`l2cache-write_bus_width_in_bytes`

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x8`

`l2cache-write_latency`

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-has_mpam`

L3 Cache has MPAM support.

Type: `bool`

Default value: false

`l3cache-hit_latency`

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-maintenance_latency`

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-miss_latency`

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-mpamf.arch_major_ver

L3 Cache MPAMF_AIDR architecture major version.

Type: `uint8_t`

Default value: 0

l3cache-mpamf.arch_minor_ver

L3 Cache MPAMF_AIDR architecture minor version.

Type: `uint8_t`

Default value: 0

l3cache-mpamf.bwa_width_ns

L3 Cache width of MPAM bandwidth allocation fields for non-secure accesses.

Type: `uint8_t`

Default value: 16

l3cache-mpamf.bwa_width_s

L3 Cache width of MPAM bandwidth allocation fields for secure accesses.

Type: `uint8_t`

Default value: 16

l3cache-mpamf.cmax_width_ns

L3 Cache, number of fractional bits used to calculate the maximum fraction of the MPAM cache capacity for the Non-Secure PARTID. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type: `uint8_t`

Default value: 0

l3cache-mpamf.cmax_width_rl

L3 Cache, number of fractional bits used to calculate the maximum fraction of the MPAM cache capacity for the Realm PARTID. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-mpamf.cmax_width_rt

L3 Cache, number of fractional bits used to calculate the maximum fraction of the MPAM cache capacity for the Root PARTID. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type: `uint8_t`

Default value: 0

l3cache-mpamf.cmax_width_s

L3 Cache, number of fractional bits used to calculate the maximum fraction of the MPAM cache capacity for the Secure PARTID. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type: `uint8_t`

Default value: 0

l3cache-mpamf.cmin_width_ns

L3 Cache, number of fractional bits used to calculate the minimum fraction of the MPAM cache capacity for the Non-Secure PARTID. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type: `uint8_t`

Default value: 0

l3cache-mpamf.cmin_width_rl

L3 Cache, number of fractional bits used to calculate the minimum fraction of the MPAM cache capacity for the Realm PARTID. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type: `uint8_t`

Default value: 0

l3cache-mpamf.cmin_width_rt

L3 Cache, number of fractional bits used to calculate the minimum fraction of the MPAM cache capacity for the Root PARTID. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`l3cache-mpamf.cmin_width_s`

L3 Cache, number of fractional bits used to calculate the minimum fraction of the MPAM cache capacity for the Secure PARTID. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type: `uint8_t`

Default value: 0

`l3cache-mpamf.cpbm_width_ns`

L3 Cache, width of MPAM cache portion bitmap for non-secure accesses. If 0, the feature is not implemented, and all ways are available.

Type: `uint8_t`

Default value: 0

`l3cache-mpamf.cpbm_width_rl`

L3 Cache, width of MPAM cache portion bitmap for realm accesses. If 0, the feature is not implemented, and all ways are available.

Type: `uint8_t`

Default value: 0

`l3cache-mpamf.cpbm_width_rt`

L3 Cache, width of MPAM cache portion bitmap for root accesses. If 0, the feature is not implemented, and all ways are available.

Type: `uint8_t`

Default value: 0

`l3cache-mpamf.cpbm_width_s`

L3 Cache, width of MPAM cache portion bitmap for secure accesses. If 0, the feature is not implemented, and all ways are available.

Type: `uint8_t`

Default value: 0

`l3cache-mpamf.csu_num_mon_ns`

L3 Cache number of MPAM cache storage usage monitors for non-secure accesses.

Type: `uint16_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-mpamf.csu_num_mon_rl

L3 Cache number of MPAM cache storage usage monitors for realm accesses.

Type: `uint16_t`

Default value: `0x0`

l3cache-mpamf.csu_num_mon_rt

L3 Cache number of MPAM cache storage usage monitors for root accesses.

Type: `uint16_t`

Default value: `0x0`

l3cache-mpamf.csu_num_mon_s

L3 Cache number of MPAM cache storage usage monitors for secure accesses.

Type: `uint16_t`

Default value: `0x0`

l3cache-mpamf.esr_mask

L3 Cache MPAMF_ESR mask value.

Type: `uint32_t`

Default value: `0xffffffff`

l3cache-mpamf.has_esr

L3 Cache's MPAMF_ESR, MPAMF_ECR, and MPAM error handling implemented.

Type: `bool`

Default value: false

l3cache-mpamf.has_extd_esr

L3 Cache's MPAMF_ESR is 64-bits.

Type: `bool`

Default value: false

l3cache-mpamf.has_impl_idr

L3 Cache's MPAMF_IMPL_IDR is present.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`l3cache-mpamf.has_mbwu_long_counter`
L3 Cache has long MBWU counter and capture registers.

Type: `bool`

Default value: false

`l3cache-mpamf.has_mpamfidr_ext`
MPAMF_IDR.EXT support.

Type: `bool`

Default value: false

`l3cache-mpamf.has_partid_nrw`
Narrowing part ID register is present. This is global rather than per-instance.

Type: `bool`

Default value: false

`l3cache-mpamf.has_priority_partioning`
The selected resource has priority partitioning described in MPAMF_PRI_IDR.

Type: `bool`

Default value: false

`l3cache-mpamf.has_prod_id`
L3 Cache MPAMF_IIDR product ID supported.

Type: `uint16_t`

Default value: `0x0`

`l3cache-mpamf.has_prod_rev`
L3 Cache MPAMF_IIDR product REVISION supported.

Type: `uint8_t`

Default value: 0

`l3cache-mpamf.has_prod_var`
L3 Cache MPAMF_IIDR product VARIENT supported.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-mpamf.has_prop_ns

Enable memory bandwidth proportional stride control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type: `bool`

Default value: false

l3cache-mpamf.has_prop_s

Enable memory bandwidth proportional stride control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type: `bool`

Default value: false

l3cache-mpamf.has_ris

L3 Cache has resource instance selection support.

Type: `bool`

Default value: false

l3cache-mpamf.max_partid_ns

L3 Cache Maximum value of non-secure PARTID supported.

Type: `uint16_t`

Default value: `0xffff`

l3cache-mpamf.max_partid_rl

L3 Cache Maximum value of realm PARTID supported for RME implementations.

Type: `uint16_t`

Default value: `0xffff`

l3cache-mpamf.max_partid_rt

L3 Cache Maximum value of root PARTID supported for RME implementations.

Type: `uint16_t`

Default value: `0xffff`

l3cache-mpamf.max_partid_s

L3 Cache Maximum value of secure PARTID supported.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xffff`

`l3cache-mpamf.max_pmg_ns`
L3 Cache Maximum value of non-secure PMG supported.

Type: `uint8_t`

Default value: 255

`l3cache-mpamf.max_pmg_rl`
L3 Cache Maximum value of realm PMG supported for RME implementations.

Type: `uint8_t`

Default value: 255

`l3cache-mpamf.max_pmg_rt`
L3 Cache Maximum value of root PMG supported for RME implementations.

Type: `uint8_t`

Default value: 255

`l3cache-mpamf.max_pmg_s`
L3 Cache Maximum value of secure PMG supported.

Type: `uint8_t`

Default value: 255

`l3cache-mpamf.mbwu_long_counter_width`
L3 Cache long MBWU counter width. 0: 63 bits, 1: 44 bits.

Type: `uint8_t`

Default value: 0

`l3cache-mpamf.no_impl_msmon`
L3 Cache's MPAMF_IMPL_IDR does not describe resource monitors.

Type: `bool`

Default value: false

`l3cache-mpamf.no_impl_part`
L3 Cache's MPAMF_IMPL_IDR does not describe resource partitioning controls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`l3cache-mpamf.ris_max`

L3 Cache's largest resource instance selector value defined.

Type: `uint8_t`

Default value: 0

`l3cache-mpamf_base`

L3 Cache memory mapped MPAM registers base address.

Type: `uint64_t`

Default value: `0x0`

`l3cache-read_access_latency`

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-read_bus_width_in_bytes`

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x8`

`l3cache-read_latency`

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-size`

L3 Cache size in bytes.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x0`

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 16

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-write_bus_width_in_bytes

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x8`

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

`legacy_combining_exc_catch_trace`

Whether exception catch is traced as part of exception entry/exit in same cycle.

Type: `bool`

Default value: true

`log2_trace_buffer_alignment`

Log2 of trace buffer alignment constraint for output buffer (0->1B ... 11->2Kib).

Type: `uint8_t`

Default value: 0

`ls64_ignore_s1_unpred_memattr_transformation`

If true, stage 1 unpredictable memory attribute transformations are ignored for FEAT_LS64 single-copy atomic 64-byte load/store instructions' (FEAT_LS64, FEAT_LS64_V, FEAT_LS64_ACCDATA).

Type: `bool`

Default value: false

`ls64_memtype_check_use_combined_memattr`

FEAT_LS64 single-copy atomic 64-byte load/store instructions' 0 : memory attributes check is performed at each enabled stage of translation, 1 : memory attributes check is done on the combined memory attribues only. 2.memory attributes check is done on the combined memory attribues with Stage1 and Stage2 fault get evaluated to check on which stage fault should be reported.

Type: `uint8_t`

Default value: 0

`ls64wb_memtype_check_allow_any_cacheable_memattr`

If true, when FEAT_LS64WB is implemented, any cacheable memory access performed by LD/ST64B instructions is 64-byte, single-copy atomic.

Type: `bool`

Default value: false

`mask_trbtrg_res0`

If true, and TRBIDR_EL1.Align>0, treat TRBTRG_EL1[TRBIDR_EL1.Align-1:0] as **RES0** for writes.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

max_32bit_el

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, x:[0:3] - All the levels below supplied ELx supports A32.

Type: `int8_t`

Default value: 3

mdrar_el1_res0

MDRAR_EL1 is **RES0**.

Type: `bool`

Default value: false

mdselr_le_16_bps_wps_behaviour

Behaviour of MDSELR_EL1 and related traps/enables if fewer than 16 watchpoints and fewer than 16 breakpoints are implemented: 0 - MDSELR_EL1 is stateful; 1 - MDSELR_EL1, EBWE, FGTS are **RAZ/WI**, traps and enables do not apply; 2 - MDSELR_EL1, EBWE, FGTS with checked traps.

Type: `uint8_t`

Default value: 0

mec_support_level

0 -> Memory Encryption Contexts not implemented, 1 -> LEGACY_TZ_EN mode i.e. MEC register fields are stateful but only supports secure/non-secure states, 2 -> Memory Encryption Contexts fully implemented (FEAT_MEC).

Type: `uint8_t`

Default value: 0

memory.acp.AxCACHE_mask

Used with memory.acp.AxCACHE_pattern to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.

Type: `uint8_t`

Default value: 0

memory.acp.AxCACHE_pattern

Used with memory.acp.AxCACHE_mask to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

memory.l2_cache.is_inner_cacheable

L2 cache obeys inner cacheable attributes (rather than outer cacheable attributes).

Type: `bool`

Default value: true

memory.l2_cache.is_inner_shareable

L2 cache obeys inner shareable attributes (rather than outer shareable attributes).

Type: `bool`

Default value: true

memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented. 1, instructions and registers only are implemented (FEAT_MTE). 2, implemented (FEAT_MTE2). 3, implemented with asymmetric handling of exceptions (FEAT_MTE3). 4, implemented (FEAT_MTE4).

Type: `uint8_t`

Default value: 0

mixed_endian

Implement support for mixed endianness. 0, not supported. 1, supported at all exception levels. 2, supported at EL0 only. Unsupported in the presence of Future Architecture Technologies (FAT).

Type: `uint8_t`

Default value: 1

mops_cpy_block_size

Block size used for memcpy memory accesses.

Type: `uint8_t`

Default value: 64

mops_cpy_default_dir

Default direction for non-overlapping memcpy operations: 0, forwards. 1, backwards.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

mops_cpy_handle_async_exceptions

Handle any pending async exceptions after copying a block of data, instead of waiting until instruction end.

Type: `bool`

Default value: false

mops_cpy_post_size

Percentage of data copied in memcpy ‘E' instructions.

Type: `uint8_t`

Default value: 10

mops_cpy_pre_size

Percentage of data copied in memcpy ‘P' instructions.

Type: `uint8_t`

Default value: 10

mops_cpy_pre_size_threshold

Size threshold in Bytes for CPY*P* instructions.

Type: `uint32_t`

Default value: `0x0`

mops_cpy_single_access

Execute memcpy as a single read and single write access.

Type: `bool`

Default value: false

mops_cpy_write_abort_before_read

Report the data aborts and watchpoint of the write accesses, before those of the read accesses.

Type: `bool`

Default value: false

mops_cpy_zero_size_can_fault

Fault because of mismatched implementation option when the operation is of size 0.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

mops_exec_order_can_fault

Enable exception on the Main/Epilogue instruction when executed after a mismatched Prologue/Main in a CPY/SET sequence, or after another random instruction.

Type: `bool`

Default value: false

mops_inst_cpy_zero_size_can_fault

Fault because of mismatched implementation option when inst_cpy_size is 0.

Type: `bool`

Default value: true

mops_inst_set_zero_size_can_fault

Fault because of mismatched implementation option when inst_set_size is 0.

Type: `bool`

Default value: true

mops_mismatched_page_crossing_access_unpred

Constrained unpredictable behaviour for FEAT_MOPS instructions when crossing page boundary with different memory types, 0 : Memory block access uses the attributes of it's own address block 1: Alignment Fault.

Type: `uint8_t`

Default value: 0

mops_mmu_abort_far_aligned

If true, in case of an MMU abort on a MOPS instruction, report FAR aligned to current translation granule.

Type: `bool`

Default value: false

mops_set_block_size

Block size used for memset memory accesses.

Type: `uint8_t`

Default value: 64

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

mops_set_handle_async_exceptions

Handle any pending async exceptions after setting a block of data, instead of waiting until instruction end.

Type: `bool`

Default value: false

mops_set_post_size

Percentage of data copied in memset ‘E' instructions.

Type: `uint8_t`

Default value: 10

mops_set_pre_size

Percentage of data copied in memset ‘P' instructions.

Type: `uint8_t`

Default value: 10

mops_set_single_access

Execute memset as a single read and single write access.

Type: `bool`

Default value: false

mops_set_zero_size_can_fault

Fault because of mismatched implementation option when the operation is of size 0.

Type: `bool`

Default value: true

mops_setg_unaligned_does_mismatch_fault

If true, in case of unaligned SETGM / SETGE, raise a mismatched memset exception because of impdef reasons, instead of alignment fault.

Type: `bool`

Default value: false

mops_wp_far_behaviour

Set option for address stored in FAR/EDWARD after watchpoints hit by MOPS instructions - FAR recorded matches lowest watchpointed address accessed by the instruction - FAR

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

recorded matches lowest address accessed by the instruction within same translation granule as watchpointed address - FAR recorded matches highest watchpointed address accessed by the instruction that triggered the watchpoint.

Type: `uint8_t`

Default value: 0

`mpam_bw_bwa_wd`

MPAM MPAMBWIDR_EL1.BWA_WD: The number of implemented bits in the bandwidth allocation fields {MPAMBWn_ELx, MPAMBWSM_EL1}.MAX and MPAMBWCAP_EL2.CAP.

Type: `uint8_t`

Default value: 1

`mpam_bw_has_hw_scale`

MPAM Whether has hardware support for auto-scaling of {MPAMBWn_ELx, MPAMBWSM_EL1}.MAX and MPAMBWCAP_EL2.CAP limits.

Type: `bool`

Default value: false

`mpam_bw_max_lim`

MPAM the implemented maximum-bandwidth limit partitioning behaviors:- 0, Both soft limit and hard limit behaviors are implemented.- 1, Soft limit behavior is implemented.- 2, Hard limit behavior is implemented.

Type: `uint8_t`

Default value: 0

`mpam_bw_us_frac`

MPAM MPAMBWIDR_EL1.US_FRAC: The fractional part of the window width in microseconds.

Type: `uint8_t`

Default value: 0

`mpam_bw_us_int`

MPAM MPAMBWIDR_EL1.US_INT: The integer part of the window width in microseconds.

Type: `uint32_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`mpam_force_ns_rao`

Whether MPAM3_EL3.FORCE_NS bit is **RAO/WI**.

Type: `bool`

Default value: false

`mpam_frac`

MPAM fractional revision number in ID_AA64PFR1_EL1.MPAM_frac field. Combines with has_mpam to give the mpam version_mpam = false, mpam_frac = 0 -> Not implemented_mpam = false, mpam_frac = 1 -> FEAT_MPAMv0p1_mpam = true, mpam_frac = 0 -> FEAT_MPAMv1p0_mpam = true, mpam_frac = 1 -> FEAT_MPAMv1p1.

Type: `uint8_t`

Default value: 0

`mpam_has_altsp`

MPAM Whether MPAMIDR_EL1.HAS_ALTSP bit is set or clear.

Type: `bool`

Default value: false

`mpam_has_bw_ctrl`

MPAM Whether MPAMIDR_EL1.HAS_BW_CTRL bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv9.3 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

`mpam_has_hcr`

MPAM Whether MPAMIDR_EL1 HAS_HCR bit is set or clear.

Type: `bool`

Default value: false

`mpam_max_partid`

MPAM Maximum PARTID Supported.

Type: `uint16_t`

Default value: `0xffff`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

mpam_max_pmg

MPAM Maximum PMG Supported.

Type: `uint16_t`

Default value: `0xffff`

mpam_max_vpmr

MPAM Maximum VPMR Supported.

Type: `uint8_t`

Default value: 0

mpam_truncate_out_of_range_virtid

If true then truncates an out-of-range virtual identifier to least significant 12 bits. If false then out-of-range virtual identifier is replaced by the default virtual identifier.

Type: `bool`

Default value: false

mpamidr_has_force_ns

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

mpamidr_has_sdeflt

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

mpamidr_has_tidr

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clearvalues of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

mpidr_layout

Layout of MPIDR. 0 AFF0 is CPUID, 1 AFF1 is CPUID.

Type: `uint8_t`

Default value: 0

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

mpmm_config

MPMMTUNE register value. The JSON schema is : . The value given for threshold value is just an indication, not specific to any core. This parameter is used only when has_mpmm is set.

Type: `string`

Default value: N/A

mte_ctrl_bits_stateful_level

If memory_tagging_support_level == 1, specify the MTE level that has control bits stateful in system registers.

Type: `uint8_t`

Default value: 0

mte_report_which_failed_address

Set to <OPT>, <MOPS_OPT>Applicable only for MTE synchronous check. OPT defines the range for the failing address to report and MOPS_OPT defines the choice within that range for MOPS operations only.Non-MOPS operations report the first address in the range defined by OPT.OPT is set to "first" or "last". If "first" then report an address from the intersection of the first failed MTE granule and the transaction's range.If "last" then report an address from the intersection of the last failed MTE granule and the transaction's range.MOPS_OPT is set to "mops_first_failing_address_in_range" or "mops_random_address_in_range". If "mops_first_failing_address_in_range" then report the first failing address in the range defined by OPT. If "mops_random_address_in_range" then report a random address within the range defined by OPT.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: “first, mops_first_failing_address_in_range”

`mte_tminline`

Value of CTR_EL0.TminLine for reading purpose only. A value configured using this does not indicate the presence of separate tag cache. 0, TminLine evaluated from smallest data cache line.

Type: `uint8_t`

Default value: 0

`mte_unpred_canonical_s2_unsupported`

When FEAT_MTE_CANONICAL_TAGS is implemented, determines whether a region is canonically tagged (true) or untagged (false) when stage 1 is tagged but the combined attributes do not allow allocation tagging.

Type: `bool`

Default value: false

`mvbar_reset_is_rvbar`

If true then the reset value of MVBAR is RVBAR, if false the reset value is **UNKNOWN**.

Type: `bool`

Default value: true

`non_secure_vgic_alias_when_ns_only`

If ! has_el3 and only non-secure side exists, then the normal position of the VGIC is a secure alias. If this parameter is non-zero then in addition a non-secure alias of the VGIC will be placed at this position (aligned to 32 KB).

Type: `uint64_t`

Default value: `0x0`

`num_loregion_descriptors`

Number of Limited Ordering Region descriptors implemented (if ARM v8.1 extensions are implemented) (FEAT_LOR).

Type: `uint8_t`

Default value: 0

`num_loregions`

Number of Limited Ordering Regions implemented excluding background region (if ARM v8.1 extensions are implemented) (FEAT_LOR).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

`number_of_abl_breakpoints`

if FEAT_ABLE is implemented, Number of address matching breakpoints that support address linking.

Type: `uint8_t`

Default value: 0

`number_of_error_records`

Cores Number of Error records supported for RAS.

Type: `uint16_t`

Default value: `0x0`

`nv_frac_support_level`

Support for a subset of FEAT_NV and FEAT_NV2 behaviours: 0 - Not implemented. 1 - Implemented. 2 - Implemented with FEAT_NV2p1. 3 - Implemented with FEAT_NV3, OPTIONAL from Armv9.6.

Type: `uint8_t`

Default value: 0

`optimal_alignment_size`

Alignment boundary which does not incur additional performance penalty from ARMv8.5.- 1, architectural misalignment is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]- 2, access crossing 4 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]- 3, access crossing 8 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]..- 12, access crossing 4 Kbyte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11].

Type: `uint8_t`

Default value: 1

`output_attributes`

User-defined transform to be applied to bus attributes like ManagerID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.

Type: `string`

Default value: “ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS”

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

pacm_support_level

Implements PSTATE.PACM from ARMv9.5. 0: Not supported, 1: Trivial implementation when FEAT_PAuth_LR and FEAT_PACIMP are supported, 2: Full implementation when FEAT_PAuth_LR is supported.

Type: `uint8_t`

Default value: 2

page_based_hardware_attributes

Implement the page based hardware attributes from ARMv8.2. This parameter indicates which page table bits are available for hardware, where bits[3:0] correspond to PTE[62:59] and to TCR_ELx.HWUnyy (FEAT_HPDS2).

Type: `uint8_t`

Default value: 0

pan_removes_priv_rw_if_unpriv_resvd_value

For regimes EL1&0/EL2&0, PSTATE.PAN = 1, whether PrivRW is removed when S1UnprivBasePerm is reserved.

Type: `bool`

Default value: true

pan_stage1_in_realm_el2_0_is_uxn

If FEAT_PAN3 is implemented, whether stage1 translation in the Realm EL2&0 regime that resolves to a NS address is treated as unprivileged execute-never.

Type: `bool`

Default value: false

par_ns_set_unknown_bit

Whether NS bit of PAR is set/clear when executing AT to perform non-secure regime translation. When true, NS is set to 1 else 0.

Type: `bool`

Default value: true

par_nse_set_unknown_bit

Whether NSE bit of PAR is set/clear when executing AT operation on secure, non-secure or realm translation regime. When true, NSE is set to 1 else 0.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`permission_overlay_s1_support_level`

Support for Stage 1 Permission Overlay: 0 - None. 1 - Support FEAT_S1POE. 2 - Support FEAT_S1POE2 (!!EXPERIMETNAL!!).

Type: `uint8_t`

Default value: 0

`pfar_is_valid`

IMPLEMENTATION DEFINED choice to configure ESR_ELx.PFV: whether PFAR_ELx is valid or **UNKNOWN** when ESR_ELx.PFV is not forced to be 0.

Type: `bool`

Default value: true

`pfr1_csv2_frac`

Fractional revision number ID_AA64PFR1_EL1.CSV2_frac when ID_AA64PFR0_EL1.CSV==1 for CSV2 extension (FEAT_CSV2_1p1, FEAT_CSV2_1p2).

Type: `uint8_t`

Default value: 0

`pmb_idr_external_abort`

Describes how the PE manages External aborts on writes made by the Statistical Profiling Extension to the Profiling Buffer. 0, External abort is reported to SPE, From Armv8.8 and Armv9.3, the value 0 is not permitted. 1, External abort is ignored. 2, The External abort generates an SError and the error is not reported to SPE.

Type: `uint8_t`

Default value: 0

`pmb_idr_flag_updates`

Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state.

Type: `bool`

Default value: true

`pmbsr_dl_razwi`

Whether PMBSR_ELx.DL is **RAZ/WI** or behaves as specified, indicating partial loss of a record due to a buffer management event or external abort.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`pmbsr_ea_razwi`

Whether PMBSR_ELx.EA is **RAZ/WI** or set as the result of an external abort.

Type: `bool`

Default value: false

`pmcr_disable_events_export`

If true, export for PMU events is disabled. This configures PMCFGR.EX field.

Type: `bool`

Default value: true

`pmmir_el1_bus_slots`

Largest value by which BUS_ACCESS can increment over BUS_CYCLES cycles. From v8.7 PMU extension.

Type: `uint16_t`

Default value: 0

`pmmir_el1_bus_width`

Width, in bytes, of accesses counted by BUS_ACCESS. From v8.7 PMU extension.

Type: `uint16_t`

Default value: `0x0`

`pms_idr_max_size`

Defines largest size for a single SPE record (rounded up to a power of 2).

Type: `uint8_t`

Default value: 6

`pmu-num_counters`

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

pmu_async_exception_delay

Configure PMU asynchronous exception delay in CPU cycles (FEAT_SEBEP).

Type: `uint32_t`

Default value: `0x0`

pmu_cycle_counter_counts_actual_cycles

If true and Timing annotation is enabled, PMU cycle counter counts actual cycles, otherwise counts instructions executed.

Type: `bool`

Default value: false

pmu_has_chain_event

PMU (if present) implements event number `0x1e`, CHAIN.

Type: `bool`

Default value: true

pmu_precise_events

"Configure v9.4 Precise PMU events. {"pmu_events":["SW_INCR", "PC_WRITE_RETIRED", "BR_RETIRED", "BR_IND_RETIRED", "BR_RETURN_RETIRED", "BR_RETURN_ANY_RETIRED", "BR_IND_TAKEN_RETIRED", "LD_RETIRED", "ST_RETIRED", "UNALIGNED_LD_ST", "INST_RETIRED", "EXCEP_TAKEN", "EXCEP_RETURN", "CHAIN"]}".

Type: `string`

Default value: N/A

pmu_threshold_bit_width

Implement FEAT_PMUv3_TH and if so the width of PMEVTYPER<n>_ELO.TH in bits. 0, not implemented. 1-12 number of bits in PMEVTYPER<n>_EL0.TH.

Type: `uint8_t`

Default value: 0

poison_range_end_addr

End PA of poisoned range.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

poison_range_start_addr

Start PA of poisoned range.

Type: `uint64_t`

Default value: `0x0`

pseudo_fault_generation_feature_register

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":`0x0`, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_psuedo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

Type: `string`

Default value: N/A

pstate_btype_on_illegal_eret

DEPRECATED. Please use pstate_unknown_fields_on_illegal_eret instead. This parameter will be ignored if both are used. In case of an illegal eret, what value to use to update PSTATE.BTYPE. 0: Set to 0, 1: Update with SPSR_ELx.BTYPE, 2: Unchanged.

Type: `uint8_t`

Default value: 0

pstate_pm_reset

Reset value of PSTATE.PM.

Type: `bool`

Default value: false

pstate_ssbs_reset

Reset value of pstate.ssbs.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

pstate_ssbs_type

Implement speculative store bypass safe feature from ARMv8.5. 0, Not supported. 1, Supported without MSR/MRS access to SSBS (FEAT_SSBS). 2, fully supported (FEAT_SSBS2).

Type: `uint8_t`

Default value: 0

pstate_unknown_fields_on_illegal_eret

For an illegal eret, each unknown field in PSTATE can be set to "set_to_0", "set_to_spsr_elx", or "unchanged". If a field is not specified but its relevant feature is enabled, it will default to "set_to_spsr_elx". Fields for disabled features are ignored. Example: {"BTYPE":"set_to_0", "DIT":"set_to_spsr_elx", "PACM":"set_to_0", "SSBS":"set_to_spsr_elx", "TCO":"unchanged", "UAO":"set_to_spsr_elx"}.

Type: `string`

Default value: N/A

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

randomize_unknowns_at_reset

Will fill in unknown bits in registers at reset with random value using register_reset_data as seed, it overrides scramble_unknowns_at_reset.

Type: `bool`

Default value: false

ras_aderr_anerr_controls_are_same

If true and FEAT_ADERR and FEAT_ANERR is implemented then ADERR and ANERR controls should always be set to the same value (FEAT_ADERR) (FEAT_ANERR).

Type: `bool`

Default value: false

ras_err_registers_undef_if_no_error_records

If true, all RAS error record registers, along with ERRSELR_EL1, will be undefined if ERRIDR_EL1 indicates that zero error records are implemented.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

ras_errselr_undef_if_no_error_records

If true, ERRSELR_EL1 will be undefined if ERRIDR_EL1 indicates that zero error records are implemented.

Type: `bool`

Default value: false

ras_extra_configurations

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCn masks - these are 64 bit masks covering the 64 bit registers ERXMISCn_EL1. E.g. [{"Index": 0, "ERXMISC0_mask": `0x0`, "ERXMISC0_reset": `0x0`, "ERXMISC1_mask": `0x0`, "ERXMISC1_reset": `0x0`, "ERXMISC2_mask": `0x0`, "ERXMISC2_reset": `0x0`, "ERXMISC3_mask": `0x0`, "ERXMISC3_reset": `0x0`, "ERXCTLR_EL1_mask": `0x0`, "ERXCTLR_EL1_reset": `0x0`}, {"Index": 1, "ERXMISC0_mask": `0x0`, "ERXMISC0_reset": `0x0`, "ERXSTATUS_IERR_mask": `0x300`}].

Type: `string`

Default value: N/A

ras_frac

0, No additional feature implemented. 1, Additional ERXMISC, *ERXPFG* registers and FaultInjection trap from RAS v1.1. implemented.

Type: `uint8_t`

Default value: 0

ras_log2_fault_granule_size

Log2 of the RAS fault granule size in Bytes.

Type: `uint8_t`

Default value: 12

ras_mmap_address

Base address of memory mapped RAS Registers for each core on system bus. 0 means the RAS is not mapped, otherwise the address must be at least 4KB aligned or more depending upon the features implemented. JSON schema for the parameter value is: {"format":"all_addrs_are_absolute_wrt_systembus", "cores": [{"ras":`0x0`},{"ras":`0x0`},{"ras":`0x0`},{"ras":`0x0`}]}.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`ras_pfg_clock_mhz`

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 24

`ras_report_aligned_pa_in_pfar`

If true, the PFAR_ELx register reports the PA aligned to the RAS fault granule size on a sync external abort or SError exception.

Type: `bool`

Default value: false

`register_reset_data`

Data used to fill register bits when they become **UNKNOWN** at reset.

Type: `uint64_t`

Default value: `0x0`

`register_reset_data_hi`

Data used to fill the upper-half of 128-bit registers when the bits become **UNKNOWN** at reset.

Type: `uint64_t`

Default value: `0x0`

`report_iside_cmo_ifsr`

fault info for an iside cache maintenance operation is reported in the IFSR.

Type: `bool`

Default value: true

`report_second_access_align_fault_non_atomic_pair_access`

If true, the non-atomic load/store pair accesses report the 2nd register as faulting address for an alignment fault. This is IMP-DEF behavior as defined in FEAT_LRCPC3.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

report_second_access_mmu_fault_non_atomic_pair_access

If true, the non-atomic load/store pair accesses report the 2nd register as faulting address for an MMU fault. This is IMP-DEF behavior as defined in FEAT_LRCPC3.

Type: `bool`

Default value: false

reported_fp_revision

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored. Updates the FPSID.revision value.

Type: `int8_t`

Default value: -1

reported_patch_level

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type: `int8_t`

Default value: -1

reported_revision_number

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type: `int8_t`

Default value: -1

reserved_HMC_SSC_PAC_treated_disabled

When DBG[B|W]CR.{HMC,SSC,PAC} bits configuration is reserved, this parameter controls whether breakpoints/watchpoints are treated as Disabled or not.

Type: `bool`

Default value: false

restore_fpsr_on_trapped_fp_exception

If true, FPSR is restored to the value of the FPSR immediately before the instruction that generated the trapped floating-point exception.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`restriction_on_speculative_execution`

Implements the ARMv8.5 security feature (Restrictions on the effects of speculation), ID_AA64PFR0_EL1.CSV2: 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx not supported), 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx supported) (FEAT_CSV2, FEAT_CSV2_2)., 3: FEAT_CSV2_3 is supported.

Type: `uint8_t`

Default value: 0

`restriction_on_speculative_execution_aarch32`

Implements the ARMv8.5 security feature (Restrictions on the effects of speculation), ID_PFR0.CSV2: 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context, 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context or at a different address in the same hardware described context (FEAT_CSV2, FEAT_CSV2_2).

Type: `uint8_t`

Default value: 0

`revision_number`

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 0

`rgsr_res0_stateful`

Mask of RGSR **RES0** bits read of which return last written value.

Type: `uint64_t`

Default value: `0x0`

`rme_ctrl_bits_stateful_level`

If rme_support_level == 1, specify the RME level that has control bits stateful in system registers. 0 - all until v9.2, 1 - v9.4 including FEAT_RME_GDI bits in MFAR_EL3 and PFAR_EL2.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

rme_default_mecid_nonsecure
Default MECID value for NON-SECURE PAS.

Type: `uint32_t`

Default value: `0x0`

rme_default_mecid_realm
Default MECID value for REALM PAS.

Type: `uint32_t`

Default value: `0x0`

rme_default_mecid_root
Default MECID value for ROOT PAS.

Type: `uint32_t`

Default value: `0x0`

rme_default_mecid_secure
Default MECID value for SECURE PAS.

Type: `uint32_t`

Default value: `0x0`

rme_full_is_tagged_nsh_treated_as_tagged
Whether a tagged NonShared memory attribute is treated as tagged or not. Does nothing if effective RME support is not full.

Type: `bool`

Default value: false

rme_level0_gpt_size
The range of address space protected by each entry in the level 0 GPT (0->1GB 1->16GB, 2->64GB, 3->512GB.

Type: `uint8_t`

Default value: 0

rme_mecid_width
Width of MECID in bits.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

rme_nsh_cacheable_is_shareable

If true, NSH cacheable becomes shareable cacheable (FEAT_RME).

Type: `bool`

Default value: false

rme_support_level

0 -> Realm management extension not implemented, 1 -> LEGACY_TZ_EN mode i.e. RME register fields are stateful but only supports secure/non-secure states, 2 -> Realm management extension fully implemented (FEAT_RME).

Type: `uint8_t`

Default value: 0

rmr_always_implemented

Always implement RMR_ELx, RMR, or HRMR at the highest implemented exception level, even if that exception level cannot use both AArch32 and AArch64.

Type: `bool`

Default value: false

rndr_rndrrs_seed

Initial seed for random engine used in RNDR register.

Type: `uint64_t`

Default value: `0x0`

s1_align_memtype_fault_prio_more_than_s2_perm_fault_on_s1_walk

If true, s1 alignment fault has priority over s2 permission faults.

Type: `bool`

Default value: true

s1_perm_fault_prio_more_than_s2_perm_fault_on_s1_walk

If true, s1 permission fault has priority over s2 on s1 translation table walk permission faults.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`s1_unsupported_atomic_fault_for_ls64_prio_more_than_s2_perm_fault`

If true, unsupported atomic/exclusive faults due to LS64 instructions at Stage 1 have higher priority than permission fault at Stage 2.

Type: `bool`

Default value: false

`scheduler_mode`

Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions. WARNING: This parameter is intended for validation purposes and may result in unwanted behaviour if altered!.

Type: `uint8_t`

Default value: 0

`scr_nET_writeable`

Whether SCR.nET is writeable. Writing to it is purely cosmetic (nET behavior not implemented).

Type: `bool`

Default value: false

`scramble_unknowns_at_reset`

Will fill in unknown bits in registers at reset with register_reset_data.

Type: `bool`

Default value: true

`serror_clear_delay`

Delay for clearing of SError if SError is level-triggered, in cpu cycles.

Type: `uint32_t`

Default value: `0x0`

`set_mops_option`

Set option for Armv8.8 SET(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

set_rasv10_for_armv84_and_higher

ARMv8.4 mandates RAS System Architecture v1.1, but when there are no error records and FEAT_DoubleFault is not implemented then there is no functional difference between the RAS System Architecture v1.0 (that is, the RAS extension as in pre-ARMv8.4 implementations) and the RAS System Architecture v1.1 (also known as FEAT_RASv1p1). This flag if true will set the RAS ID to declare RAS v1.0 rather than RAS v1.1 for ARMv8.4 and higher implementations. If this is set and the core does not conform to the restrictions then this parameter is ignored.

Type: `bool`

Default value: false

setg_mops_option

Set option for Armv8.8 SETG(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B.

Type: `uint8_t`

Default value: 0

skip_trace_on_write_to_oseccr_el1_when_oslock_is_unlocked

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an unknown value on reads and ignores writes. When true, also skips the traces on writes to OSECCR_EL1 when OSLSR_EL1.OSLK == 0.

Type: `bool`

Default value: false

spe_counter_size

Size of counter packet payload in Statistical Profiling Extension- 1, Counter packet payloads are 12-bit saturating counters- 2, Counter packet payloads are 16-bit saturating counters.

Type: `uint8_t`

Default value: 1

spmu_support_level

Implement System PMU: 0: Not supported, 1: v8.9 System PMU Extension is implemented (FEAT_SPMU), 2: v9.5 System PMU2 Extension is implemented (FEAT_SPMU2)values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.9 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`spsr_el3_is_mapped_to_spsr_mon`

Whether SPSR_EL3 is mapped to AArch32 register SPSR_mon.

Type: `bool`

Default value: true

`spsr_m4_res0`

Whether SPSR_ELx.M[4] bit should be **RES0** for AARCH64 only implementations.

Type: `bool`

Default value: false

`stage12_tlb_size`

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: `uint32_t`

Default value: `0x4000`

`stage1_tlb_size`

Number of stage1 only tlb entries. Valid values are 0 or >= 4.

Type: `uint32_t`

Default value: `0x0`

`stage1_walkcache_size`

Number of stage1 only walk cache entries.

Type: `uint32_t`

Default value: `0x0`

`stage2_tlb_size`

Number of stage2 only tlb entries.

Type: `uint32_t`

Default value: `0x0`

`stage2_walkcache_size`

Number of stage2 only walk cache entries.

Type: `uint32_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`statistical_profiling_buffer_alignment`

Statistical profiling alignment constraint for sample buffer.

Type: `uint16_t`

Default value: `0x1`

`statistical_profiling_datasrc_payload_size`

Statistical profiling size in bytes of Data Source packet' payloads.

Type: `uint8_t`

Default value: 1

`statistical_profiling_random_interval_is_separate`

Statistical profiling random interval gets added to the main timer interval(false) or (true) runs as separate timer.

Type: `bool`

Default value: false

`statistical_profiling_recommended_min_sampling`

Statistical profiling recommended minimum sampling interval.

Type: `uint16_t`

Default value: `0x100`

`stex_fail_suppress_sync_data_aborts`

If true, synchronous data aborts are not reported if store exclusive fails.

Type: `bool`

Default value: false

`store_excl_fail_tag_check_action`

Behavior of tag check by core when a store exclusive fails. 0, Tag check ignored, 1, Tag check done if exclusive fails by global monitor.

Type: `uint8_t`

Default value: 0

`strex_fail_can_hit_watchpoint`

If true, a strex fail can hit watchpoint.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`stzgm_reports_fault_address_from_reg_arg`

Which faulting address should be reported in FAR_ELx on a failed STZGM: 0: the lowest aligned addr to DCZID-log2-block-size, 1: the addr held in the register argument, 2: if it is a tag-check fault, the addr aligned to DCZID-log2-block-size, otherwise the addr held in the register argument.

Type: `uint8_t`

Default value: 0

`supports_multi_threading`

Sets the MPIDR.MT bit. Setting this to true hints the the cluster is multi-threading compatible.

Type: `bool`

Default value: false

`sve.clear_constrained_lanes`

When a constrained vector length increases, previously inaccessible bits are set to zero. Possible values are: 0=never, 1=always, 2=if the register was written to while the vector length was constrained.

Type: `uint8_t`

Default value: 0

`sve.combine_movprfx_and_destructive`

Attempt to combine the execution of MOVPRFX and the destructively-encoded instruction that follows it.

Type: `bool`

Default value: false

`sve.disable_speculative_accesses`

All speculative memory accesses behave as though faulting, without accessing memory.

Type: `bool`

Default value: false

`sve.enable_at_reset`

Start with system registers set up for Scalable Vector Extension use.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`sve.ffr_16b_pattern_UNKNOWN`

A specific 16-bit **UNKNOWN** value that is used by parameter force_UNKNOWN_to_ffr.

Type: `uint16_t`

Default value: `0x0`

`sve.force_UNKNOWN_to_ffr`

Governs behavior if WRFFR writes a non-monotonic value to FFR. Possible values are: 0 - Write non-canonical value to FFR, 1 - Overwrite FFR with a specific pattern of 16-bit **UNKNOWN** value. See ffr_16b_pattern_UNKNOWN, 2 - Clear all bits above first zero 3 - Set all bits after first one.

Type: `uint8_t`

Default value: 0

`sve.fp_exception_report_lowest`

If true, for multiple trapped FP exceptions, report the lowest lane in VECITR. Otherwise, report the highest.

Type: `bool`

Default value: false

`sve.fp_exception_set_tfv`

Set ESR_ELx.TFV during FP exception. Trapped exception flags are valid.

Type: `bool`

Default value: true

`sve.fp_exception_set_vecitr`

If true, set ESR_ELx.VECITR during FP exception. Otherwise, set **RES0**.

Type: `bool`

Default value: false

`sve.has_b16b16`

Whether FEAT_SVE_B16B16 is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if either FEAT_SVE2 or FEAT_SME2 is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

sve.has_b16mm

Whether FEAT_SVE_B16MM is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if either FEAT_SVE2 or FEAT_SME2 is implemented.

Type: `uint8_t`

Default value: 0

sve.has_bfscale

Whether FEAT_SVE_BFSCALE is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if either FEAT_SVE2 or FEAT_SME2 is implemented.

Type: `uint8_t`

Default value: 0

sve.has_sme

Whether SME is implemented (FEAT_SME).

Type: `bool`

Default value: false

sve.has_sme2

Whether SME2 is implemented (FEAT_SME2).

Type: `bool`

Default value: false

sve.has_sme_b16b16

Whether FEAT_SME_B16B16 is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if FEAT_SME2 is implemented.

Type: `uint8_t`

Default value: 0

sve.has_sme_f16f16

Whether FEAT_SME_F16F16 is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if FEAT_SME2 is implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`sve.has_sme_f64f64`

If SME is implemented, whether double-precision FMOPA and FMOPS are implemented.

Type: `uint8_t`

Default value: 1

`sve.has_sme_f8f16`

If SME2 is implemented, whether FEAT_SME_F8F16 is implemented.

Type: `uint8_t`

Default value: 1

`sve.has_sme_f8f32`

If SME2 is implemented, whether FEAT_SME_F8F32 is implemented.

Type: `uint8_t`

Default value: 1

`sve.has_sme_fa64`

Whether FEAT_SME_FA64 is implemented.

Type: `bool`

Default value: false

`sve.has_sme_i16i64`

If SME is implemented, whether instructions that accumulate 16-bit integer outer products into 64-bit integer tiles are implemented.

Type: `uint8_t`

Default value: 1

`sve.has_sme_lutv2`

Whether FEAT_SME_LUTv2 is implemented.

Type: `bool`

Default value: false

`sve.has_sme_mop4`

Whether FEAT_SME_MOP4 is implemented. Possible values are 0 - Implemented if FEAT_SME2p2 is implemented, 1 - Implemented if FEAT_SME2p1 is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

`sve.has_sme_priority_control`

Whether SME Priority Control is implemented.

Type: `bool`

Default value: true

`sve.has_sme_tmop`

Whether FEAT_SME_TMOP is implemented. Possible values are 0 - Implemented if FEAT_SME2p2 is implemented, 1 - Implemented if FEAT_SME2p1 is implemented.

Type: `uint8_t`

Default value: 0

`sve.has_ssve_aes`

Indicates support for SVE2 and SME2 AES instructions when the PE is in Streaming SVE mode (FEAT_SSVE_AES).

Type: `uint8_t`

Default value: 0

`sve.has_ssve_bit_perm`

Whether FEAT_SSVE_BitPerm is implemented. Possible values are 0 - Not Implemented, 1 - Implemented if FEAT_SME2p1 is implemented.

Type: `uint8_t`

Default value: 0

`sve.has_ssve_fexpa`

Whether FEAT_SSVE_FEXPA is implemented. Possible values are 0 - Implemented if FEAT_SME2p2 is implemented, 1 - Implemented if FEAT_SME2p1 is implemented.

Type: `uint8_t`

Default value: 0

`sve.has_sve2`

Whether SVE2 is implemented (FEAT_SVE2).

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`sve.has_sve2_aes`

If SVE2 is implemented, whether AES instructions are implemented. Possible values are: 0 - not implemented, 1 - SVE2 AESE, AESD, AESMC, and AESIMC are implemented (FEAT_SVE_AES), 2 - Same as 1 but in addition SVE2 PMULLB and PMULLT with 64-bit source are implemented, 3 - Same as 2 but SVE2 64-bit source element PMLALB and PMLALT instruction variants are implemented (FEAT_SVE_PMULL128).

Type: `uint8_t`

Default value: 2

`sve.has_sve2_bit_perm`

If SVE2 is implemented, whether BitPerm instructions are implemented (FEAT_SVE_BitPerm).

Type: `bool`

Default value: true

`sve.has_sve2_sha3`

If SVE2 is implemented, whether SHA3 instructions are implemented (FEAT_SVE_SHA3).

Type: `bool`

Default value: true

`sve.has_sve2_sm4`

If SVE2 is implemented, whether SM4 instructions are implemented (FEAT_SVE_SM4).

Type: `bool`

Default value: true

`sve.has_sve_bf16`

Whether SVE BFloat16 instructions are implemented.

Type: `bool`

Default value: true

`sve.has_sve_extended_bf16`

Deprecated: to enable FEAT_EBF16, use CPU parameter has_ebf16. Whether Extended BFloat16 instructions are implemented. Possible values are: 0 - Disabled, 1 - Enabled if SME or SVE is implemented, 2 - Enabled if SME is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 2

sve.has_sve_f16f32mm

Whether the SVE half-precision to single-precision Matrix Multiply instructions are implemented (FEAT_F16F32MM).

Type: `bool`

Default value: false

sve.has_sve_mm_f32

Whether the SVE FP32 Matrix Multiply instructions are implemented (FEAT_F32MM).

Type: `bool`

Default value: true

sve.has_sve_mm_f64

Whether the SVE FP64 Matrix Multiply instructions are implemented (FEAT_F64MM).

Type: `bool`

Default value: true

sve.has_sve_mm_i8

Whether the SVE Int8 Matrix Multiply instructions are implemented (FEAT_I8MM).

Type: `bool`

Default value: true

sve.movprfx_unpredictable_behavior

Defines the behavior of MOVPRFX and the instruction it immediately precedes when the behavior is **CONSTRAINED UNPREDICTABLE**. Possible values are: 0 - UNDEF execution from MOVPRFX, 1 - MOVPRFX and second half of instruction executes as **NOP**, 2 - **NOP** MOVPRFX only, 3 - UNDEF execution from MOVPRFX unless otherwise trapped.

Type: `uint8_t`

Default value: 0

sve.predicated_sp_align_check_behaviour

Governs behavior of SP alignment checking for predicated memory accesses. Possible values are: 0 - Always perform, 1 - Skip if governing predicate is 0, 2 - Skip for contiguous accesses if governing predicate is 0, 3 - Skip for gather/scatter accesses if governing predicate is 0.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

sve.relax_sme_watchpoint_matching_16

Whether memory accesses through Z and P registers in Streaming Mode and all accesses through ZA match watchpoints rounded to 16-byte alignment.

Type: `bool`

Default value: false

sve.relax_sve_watchpoint_matching_16

If FEAT_DEBUGv8p9 is implemented, whether memory accesses through Z and P registers outside Streaming Mode match watchpoints rounded to 16-byte alignment.

Type: `bool`

Default value: false

sve.sm_tag_checked

Whether SME, SVE, and SIMD&FP load and store instructions executed when the PE is in Streaming SVE mode perform a Tag Check.

Type: `bool`

Default value: true

sve.sme2_version

The version of SME2 if implemented. Possible values are: 0 - FEAT_SME2, 1 - FEAT_SME2p1, 2 - FEAT_SME2p2, 3 - FEAT_SME2p3.

Type: `uint8_t`

Default value: 0

sve.sme_highest_implemented_priority

When SME Priority Control and SME2p2 are implemented, controls the highest implemented priority.

Type: `uint8_t`

Default value: 0

sve.sme_only

If SME is implemented, whether SVE functionality is available only when SM=1.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

sve.sme_ssve_fp8_support_level

If FEAT_SME2 and FEAT_FP8 are implemented, whether FP8 operations are supported in Streaming Mode where not implemented outside Streaming Mode. Possible values are: 0 - No support above FEAT_FP8, 1 - FEAT_SSVE_FP8FMA, 2 - FEAT_SSVE_FP8DOT4, 3 - FEAT_SSVE_FP8DOT2.

Type: `uint8_t`

Default value: 0

sve.sme_veclens_implemented

Which SME vector lengths are implemented. Represented as a bitfield where bit[n]==1 implies SME vector length of 128*2^n bits is implemented.

Type: `uint8_t`

Default value: 7

sve.smidr_el1_implementer_val

The value of SMIDR_EL1.Implementer.

Type: `uint8_t`

Default value: 65

sve.smidr_el1_nsmc_val

The value of SMIDR_EL1.NSMC.

Type: `uint8_t`

Default value: 0

sve.smidr_el1_revision_val

The value of SMIDR_EL1.Revision.

Type: `uint8_t`

Default value: 0

sve.smidr_el1_sh_val

The value of SMIDR_EL1.SH.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

sve.sve2_version

The version of SVE2 if implemented. Possible values are: 0 - FEAT_SVE2, 1 - FEAT_SVE2p1, 2 - FEAT_SVE2p2, 3 - FEAT_SVE2p3.

Type: `uint8_t`

Default value: 0

sve.sve_dabt_far_behaviour

Whether the FAR reported on a Data Abort is imprecise. Possible values are: 0 - FAR Precise, 1 - FAR not Precise on abort due to an SVE contiguous vector load/store or an SME load/store, 2 - As per 1, but only for predicated SVE/SME instructions, 3 - As per 1, but only for predicated SME/SVE load/store instructions that are executed in Streaming Mode.

Type: `uint8_t`

Default value: 0

sve.sve_wp_far_behaviour

FAR reporting behavior on a Watchpoint debug exception. Possible values are: 0 - FAR Precise, 1 - FAR not Precise on abort due to an SVE contiguous vector load/store in Streaming SVE mode, or an SME load/store, 2 - FAR not valid on abort due to an SVE contiguous vector load/store in Streaming SVE mode, or an SME load/store, 3 - As per 1, but only for predicated SVE/SME instructions, 4 - As per 1, but only for predicated SME/SVE load/store instructions that are executed in Streaming Mode.

Type: `uint8_t`

Default value: 0

sve.trace_za_tilewise

Whether tile-wise accesses to ZA are traced tile-wise rather than array-wise. Note: if false, column-wise accesses cause an event for every vector in the tile.

Type: `bool`

Default value: true

sve.undef_invalid_combined_movprfx

If a combined MOVPRFX is invalid, raise an UNDEF exception. Otherwise, **NOP** the second half.This parameter is deprecated.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`sve.unknown_value`

Simulated value for a state that has an **UNKNOWN** value after reset.

Type: `uint64_t`

Default value: `0xdeaddeaddeaddead`

`sve.veclen`

SVE vector length in units of 64 bits.

Type: `uint8_t`

Default value: 8

`sve.z_reg_on_load_fault_behaviour`

Governs the behavior of destination Z-registers in case of a load fault. Possible values are: 0 - Register becomes **UNKNOWN**, 1 - Register is preserved.

Type: `uint8_t`

Default value: 0

`sve.za_on_svl_increase_behaviour`

Controls the state of the previously inaccessible portion of the ZA registers on SVL increase. Possible values are: 0 - Retain values, 1 - Zero ZA.

Type: `uint8_t`

Default value: 0

`sve.za_tag_checked`

Whether memory accesses due to SME LDR and STR instructions that access the SME ZA array perform a Tag Check.

Type: `bool`

Default value: true

`swp_with_xzr_is_st_atomic`

If true, swp with dest as xzr is treated as store atomic.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`sync_ext_abort_is_sync_serror`

Treat synchronous external aborts as synchronous SErrors (RASv8.9). 0, synchronous external abort. 1, synchronous serror.

Type: `bool`

Default value: false

`system_pmu_id`

When FEAT_SPMU is implemented, indicates the largest value s to select a System PMU <s>.

Type: `uint8_t`

Default value: 0

`take_ccfail_tsc_trap`

When take_ccfail_undef=1 this parameter controls whether or not an SMC instruction that is trapped by HCR_EL2.TSC but fails its condition code check generates a trap to EL2.

Type: `bool`

Default value: false

`take_ccfail_undef`

UNDEF exception is taken even if condition code check fails.

Type: `bool`

Default value: true

`tcr_ps_reserved_value_size`

Physical size treated when TCR.(I)PS is programmed with a reserved value. 0, 48 bits. 1, 52 bits. The parameter value is treated 0 if LPA is not supported.

Type: `uint8_t`

Default value: 0

`tcr_txsz_undersize_should_fault`

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

tdosa_traps_osdlr_if_no_os_double_lock

MDCR_EL*.TDOSA enables trap on OSDLR_EL1 and DBGOSDLR when OS double-lock is not implemented.

Type: `bool`

Default value: true

tidcp_traps_el0_undef_imp_def

TIDCP has priority over UNDEF for accesses to **IMPLEMENTATION DEFINED** functionality from EL0.

Type: `bool`

Default value: true

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

tlbi_or_ic_invalid_xt

Behavior of TLBI and IC instructions that don't take Xt as an argument when Xt != `0b11111`. 0: TLB and IC not UNDEF, 1: TLBI UNDEF, IC not UNDEF, 2: TLBI not UNDEF, IC UNDEF, 3: TLBI and IC UNDEF.

Type: `uint8_t`

Default value: 0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

tlbid_nis

Number of bits supported for IS TLBI Domains (FEAT_TLBID). 0 - 16 : log(number of supported ISH tlbid domains).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`tlbid_nos`

Number of bits supported for OS TLBI Domains (FEAT_TLBID). 0 - 16 : log(number of supported OSH tlbid domains).

Type: `uint8_t`

Default value: 0

`tlbid_nvis`

Number of bits supported for Virtual IS TLBI Domains (FEAT_TLBID). 0 - 5 : log(number of supported Virtual ISH tlbid domains).

Type: `uint8_t`

Default value: 0

`tlbid_nvos`

Number of bits supported for Virtual OS TLBI Domains (FEAT_TLBID). 0 - 5 : log(number of supported Virtual OSH tlbid domains).

Type: `uint8_t`

Default value: 0

`tme_disable-read-write-set-optimizations`

If true, disables the read/write set related optimizations of the model.

Type: `bool`

Default value: false

`tme_imp-failures-can-retry`

If true, IMP=1 failures introduced by the parameters: _wfe-fails-transactions _tcommit-fails-transactions _wakeup-from-wfe-always-fails-transactions also report RTRY=1.

Type: `bool`

Default value: false

`tme_implementation-type`

Implementation type for TME. following options are available: x0: Always fail starting transactions with the IMP cause. x1: Fail on forbidden operations (e.g. some system register accesses) and at model's convenience. x2: As `0x1` but also enable inter PE memory conflict checking. .

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`tme_random-memory-access-fail-chance`

If >0, add a pseudorandom chance for every memory access (loads, stores, TCOMMIT) inside a transaction to cause the transaction to fail with IMP.

Type: `uint8_t`

Default value: 0

`tme_read-set-size`

Size of the transactional read set in bytes, rounded up to the nearest integer number of transaction granules. 0 == unlimited.

Type: `uint32_t`

Default value: `0x0`

`tme_support-only-guaranteed-mem-attr`

If true, a transactional access to memory with a type not architecturally guaranteed to be supported will cause a transaction failure with IMP=1.

Type: `bool`

Default value: false

`tme_tcommit-fails-transactions`

If true, executing TCOMMIT inside a transaction will cause it to fail with IMP=1.

Type: `bool`

Default value: false

`tme_wakeup-from-wfe-always-fails-transactions`

If true, waking up from a WFE will always fail the transaction, even if not required.

Type: `bool`

Default value: false

`tme_wfe-fails-transactions`

If true, executing WFE inside a transaction will cause it to fail with IMP=1.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`tme_write-set-size`

Size of the transactional write set in bytes, rounded up to the nearest integer number of transaction granules. 0 == unlimited.

Type: `uint32_t`

Default value: `0x0`

`tps_support_level`

Support for thread private state extension: 0 - Not implemented. 1 - Implemented at EL0 only (FEAT_TPS). 2 - Implemented at EL0, EL1 and EL2. (FEAT_TPS, FEAT_TPSP).

Type: `uint8_t`

Default value: 0

`trace_full_simd_reg_with_nep`

Whether full simd register is traced even if partial update is done when FPCR.NEP=1.

Type: `bool`

Default value: false

`trace_has_sysreg_access`

ETM trace registers support access via system registers.

Type: `bool`

Default value: true

`trace_icc_registers_as_icv_when_redirected`

If true, update trace with ICV, instead of ICC when ICV registers are accessed depending on the core state.

Type: `bool`

Default value: false

`trace_physical_registers_when_host_virtualisation_enabled`

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`trace_xzr_in_core_regs64_trace`
Whether CORE_REGS64_READ traces XZR and WZR input registers.

Type: `bool`

Default value: true

`trap_dc_cmo_to_pou_if_nop`
Whether traps to DC CMO operations to PoU are ignored if the same is treated as **NOP**.

Type: `bool`

Default value: true

`trap_ic_cmo_to_pou_if_nop`
Whether traps to IC CMO operations to PoU are ignored if the same is treated as **NOP**.

Type: `bool`

Default value: true

`trap_reserved_group3_id_regs`
Whether setting HCR_EL2.TID3 traps reserved group3 id registers.

Type: `bool`

Default value: false

`trbe_cmod`
TRBE Customer Modified.

Type: `uint8_t`

Default value: 0

`trbe_des`
Designer, JEP106 identification code.

Type: `uint16_t`

Default value: `0x0`

`trbe_external_abort_handling`
Describes how the PE manages External aborts on writes made by the Trace Buffer Unit to the trace buffer. (0->External abort is reported to TRBE. From Armv9.3, the value 0 is not permitted and will be 1 if Armv9.3 is implemented. 1-> External abort is ignored. 2->The External abort generates an SError and the error is not reported to TRBE.).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

trbe_has_hardware_translation_table_update

If true, address translation performed by the Trace Buffer Extension manages the Access Flag and dirty state.

Type: `bool`

Default value: true

trbe_implemented_version

Trace Buffer Extension implemented version, 1: FEAT_TRBE implemented (Armv9.0), 2: FEAT_TRBEv1p1 and FEAT_TRBE_EXC are implemented.

Type: `uint8_t`

Default value: 1

trbe_mpam

TRBE MPAM support.

Type: `uint8_t`

Default value: 0

trbe_part

Part number.

Type: `uint16_t`

Default value: `0x0`

trbe_partid_max

Largest permitted TRBDEVID1.PARTID value.

Type: `uint16_t`

Default value: `0x0`

trbe_pmg_max

Largest permitted TRBDEVID1.PMG value if FEAT_MPAMv2 is implemented, otherwise `0xff`.

Type: `uint16_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`trbe_revand`

TRBE component minor revision.

Type: `uint8_t`

Default value: 0

`trbe_revision`

TRBE architecture revision.

Type: `uint8_t`

Default value: 0

`trbe_stop_on_misaligned_pointers`

If true, the Trace Buffer Extension will stop tracing if a buffer pointer is not aligned to TRBIDR_EL1.Align.

Type: `bool`

Default value: false

`treat-dcache-cmos-to-occ-as-nop`

Implement CMOs to Outer cache level as **NOP**.

Type: `bool`

Default value: false

`treat-dcache-cmos-to-poc-as-nop`

Whether dcache maintenance operations to the point of coherency are required for instruction to data coherence. 0 - Clean/Invalidate ops required, 1 - Clean/Invalidate ops not required and cannot generate faults, 2 - Clean/Invalidate ops not required but can generate faults.

Type: `uint8_t`

Default value: 0

`treat-dcache-cmos-to-pou-as-nop`

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

treat-dcache-invalidate-as-clean-invalidate

Treat data cache invalidate operations as clean and invalidate.

Type: `bool`

Default value: false

treat-icache-cmos-to-pou-as-nop

If has_coherent_icache is true, whether instruction cache invalidation operations to PoU which are treated as **NOP** can generate fault. 0 - cannot generate faults, 1 - can generate faults.

Type: `uint8_t`

Default value: 0

treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

treat_forced_normal_as_device_for_excl_atomics

Whether exclusive/atomic access is supported in same manner as access to device if stage1 is Device memory and final memory attribute forced to normal by FWB.

Type: `bool`

Default value: false

treat_pld_as_nop

If true, treat PLD as **NOP**.

Type: `bool`

Default value: false

treat_pli_as_nop

If true, treat PLI as **NOP**.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

treat_wfi_wfe_as_nop

If true, never go into wait state for WFI or WFE instructions.

Type: `bool`

Default value: false

truncate_pc_on_illegal_exception_return_to_aarch32

On Illegal ERET to AArch32, truncate PC to 32-bits.

Type: `bool`

Default value: true

ttt_fetch_fault_report_type

Behaviour for TTT fetch faults: 0, report as data abort. 1, report as instruction abort.

Type: `bool`

Default value: false

tune_spe_cache_events

"Set the percentage of cache event bits set on a load instruction. Supplying any valid, non-empty JSON makes PMSNEVFR_EL1[23:19] stateful. Each field if present, must be between 5\342\200\22395. Omitted fields default to 0. Example: {‘l2_dcache_access':20, ‘l2_dcache_miss':20, ‘dcache_modified':20, ‘recently_fetched':20, ‘data_snooped':20}".

Type: `string`

Default value: N/A

undef_ccsidr2_access_for_unimplemented_aarch32

Whether access to CCSIDR2 is undef if AArch32 is implemented or not at EL1.

Type: `bool`

Default value: false

unification-level

Level of Unification Inner Shareable for the cache hierarchy.

Type: `uint8_t`

Default value: 1

unification-uniprocessor-level

Level of Unification Uniprocessor for the cache hierarchy.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

`unpred_LSE128_overlap`

Constrained unpredictable behaviours for 128-bit LSE overlap. 1 Constraint_UNDEF, 2 Constraint_NOP.

Type: `uint8_t`

Default value: 1

`unpred_brb_iall_or_inj_invalid_xt_behave_as_undef`

If true, BRB IALL/INJ instruction will behave as **UNDEFINED** if Xt != `0b11111`.

Type: `bool`

Default value: false

`unpred_brbe_next_branch_cycle_count_unknown`

If true, cycle count value for the next BRBE branch record after BRB INJ execution outside prohibited region is unknown.

Type: `bool`

Default value: false

`unpred_clear_ISV_for_exception_before_software_step`

Whether ESR_ELx.ISV bit is cleared/set, when it is constrained unpredictable due to a different exception before a software step exception.

Type: `bool`

Default value: false

`unpred_edscr_ns_set_unknown_bit`

Unknown(x) bit in NS field in EDSCR can be configure to 0 or 1.

Type: `bool`

Default value: false

`unpred_edscr_rw_unknown_bits_read_as_1`

Unknown(x) bits in RW field in EDSCR are read as 1 instead of 0.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`unpred_edscr_status_read_as_no_syndrome`

Controls the choice of EDSCR.STATUS bit-values, when it is constrained unpredictable behaviour due to a different exception before a halting step debug event.

Type: `bool`

Default value: false

`unpred_extdbg_unknown_bits`

Data used to fill only in **UNKNOWN** bit-fields of external debug registers e.g., EDPFR and EDDFR.

Type: `uint64_t`

Default value: `0x0`

`unpred_load_single_reg_overlap_with_wb`

Constrained unpredictable behaviours for single load with writeback(might impact certain load pair instructions) 0 Constraint_WBSUPPRESS, 1 Constraint_UNDEF, 2 Constraint_NOP.

Type: `uint8_t`

Default value: 0

`unpred_mrsmsr_currentlymapped_undef`

UNPREDICTABLE register access (accessible from current mode using different instruction) modeled as **NOP** when false and UNDEF when true.

Type: `bool`

Default value: false

`unpred_mrsmsr_protfailed_undef`

UNPREDICTABLE register access (not accessible from current PL and security state) modeled as **NOP** when false and UNDEF when true.

Type: `bool`

Default value: false

`unpred_mte_stzgm_tag_operation_before_data`

Whether Tag operations are performed before data operations for an STGZM instruction.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

unpred_mte_tag_read_when_ata_controls_are_zero_or_untagged_attr

Constrained unpredictable for MTE tag read when ATA controls are 0 or untagged attribute. false, Read as zero. true, Permitted to generate an external abort if a read of data from the same address would generate an external abort.

Type: `bool`

Default value: false

unpred_mte_tag_store_data_cache_instr_to_device_mem_as_alignment_fault

Constrained unpredictable choice for MTE instructions which store tags (on DC instructions) to memory locations marked as Device. false, Storing the data, if any, to the locations. true, Generating an Alignment Fault.

Type: `bool`

Default value: false

unpred_mte_tag_store_to_device_mem_as_alignment_fault

Constrained unpredictable choice for STZGM instruction which store tags to memory locations marked as Device. false, Storing the data, if any, to the locations. true, Generating an Alignment Fault.

Type: `bool`

Default value: false

unpred_nested_virtualization_nv_behaviour

Constrained unpredictable choices for HCR_EL2.NV=0 and HCR_EL2.NV1=1 with respect to nested virtualization- 0, Behave as defined in the specification as per bit values- 1, Behave as if HCR_EL2.NV=1 and HCR_EL2.NV1=1 for all purpose other than reading back HCR_EL2.NV- 2, Behave as if HCR_EL2.NV=0 and HCR_EL2.NV1=0 for all purpose other than reading back HCR_EL2.NV1.

Type: `uint8_t`

Default value: 0

unpred_par_attr_returns_mair

If true, PAR_EL1.ATTR represents the memory attributes as per the MAIR value instead of the ones in the descriptor.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`unpred_poe2_va_ress_mismatch`

Constrained unpredictable choices when bits marked as RESS do not all have the same value for POE2 registers containing a VA - 0, Generating a translation abort on use of the register- 1, Reserved sign extended bits of the register are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes other than reading back the register- 2, Reserved sign extended bits of the register are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes .

Type: `uint8_t`

Default value: 0

`unpred_s2_hw_dirty_update_on_atomic_wo_read_perm_fault`

Constrained unpredictable behavior for atomic instructions that generate a stage 2 permission fault only due to lack of read permission, on a stage 2 writable-clean descriptor. If true, hardware is allowed to update the stage 2 dirty state; else, the dirty update is suppressed.

Type: `bool`

Default value: false

`unpred_sctlr_c_0_taggable_behaviour`

Controls unpredictable effects when SCTLTR_ELx.C=0 for a stage 1 translation regime on whether memory is treated as taggable. Values: 0=Tagged, 1=Untagged but forced to Tagged when FWB=1 and stage 2 restores WB, 2 = Untagged.

Type: `uint8_t`

Default value: 2

`unpred_store_exclusive_base_overlap`

Constrained unpredictable behaviours for store exclusive when s==n. 0 Constraint_NONE, 1 Constraint_UNDEF, 2 Constraint_NOP.

Type: `uint8_t`

Default value: 0

`unpred_store_pair_and_single_reg_overlap_with_wb`

Constrained unpredictable behaviours for pair and single store with writeback(doesn't cover store exclusive) 0 Constraint_NONE, 1 Constraint_UNDEF, 2 Constraint_NOP.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`unpred_tchange_tenter_and_texit_behaviour`

TCHANGE, TENTER and TEXIT unpredictable behaviour in debug state. 0, **NOP**. 1, Undefined. 2, Execute as in non-debug state.

Type: `uint8_t`

Default value: 0

`unpred_tlbi_not_in_monitor_mode`

Constrained unpredictable behaviors for AArch32 TLBI instructions executed in secure privileged mode other than Monitor mode. 0: Preferred behavior (default), 1: UNDEF, 2: **NOP**, 3: execute as if had been executed in Monitor mode.

Type: `uint8_t`

Default value: 0

`unpred_tps_range`

When TPMINn_ELx > TPMAXn_ELx: 0 - Prevent all accesses. 1 - Allow all accesses. 2 - Wrap around.

Type: `uint8_t`

Default value: 0

`unpred_tps_va_ress_mismatch`

Constrained unpredictable choices when bits marked as RESS do not all have the same value for TPS registers containing a VA - 0, Generating a translation abort on use of the register- 1, Reserved sign extended bits of the register are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes other than reading back the register- 2, Reserved sign extended bits of the register are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes .

Type: `uint8_t`

Default value: 0

`unpred_tsize_aborts`

Behaviour when TSize is out of range. 0, force into range. 1, translation fault, forces unpred_tsize_pamax_aborts to 1.

Type: `bool`

Default value: false

`unpred_tsize_pamax_aborts`

Behaviour when stage 2 TSize exceeds the physical address size (or 40bits, from AArch32). 0, force into range. 1, translation fault. Ignored if unpred_tsize_aborts is 1.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`unpred_vncr_el2_ress_mismatch`

Constrained unpredictable choices when bits marked as RESS do not all have the same value for VNCR_EL2 - 0, Generating an EL2 translation regime translation abort on use of the VNCR_EL2 register- 1, Reserved sign extended bits of VNCR_EL2 are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes other than reading back the register- 2, Reserved sign extended bits of VNCR_EL2 are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes .

Type: `uint8_t`

Default value: 0

`unpred_zero_spsr_btype`

Constrained unpredictable control to make SPSR_ELx.BTYPE 0 instead of PSTATE.BTYPE on synchronous exceptions other than Software Step, PC alignment fault, Instruction Abort, Breakpoint or Address Matching Vector Catch, Illegal Execution State, BRK instruction, Branch Target.

Type: `bool`

Default value: true

`unpredictable_exclusive_abort_memtype`

Cause MMU abort if exclusive access is not supported in certain memory type (0=exclusives allowed in all memory types, 1=exclusives abort in Device memory types, 2=exclusives abort in any type other than WB inner cacheable).

Type: `uint8_t`

Default value: 0

`unpredictable_hvc_behaviour`

HVC unpredictable behaviour. 0, UNDEF. 1, **NOP**.

Type: `uint8_t`

Default value: 0

`unpredictable_smc_behaviour`

SMC unpredictable behaviour. 0, UNDEF. 1, **NOP**.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`unpredictable_wfet_and_wfit_behaviour`

WFET and WFIT unpredictable behaviour in debug state. 0, **UNDEFINED**. 1, **NOP**.

Type: `uint8_t`

Default value: 1

`unsupported_atomic_fault_type`

Type of fault reported on unsupported atomic access. 0 = external abort if any reported by interconnect, 1 = precise unsupported atomic fault, 2 = precise external abort, 3 = imprecise external abort.

Type: `uint8_t`

Default value: 0

`unsupported_fp8_format_behaviour`

Behaviour when FPMR.{F8S1,F8S2,F8D} are programmed to a reserved value 0->FP8 Inputs are treated as a signalling NaN, FP8 outputs are `0xFF` 1->Format is treated as FPMR.{F8S1,F8S2,F8D} & `0x1`.

Type: `uint8_t`

Default value: 0

`unsupported_hw_update_fault_type`

Type of abort reported when hw update to descriptor is done using unsupported memtype (0=No abort, 1=IMPDEF abort caused by memtype, 2=Sync external abort).

Type: `uint8_t`

Default value: 0

`use_architectural_names`

Use names SP/LR/PC instead of R13/R14/R15.

Type: `bool`

Default value: false

`use_sif_to_compute_pan`

Where FEAT_PAN3 is implemented, whether SCR_EL3.SIF bit is used to determine instruction access permission for the purpose of PAN.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

use_stage1_sh_as_input_to_stage2

IMPDEF case of whether to use stage1 shareability or OuterShareable as input to stage2 if stage1 is Device memtype.

Type: `bool`

Default value: false

use_tlb_contig_hint

Translation table entries with the contiguous hint bit set generate large TLB entries.

Type: `bool`

Default value: false

user_defined_rom_table_debug_power_config

User defined ROM Table debug power domains for ED,CTI,PMU and TRACE, and DBGPCR configuration. The "version" field and "cores" array are mandatory. The "dbgpcr" array, if provided, must contain unique integers in the range [0, 31] describing which debug power domains have power control implemented. The "rom" and "dbgpcr" fields in objects in the "cores" array are only allowed when ‘debug_rom_is_flat' is false. All power domain ID fields ("rom", "ed/pmu", "cti", "etm") must be in the range [0, 31]. The "ed/pmu" field is mandatory. Example JSON for a hierarchical debug ROM layout: ‘{"version": 0, "dbgpcr": [0, 1], "cores":[{"dbgpcr": [1, 31], "rom": 0, "ed/pmu": 0, "cti": 31, "etm": 1}, {"ed/pmu": 0}]}'.

Type: `string`

Default value: N/A

vmte_support_level

Specify the Virtual Tagging Base Feature support level:- 0 Not Implemented- 1 Implement Virtual Tagging and Checking controls and instructions, but not enablement (FEAT_VMTE +FEAT_VMTETC)- 2 As per 1 but can be enabled (FEAT_VMTEE+FEAT_VMTETCE +FEAT_FMTETCL).

Type: `uint8_t`

Default value: 0

vpu_datapath_width

VPU data path width.

Type: `uint8_t`

Default value: 128

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

warn_for_dbgwcr_reserved_values_with_razwi_bits

Display a warning when DBGWCR is programmed with a reserved value even if some bits(e.g. HMC) are **RAZ/WI**.

Type: `bool`

Default value: true

warn_unpredictable_in_v7

If true, behaviour which is unpredictable in V7 yet is predictable in V8 will produce a warning.

Type: `bool`

Default value: true

watchpoint-log2secondary_restriction

log2 size of secondary restriction of FAR/EDWAR possible values on watchpoint hit for load/store operations.

Type: `uint8_t`

Default value: 0

wfe_wakeup_delay

Configure WFE wakeup delay in CPU cycles.

Type: `uint32_t`

Default value: `0x0`

wfi_wakeup_delay

Configure WFI wakeup delay in CPU cycles.

Type: `uint32_t`

Default value: `0x0`

wnr_is_read_for_s2f_on_s1_atomic_instr_fault

Whether WnR is 0 for stage2 fault on stage1 for atomic instructions.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`wnr_is_read_for_s2f_on_s1_dbm_update`

Whether WnR is 0 for stage2 fault on stage1 descriptor dbm update.

Type: `bool`

Default value: false

`wp_ignores_dbm_update`

If true, dbm update is ignored on watchpoint hit.

Type: `bool`

Default value: false

`wp_num_reporting`

When reporting of the watchpoint number on Watchpoint Exceptions and Debug Events is performed - When FEAT_Debugv8p9 is implemented or otherwise required - When FEAT_Debugv8p9 or FEAT_SME is implemented.

Type: `uint8_t`

Default value: 0

3.4 AHCI_SATA

Defined in `LISA/AHCI_SATA.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see Quality level definitions.

About AHCI_SATA

This component implements an AHCI controller including attached SATA disks. It connects as a PCIe end-point device to a PCIe framework.

Iris and MTI instances for AHCI_SATA

This model has the following Iris instances:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
AHCI_SATA	AHCI_SATA
AHCI_SATA.ahci_master	PVBusMaster
AHCI_SATA.register_slave	PVBusSlave

This model has the following MTI trace components:

Name	Component type
AHCI_SATA	AHCI_SATA
AHCI_SATA.ahci_master	PVBusMaster
AHCI_SATA.register_slave	PVBusSlave

Ports for AHCI_SATA

Port	Direction	Protocol	Description
ahci_dma_m	master	PVBus	AHCI device performs DMA accesses via master
client_s	slave	PCIDevice2ClientProtocol	PCIDevice client slave port, used for MSI-X
pvbus	slave	PVBus	AHCI pci/control/config/status registers

Parameters for AHCI_SATA

force_mode

Force disk to report support for at most PIO/DMA/NCQ mode (only for testing/bring-up purposes). PIO mode is always supported. Use NCQ for maximum performance (default).

Type: `string`

Default value: “NCQ”

image_path

Comma separated list of zero or more disk images (up to 32). Each image represents one SATA disk which is connected to one port of the AHCI controller. Empty list elements are allowed and result in a SATA port which has no disk attached. Empty string (default) means: One SATA port with no disk attached. Use ‘truncate -s 4T disk.img' to create a 4 TByte sparse image. Use ‘dd if=/dev/zero of=disk.img bs=1M count=42' to create a 42 MByte non-sparse image.

Type: `string`

Default value: N/A

run_async

Do host I/O in a background thread asynchronously. Enabling this makes the simulation non-deterministic and may or may not improve performance. Default is ‘false' (do all disk accesses synchronously).

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

3.5 AMBAPV2PVBus

Defined in `examples/SystemCExport/Bridges/AMBAPV2PVBus.lisa`.

About AMBAPV2PVBus

- PVBus does not support transactions with byte_enable set (strobing transactions, in AXI terms). This bridge component rejects them.
- Variants of this component also exist with multiple input and output ports.

The bridge enables the ACP port to treat a transaction as coherent. It provides an additional parameter to specify the default shared bit value for incoming AMBA-PV transactions.

It also enables the shared bit to be specified by the "shareable" attribute of an AMBA-PV transaction using the amba_pv_attributes class. (Requires you to define the `AMBA_PV_INCLUDE_ATTRIBUTES` macro at compile time.)

Limitations

Fast Models bridges between PVBus and AMBA-PV can transport Memory Tagging Extension (MTE) operations (tag stores, tag loads, and tag-checked loads and stores). These operations are transported opaquely, so the endpoint must be using PVBus. This means you cannot handle these operations in your own TLM components.

Iris and MTI instances for AMBAPV2PVBus

This model has the following Iris instances:

Name	Instance type
`AMBAPV2PVBus`	AMBAPV2PVBus
`AMBAPV2PVBus.bus_master`	PVBusMaster

This model has the following MTI trace components:

Name	Component type
`AMBAPV2PVBus`	AMBAPV2PVBus
`AMBAPV2PVBus.bus_master`	PVBusMaster

Ports for AMBAPV2PVBus

Port	Direction	Protocol	Description
`amba_pv_s`	slave	AMBAPV	-
`pvbus_m`	master	PVBus	-

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Parameters for AMBAPV2PVBus

`base_addr`

Base address.

Type: `uint64_t`

Default value: `0x0`

`report_errors`

Report transactions which do not comply with PVBus protocol requirements.

Type: `bool`

Default value: false

`shareable`

Shareable default.

Type: `bool`

Default value: true

3.6 AMBAPV2PVBusx4

Defined in `examples/SystemCExport/Bridges/AMBAPV2PVBusx4.lisa`.

About AMBAPV2PVBusx4

AMBA-PV to PVBus protocol converter with array size 4.

Iris and MTI instances for AMBAPV2PVBusx4

This model has the following Iris instances:

Name	Instance type
`AMBAPV2PVBusx4`	AMBAPV2PVBusx4
`AMBAPV2PVBusx4.ambapv2pvbus_U` (where *U* = 0–3)	AMBAPV2PVBus
`AMBAPV2PVBusx4.ambapv2pvbus_U.bus_master` (where *U* = 0–3)	PVBusMaster

This model has the following MTI trace components:

Name	Component type
`AMBAPV2PVBusx4.ambapv2pvbus_U` (where *U* = 0–3)	AMBAPV2PVBus
`AMBAPV2PVBusx4.ambapv2pvbus_U.bus_master` (where *U* = 0–3)	PVBusMaster

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Ports for AMBAPV2PVBusx4

Port	Direction	Protocol	Description
`amba_pv_s`	slave	AMBAPV	From SystemC, bridge to array port pvbus_m[x].
`pvbus_m`	master	PVBus	To SystemC.

Parameters for AMBAPV2PVBusx4

No LISA parameters found.

3.7 AMBAPV2PVBusx8

Defined in `examples/SystemCExport/Bridges/AMBAPV2PVBusx8.lisa`.

About AMBAPV2PVBusx8

AMBA-PV to PVBus protocol converter with array size 8.

Iris and MTI instances for AMBAPV2PVBusx8

This model has the following Iris instances:

Name	Instance type
`AMBAPV2PVBusx8`	AMBAPV2PVBusx8
`AMBAPV2PVBusx8.ambapv2pvbus_U` (where *U* = 0–7)	AMBAPV2PVBus
`AMBAPV2PVBusx8.ambapv2pvbus_U.bus_master` (where *U* = 0–7)	PVBusMaster

This model has the following MTI trace components:

Name	Component type
`AMBAPV2PVBusx8.ambapv2pvbus_U` (where *U* = 0–7)	AMBAPV2PVBus
`AMBAPV2PVBusx8.ambapv2pvbus_U.bus_master` (where *U* = 0–7)	PVBusMaster

Ports for AMBAPV2PVBusx8

Port	Direction	Protocol	Description
`amba_pv_s`	slave	AMBAPV	From SystemC, birdged to pvbus_m[x].
`pvbus_m`	master	PVBus	To SystemC.

Parameters for AMBAPV2PVBusx8

No LISA parameters found.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

3.8 AMBAPVACE2PVBus

Defined in `examples/SystemCExport/Bridges/AMBAPVACE2PVBus.lisa`.

About AMBAPVACE2PVBus

- AMBAPVACE2PVBus depends on the AMBA-PV API, which must be at least version 1.4.
- The translation of bus transactions by the bridge has some impact on performance. Bus masters that cache memory transactions avoid much of this impact. The bridge does not support DMI.
- PVBus does not support transactions with `byte_enable` set (strobing transactions, in AXI terms). This bridge component rejects them.

Iris and MTI instances for AMBAPVACE2PVBus

This model has the following Iris instances:

Name	Instance type
`AMBAPVACE2PVBus`	AMBAPVACE2PVBus
`AMBAPVACE2PVBus.bus_master`	PVBusMaster

This model has the following MTI trace components:

Name	Component type
`AMBAPVACE2PVBus`	AMBAPVACE2PVBus
`AMBAPVACE2PVBus.bus_master`	PVBusMaster

Ports for AMBAPVACE2PVBus

Port	Direction	Protocol	Description
`amba_pv_ace_s`	slave	AMBAPVACE	-
`pvbus_m`	master	PVBus	-

Parameters for AMBAPVACE2PVBus

`report_errors`

Report transactions which do not comply with PVBus protocol requirements.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

3.9 AMBAPVSignal2SGSignal

Defined in `examples/SystemCExport/Bridges/AMBAPVSignal2SGSignal.lisa`.

Note

Variants of this component also exist with multiple input and output ports.

Iris and MTI instances for AMBAPVSignal2SGSignal

This model has the following Iris instances:

Name	Instance type
`AMBAPVSignal2SGSignal`	AMBAPVSignal2SGSignal

No MTI components available.

Ports for AMBAPVSignal2SGSignal

Port	Direction	Protocol	Description
`amba_pv_signal_s`	slave	AMBAPVSignal	Input slave port for connection from top-level AMBAPVSignal slave port.
`sg_signal_m`	master	Signal	Handles outgoing signal state changes. Converted signal state changes are sent out through this port.

Parameters for AMBAPVSignal2SGSignal

No LISA parameters found.

3.10 AMBAPVSignal2SGSignalx1024

Defined in `examples/SystemCExport/Bridges/AMBAPVSignal2SGSignalx1024.lisa`.

About AMBAPVSignal2SGSignalx1024

AMBA-PV Signal to SystemGenerator Signal array protocol converter.

Iris and MTI instances for AMBAPVSignal2SGSignalx1024

This model has the following Iris instances:

Name	Instance type
`AMBAPVSignal2SGSignalx1024`	AMBAPVSignal2SGSignalx1024

No MTI components available.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Ports for AMBAPVSignal2SGSignalx1024

Port	Direction	Protocol	Description
amba_pv_signal_s	slave	AMBAPVSignal	-
sg_signal_m	master	Signal	-

Parameters for AMBAPVSignal2SGSignalx1024

No LISA parameters found.

3.11 AMBAPVSignal2SGSignalx16

Defined in `examples/SystemCExport/Bridges/AMBAPVSignal2SGSignalx16.lisa`.

About AMBAPVSignal2SGSignalx16

AMBA-PV Signal to SystemGenerator Signal array protocol converter.

Iris and MTI instances for AMBAPVSignal2SGSignalx16

This model has the following Iris instances:

Name	Instance type
AMBAPVSignal2SGSignalx16	AMBAPVSignal2SGSignalx16

No MTI components available.

Ports for AMBAPVSignal2SGSignalx16

Port	Direction	Protocol	Description
amba_pv_signal_s	slave	AMBAPVSignal	Input slave port for connection from top-level AMBAPVSignal slave port.
sg_signal_m	master	Signal	Handles outgoing signal state changes. Converted signal state changes are sent out through this port.

Parameters for AMBAPVSignal2SGSignalx16

No LISA parameters found.

3.12 AMBAPVSignal2SGSignalx224

Defined in `examples/SystemCExport/Bridges/AMBAPVSignal2SGSignalx224.lisa`.

About AMBAPVSignal2SGSignalx224

AMBA-PV Signal to SystemGenerator Signal array protocol converter.

Iris and MTI instances for AMBAPVSignal2SGSignalx224

This model has the following Iris instances:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
`AMBAPVSignal2SGSignalx224`	AMBAPVSignal2SGSignalx224

No MTI components available.

Ports for AMBAPVSignal2SGSignalx224

Port	Direction	Protocol	Description
`amba_pv_signal_s`	slave	AMBAPVSignal	-
`sg_signal_m`	master	Signal	-

Parameters for AMBAPVSignal2SGSignalx224

No LISA parameters found.

3.13 AMBAPVSignal2SGSignalx4

Defined in `examples/SystemCExport/Bridges/AMBAPVSignal2SGSignalx4.lisa`.

About AMBAPVSignal2SGSignalx4

AMBA-PV Signal to SystemGenerator Signal array protocol converter.

Iris and MTI instances for AMBAPVSignal2SGSignalx4

This model has the following Iris instances:

Name	Instance type
`AMBAPVSignal2SGSignalx4`	AMBAPVSignal2SGSignalx4

No MTI components available.

Ports for AMBAPVSignal2SGSignalx4

Port	Direction	Protocol	Description
`amba_pv_signal_s`	slave	AMBAPVSignal	-
`sg_signal_m`	master	Signal	-

Parameters for AMBAPVSignal2SGSignalx4

No LISA parameters found.

3.14 AMBAPVSignal2SGSignalx48

Defined in `examples/SystemCExport/Bridges/AMBAPVSignal2SGSignalx48.lisa`.

About AMBAPVSignal2SGSignalx48

AMBA-PV Signal to SystemGenerator Signal array protocol converter.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

Non-Confidential

3.23 AMBAPVValue2SGValuex4

Defined in `examples/SystemCExport/Bridges/AMBAPVValue2SGValuex4.lisa`.

About AMBAPVValue2SGValuex4

AMBA-PV Value to SystemGenerator Value array protocol converter.

Iris and MTI instances for AMBAPVValue2SGValuex4

This model has the following Iris instances:

Name	Instance type
`AMBAPVValue2SGValuex4`	AMBAPVValue2SGValuex4

No MTI components available.

Ports for AMBAPVValue2SGValuex4

Port	Direction	Protocol	Description
`amba_pv_value_s`	slave	AMBAPVValue	-
`sg_value_m`	master	Value	-

Parameters for AMBAPVValue2SGValuex4

No LISA parameters found.

3.24 AMBAPVValue642SMMUv3AEMIdentify

Defined in `examples/SystemCExport/Bridges/AMBAPVValue642SMMUv3AEMIdentify.lisa`.

About AMBAPVValue642SMMUv3AEMIdentify

AMBA-PV Value64 to SMMUv3AEMIdentify protocol converter.

Iris and MTI instances for AMBAPVValue642SMMUv3AEMIdentify

This model has the following Iris instances:

Name	Instance type
`AMBAPVValue642SMMUv3AEMIdentify`	AMBAPVValue642SMMUv3AEMIdentify

No MTI components available.

Ports for AMBAPVValue642SMMUv3AEMIdentify

Port	Direction	Protocol	Description
`identify_reply`	master	AMBAPVValue64	-
`identify_request`	slave	AMBAPVValue64	-
`identify`	master	SMMUv3AEMIdentifyProtocol	-

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Parameters for AMBAPVValue642SMMUv3AEMIdentify

No LISA parameters found.

3.25 AMBAPVValue642VECB

Defined in `examples/SystemCExport/Bridges/AMBAPVValue642VECB.lisa`.

About AMBAPVValue642VECB

AMBA-PV to VECB protocol converter.

Iris and MTI instances for AMBAPVValue642VECB

This model has the following Iris instances:

Name	Instance type
`AMBAPVValue642VECB`	AMBAPVValue642VECB

No MTI components available.

Ports for AMBAPVValue642VECB

Port	Direction	Protocol	Description
`amba_pv_ctrl_s`	slave	AMBAPVValue	-
`amba_pv_data_s`	slave	AMBAPVValue64	-
`vecb_m`	master	VECBProtocol	-

Parameters for AMBAPVValue642VECB

No LISA parameters found.

3.26 AMBAPVValueState2SGValueState

Defined in `examples/SystemCExport/Bridges/AMBAPVValueState2SGValueState.lisa`.

Note

Variants of this component also exist with multiple input and output ports.

Iris and MTI instances for AMBAPVValueState2SGValueState

This model has the following Iris instances:

Name	Instance type
`AMBAPVValueState2SGValueState`	AMBAPVValueState2SGValueState

Non-Confidential

No MTI components available.

Ports for AMBAPVValueState2SGValueState

Port	Direction	Protocol	Description
`amba_pv_value_s`	slave	AMBAPVValueState	-
`sg_value_m`	master	ValueState	-

Parameters for AMBAPVValueState2SGValueState

No LISA parameters found.

3.27 AMBAPVValueState2SGValueState64

Defined in `examples/SystemCExport/Bridges/AMBAPVValueState2SGValueState64.lisa`.

Note

Variants of this component also exist with multiple input and output ports.

Iris and MTI instances for AMBAPVValueState2SGValueState64

This model has the following Iris instances:

Name	Instance type
`AMBAPVValueState2SGValueState64`	AMBAPVValueState2SGValueState64

No MTI components available.

Ports for AMBAPVValueState2SGValueState64

Port	Direction	Protocol	Description
`amba_pv_value_s`	slave	AMBAPVValueState64	-
`sg_value_m`	master	ValueState_64	-

Parameters for AMBAPVValueState2SGValueState64

No LISA parameters found.

3.28 AMBAPVValueState2SGValueState64x4

Defined in `examples/SystemCExport/Bridges/AMBAPVValueState2SGValueState64x4.lisa`.

About AMBAPVValueState2SGValueState64x4

AMBA-PV ValueState64 to SystemGenerator ValueState_64 array protocol converter.

3.30 ARMAEMv8MCT

Defined in `LISA/ARMAEMv8MCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
v8.0M	Full support
v8.1M	Full support

For an explanation of the quality levels, see Quality level definitions.

Changes in 11.30.27

The following parameters were added:

- `manager_id`

The following parameters were removed:

- `master_id`

About ARMAEMv8MCT

ARMAEMv8MCT CPU component.

Iris and MTI instances for ARMAEMv8MCT

This model has the following Iris instances:

Name	Instance type
`ARMAEMv8MCT`	ARM_AEMv8M
`ARMAEMv8MCT.acp_mapper`	PVBusMapper
`ARMAEMv8MCT.ext_bus`	PVBusLogger
`ARMAEMv8MCT.ext_bus.mapper`	PVBusMapper
`ARMAEMv8MCT.l1_incoherent_interconnect`	PVCache
`ARMAEMv8MCT.l1_incoherent_interconnect.upstream[Z]` (where *Z* = 0–17)	PVBusSlave
`ARMAEMv8MCT.l1dcache`	PVCache
`ARMAEMv8MCT.l1dcache.upstream[0]`	PVBusSlave
`ARMAEMv8MCT.l1icache`	PVCache
`ARMAEMv8MCT.l1icache.upstream[0]`	PVBusSlave
`ARMAEMv8MCT.l2_flusher`	AsyncCacheFlushUnit

This model has the following MTI trace components:

Name	Component type
`ARMAEMv8MCT`	ARM_AEMv8M
`ARMAEMv8MCT.acp_mapper`	PVBusMapper
`ARMAEMv8MCT.ext_bus`	PVBusLogger

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Component type
ARMAEMv8MCT.ext_bus.mapper	PVBusMapper
ARMAEMv8MCT.l1_incoherent_interconnect	PVCache
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[Z] (where *Z* = 0–17)	PVBusSlave
ARMAEMv8MCT.l1dcache	PVCache
ARMAEMv8MCT.l1dcache.upstream[0]	PVBusSlave
ARMAEMv8MCT.l1icache	PVCache
ARMAEMv8MCT.l1icache.upstream[0]	PVBusSlave
ARMAEMv8MCT.l2_flusher	AsyncCacheFlushUnit

Ports for ARMAEMv8MCT

Port	Direction	Protocol	Description
ahbd	slave	PVBus	Debug AHB - core bus slave driven by the DAP.
ahbp_m	master	PVBus	The core will generate Vendor System data accesses on this port.
ahbs	slave	PVBus	External master (e.g. DMA) can write TCMs (whether or not enabled in xTCMCR).
auxfault	slave	Value	This is wired to the Auxiliary Fault Status Register.
bigend	slave	Signal	Configure big endian data format.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
coproc_bus	slave	CoprocBusProtocol	Co-Processor Interface
cpuwait	slave	Signal	When this signal is HIGH out of reset, it forces the processor into a quiescent state that delays its boot-up sequence and instruction execution until this signal is driven LOW.
currpri	master	Value	Current execution priority.
dap_s	slave	PVBus	Debug Access Port (DAP).
dbgen	slave	Signal	Invasive debug enable.
dbgrestart	slave	Signal	External debug request.
dbgrestarted	master	Signal	External debug request.
edbgrq	slave	Signal	External debug request.
etm_reset	slave	Signal	Separate reset for ETM, if param “has_etm_reset” is true.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	master	Value	Port that sends the value of the FPxxC exception flags (FPIXC, FPIDC, FPOFC, FPUFC, FPDZC, FPIOC). Each flag is present in the same position as in the FPSCR register (e.g. fpxxc[0] = FPIOC).
halted	master	Signal	External debug request.
idau_ invalidate_region	slave	Value_64	64 bit number to invalid IDAU memory ranage (start_address<<32|end_address)
idau	master	PVBus	The core will generate IDAU Bus request.
initpahben	slave	Signal	Enable P-AHB on the next reset
initvtor_ns	slave	Value	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`initvtor_s`	slave	Value	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
`intisr`	slave	Signal	This signal array delivers signals to the NVIC.
`intnmi`	slave	Signal	Configure non maskable interrupt.
`intnum`	master	Value	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
`io_port_in`	slave	PVBus	I/O port pair. See the documentation for the io_port_out port.
`io_port_out`	master	PVBus	I/O port pair. Used if IOP is true. Transactions from io_port_out which do not “match” should be returned via io_port_in. For performance reasons, the I/O port interface is not modelled directly. Instead, a simple PVBus gasket is inserted at the point in the memory system where the I/O port would be. In hardware, a device would be attached to the port which would tell the CPU whether it would like to intercept each transaction, given its address. This can be modelled in a performant manner by connecting a PVBusMapper-based device to io_port_out which intercepts transactions of interest and passes other transactions back to the CPU via io_port_in. Your I/O port device model is also responsible for aborting transactions which would be aborted on hardware (e.g. exclusives) if necessary.
`lockdcaic`	slave	Signal	-
`locknsmpu`	slave	Signal	Disable writes to the Non-Secure MPU_*_NS registers
`locknsvtor`	slave	Signal	Disable writes to VTOR_NS
`lockpahb`	slave	Signal	P-AHB related ports Disable writes to PAHBCR
`locksau`	slave	Signal	Disable writes to the SAU_* registers
`locksmpu`	slave	Signal	Disable writes to the Secure MPU_* registers
`locksvtaircr`	slave	Signal	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
`lockup`	master	Signal	Asserted when the processor is in lockup state.
`niden`	slave	Signal	Non-invasive debug enable.
`poreset`	slave	Signal	Raising this signal will do a power-on reset of the core.
`pv_ppbus_m`	master	PVBus	The core will generate External Private Peripheral Bus requests on this port.
`pvbus_m`	master	PVBus	The core will generate bus requests on this port.
`sleepdeep`	master	Signal	Asserted when the processor is in deep sleep.
`sleeping`	master	Signal	Asserted when the processor is in sleep.
`spiden`	slave	Signal	Secure invasive debug enable.
`spniden`	slave	Signal	Secure non-invasive debug enable.
`stcalib`	slave	Value	This is the calibration value for the SysTick timer.
`stclk`	slave	ClockSignal	This is the reference clock for the SysTick timer.
`sysreset`	slave	Signal	Raising this signal will put the core into reset mode (but does not reset the debug logic).
`sysresetreq`	master	Signal	Asserted to indicate that a reset is required.
`ticks`	master	InstructionCount	Port allowing the number of instructions since startup to be read from the CPU.

Parameters for ARMAEMv8MCT

`SAU_REGIONX.BADDR`

Base address of SAU region0 at reset.

Type: `uint32_t`

Default value: `0x0`

`SAU_REGIONX.ENABLE`

Enable SAU region0 at reset.

Type: `bool`

Default value: false

`SAU_REGIONX.LADDR`

Limit address of SAU region0 at reset.

Type: `uint32_t`

Default value: `0x0`

`SAU_REGIONX.NSC`

Set NSC for SAU region0 at reset.

Type: `bool`

Default value: false

`AFSR_type`

0:No AFSR, 1:state-only 2:Many bits set from (im)precise aborts on AXI, TCM, etc.

Type: `uint8_t`

Default value: 1

`AIRCR.BFHFNMINS_reset`

If true, set the bit after reset (as if by IMP_DEF mechanism). Ignored if SECEXT=false.

Type: `bool`

Default value: false

`AIRCR.BFHFNMINS_writable`

Is AIRCR.BFHFNMINS bit[13] writeable.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

`AIRCR.ENDIANNESS`

Initialize processor to big endian mode.

Type: `bool`

Default value: false

`AIRCR.PRIS_writable`

Is AIRCR.PRIS bit[14] writeable.

Type: `bool`

Default value: true

`AIRCR.VECTCLRACTIVE_changes_mode`

Asserting AIRCR.VECTCLRACTIVE clears IPSR and any active exceptions. The mode is also changed to thread if this flag is true. Ignored for v8-M.

Type: `bool`

Default value: true

`AIRCR_NS.DIT_reset`

If true and AIRCR_NS.DIT_writable==0, set the bit after reset (as if by IMP_DEF mechanism).

Type: `bool`

Default value: true

`AIRCR_NS.DIT_writable`

Is AIRCR_NS.DIT bit[4] writeable.

Type: `bool`

Default value: true

`AIRCR_S.DIT_reset`

If true and AIRCR_S.DIT_writable==0, set the bit after reset (as if by IMP_DEF mechanism).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`AIRCR_S.DIT_writable`

Is AIRCR_S.DIT bit[4] writeable.

Type: `bool`

Default value: true

`BB_PRESENT`

Enable bitbanding.

Type: `bool`

Default value: false

`BEATS_PER_TICK`

Number of beats from each in-flight vector instruction executed in 1 tick (1,2 or 4).

Type: `uint8_t`

Default value: 2

`BF_is_nop`

BF instruction executes as **NOP**, even if we have LO_BRANCH_INFO.

Type: `bool`

Default value: true

`CCR.BP`

Reset value of the Configuration and Control Register's branch prediction enable bit.

Type: `bool`

Default value: true

`CCR.BP_writable`

Whether it is possible to modify the Configuration and Control Register's branch prediction enable bit.

Type: `bool`

Default value: false

`CDEMAPPEDONCP`

Bit N specifies whether the instruction for coprocessor N (CP7:CP0) is redirected to the CDE module.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 255

CDERTLID

Value of ID_AFR0.CDERTLID.

Type: `uint8_t`

Default value: 32

CFGMEMALIAS

Memory address alias bit for the ITCM, DTCM and P-AHB regions. 0=No alias, 1=Alias bit 24, 2=Alias bit 25, 4=Alias bit 26, 8=Alias bit 27, 16=Alias bit 28.

Type: `uint8_t`

Default value: 0

CFGNOCDECP

Bit N means external coprocessor N (CP7:CP0) disable for CDE coprocessor.

Type: `uint8_t`

Default value: 0

CFGPAHBSZ

Size of the P-AHB peripheral port memory region. 0=P-AHB disabled, 1=64MB, 2=128MB, 3=256MB, 4=512MB.

Type: `uint8_t`

Default value: 0

CPNSPRESENT

Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state.

Type: `uint8_t`

Default value: 255

CPSPRESENT

Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state.

Type: `uint8_t`

Default value: 255

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

CPUID
Set SCS CPUID Base Register. If set to zero, a default CPUID is used.

Type: `uint32_t`

Default value: `0x0`

CTI
CTI (Cross Trigger Interface) included.

Type: `bool`

Default value: false

CTI_irq0_pin
CTI interrupt request 0 pin.

Type: `uint16_t`

Default value: 4

CTI_irq1_pin
CTI interrupt request 1 pin.

Type: `uint16_t`

Default value: 5

DTGU
DTCM Security Gate Unit included.

Type: `bool`

Default value: false

DTGUBLKSZ
DTCM gate unit block size. Size=pow(2, DTGUBLKSZ + 5) bytes.

Type: `uint8_t`

Default value: 3

DTGUMAXBLKS
Maximum number of DTCM gate unit blocks. Number of blocks=pow(2, DTGUMAXBLKS).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

DWT_CTRL.NOCYCCNT

DWT cycle-counter not present (v8M_bl/v6M never have one).

Type: `bool`

Default value: false

DWT_CTRL.NOPRFCNT

DWT performance-counters not present (v8M_bl/v6M never have them).

Type: `bool`

Default value: false

DWT_CTRL.NUMCOMP

Number of watchpoint unit comparators implemented.

Type: `uint8_t`

Default value: 4

DWT_DEVARCH.REVISION

0: V2, 1: V2.1.

Type: `uint8_t`

Default value: 1

DWT_FUNCTION0.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION0. If ‘baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 11

DWT_FUNCTION1.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION1. If ‘baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 30

DWT_FUNCTION10.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION10. If ‘baseline' is set, invalid ID bits are cleared.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 11

`DWT_FUNCTION11.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION11. If 'baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 30

`DWT_FUNCTION12.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION12. If 'baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 11

`DWT_FUNCTION13.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION13. If 'baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 30

`DWT_FUNCTION14.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION14. If 'baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 11

`DWT_FUNCTION15.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION15. If 'baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 30

`DWT_FUNCTION2.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION2. If 'baseline' is set, invalid ID bits are cleared.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 11

`DWT_FUNCTION3.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION3. If ‘baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 30

`DWT_FUNCTION4.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION4. If ‘baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 11

`DWT_FUNCTION5.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION5. If ‘baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 30

`DWT_FUNCTION6.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION6. If ‘baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 11

`DWT_FUNCTION7.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION7. If ‘baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 30

`DWT_FUNCTION8.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION8. If ‘baseline' is set, invalid ID bits are cleared.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 11

`DWT_FUNCTION9.ID`

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION9. If 'baseline' is set, invalid ID bits are cleared.

Type: `uint8_t`

Default value: 30

`DWT_TRACE`

Support for DWT trace, controls the DWT_CTRL.NOTRCPKT bit. false : No DWT trace included, true: DWT trace included.

Type: `bool`

Default value: true

`DWT_VMASK_reset_data`

DWT_VMASK register reset value.

Type: `uint32_t`

Default value: `0x0`

`ERRDEVID.NUM`

RAS: Number of implemented error record indexes, 0 to 56.

Type: `uint8_t`

Default value: 56

`FPB_HAS_LSR`

FPB has LAR and LSR for software lock if mainline.

Type: `bool`

Default value: true

`FP_CTRL.NUM_CODE`

Number of breakpoint unit comparators implemented (limited to 15 in V6M or baseline).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`FP_CTRL.NUM_LIT`

How many Literals FPB supports remapping (ignored if baseline or TZM).

Type: `uint8_t`

Default value: 0

`FP_REMAP.RMPSPT`

FPB supports remapping (ignored if baseline or SECEXT).

Type: `bool`

Default value: true

`ID_DFR0.Debug_Model_M_profile`

Set whether debug extensions are implemented.

Type: `bool`

Default value: true

`ID_ISAR0.CmpBranch`

Support for Compare and Branch instructions. 1 = Supports CBNZ and CBZ instructions; 3 = Supports non-predicated low overhead looping (WLS, DLS, LE, and LC) and branch future (BF, BFX, BFL, BFLX, and BFCSEL) instructions.

Type: `uint8_t`

Default value: 3

`ID_ISAR0.coproc_instrs`

Supported Coprocessor instructions 0: None 1: CDP, LDC, MCR, MRC, and STC instructions 2: As for 1, and CDP2, LDC2, MCR2, MRC2, and STC2 instructions 3: As for 2, and MCRR and MRRC instructions 4: As for 2, and MCRR and MRRC instructions.

Type: `uint8_t`

Default value: 4

`ID_ISAR1.extend_instrs`

level of support for extend instructions.

Type: `uint8_t`

Default value: 2

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ID_ISAR1.interwork_instrs`
level of support for Interworking instructions.

Type: `uint8_t`

Default value: 2

`ID_ISAR2.MultiAccessInt`
level of support for interruptible multi-access instructions.

Type: `uint8_t`

Default value: 2

`ID_ISAR2.multS_instrs`
level of support for advanced signed Multiply instructions.

Type: `uint8_t`

Default value: 3

`ID_ISAR2.multU_instrs`
level of support for advanced unsigned Multiply instructions.

Type: `uint8_t`

Default value: 2

`ID_ISAR3.SIMD_instrs`
level of support for SIMD instructions.

Type: `uint8_t`

Default value: 3

`ID_ISAR3.saturate_instrs`
level of support for saturate instructions.

Type: `uint8_t`

Default value: 1

`ID_ISAR3.synchprim_instrs`
level of support for synchronization primitives ID_ISAR3.

Type: `uint8_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ID_ISAR4.synchPrim_instrs_frac`

level of support for synchronization primitives ID_ISAR4.

Type: `uint8_t`

Default value: 3

`ID_ISAR4.unpriv_instrs`

supported unprivileged instructions 0: None 1: LDRBT, LDRT, STRBT, and STRT instructions 2: As for 1, and LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

Type: `uint8_t`

Default value: 2

`ID_ISAR4.withshifts_instrs`

level of support for instructions with shifts.

Type: `uint8_t`

Default value: 3

`ID_ISAR5.PACBTI`

0: PAC/BTI not implemented, 1: PAC implemented using the QARMA5 algorithm with BTI, 2: PAC implemented using an IMP DEF algorithm with BTI, 4: PAC implemented using the QARMA3 algorithm with BTI.

Type: `uint8_t`

Default value: 0

`ID_MMFR0.Auxiliary_registers`

Auxiliary registers bits in ID_MMFR0, indicate the support for Auxiliary registers.

Type: `bool`

Default value: true

`ID_MMFR0.Outermost_shareability`

Outermost shareability bits in ID_MMFR0, indicate the outermost shareability domain implemented.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ID_MMFR0.ShareLvl`
Shareability levels bits in ID_MMFR0, indicate the number of Shareability levels implemented.

Type: `uint8_t`

Default value: 1

`INITPAHBEN`
The P-AHB enable state at reset.

Type: `bool`

Default value: false

`INITVTOR_NS`
Non-Secure vector-table offset at reset.

Type: `uint32_t`

Default value: `0x0`

`INITVTOR_S`
Secure vector-table offset at reset.

Type: `uint32_t`

Default value: `0x0`

`IOP`
Send all d-side transactions to the port, io_port_out. Transactions which do not match should be returned to the port, io_port_in.

Type: `bool`

Default value: false

`IRQDIS0`
IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0].

Type: `uint32_t`

Default value: `0x0`

`IRQDIS1`
IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32].

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

IRQDIS10

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320].

Type: `uint32_t`

Default value: `0x0`

IRQDIS11

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352].

Type: `uint32_t`

Default value: `0x0`

IRQDIS12

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384].

Type: `uint32_t`

Default value: `0x0`

IRQDIS13

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416].

Type: `uint32_t`

Default value: `0x0`

IRQDIS14

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448].

Type: `uint32_t`

Default value: `0x0`

IRQDIS15

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+480].

Type: `uint32_t`

Default value: `0x0`

IRQDIS2

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64].

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

IRQDIS3

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96].

Type: `uint32_t`

Default value: `0x0`

IRQDIS4

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128].

Type: `uint32_t`

Default value: `0x0`

IRQDIS5

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160].

Type: `uint32_t`

Default value: `0x0`

IRQDIS6

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192].

Type: `uint32_t`

Default value: `0x0`

IRQDIS7

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224].

Type: `uint32_t`

Default value: `0x0`

IRQDIS8

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256].

Type: `uint32_t`

Default value: `0x0`

IRQDIS9

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288].

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

`ITGU`

ITCM Security Gate Unit included.

Type: `bool`

Default value: false

`ITGUBLKSZ`

ITCM gate unit block size. Size=pow(2, ITGUBLKSZ + 5) bytes.

Type: `uint8_t`

Default value: 3

`ITGUMAXBLKS`

Maximum number of ITCM gate unit blocks. Number of blocks=pow(2, ITGUMAXBLKS).

Type: `uint8_t`

Default value: 0

`ITM`

Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included (unless baseline).

Type: `bool`

Default value: true

`ITM_HAS_LSR`

ITM support LAR and LSR for software lock.

Type: `bool`

Default value: true

`LOCKDTGU`

Lock down of Data TGU registers write.

Type: `bool`

Default value: false

`LOCKITGU`

Lock down of Instruction TGU registers write.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`LOCKTCM`
Lock down of TCM registers write.

Type: `bool`

Default value: false

`LOCK_NS_MPU`
Lock down of Non-Secure MPU registers write.

Type: `bool`

Default value: false

`LOCK_SAU`
Lock down of SAU registers write.

Type: `bool`

Default value: false

`LOCK_S_MPU`
Lock down of Secure MPU registers write.

Type: `bool`

Default value: false

`LVL_WIDTH`
Number of bits of interrupt priority (baseline has 2).

Type: `uint8_t`

Default value: 3

`MEMORY_REGION_MASK`
Read/Write Mask for MPU_RBAR, MPU_RLAR, SAU_RBAR, SAU_RLAR. Bits[4:0] of this parameter are ignored.

Type: `uint32_t`

Default value: `0xffffffff`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

MPU_TYPE_NS.DREGION

Number of regions in the Non-Secure MPU. If Security Extensions are absent, this is the total number of MPU regions.

Type: `uint16_t`

Default value: 16

MPU_TYPE_S.DREGION

Number of regions in the Secure MPU. If Security Extensions are absent, this is ignored.

Type: `uint16_t`

Default value: 16

MVE

Set whether the model has MVE support. If FPU = 0: 0=MVE not included, 1=Integer subset of MVE included. If FPU = 1: 0=MVE not included, 1=Integer subset of MVE included, 2=Integer and half and single precision floating point MVE included.

Type: `uint8_t`

Default value: 2

MVFR0.Double-precision

Support 8-byte floats.

Type: `bool`

Default value: true

MVFR1.FP16

FP extension implements half-precision floating-point operations. 0 = Not supported; 1 = Supported.

Type: `bool`

Default value: true

MVFR1.FPHP

FP extension implements half-precision floating-point conversion instructions. `0x1`: Half-precision to single-precision, `0x2`: As for `0x1` and also half-precision to double-precision.

Type: `uint8_t`

Default value: 2

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

MVFR1.MVE

DEPRECATED: Use parameter MVE instead.

Type: `uint8_t`

Default value: 2

NUM_IRQ

Number of user interrupts.

Type: `uint16_t`

Default value: 16

NVIC_ITNS0

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

NVIC_ITNS1

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

NVIC_ITNS10

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

NVIC_ITNS11

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`NVIC_ITNS12`

Each character fixes a security state target for a given external interrupt. ‘N' implies NS; ‘S' implies S; anything else is ignored. The largest bit is first, e.g. ‘S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

`NVIC_ITNS13`

Each character fixes a security state target for a given external interrupt. ‘N' implies NS; ‘S' implies S; anything else is ignored. The largest bit is first, e.g. ‘S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

`NVIC_ITNS14`

Each character fixes a security state target for a given external interrupt. ‘N' implies NS; ‘S' implies S; anything else is ignored. The largest bit is first, e.g. ‘S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

`NVIC_ITNS15`

Each character fixes a security state target for a given external interrupt. ‘N' implies NS; ‘S' implies S; anything else is ignored. The largest bit is first, e.g. ‘S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

`NVIC_ITNS2`

Each character fixes a security state target for a given external interrupt. ‘N' implies NS; ‘S' implies S; anything else is ignored. The largest bit is first, e.g. ‘S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

NVIC_ITNS3

Each character fixes a security state target for a given external interrupt. ‘N' implies NS; ‘S' implies S; anything else is ignored. The largest bit is first, e.g. ‘S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

NVIC_ITNS4

Each character fixes a security state target for a given external interrupt. ‘N' implies NS; ‘S' implies S; anything else is ignored. The largest bit is first, e.g. ‘S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

NVIC_ITNS5

Each character fixes a security state target for a given external interrupt. ‘N' implies NS; ‘S' implies S; anything else is ignored. The largest bit is first, e.g. ‘S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

NVIC_ITNS6

Each character fixes a security state target for a given external interrupt. ‘N' implies NS; ‘S' implies S; anything else is ignored. The largest bit is first, e.g. ‘S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

NVIC_ITNS7

Each character fixes a security state target for a given external interrupt. ‘N' implies NS; ‘S' implies S; anything else is ignored. The largest bit is first, e.g. ‘S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

NVIC_ITNS8

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

NVIC_ITNS9

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

Type: `string`

Default value: N/A

REGISTER_POP_ORDER

Order in which the registers are popped off the stack during exception return. A comma separated list of register names and ranges.

Type: `string`

Default value: "R4-R11,R0-R3,R12,R14,RETURN_ADDR,CPSR,S0-S15,FPSCR,PADDING,S16-S31"

REGISTER_PUSH_ORDER

Order in which the registers are pushed on to the stack during exception handling. A comma separated list of register names and ranges.

Type: `string`

Default value: "R0-R3,R12,R14,RETURN_ADDR,CPSR,S0-S15,FPSCR,PADDING,S16-S31"

SAU_CTRL.ALLNS

At reset, the SAU treats entire memory space as NS when the SAU is disabled if this is set.

Type: `bool`

Default value: false

SAU_CTRL.ENABLE

Enable SAU at reset.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

SAU_TYPE.SREGION
Number of SAU regions (0 => no SAU).

Type: `uint16_t`

Default value: 16

SECEXT
Whether the ARMv8-M Security Extensions are included.

Type: `bool`

Default value: true

SYST
Include SysTick timer functionality (0=Absent, 1=Secure only, 2=Secure and NS).

Type: `uint8_t`

Default value: 2

SYST_CALIB_NS_reset
SYST_CALIB_NS reset value.

Type: `uint32_t`

Default value: `0x0`

SYST_CALIB_reset
SYST_CALIB reset value.

Type: `uint32_t`

Default value: `0x0`

VTOR_NS
NonSecure Vector Table Offset Register is writeable.

Type: `bool`

Default value: true

VTOR_NS_MASK
Non-Secure VTOR write mask.

Type: `uint32_t`

Default value: `0xffffff80`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

VTOR_S

Secure Vector Table Offset Register is writeable.

Type: `bool`

Default value: true

VTOR_S_MASK

Secure VTOR write mask.

Type: `uint32_t`

Default value: `0xffffff80`

WIC

Include support for WIC-mode deep sleep.

Type: `bool`

Default value: true

abort_unaligned_nonNormal

If true, **UNPREDICTABLE** accesses of device and strongly ordered memory abort; if false they are allowed.

Type: `bool`

Default value: true

aircr_iesb_is_writable

IS the AIRCR.IESB bit [5] writable?.

Type: `bool`

Default value: true

aircr_iesb_reset

Set the AIRCR.IESB bit [5] after reset.

Type: `bool`

Default value: false

allow_dap_writes_while_core_running

Debug writes are respected even while the core is running, i.e. the core does not have to be halted.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

allow_debug_monitor_with_in_flight_inst

Allow handling Debug Monitor exception with in-flight instructions.

Type: `bool`

Default value: false

allow_stack_accesses_to_ppb_space

Allow stack accesses to PPB space.

Type: `bool`

Default value: false

always_undefinstr_over_nocp

Only v8.0M. Always fault with UNDEFINSTR for undefined instructions that fall in CP space (don't check coprocessor status).

Type: `bool`

Default value: false

apply_prigroup_to_pending_tree

DEPRECATED: please use sep_sec_state_then_apply_prigroup_to_pending. Original description: Apply AIRCR.PRIGROUP to the pending and active trees (instead of just the active tree) when selecting the highest priority pending exception.

Type: `bool`

Default value: false

baseline

Use the baseline profile (if false, use mainline).

Type: `bool`

Default value: true

bp_on_2nd_halfword

Respect DWT/BPU breakpoint-hit on 2nd halfword of 32-bit instruction.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

callee_register_push_low_to_high

If true, push callee registers in order from R4 to R11. If false, push R11 to R4.

Type: `bool`

Default value: true

cde_fp_check_on_unsupported

Run FP checks on both supported and unsupported CDE instructions.

Type: `bool`

Default value: false

cde_impl_name

Name of the CDE implementation for this core (implementation contributed by MTI plugin).

Type: `string`

Default value: N/A

clear_non_secure_EXC_RETURN.ES_on_tailchain

Clear EXC_RETURN.ES in LR value on entry to a tail-chained exception when returning from Non-secure state.

Type: `bool`

Default value: true

condition_flags_reset

Reset Value of condition flags in APSR.

Type: `uint8_t`

Default value: 0

cpi_div

divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

cpi_mul

multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x1`

`cpu_can_access_debug_regs`

The DWT, BPU, ROM table, DCB, and the SHCSR and DFSR registers access from the processor.

Type: `bool`

Default value: true

`dbg_coproc_load_store_enable`

Enable LDCX and STCX instructions.

Type: `uint8_t`

Default value: 0

`dcache-invalidate-ns-cleans-s`

Whether V8M DCI* in non-secure should clean-and-invalidate secure cache contents.

Type: `bool`

Default value: false

`dcache-size`

L1 D-cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

`dcache-state_modelled`

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

`delay_faultmask_update`

Delay FAULTMASK update to context sync.

Type: `bool`

Default value: false

`delay_sysreg_update`

Delay some system register updates (e.g. SHCSR) to context sync.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

do_exclusive_monitor_check_first

In exclusive stores, check local exclusive monitor before detecting other memory aborts.

Type: `bool`

Default value: false

drop_mem_fault

Whether to drop mem_fault in favour of subsequently generated NOCP/secure fault in PushStack.

Type: `bool`

Default value: false

dtcm_enable

Enable DTCM at reset.

Type: `bool`

Default value: false

dtcm_size

DTCM size in KB.

Type: `uint16_t`

Default value: `0x100`

dwt_unaligned_word_access_as_half_word

DWT Treat unaligned word access as half word or bytes.

Type: `bool`

Default value: true

enable_helium_extension

Enable Helium extension.

Type: `bool`

Default value: false

exercise_strex_fail

Reject a pseudo-random majority of exclusive store instructions.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`has_ahbp`
Are Vendor-Sys accesses sent to a separate bus (AHBP on CM7).

Type: `bool`

Default value: true

`has_arm_v8-1m`
Enable v8.1M architecture version and features.

Type: `bool`

Default value: false

`has_cde`
Enables Custom Datapath Extensions.

Type: `bool`

Default value: false

`has_core_dside_bus_gasket`
STL gasket enabled.

Type: `bool`

Default value: false

`has_lob_cache`
Support for LOB cache (only if support for LO instructions is enabled as well).

Type: `bool`

Default value: true

`has_m55_tcmcr`
If true, enables the CortexM55 TCM Control Registers (ITCMCR and DTCMCR), If false, CortexM55 TCM Control Registers are disabled.

Type: `bool`

Default value: false

`has_pmu`
Availability of optional PMU.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

has_separate_etm_reset

If true, signal ‘etmreset' resets the core, else the core power-on-reset does.

Type: `bool`

Default value: false

has_unpriviledged_debug

Unprivileged Debug Extension supported for Mainline Extension.

Type: `bool`

Default value: true

has_writebuffer

Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.

Type: `bool`

Default value: false

icache-size

L1 I-cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

icache-state_modelled

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

ignore_RNR_top_nibble

If set, only the bottom four bits of MPU_RNR.REGION are used.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ignore_demcr_sdme_for_nonhalting_bkpt`

Ignore the SDME bit of the DEMCR register when escalating a Debug Monitor exception to a HardFault.

Type: `bool`

Default value: false

`ignore_out_of_range_RNR_write`

If an MPU_RNR.REGION write is out of range, ignore it ; if false, MPU_RNR values wrap.

Type: `bool`

Default value: false

`ignore_unpred_SBZSBO`

Use smaller decoder does not UNDEF some unpredicable SBZ/SBO fields.

Type: `bool`

Default value: false

`ignore_unpred_ZeroRegistersInList`

VLDM,VSTM,STM,LDM with no registers **NOP** instead of UNDEF.

Type: `bool`

Default value: false

`itcm_enable`

Enable ITCM at reset.

Type: `bool`

Default value: false

`itcm_size`

ITCM size in KB.

Type: `uint16_t`

Default value: `0x100`

`late_arrival`

Enable late arrival support.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

manager_id

Manager ID presented in bus transactions.

Type: `uint64_t`

Default value: `0x0`

min_sync_level

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

mve_has_atomic_ticks

Enable atomic ticks behaviour for vector instructions flagged as such (e.g. VLDR).

Type: `bool`

Default value: false

num_pmu_counters

Number of available PMU counters.

Type: `uint8_t`

Default value: 31

number_of_itm_stimulus_ports

The number of ITM stimulus ports.

Type: `uint16_t`

Default value: 32

pend_overriden_exception_on_stack_push

Mark any overriden exceptions on stack push as pending (instead of dropping them).

Type: `bool`

Default value: false

preserve_unknown_caller_save_regs_at_S_to_S

preserve unknown caller registers when they become **UNKNOWN** at secure to secure.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

ras_ERRFR0

A JSON object or array of objects for each field of ERRFR. Records not described default to **RAZ** e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type: `string`

Default value: "'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'"

ras_ERRFR1

A JSON object or array of objects for each field of ERRFR. Records not described default to **RAZ** e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type: `string`

Default value: "'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'"

ras_ERRFR10

A JSON object or array of objects for each field of ERRFR. Records not described default to **RAZ** e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type: `string`

Default value: "'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'"

ras_cei_pin

RAS: Critical error interrupt pin.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: 2

ras_cei_support

RAS: Whether Critical Error Interrupt is supported.

Type: `bool`

Default value: true

ras_eri_pin

RAS: Error recovery interrupt pin.

Type: `uint16_t`

Default value: 1

ras_eri_support

RAS: Whether Error Recovery Interrupt is supported.

Type: `bool`

Default value: true

ras_error_record

56 bit value that specifies which nodes out of 0-55 are implemented (ERRDEVID is derived from this parameter).

Type: `uint64_t`

Default value: `0xffffffffffffff`

ras_fhi_pin

RAS: Fault handling interrupt pin.

Type: `uint16_t`

Default value: 0

ras_fhi_support

RAS: Whether Fault Handling Interrupt is supported.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`rd_ns_bus_err_behave`

External read aborts in nonsecure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

Type: `uint8_t`

Default value: 1

`rd_s_bus_err_behave`

External read aborts in secure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

Type: `uint8_t`

Default value: 1

`register_reset_data`

Data used to fill register bits when they become **UNKNOWN** at reset.

Type: `uint32_t`

Default value: `0x0`

`reported_patch_level`

Purely cosmetic patch level value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type: `int8_t`

Default value: -1

`reported_revision_number`

Purely cosmetic revision number value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type: `int8_t`

Default value: -1

`semihosting-Thumb_SVC`

T32 SVC number for semihosting.

Type: `uint8_t`

Default value: 171

`semihosting-cmd_line`

Command line available to semihosting SVC calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `string`

Default value: N/A

`semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`semihosting-enable`

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

Type: `bool`

Default value: true

`semihosting-heap_base`

Virtual address of heap base.

Type: `uint32_t`

Default value: `0x0`

`semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint32_t`

Default value: `0x20700000`

`semihosting-prefix`

Prefix semihosting output with target instance name.

Type: `bool`

Default value: false

`semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint32_t`

Default value: `0x20800000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint32_t`

Default value: `0x20700000`

`sep_sec_state_then_apply_prigroup_to_pending`

Use separate comparison trees for Secure and Non-Secure pending exceptions and apply AIRCR.PRIGROUP to the output of each before they are compared to determine the overall highest priority.

Type: `bool`

Default value: false

`sequential_security_transitions`

Allow transition of security state in sequential instruction fetches that cross from non-secure to secure memory with SG instruction 0: never, 1: always, 2: 32-bit instrs, 3: ISB.

Type: `uint8_t`

Default value: 1

`share_fault_address_reg`

If true, Fault Address Register is shared.

Type: `bool`

Default value: false

`stack_limit_check`

Implementation defined stack limit checks for instructions. Bit 0: Load-exclusive, Bit 1: Load-acquire, Bit 2: VLDM. Any instruction that can't be configured does stack limit check by default.

Type: `uint8_t`

Default value: 7

`stack_limit_check_optimization`

Stack limit check optimization (0: limit check done for each word on the stack, 1: limit check done only on stack pointer.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

stacking_writes_are_precise

Faults on stack writes are precise.

Type: `bool`

Default value: true

supports_unprivileged

Enable support for Unprivileged/Privileged Extension.

Type: `bool`

Default value: true

tail_chain

Enable tail-chaining optimisation.

Type: `bool`

Default value: true

trace_style

MVE instruction trace style: Add 16 for [**–] beat trace. Add 32 for tracing IMPLIED LOB instructions. Add 64 to change opcode of implied BF to `0xBF00`.

Type: `uint8_t`

Default value: 2

unknown_regs_at_exception_value

Data used to fill registers when they become **UNKNOWN** at exception and exception-return.

Type: `uint32_t`

Default value: `0x0`

unpred_WriteBackandBaseInList_stores_old_base_value

allow STM with write back to base register in register list.

Type: `bool`

Default value: false

unpred_mon_step_write

Behavior on unpredictable updates to MON_STEP bit of DEMCR. 0: ignore write, 1: set one, 2: set zero.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

`unpred_msr_psr_with_one_mask_and_nodsp_is_nop`

If true, MSR to *PSR with a one mask and no DSP does nothing.

Type: `bool`

Default value: true

`unpred_msr_psr_with_zero_mask_is_nop`

If true, MSR to *PSR with a zero mask does nothing.

Type: `bool`

Default value: false

`unstack_R_regs_before_fp_cp_check`

In exception return unstack normal register before checking fp coprocessor is enable to unstack FP register.

Type: `bool`

Default value: false

`vector_fetch_as_wpt_event`

Watchpoint on exception vector fetch.

Type: `bool`

Default value: false

`vector_fetch_busfault_sets_HFSR_FORCED`

Only v8.0M. Set HFSR.FORCED when a vector table read generates a HardFault.

Type: `bool`

Default value: false

`vector_fetch_on_iside`

Perform vector fetch on I-side.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

vfp-present

Set whether the model has VFP support.

Type: `bool`

Default value: true

wr_ns_bus_err_behave

External write aborts in nonsecure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

Type: `uint8_t`

Default value: 3

wr_s_bus_err_behave

External write aborts in secure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

Type: `uint8_t`

Default value: 3

write_unknown_regs_at_exception

Do we write registers when they become **UNKNOWN** at exception or exception-return.

Type: `bool`

Default value: false

3.31 ARMC1NanoCT

Defined in `LISA/ARMC1NanoCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Preliminary support

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

For an explanation of the quality levels, see Quality level definitions.

About ARMC1NanoCT

The following example platforms are available:

- FVP_Base_C1-Nano
- EVS_Dhrystone_C1-Nanox1
- SVP_Base_C1-Nanox1

The following functionality is supported in this release:

- C1-SME2 is supported with the following limitations:
  - The arbitration and assignment logic is not supported.
  - RAS error handling is supported in the first CME only.
  - The C1-SME2 auxiliary AMU counters are not supported.
  - It is assumed that C1-SME2 units are operating in dynamic mode, with a minimum power mode of OFF. Accompanying PPU registers may be read or written to, but they do not determine the behavior of the CME. The PPU interrupt signal for the C1-SME2 is also not modeled or exposed at this time.
- Pilatus DSU support for C1-SME2.
- L2Cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2Cache yet.
- BROADCASTPERSIST pin is implemented.
- Optional peripheral port is supported.
- L3Cache partition is supported.
- Per-core clock is supported.

Limitations

The following features are not yet supported, and will be added in a future release:

- No support for transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols yet.
- No support for Core-Complex yet.
- BROADCASTCACHEMAINTPOU pin is not implemented.
- COREINSTRRET signals are not implemented.
- MEM_RET power mode is not supported.

The following features are not implemented:

- DynamIQ features that are negligible to the programmers' view simulation will not be implemented in the Fast Model.
- 256-bit wide output transactions will not be supported.
- Error correction/detection features will not be supported.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- Self-test features (MBIST) will not be supported.
- Latency configuration will not be supported.
- Snoop filtering will not be supported.
- Cache stashing capability will not be supported.

Iris and MTI instances for ARMC1NanoCT

This model has the following Iris instances:

Name	Instance type
`ARMC1NanoCT`	Cluster_ARM_C1-Nano
`ARMC1NanoCT.AMU`	PVBusLogger
`ARMC1NanoCT.AMU.mapper`	PVBusMapper
`ARMC1NanoCT.DAP`	PVBusLogger
`ARMC1NanoCT.DAP.mapper`	PVBusMapper
`ARMC1NanoCT.DSU`	C1-DSU
`ARMC1NanoCT.DSU.PPU_cluster`	PPUv1
`ARMC1NanoCT.DSU.PPU_cluster.busslave`	PVBusSlave
`ARMC1NanoCT.DSU.PPU_core0`	PPUv1
`ARMC1NanoCT.DSU.PPU_core0.busslave`	PVBusSlave
`ARMC1NanoCT.DSU.l3_flusher`	AsyncCacheFlushUnit
`ARMC1NanoCT.DSU.mpam_busslave`	PVBusSlave
`ARMC1NanoCT.DSU.shared_cache`	PVCache
`ARMC1NanoCT.DSU.shared_cache.upstream[Y]` (where *Y* = 0–4)	PVBusSlave
`ARMC1NanoCT.DSU.utility_slave[0]`	PVBusSlave
`ARMC1NanoCT.MMAP`	PVBusLogger
`ARMC1NanoCT.MMAP.mapper`	PVBusMapper
`ARMC1NanoCT.RAS`	PVBusLogger
`ARMC1NanoCT.RAS.mapper`	PVBusMapper
`ARMC1NanoCT.cpu0`	ARM_C1-Nano
`ARMC1NanoCT.cpu0.UTLB`	TLB
`ARMC1NanoCT.cpu0.debug_rom`	debug_rom
`ARMC1NanoCT.cpu0.dtlb`	TLB
`ARMC1NanoCT.cpu0.l1dcache`	PVCache
`ARMC1NanoCT.cpu0.l1dcache.upstream[0]`	PVBusSlave
`ARMC1NanoCT.cpu0.l1icache`	PVCache
`ARMC1NanoCT.cpu0.l1icache.upstream[0]`	PVBusSlave
`ARMC1NanoCT.cpu0.l2cache`	PVCache
`ARMC1NanoCT.cpu0.l2cache.upstream[U]` (where *U* = 0–1)	PVBusSlave
`ARMC1NanoCT.ext_bus`	PVBusLogger
`ARMC1NanoCT.ext_bus.mapper`	PVBusMapper
`ARMC1NanoCT.gic_cpuif_decoder_cluster`	GICv3CPUInterfaceDecoder

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
ARMC1NanoCT.global_debug_rom	debug_rom
ARMC1NanoCT.secondary_debug_rom	debug_rom
ARMC1NanoCT.sve	ScalableVectorExtension

This model has the following MTI trace components:

Name	Component type
ARMC1NanoCT.AMU	PVBusLogger
ARMC1NanoCT.AMU.mapper	PVBusMapper
ARMC1NanoCT.DAP	PVBusLogger
ARMC1NanoCT.DAP.mapper	PVBusMapper
ARMC1NanoCT.DSU	C1-DSU
ARMC1NanoCT.DSU.PPU_cluster	PPUv1
ARMC1NanoCT.DSU.PPU_cluster.busslave	PVBusSlave
ARMC1NanoCT.DSU.PPU_core0	PPUv1
ARMC1NanoCT.DSU.PPU_core0.busslave	PVBusSlave
ARMC1NanoCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1NanoCT.DSU.mpam_busslave	PVBusSlave
ARMC1NanoCT.DSU.shared_cache	PVCache
ARMC1NanoCT.DSU.shared_cache.upstream[Y] (where *Y* = 0–4)	PVBusSlave
ARMC1NanoCT.DSU.utility_slave[0]	PVBusSlave
ARMC1NanoCT.MMAP	PVBusLogger
ARMC1NanoCT.MMAP.mapper	PVBusMapper
ARMC1NanoCT.RAS	PVBusLogger
ARMC1NanoCT.RAS.mapper	PVBusMapper
ARMC1NanoCT.cpu0	ARM_C1-Nano
ARMC1NanoCT.cpu0.UTLB	TLB
ARMC1NanoCT.cpu0.l1dcache	PVCache
ARMC1NanoCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMC1NanoCT.cpu0.l1icache	PVCache
ARMC1NanoCT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMC1NanoCT.cpu0.l2cache	PVCache
ARMC1NanoCT.cpu0.l2cache.upstream[U] (where *U* = 0–1)	PVBusSlave
ARMC1NanoCT.ext_bus	PVBusLogger
ARMC1NanoCT.ext_bus.mapper	PVBusMapper
ARMC1NanoCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

Ports for ARMC1NanoCT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clustercriticalirq	master	Signal	Cluster Critical Irq
clustererrirq	master	Signal	Cluster Error Irq
clusterfaultirq	master	Signal	Cluster Fault Irq
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
cme_pcsm_pchannel	master	PChannel	Cluster PCSM signal

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
cmeerrirq	master	Signal	RAS cme err irq
cmefaultirq	master	Signal	RAS cme fault irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
complexerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
complexfaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsm_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	slave	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_cme_irq	master	Signal	PPU CME interrupt
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus subordinate
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMC1NanoCT

`cpuX.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`cpuX.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`cpuX.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`cpuX.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`cpuX.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`cpuX.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`cpuX.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`cpuX.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`cpuX.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`cpuX.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`cpuX.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`cpuX.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`cpuX.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`cpuX.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`cpuX.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`cpuX.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`AEND0_DEFAULT`

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND1_DEFAULT`

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND2_DEFAULT`

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND3_DEFAULT`

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

`ASTART0_DEFAULT`

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: `0x0`

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: `bool`

Default value: false

DSU.cme.CMECFR

Value of CMECFR_EL1 fields (ECC, CHI) for all CMEs.

Type: `string`

Default value: “{"ECC": 0, "CHI": 0}”

DSU.cme.mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

DSU.cme.power_on_by_default

If true, CME PPUs will initialize in Dynamic mode out of reset, enabling the CME to power itself on/off automatically as it is used.

Type: `bool`

Default value: true

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

NUM_CMES

Defines how many CMEs are associated with each cluster. This parameter must be in sync with SVE.ScalableVectorExtension SME configuration.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

NUM_CORES

Number of cores per cluster.

Type: `uint8_t`

Default value: 1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

core_cache_protection

core_cache_protection can change ERR0FR, ERR0PFGF and ERR0PFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: 1

core_complex_mapping

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" :{"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type: `string`

Default value: “{"complex0": { "cores": [0, 1], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex1": { "cores": [2, 3], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex2": { "cores": [4, 5], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex5": { "cores": [10, 11], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex6": { "cores": [12, 13], "l2-cache" :{"exists":1, "size":"16MB"}} }”

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-state_modelled

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-write_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`enable_simulation_performance_optimizations`

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

`ete.CLAIMTAGS`

Number of claim tags.

Type: `uint8_t`

Default value: 4

`ete.MAX_INST_PER_Q`

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

`ete.PIDR_CMOD`

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ete.PIDR_REVAND

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

ete.PIDR_REVISION

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

ete.Q_CADENCE

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

ete.RES0_STATEFUL

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

ete.RETSTACK

Return stack depth.

Type: `uint8_t`

Default value: 3

ete.REVISION

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

ete.SOURCE_ADDRESS

Allow generation of source address elements.

Type: `bool`

Default value: false

ete.TRACE_OUTPUT

File to which to write trace byte stream.

Type: `string`

Default value: N/A

ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

has_actlr2

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

Type: `bool`

Default value: true

has_dot_product

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`icache-maintenance_latency`

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`icache-miss_latency`

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`icache-prefetch_enabled`

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

`icache-read_access_latency`

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`icache-read_latency`

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`icache-size`

L1 I-Cache size in bytes.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x8000`

icache-state_modelled

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

l3cache-has_mpam

L3 Cache has MPAM support.

Type: `bool`

Default value: true

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

l3cache-mpamf.max_partid_ns

Maximum value of non-secure PARTID supported for DSU L3Cache. Options are 7 or 63.

Type: `uint8_t`

Default value: 63

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-read_bus_width_in_bytes

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-size

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 16

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-write_bus_width_in_bytes

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`memory_tagging_support_level`

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

`mpmm_accumulator_multiplier`

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

`num_nodes`

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

`pmu-num_counters`

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

`ptw_latency`

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`ras_pfg_clock_mhz`

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`scu_cache_protection`

SCU-L3 is configured with ECC if true.

Type: `bool`

Default value: true

`tlb_latency`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`tlbi_stall_enabled`

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

`treat_PAC_as_NOP`

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

`walk_cache_latency`

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

3.32 ARMC1NanoCT_C1ProCT

Defined in `LISA/ARMC1NanoCT_C1ProCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Revision	Quality level
C1Nano r0p0	Preliminary support
C1Pro r0p0	Preliminary support

For an explanation of the quality levels, see Quality level definitions.

About ARMC1NanoCT_C1ProCT

The number of cores in each subcluster is configurable using the following parameters:

`subcluster0.NUM_CORES`
: Possible values are 1-13 (ARMC1NanoCT).

`subcluster1.NUM_CORES`
: Possible values are 1-13 (ARMC1ProCT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>`[0-12] for cores in `subcluster0`.
- `<port_name>`[13-25] for cores in `subcluster1`.

Note

All instances in the Master cross trigger matrix port array, `cti[26]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu12` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu12` identify cores in `subcluster1`.

For information about the cores in this model, see:

- ARMC1NanoCT.
- ARMC1ProCT.

Iris and MTI instances for ARMC1NanoCT_C1ProCT

This model has the following Iris instances:

Name	Instance type
`ARMC1NanoCT_C1ProCT`	Cluster_ARM_C1-Nano_C1-PRO_Heterogeneous
`ARMC1NanoCT_C1ProCT.AMU`	PVBusLogger
`ARMC1NanoCT_C1ProCT.AMU.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT.DAP`	PVBusLogger
`ARMC1NanoCT_C1ProCT.DAP.mapper`	PVBusMapper

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
`ARMC1NanoCT_C1ProCT.DSU`	C1-DSU
`ARMC1NanoCT_C1ProCT.DSU.PPU_cluster`	PPUv1
`ARMC1NanoCT_C1ProCT.DSU.PPU_cluster.busslave`	PVBusSlave
`ARMC1NanoCT_C1ProCT.DSU.PPU_coreZ` (where *Z* = 0–1)	PPUv1
`ARMC1NanoCT_C1ProCT.DSU.PPU_coreZ.busslave` (where *Z* = 0–1)	PVBusSlave
`ARMC1NanoCT_C1ProCT.DSU.l3_flusher`	AsyncCacheFlushUnit
`ARMC1NanoCT_C1ProCT.DSU.mpam_busslave`	PVBusSlave
`ARMC1NanoCT_C1ProCT.DSU.shared_cache`	PVCache
`ARMC1NanoCT_C1ProCT.DSU.shared_cache.upstream[Z]` (where *Z* = 0–6)	PVBusSlave
`ARMC1NanoCT_C1ProCT.DSU.utility_slave[0]`	PVBusSlave
`ARMC1NanoCT_C1ProCT.MMAP`	PVBusLogger
`ARMC1NanoCT_C1ProCT.MMAP.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT.RAS`	PVBusLogger
`ARMC1NanoCT_C1ProCT.RAS.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT.cpuZ.debug_rom` (where *Z* = 0–1)	debug_rom
`ARMC1NanoCT_C1ProCT.ext_bus`	PVBusLogger
`ARMC1NanoCT_C1ProCT.ext_bus.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT.gic_cpuif_decoder_cluster`	GICv3CPUInterfaceDecoder
`ARMC1NanoCT_C1ProCT.global_debug_rom`	debug_rom
`ARMC1NanoCT_C1ProCT.secondary_debug_rom`	debug_rom
`ARMC1NanoCT_C1ProCT.subcluster0`	Subcluster_ARM_C1-Nano
`ARMC1NanoCT_C1ProCT.subcluster0.cpu0`	ARM_C1-Nano
`ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.UTLB` (where *Z* = 0–1)	TLB
`ARMC1NanoCT_C1ProCT.subclusterZ.cpuU.dtlb` (where *Z* = 0–1; *U* = 0–1)	TLB
`ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l1dcache` (where *Z* = 0–1)	PVCache
`ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l1dcache.upstream[0]` (where *Z* = 0–1)	PVBusSlave
`ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l1icache` (where *Z* = 0–1)	PVCache
`ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l1icache.upstream[0]` (where *Z* = 0–1)	PVBusSlave
`ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l2cache` (where *Z* = 0–1)	PVCache
`ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l2cache.upstream[W]` (where *Z* = 0–1; *W* = 0–1)	PVBusSlave
`ARMC1NanoCT_C1ProCT.subclusterZ.sve` (where *Z* = 0–1)	ScalableVectorExtension
`ARMC1NanoCT_C1ProCT.subcluster1`	Subcluster_ARM_C1-Pro
`ARMC1NanoCT_C1ProCT.subcluster1.cpu0`	ARM_C1-Pro

This model has the following MTI trace components:

Name	Component type
`ARMC1NanoCT_C1ProCT.AMU`	PVBusLogger
`ARMC1NanoCT_C1ProCT.AMU.mapper`	PVBusMapper

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Component type
ARMC1NanoCT_C1ProCT.DAP	PVBusLogger
ARMC1NanoCT_C1ProCT.DAP.mapper	PVBusMapper
ARMC1NanoCT_C1ProCT.DSU	C1-DSU
ARMC1NanoCT_C1ProCT.DSU.PPU_cluster	PPUv1
ARMC1NanoCT_C1ProCT.DSU.PPU_cluster.busslave	PVBusSlave
ARMC1NanoCT_C1ProCT.DSU.PPU_coreZ (where *Z* = 0–1)	PPUv1
ARMC1NanoCT_C1ProCT.DSU.PPU_coreZ.busslave (where *Z* = 0–1)	PVBusSlave
ARMC1NanoCT_C1ProCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1NanoCT_C1ProCT.DSU.mpam_busslave	PVBusSlave
ARMC1NanoCT_C1ProCT.DSU.shared_cache	PVCache
ARMC1NanoCT_C1ProCT.DSU.shared_cache.upstream[Z] (where *Z* = 0–6)	PVBusSlave
ARMC1NanoCT_C1ProCT.DSU.utility_slave[0]	PVBusSlave
ARMC1NanoCT_C1ProCT.MMAP	PVBusLogger
ARMC1NanoCT_C1ProCT.MMAP.mapper	PVBusMapper
ARMC1NanoCT_C1ProCT.RAS	PVBusLogger
ARMC1NanoCT_C1ProCT.RAS.mapper	PVBusMapper
ARMC1NanoCT_C1ProCT.ext_bus	PVBusLogger
ARMC1NanoCT_C1ProCT.ext_bus.mapper	PVBusMapper
ARMC1NanoCT_C1ProCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMC1NanoCT_C1ProCT.subcluster0.cpu0	ARM_C1-Nano
ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.UTLB (where *Z* = 0–1)	TLB
ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l1dcache (where *Z* = 0–1)	PVCache
ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l1dcache.upstream[0] (where *Z* = 0–1)	PVBusSlave
ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l1icache (where *Z* = 0–1)	PVCache
ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l1icache.upstream[0] (where *Z* = 0–1)	PVBusSlave
ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l2cache (where *Z* = 0–1)	PVCache
ARMC1NanoCT_C1ProCT.subclusterZ.cpu0.l2cache.upstream[W] (where *Z* = 0–1; *W* = 0–1)	PVBusSlave
ARMC1NanoCT_C1ProCT.subcluster1.cpu0	ARM_C1-Pro

Ports for ARMC1NanoCT_C1ProCT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
cme_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cmeerrirq	master	Signal	RAS cme err irq
cmefaultirq	master	Signal	RAS cme fault irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`core_clk_in`	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
`core_pcsm_pchannel`	master	PChannel	Core PCSM signals
`core_powerdown_out`	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
`core_ppu_hw_stat`	master	Value	Notify the power state change inside the PPU.
`coreerrirq`	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
`corefaultirq`	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
`coreinstrrun`	slave	Signal	Core Running State
`cryptodisable`	slave	Signal	Disable cryptography extensions after reset.
`cti`	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
`ctidbgirq`	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
`dbgen`	slave	Signal	External debug interface.
`dbgnopwrdwn`	master	Signal	No power-down request.
`dbgpwrupreq`	master	Signal	Debug power up request.
`defaultMP`	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
`dev_debug_s`	slave	PVBus	External debug interface.
`event`	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
`fiq`	slave	Signal	This signal drives the CPUs fast-interrupt handling.
`gicreset`	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
`gicv3_redistributor_s`	slave	GICv3Comms	GICv3 AXI-stream port.
`irq`	slave	Signal	This signal drives the CPUs interrupt handling.
`memorymapped_debug_s`	slave	PVBus	External debug interface.
`pmbirq`	master	Signal	Interrupt signal from the statistical profiling unit.
`pmuirq`	master	Signal	Interrupt signal from performance monitoring unit.
`ppu_cluster_irq`	master	Signal	PPU cluster interrupt.
`ppu_cluster_isolate`	master	Signal	PPU Cluster Domain isolation control.
`ppu_cluster_wakerequest`	slave	Signal	PPU cluster wake request signal.
`ppu_cme_irq`	master	Signal	PPU CME interrupt
`ppu_core_irq`	master	Signal	PPU core interrupt.
`ppu_core_isolate`	master	Signal	PPU Core Domain isolation control.
`ppu_core_wakerequest`	slave	Signal	PPU core wake request signal.
`presetdbg`	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
`pvbus_m0`	master	PVBus	The core will generate bus requests on this port.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`pvbus_periph_m`	master	PVBus	The core can generate peripheral bus request on this port.
`rei`	slave	Signal	Per core RAM Error Interrupt.
`reset`	slave	Signal	Reset signal to cluster.
`rvbaraddr`	slave	Value_64	Reset vector base address.
`sci_m`	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
`sei`	slave	Signal	Per core System Error physical pins.
`spiden`	slave	Signal	External debug interface.
`ticks`	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
`trbirq`	master	Signal	Interrupt signal from the trace buffer unit.
`utility_bus_s`	slave	PVBus	Utility bus subordinate
`vcpumntirq`	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
`vfiq`	slave	Signal	Virtualised FIQ.
`virq`	slave	Signal	Virtualised IRQ.
`virtio_s`	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
`vsei`	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMC1NanoCT_C1ProCT

`AEND0_DEFAULT`

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND1_DEFAULT`

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND2_DEFAULT`

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

`DBGROMADDR`

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: `0x0`

`DBGROMADDRV`

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: `bool`

Default value: false

`GICDISABLE`

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

`NUM_CMES`

Defines how many CMEs are associated with each cluster. This parameter must be in sync with SVE.ScalableVectorExtension SME configuration.

Type: `uint8_t`

Default value: 0

`bus_type`

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

`core_complex_mapping`

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" :{"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: “{"complex0": { "cores": [0, 1], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex1": { "cores": [2, 3], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex2": { "cores": [4, 5], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex5": { "cores": [10, 11], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex6": { "cores": [12, 13], "l2-cache" :{"exists":1, "size":"16MB"}} }”

`core_power_on_by_default`

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

`dcache-state_modelled`

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

`enable_simulation_performance_optimizations`

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

`has_peripheral_port`

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

`icache-state_modelled`

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

`l3cache-has_mpam`

L3 Cache has MPAM support.

Type: `bool`

Default value: true

`l3cache-hit_latency`

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-maintenance_latency`

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-miss_latency`

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-mpamf.max_partid_ns`

Maximum value of non-secure PARTID supported for DSU L3Cache. Options are 7 or 63.

Type: `uint8_t`

Default value: 63

`l3cache-read_access_latency`

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`l3cache-read_bus_width_in_bytes`

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

`l3cache-read_latency`

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-size`

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

`l3cache-snoop_data_transfer_latency`

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-snoop_issue_latency`

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-ways`

L3 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 16

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-write_bus_width_in_bytes

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

num_nodes

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

scu_cache_protection

SCU-L3 is configured with ECC if true.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

subcluster0.CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

subcluster0.core_cache_protection

core_cache_protection can change ERR0FR, ERR0PFGF and ERR0PFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: 1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster0.cpu0.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu0.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu0.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu0.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu0.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu0.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu0.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu0.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu0.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu0.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu0.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu0.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu0.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu0.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu0.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu0.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu0.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu0.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu0.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu0.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu0.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu0.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu0.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`subcluster0.cpu0.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster0.cpu1.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster0.cpu1.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster0.cpu1.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu1.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster0.cpu1.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu1.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x80000`

subcluster0.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu1.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu1.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu1.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu1.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu1.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 171

`subcluster0.cpu1.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu1.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu1.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu1.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu1.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu1.semihosting-stack_base`
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu1.semihosting-stack_limit`
Virtual address of stack limit.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu1.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu1.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu10.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu10.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu10.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu10.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x10`

subcluster0.cpu10.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu10.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu10.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu10.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu10.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu10.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu10.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu10.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu10.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu10.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu10.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu10.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu10.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu10.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu10.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu10.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu10.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu10.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu10.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu11.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu11.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu11.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu11.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu11.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu11.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu11.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu11.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu11.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu11.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

`subcluster0.cpu11.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster0.cpu11.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu11.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu11.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu11.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu11.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu11.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu11.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu11.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu11.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu11.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu11.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu11.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu11.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu11.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu12.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu12.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu12.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu12.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu12.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Default value: `0x0`

subcluster0.cpu12.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu12.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu12.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu12.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu12.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu12.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu12.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu12.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu12.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster0.cpu12.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu12.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu12.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu12.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu12.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu12.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu12.semihosting-stack_base`

Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu12.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu12.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu12.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu12.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu2.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.cpu2.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu2.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu2.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu2.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu2.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu2.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu2.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu2.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu2.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu2.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu2.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu2.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu2.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu2.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu2.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu2.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu2.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu2.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu2.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu2.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu2.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu2.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu3.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu3.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu3.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu3.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu3.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu3.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu3.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu3.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu3.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu3.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

`subcluster0.cpu3.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster0.cpu3.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu3.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu3.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu3.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu3.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu3.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu3.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu3.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu3.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu3.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu3.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu3.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu3.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu4.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu4.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu4.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu4.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu4.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu4.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu4.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu4.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu4.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu4.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu4.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu4.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu4.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu4.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster0.cpu4.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu4.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu4.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu4.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu4.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu4.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu4.semihosting-stack_base`

Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu4.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu4.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu4.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu4.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu5.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu5.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.cpu5.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu5.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Non-Confidential

Default value: `0x0`

subcluster0.cpu5.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu5.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu5.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu5.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu5.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu5.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu5.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu5.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu5.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu5.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu5.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu5.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu5.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu5.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu5.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu5.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu5.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu5.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu5.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu5.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu6.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu6.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu6.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu6.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu6.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu6.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu6.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu6.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu6.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu6.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster0.cpu6.min_sync_level
Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu6.semihosting-A32_HLT
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu6.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu6.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu6.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu6.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu6.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu6.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu6.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu6.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu6.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu6.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster0.cpu6.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster0.cpu7.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster0.cpu7.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster0.cpu7.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu7.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu7.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu7.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu7.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu7.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu7.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu7.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu7.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

subcluster0.cpu7.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu7.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu7.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu7.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu7.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu7.semihosting-stack_base

Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu7.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu7.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu7.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu8.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu8.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.cpu8.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu8.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu8.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu8.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu8.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu8.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu8.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu8.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu8.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu8.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu8.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu8.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu8.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu8.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu8.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu8.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu8.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu8.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu8.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu8.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu8.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu8.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu9.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu9.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu9.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu9.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu9.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu9.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu9.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu9.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu9.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu9.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

`subcluster0.cpu9.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster0.cpu9.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu9.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu9.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu9.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu9.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu9.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster0.cpu9.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu9.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu9.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu9.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu9.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu9.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu9.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu9.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

subcluster0.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

subcluster0.ete.PIDR_CMOD

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.PIDR_REVAND

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.PIDR_REVISION

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0x1`

subcluster0.ete.RES0_STATEFUL

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

subcluster0.ete.RETSTACK

Return stack depth.

Type: `uint8_t`

Default value: 3

subcluster0.ete.REVISION

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

subcluster0.ete.SOURCE_ADDRESS

Allow generation of source address elements.

Type: `bool`

Default value: false

subcluster0.ete.TRACE_OUTPUT

File to which to write trace byte stream.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `string`

Default value: N/A

subcluster0.ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

subcluster0.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

subcluster0.has_actlr2

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

Type: `bool`

Default value: true

subcluster0.has_dot_product

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 2

subcluster0.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

subcluster0.invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

subcluster0.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

subcluster0.pmu-num_counters

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.ptw_latency`

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.ras_pfg_clock_mhz`

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

`subcluster0.tlb_latency`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.tlbi_stall_enabled`

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

`subcluster0.treat_PAC_as_NOP`

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

`subcluster0.walk_cache_latency`

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

subcluster1.core_cache_protection

core_cache_protection can change ERR0FR, ERR0PFGF and ERR0PFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: 1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster1.cpu0.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu0.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`subcluster1.cpu0.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster1.cpu0.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster1.cpu0.force-fpsid`

Override the FPSID value.

Type: `bool`

Default value: true

`subcluster1.cpu0.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu0.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu0.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu0.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu0.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu0.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu0.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu0.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu0.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu0.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu0.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu0.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu0.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu0.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu0.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu0.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu0.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu0.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu1.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu1.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu1.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu1.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu1.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu1.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu1.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu1.semihosting-A32_HLT
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu1.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu1.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu1.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu1.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu1.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu1.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu1.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu1.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu1.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu1.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu1.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`subcluster1.cpu1.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster1.cpu10.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster1.cpu10.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`subcluster1.cpu10.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster1.cpu10.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu10.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu10.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

`subcluster1.cpu10.l2cache-size`

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

`subcluster1.cpu10.l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu10.l2cache-snoop_issue_latency`

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu10.l2cache-write_access_latency`

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu10.l2cache-write_latency`

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu10.max_code_cache_mb`

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster1.cpu10.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu10.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu10.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu10.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu10.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu10.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu10.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster1.cpu10.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu10.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu10.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu10.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu10.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu10.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu10.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu10.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu11.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu11.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu11.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu11.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu11.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu11.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu11.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu11.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu11.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.cpu11.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu11.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu11.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu11.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu11.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu11.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu11.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 171

subcluster1.cpu11.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu11.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu11.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu11.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu11.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu11.semihosting-stack_limit

Virtual address of stack limit.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu11.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu11.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu11.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu12.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu12.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu12.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster1.cpu12.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu12.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu12.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu12.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu12.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu12.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu12.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu12.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu12.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu12.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu12.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu12.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu12.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu12.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu12.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu12.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu12.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu12.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu12.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu12.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu2.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu2.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu2.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu2.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu2.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu2.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu2.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu2.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu2.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu2.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu2.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu2.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu2.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu2.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu2.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu2.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu2.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu2.semihosting-stack_base
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu2.semihosting-stack_limit
Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu2.trace_special_hlt_imm16
For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu2.vfp-enable_at_reset
Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu2.vfp-present
Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

`subcluster1.cpu3.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster1.cpu3.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`subcluster1.cpu3.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster1.cpu3.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu3.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster1.cpu3.force-fpsid`

Override the FPSID value.

Type: `bool`

Default value: true

Non-Confidential

subcluster1.cpu3.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100000`

subcluster1.cpu3.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu3.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster1.cpu3.semihosting-A32_HLT`
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu3.semihosting-A64_HLT`
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu3.semihosting-ARM_SVC`
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu3.semihosting-T32_HLT`
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu3.semihosting-Thumb_SVC`
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu3.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu3.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster1.cpu3.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu3.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu3.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu3.semihosting-stack_base`
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu3.semihosting-stack_limit`
Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu3.trace_special_hlt_imm16`
For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu3.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu3.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu4.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu4.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu4.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu4.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster1.cpu4.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu4.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-read_latency

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu4.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpu4.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu4.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu4.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu4.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu4.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu4.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu4.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster1.cpu4.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu4.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu4.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu4.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu4.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu4.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Non-Confidential

Default value: `0xf000000`

subcluster1.cpu4.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu4.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu4.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu5.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu5.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu5.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu5.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu5.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu5.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu5.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu5.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu5.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu5.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu5.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu5.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu5.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu5.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu5.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu5.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu5.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu6.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu6.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu6.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu6.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu6.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu6.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu6.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu6.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu6.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu6.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu6.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu6.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu6.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu6.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu6.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu6.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu6.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu6.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu6.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu6.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu6.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu6.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu6.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster1.cpu7.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu7.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu7.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu7.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu7.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu7.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100000`

subcluster1.cpu7.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu7.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

`subcluster1.cpu7.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu7.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu7.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu7.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu7.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu7.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu7.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster1.cpu7.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu7.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu7.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu7.semihosting-stack_base`
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu7.semihosting-stack_limit`
Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu7.trace_special_hlt_imm16`
For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu7.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu7.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu8.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu8.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu8.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu8.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`subcluster1.cpu8.force-fpsid`

Override the FPSID value.

Type: `bool`

Default value: true

`subcluster1.cpu8.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.l2cache-read_access_latency`

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.l2cache-read_latency`

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.l2cache-size`

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

`subcluster1.cpu8.l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.l2cache-snoop_issue_latency`

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.l2cache-write_access_latency`

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.l2cache-write_latency`

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

subcluster1.cpu8.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu8.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu8.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu8.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu8.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu8.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu8.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster1.cpu8.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu8.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu8.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu8.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu8.semihosting-stack_base
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu8.semihosting-stack_limit
Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster1.cpu8.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu8.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu8.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu9.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu9.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu9.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.RVBARADDR
Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.enable_trace_special_hlt_imm16
Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu9.force-fpsid
Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu9.l2cache-hit_latency
L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-maintenance_latency
L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-miss_latency
L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu9.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu9.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu9.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu9.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu9.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu9.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu9.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu9.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu9.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu9.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu9.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu9.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu9.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster1.cpu9.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster1.dcache-hit_latency`

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x10000`

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

subcluster1.ete.ETE_REVISION

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 1

subcluster1.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x1`

subcluster1.ete.NumberOfRSPairs

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

subcluster1.ete.PIDR_CMOD

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

subcluster1.ete.PIDR_REVAND

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

subcluster1.ete.PIDR_REVISION

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

subcluster1.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

subcluster1.ete.RES0_STATEFUL

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

subcluster1.ete.RETSTACK

Return stack depth.

Type: `uint8_t`

Default value: 1

subcluster1.ete.REVISION

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 1

subcluster1.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

subcluster1.ete.SOURCE_ADDRESS

Allow generation of source address elements.

Type: `bool`

Default value: false

subcluster1.ete.TRACE_OUTPUT

File to which to write trace byte stream.

Type: `string`

Default value: N/A

subcluster1.ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

subcluster1.ete.TSMARK

Whether timestamp markers are supported.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

subcluster1.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

subcluster1.has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

subcluster1.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

subcluster1.instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

subcluster1.invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

subcluster1.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

subcluster1.pmu-num_counters

Number of PMU counters implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 6

`subcluster1.ptw_latency`

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.stage12_tlb_size`

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: `uint32_t`

Default value: `0x80`

`subcluster1.tlb_latency`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.tlbi_stall_enabled`

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

`subcluster1.treat_PAC_as_NOP`

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

`subcluster1.walk_cache_latency`

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

3.33 ARMC1NanoCT_C1ProCT_C1UltraCT

Defined in `LISA/ARMC1NanoCT_C1ProCT_C1UltraCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
C1Nano r0p0	Preliminary support
C1Pro r0p0	Preliminary support
C1Ultra r0p0	Preliminary support

For an explanation of the quality levels, see Quality level definitions.

About ARMC1NanoCT_C1ProCT_C1UltraCT

The number of cores in each subcluster is configurable using the following parameters:

`subcluster0.NUM_CORES`
: Possible values are 1-12 (ARMC1NanoCT).

`subcluster1.NUM_CORES`
: Possible values are 1-12 (ARMC1ProCT).

`subcluster2.NUM_CORES`
: Possible values are 1-12 (ARMC1UltraCT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <`port_name`>[0-11] for cores in `subcluster0`.
- <`port_name`>[12-23] for cores in `subcluster1`.
- <`port_name`>[24-35] for cores in `subcluster2`.

Note

All instances in the Master cross trigger matrix port array, `cti[36]` must be connected, regardless of the `NUM_CORES` values used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu11` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu11` identify cores in `subcluster1`.
- `subcluster2.cpu0` to `subcluster2.cpu11` identify cores in `subcluster2`.

Non-Confidential

For information about the cores in this model, see:

- ARMC1NanoCT.
- ARMC1ProCT.
- ARMC1UltraCT.

Iris and MTI instances for ARMC1NanoCT_C1ProCT_C1UltraCT

This model has the following Iris instances:

Name	Instance type
`ARMC1NanoCT_C1ProCT_C1UltraCT`	Cluster_ARM_C1-Nano_C1-PRO_C1-ULTRA_Heterogeneous
`ARMC1NanoCT_C1ProCT_C1UltraCT.AMU`	PVBusLogger
`ARMC1NanoCT_C1ProCT_C1UltraCT.AMU.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT_C1UltraCT.DAP`	PVBusLogger
`ARMC1NanoCT_C1ProCT_C1UltraCT.DAP.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU`	C1-DSU
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.PPU_cluster`	PPUv1
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.PPU_cluster.busslave`	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.PPU_coreU` (where *U* = 0–2)	PPUv1
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.PPU_coreU.busslave` (where *U* = 0–2)	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.l3_flusher`	AsyncCacheFlushUnit
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.mpam_busslave`	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.shared_cache`	PVCache
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.shared_cache.upstream[U]` (where *U* = 0–8)	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.utility_slave[0]`	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.MMAP`	PVBusLogger
`ARMC1NanoCT_C1ProCT_C1UltraCT.MMAP.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT_C1UltraCT.RAS`	PVBusLogger
`ARMC1NanoCT_C1ProCT_C1UltraCT.RAS.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT_C1UltraCT.cpuU.debug_rom` (where *U* = 0–2)	debug_rom
`ARMC1NanoCT_C1ProCT_C1UltraCT.ext_bus`	PVBusLogger
`ARMC1NanoCT_C1ProCT_C1UltraCT.ext_bus.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT_C1UltraCT.gic_cpuif_decoder_cluster`	GICv3CPUInterfaceDecoder
`ARMC1NanoCT_C1ProCT_C1UltraCT.global_debug_rom`	debug_rom
`ARMC1NanoCT_C1ProCT_C1UltraCT.secondary_debug_rom`	debug_rom
`ARMC1NanoCT_C1ProCT_C1UltraCT.subcluster0`	Subcluster_ARM_C1-Nano
`ARMC1NanoCT_C1ProCT_C1UltraCT.subcluster0.cpu0`	ARM_C1-Nano
`ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.UTLB` (where *U* = 0–2)	TLB
`ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpuV.dtlb` (where *U* = 0–2; *V* = 0–2)	TLB

Name	Instance type
`ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l1dcache` (where *U* = 0–2)	PVCache
`ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l1dcache.upstream[0]` (where *U* = 0–2)	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l1icache` (where *U* = 0–2)	PVCache
`ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l1icache.upstream[0]` (where *U* = 0–2)	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l2cache` (where *U* = 0–2)	PVCache
`ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l2cache.upstream[A]` (where *U* = 0–2; *A* = 0–1)	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.sve` (where *U* = 0–2)	ScalableVectorExtension
`ARMC1NanoCT_C1ProCT_C1UltraCT.subcluster1`	Subcluster_ARM_C1-Pro
`ARMC1NanoCT_C1ProCT_C1UltraCT.subcluster1.cpu0`	ARM_C1-Pro
`ARMC1NanoCT_C1ProCT_C1UltraCT.subcluster2`	Subcluster_ARM_C1-Ultra
`ARMC1NanoCT_C1ProCT_C1UltraCT.subcluster2.cpu0`	ARM_C1-Ultra

This model has the following MTI trace components:

Name	Component type
`ARMC1NanoCT_C1ProCT_C1UltraCT.AMU`	PVBusLogger
`ARMC1NanoCT_C1ProCT_C1UltraCT.AMU.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT_C1UltraCT.DAP`	PVBusLogger
`ARMC1NanoCT_C1ProCT_C1UltraCT.DAP.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU`	C1-DSU
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.PPU_cluster`	PPUv1
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.PPU_cluster.busslave`	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.PPU_coreU` (where *U* = 0–2)	PPUv1
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.PPU_coreU.busslave` (where *U* = 0–2)	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.l3_flusher`	AsyncCacheFlushUnit
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.mpam_busslave`	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.shared_cache`	PVCache
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.shared_cache.upstream[U]` (where *U* = 0–8)	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.DSU.utility_slave[0]`	PVBusSlave
`ARMC1NanoCT_C1ProCT_C1UltraCT.MMAP`	PVBusLogger
`ARMC1NanoCT_C1ProCT_C1UltraCT.MMAP.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT_C1UltraCT.RAS`	PVBusLogger
`ARMC1NanoCT_C1ProCT_C1UltraCT.RAS.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT_C1UltraCT.ext_bus`	PVBusLogger
`ARMC1NanoCT_C1ProCT_C1UltraCT.ext_bus.mapper`	PVBusMapper
`ARMC1NanoCT_C1ProCT_C1UltraCT.gic_cpuif_decoder_cluster`	GICv3CPUInterfaceDecoder
`ARMC1NanoCT_C1ProCT_C1UltraCT.subcluster0.cpu0`	ARM_C1-Nano

Name	Component type
ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.UTLB (where *U* = 0–2)	TLB
ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l1dcache (where *U* = 0–2)	PVCache
ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l1dcache.upstream[0] (where *U* = 0–2)	PVBusSlave
ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l1icache (where *U* = 0–2)	PVCache
ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l1icache.upstream[0] (where *U* = 0–2)	PVBusSlave
ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l2cache (where *U* = 0–2)	PVCache
ARMC1NanoCT_C1ProCT_C1UltraCT.subclusterU.cpu0.l2cache.upstream[A] (where *U* = 0–2; *A* = 0–1)	PVBusSlave
ARMC1NanoCT_C1ProCT_C1UltraCT.subcluster1.cpu0	ARM_C1-Pro
ARMC1NanoCT_C1ProCT_C1UltraCT.subcluster2.cpu0	ARM_C1-Ultra

Ports for ARMC1NanoCT_C1ProCT_C1UltraCT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_ pcsm_pchannel	master	PChannel	Cluster PCSM signal

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
cluster_ powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
cme_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cmeerrirq	master	Signal	RAS cme err irq
cmefaultirq	master	Signal	RAS cme fault irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsm_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	slave	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.

Port	Direction	Protocol	Description
`defaultMP`	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
`dev_debug_s`	slave	PVBus	External debug interface.
`event`	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
`fiq`	slave	Signal	This signal drives the CPUs fast-interrupt handling.
`gicreset`	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
`gicv3_redistributor_s`	slave	GICv3Comms	GICv3 AXI-stream port.
`irq`	slave	Signal	This signal drives the CPUs interrupt handling.
`memorymapped_debug_s`	slave	PVBus	External debug interface.
`pmbirq`	master	Signal	Interrupt signal from the statistical profiling unit.
`pmuirq`	master	Signal	Interrupt signal from performance monitoring unit.
`ppu_cluster_irq`	master	Signal	PPU cluster interrupt.
`ppu_cluster_isolate`	master	Signal	PPU Cluster Domain isolation control.
`ppu_cluster_wakerequest`	slave	Signal	PPU cluster wake request signal.
`ppu_cme_irq`	master	Signal	PPU CME interrupt
`ppu_core_irq`	master	Signal	PPU core interrupt.
`ppu_core_isolate`	master	Signal	PPU Core Domain isolation control.
`ppu_core_wakerequest`	slave	Signal	PPU core wake request signal.
`presetdbg`	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
`pvbus_m0`	master	PVBus	The core will generate bus requests on this port.
`pvbus_periph_m`	master	PVBus	The core can generate peripheral bus request on this port.
`rei`	slave	Signal	Per core RAM Error Interrupt.
`reset`	slave	Signal	Reset signal to cluster.
`rvbaraddr`	slave	Value_64	Reset vector base address.
`sci_m`	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
`sei`	slave	Signal	Per core System Error physical pins.
`spiden`	slave	Signal	External debug interface.
`ticks`	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
`trbirq`	master	Signal	Interrupt signal from the trace buffer unit.
`utility_bus_s`	slave	PVBus	Utility bus subordinate
`vcpumntirq`	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
`vfiq`	slave	Signal	Virtualised FIQ.
`virq`	slave	Signal	Virtualised IRQ.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`virtio_s`	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
`vsei`	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMC1NanoCT_C1ProCT_C1UltraCT

`AEND0_DEFAULT`

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND1_DEFAULT`

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND2_DEFAULT`

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND3_DEFAULT`

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

`ASTART0_DEFAULT`

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: `0x0`

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

NUM_CMES

Defines how many CMEs are associated with each cluster. This parameter must be in sync with SVE.ScalableVectorExtension SME configuration.

Type: `uint8_t`

Default value: 0

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

core_complex_mapping

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" :{"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type: `string`

Default value: “{"complex0": { "cores": [0, 1], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex1": { "cores": [2, 3], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex2": { "cores": [4, 5], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex5": { "cores": [10, 11], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex6": { "cores": [12, 13], "l2-cache" :{"exists":1, "size":"16MB"}} }”

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

dcache-state_modelled

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

icache-state_modelled

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

l3cache-has_mpam

L3 Cache has MPAM support.

Type: `bool`

Default value: true

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-mpamf.max_partid_ns

Maximum value of non-secure PARTID supported for DSU L3Cache. Options are 7 or 63.

Type: `uint8_t`

Default value: 63

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-read_bus_width_in_bytes

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

`l3cache-size`

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

`l3cache-snoop_data_transfer_latency`

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-snoop_issue_latency`

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-ways`

L3 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 16

`l3cache-write_access_latency`

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-write_bus_width_in_bytes`

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`l3cache-write_latency`

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`mpmm_accumulator_multiplier`

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

`num_nodes`

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

`scu_cache_protection`

SCU-L3 is configured with ECC if true.

Type: `bool`

Default value: true

`subcluster0.CPUCFR`

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.NUM_CORES`

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.core_cache_protection

core_cache_protection can change ERR0FR, ERR0PFGF and ERR0PFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: 1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster0.cpu0.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu0.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu0.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster0.cpu0.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu0.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu0.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu0.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu0.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu0.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu0.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu0.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu0.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu0.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu0.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu0.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu0.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu0.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu0.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu0.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu0.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu0.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu0.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu1.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu1.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster0.cpu1.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu1.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster0.cpu1.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu1.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu1.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu1.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu1.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu1.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu1.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu1.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu1.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu1.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu1.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu1.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu1.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu1.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu1.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu1.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu1.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu1.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu1.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu1.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster0.cpu1.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu10.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu10.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu10.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu10.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x80000`

subcluster0.cpu10.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu10.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu10.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu10.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu10.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu10.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu10.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu10.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 171

subcluster0.cpu10.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu10.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu10.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu10.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu10.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu10.semihosting-stack_limit

Virtual address of stack limit.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu10.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu10.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu11.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu11.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu11.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu11.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu11.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x10`

subcluster0.cpu11.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu11.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu11.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu11.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu11.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu11.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu11.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu11.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu11.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu11.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu11.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu11.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu11.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu11.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu11.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu11.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu11.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu11.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu11.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu11.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu11.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu2.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu2.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu2.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu2.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu2.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu2.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu2.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu2.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu2.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster0.cpu2.min_sync_level
Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu2.semihosting-A32_HLT
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu2.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu2.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu2.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu2.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu2.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster0.cpu2.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu2.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu2.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu2.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu2.semihosting-stack_base`
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu2.semihosting-stack_limit`
Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu2.trace_special_hlt_imm16`
For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu2.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu2.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu3.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu3.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu3.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu3.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu3.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu3.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu3.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu3.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu3.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu3.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu3.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu3.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster0.cpu3.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu3.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu3.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu3.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu3.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu3.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu3.semihosting-stack_base`

Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu3.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu3.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu3.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu4.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu4.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.cpu4.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu4.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu4.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu4.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu4.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu4.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu4.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu4.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu4.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu4.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu4.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu4.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu4.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu4.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu4.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu4.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu4.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu4.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu4.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu4.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu4.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu4.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu5.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu5.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu5.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu5.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu5.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu5.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu5.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu5.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu5.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

`subcluster0.cpu5.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster0.cpu5.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu5.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu5.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu5.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu5.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu5.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu5.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu5.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu5.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu5.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu5.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu5.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu5.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu5.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu6.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu6.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu6.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu6.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu6.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu6.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu6.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu6.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu6.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu6.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu6.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu6.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster0.cpu6.semihosting-Thumb_SVC`
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu6.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu6.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu6.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu6.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu6.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu6.semihosting-stack_base`
Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu6.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu6.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu6.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu7.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu7.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`subcluster0.cpu7.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu7.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster0.cpu7.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu7.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu7.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu7.l2cache-read_access_latency`

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu7.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu7.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu7.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu7.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu7.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu7.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu7.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu7.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu7.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu7.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu7.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu7.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu7.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu7.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu7.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu8.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu8.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu8.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu8.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu8.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu8.l2cache-read_access_latency`

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu8.l2cache-read_bus_width_in_bytes`

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

`subcluster0.cpu8.l2cache-read_latency`

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu8.l2cache-size`

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

`subcluster0.cpu8.l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu8.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu8.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu8.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster0.cpu8.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu8.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu8.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu8.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu8.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu8.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu8.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu8.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu8.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu8.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu8.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu8.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu8.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu8.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu8.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu9.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu9.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu9.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu9.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu9.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu9.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu9.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu9.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu9.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu9.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu9.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu9.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster0.cpu9.semihosting-Thumb_SVC`
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu9.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu9.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu9.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu9.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu9.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu9.semihosting-stack_base`
Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu9.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu9.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu9.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

subcluster0.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

subcluster0.ete.PIDR_CMOD

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.PIDR_REVAND

TRCPIDR REVAND value.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

`subcluster0.ete.PIDR_REVISION`

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

`subcluster0.ete.Q_CADENCE`

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

`subcluster0.ete.RES0_STATEFUL`

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

`subcluster0.ete.RETSTACK`

Return stack depth.

Type: `uint8_t`

Default value: 3

`subcluster0.ete.REVISION`

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

`subcluster0.ete.SIM_OVERFLOW_GRANULARITY`

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

`subcluster0.ete.SIM_OVERFLOW_PERCENTAGE`

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

subcluster0.ete.SOURCE_ADDRESS

Allow generation of source address elements.

Type: `bool`

Default value: false

subcluster0.ete.TRACE_OUTPUT

File to which to write trace byte stream.

Type: `string`

Default value: N/A

subcluster0.ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

subcluster0.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

subcluster0.has_actlr2

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

Type: `bool`

Default value: true

subcluster0.has_dot_product

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

subcluster0.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

subcluster0.invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

subcluster0.pmu-num_counters

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster0.ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster1.CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

subcluster1.core_cache_protection

core_cache_protection can change ERR0FR, ERR0PFGF and ERR0PFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: 1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster1.cpu0.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu0.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu0.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu0.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu0.force-fpsid

Override the FPSID value.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

subcluster1.cpu0.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-size

L2 Cache size in bytes.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu0.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

`subcluster1.cpu0.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu0.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu0.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu0.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu0.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu0.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu0.semihosting-cwd`

Base directory for semihosting file access.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `string`

Default value: N/A

`subcluster1.cpu0.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu0.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu0.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu0.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu0.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu0.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu0.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu1.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu1.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu1.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu1.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster1.cpu1.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu1.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu1.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu1.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu1.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu1.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster1.cpu1.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu1.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu1.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu1.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu1.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu1.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster1.cpu1.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu1.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu10.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu10.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu10.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu10.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu10.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

subcluster1.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu10.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu10.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu10.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu10.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu10.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu10.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu10.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu10.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu10.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu10.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu10.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu10.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu10.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu11.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu11.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu11.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu11.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu11.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu11.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu11.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu11.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu11.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu11.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu11.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu11.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu11.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu11.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu11.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu11.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu11.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu11.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu11.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu11.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu11.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu11.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu11.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster1.cpu2.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu2.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu2.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu2.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu2.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Default value: 0

subcluster1.cpu2.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu2.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu2.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu2.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu2.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu2.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu2.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster1.cpu2.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu2.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu2.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu2.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu2.trace_special_hlt_imm16

subcluster1.cpu3.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu3.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu3.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu3.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu3.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu3.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu3.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

Default value: 171

subcluster1.cpu3.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu3.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu3.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu3.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu3.semihosting-stack_base
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu3.semihosting-stack_limit
Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster1.cpu3.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu3.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu3.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu4.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu4.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu4.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu4.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu4.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu4.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu4.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu4.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu4.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu4.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu4.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu4.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu4.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu4.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu4.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu4.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu4.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu4.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu4.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu4.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu4.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu4.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu5.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu5.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`subcluster1.cpu5.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster1.cpu5.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu5.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster1.cpu5.force-fpsid`

Override the FPSID value.

Type: `bool`

Default value: true

`subcluster1.cpu5.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu5.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu5.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu5.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu5.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu5.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu5.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu5.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu5.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu5.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu5.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu5.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu5.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu5.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu5.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu5.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu5.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu5.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu5.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster1.cpu6.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu6.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu6.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu6.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu6.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu6.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Default value: 0

subcluster1.cpu6.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu6.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu6.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu6.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu6.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu6.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu6.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster1.cpu6.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu6.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu6.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu6.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu6.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu6.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu6.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu6.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu7.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu7.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu7.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu7.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster1.cpu7.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu7.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu7.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpu7.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu7.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu7.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu7.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu7.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu7.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu7.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster1.cpu7.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu7.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu7.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu7.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu7.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu7.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster1.cpu7.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu7.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu7.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu8.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu8.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu8.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu8.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster1.cpu8.force-fpsid`

Override the FPSID value.

Type: `bool`

Default value: true

`subcluster1.cpu8.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu8.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu8.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu8.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu8.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu8.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu8.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu8.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu8.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu8.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu8.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu8.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu8.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu8.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu8.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu8.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu8.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster1.cpu8.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster1.cpu9.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu9.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu9.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu9.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster1.cpu9.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster1.cpu9.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu9.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu9.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu9.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu9.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu9.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu9.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu9.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu9.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu9.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu9.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu9.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu9.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu9.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 4

subcluster1.ete.ETE_REVISION

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 1

subcluster1.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

subcluster1.ete.NumberOfRSPairs

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

subcluster1.ete.PIDR_CMOD

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

subcluster1.ete.PIDR_REVAND

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

subcluster1.ete.PIDR_REVISION

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

subcluster1.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x1`

`subcluster1.ete.RES0_STATEFUL`

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

`subcluster1.ete.RETSTACK`

Return stack depth.

Type: `uint8_t`

Default value: 1

`subcluster1.ete.REVISION`

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 1

`subcluster1.ete.SIM_OVERFLOW_GRANULARITY`

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

`subcluster1.ete.SIM_OVERFLOW_PERCENTAGE`

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

`subcluster1.ete.SOURCE_ADDRESS`

Allow generation of source address elements.

Type: `bool`

Default value: false

`subcluster1.ete.TRACE_OUTPUT`

File to which to write trace byte stream.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster1.ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

subcluster1.ete.TSMARK

Whether timestamp markers are supported.

Type: `bool`

Default value: true

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

subcluster1.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

subcluster1.has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 2

subcluster1.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

subcluster1.has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

subcluster1.instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

subcluster1.invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

subcluster1.pmu-num_counters

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster1.stage12_tlb_size

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: `uint32_t`

Default value: `0x80`

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster1.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster2.CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x1`

subcluster2.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

subcluster2.cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster2.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu0.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster2.cpu0.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster2.cpu0.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster2.cpu0.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu0.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster2.cpu0.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu0.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu0.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu0.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu0.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu0.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu0.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster2.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu0.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu0.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster2.cpu0.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu0.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu0.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu0.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster2.cpu0.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster2.cpu0.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster2.cpu0.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster2.cpu0.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster2.cpu0.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster2.cpu0.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu0.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu0.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster2.cpu0.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu0.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu0.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster2.cpu0.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster2.cpu1.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster2.cpu1.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster2.cpu1.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster2.cpu1.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu1.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu1.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu1.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu1.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu1.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster2.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu1.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

`subcluster2.cpu1.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster2.cpu1.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu1.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu1.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster2.cpu1.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster2.cpu1.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster2.cpu1.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster2.cpu1.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster2.cpu1.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster2.cpu1.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu1.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu1.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster2.cpu1.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu1.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu1.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster2.cpu1.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster2.cpu10.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster2.cpu10.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster2.cpu10.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster2.cpu10.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu10.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster2.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu10.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Default value: `0x0`

subcluster2.cpu10.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu10.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu10.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu10.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster2.cpu10.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu10.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Default value: `0x0`

`subcluster2.cpu10.max_code_cache_mb`

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

`subcluster2.cpu10.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster2.cpu10.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu10.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu10.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster2.cpu10.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster2.cpu10.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 171

subcluster2.cpu10.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster2.cpu10.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster2.cpu10.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster2.cpu10.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu10.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster2.cpu10.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster2.cpu10.semihosting-stack_limit

Virtual address of stack limit.

Non-Confidential

Type: `uint64_t`

Default value: `0xf000000`

subcluster2.cpu10.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu10.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster2.cpu10.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster2.cpu11.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster2.cpu11.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster2.cpu11.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster2.cpu11.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu11.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster2.cpu11.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu11.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu11.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu11.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster2.cpu11.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu11.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu11.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu11.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu11.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster2.cpu11.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster2.cpu11.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu11.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster2.cpu11.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster2.cpu11.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu11.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu11.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu11.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster2.cpu11.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster2.cpu11.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster2.cpu11.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster2.cpu11.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster2.cpu11.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu11.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster2.cpu11.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster2.cpu11.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu11.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu11.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster2.cpu11.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster2.cpu2.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu2.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster2.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster2.cpu2.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu2.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster2.cpu2.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu2.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu2.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu2.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu2.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu2.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu2.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu2.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu2.l2cache-ways
L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster2.cpu2.l2cache-write_access_latency
L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu2.l2cache-write_latency
L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu2.max_code_cache_mb
Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster2.cpu2.min_sync_level
Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster2.cpu2.semihosting-A32_HLT
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu2.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu2.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster2.cpu2.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster2.cpu2.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster2.cpu2.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster2.cpu2.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster2.cpu2.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster2.cpu2.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu2.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu2.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster2.cpu2.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu2.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu2.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster2.cpu2.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster2.cpu3.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster2.cpu3.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster2.cpu3.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster2.cpu3.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu3.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster2.cpu3.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu3.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu3.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu3.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu3.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu3.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu3.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster2.cpu3.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu3.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster2.cpu3.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu3.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu3.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster2.cpu3.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

subcluster2.cpu3.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu3.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu3.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster2.cpu3.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster2.cpu3.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster2.cpu3.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster2.cpu3.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster2.cpu3.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster2.cpu3.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu3.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu3.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster2.cpu3.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu3.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster2.cpu3.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster2.cpu3.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster2.cpu4.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster2.cpu4.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`subcluster2.cpu4.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster2.cpu4.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu4.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster2.cpu4.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu4.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu4.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu4.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu4.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu4.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu4.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu4.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu4.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster2.cpu4.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu4.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu4.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster2.cpu4.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster2.cpu4.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu4.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu4.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster2.cpu4.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster2.cpu4.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

`subcluster2.cpu4.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster2.cpu4.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster2.cpu4.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster2.cpu4.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu4.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu4.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster2.cpu4.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster2.cpu4.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu4.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster2.cpu4.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster2.cpu5.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster2.cpu5.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster2.cpu5.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu5.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu5.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster2.cpu5.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu5.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu5.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu5.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu5.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu5.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu5.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu5.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster2.cpu5.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu5.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu5.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster2.cpu5.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster2.cpu5.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu5.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu5.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster2.cpu5.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

subcluster2.cpu5.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster2.cpu5.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster2.cpu5.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster2.cpu5.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster2.cpu5.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu5.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster2.cpu5.semihosting-stack_base

Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

`subcluster2.cpu5.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu5.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu5.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster2.cpu5.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster2.cpu6.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster2.cpu6.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`subcluster2.cpu6.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster2.cpu6.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu6.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster2.cpu6.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu6.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu6.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu6.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu6.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu6.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu6.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu6.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu6.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 8

subcluster2.cpu6.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu6.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu6.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster2.cpu6.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster2.cpu6.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu6.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu6.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster2.cpu6.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster2.cpu6.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster2.cpu6.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster2.cpu6.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster2.cpu6.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster2.cpu6.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu6.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster2.cpu6.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster2.cpu6.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster2.cpu6.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu6.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster2.cpu6.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu7.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster2.cpu7.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster2.cpu7.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster2.cpu7.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu7.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster2.cpu7.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu7.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu7.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu7.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu7.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu7.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu7.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu7.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu7.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster2.cpu7.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu7.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu7.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster2.cpu7.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster2.cpu7.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu7.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu7.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster2.cpu7.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster2.cpu7.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster2.cpu7.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster2.cpu7.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster2.cpu7.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster2.cpu7.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu7.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu7.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster2.cpu7.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu7.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu7.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster2.cpu7.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster2.cpu8.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster2.cpu8.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster2.cpu8.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster2.cpu8.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu8.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster2.cpu8.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster2.cpu8.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster2.cpu8.min_sync_level
Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster2.cpu8.semihosting-A32_HLT
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu8.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu8.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster2.cpu8.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster2.cpu8.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster2.cpu8.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster2.cpu8.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster2.cpu8.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster2.cpu8.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu8.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster2.cpu8.semihosting-stack_base
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster2.cpu8.semihosting-stack_limit
Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster2.cpu8.trace_special_hlt_imm16
For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

`subcluster2.cpu8.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster2.cpu8.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster2.cpu9.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster2.cpu9.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`subcluster2.cpu9.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster2.cpu9.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.cpu9.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster2.cpu9.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu9.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu9.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu9.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.cpu9.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

`subcluster2.cpu9.l2cache-size`

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

`subcluster2.cpu9.l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu9.l2cache-snoop_issue_latency`

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu9.l2cache-ways`

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

`subcluster2.cpu9.l2cache-write_access_latency`

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu9.l2cache-write_latency`

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster2.cpu9.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster2.cpu9.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster2.cpu9.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu9.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu9.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster2.cpu9.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster2.cpu9.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 171

`subcluster2.cpu9.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster2.cpu9.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster2.cpu9.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster2.cpu9.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.cpu9.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster2.cpu9.semihosting-stack_base`
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster2.cpu9.semihosting-stack_limit`
Virtual address of stack limit.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0xf000000`

subcluster2.cpu9.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster2.cpu9.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster2.cpu9.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster2.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster2.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

subcluster2.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

subcluster2.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster2.dcache-write_access_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.dcache-write_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.ecv_support_level`

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

Type: `uint8_t`

Default value: 2

`subcluster2.ete.CLAIMTAGS`

Number of claim tags.

Type: `uint8_t`

Default value: 4

`subcluster2.ete.ETE_REVISION`

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 1

`subcluster2.ete.MAX_INST_PER_Q`

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.ete.NumberOfRSPairs

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

subcluster2.ete.PIDR_CMOD

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

subcluster2.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

subcluster2.ete.RES0_STATEFUL

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

subcluster2.ete.RETSTACK

Return stack depth.

Type: `uint8_t`

Default value: 3

subcluster2.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

subcluster2.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.ete.SOURCE_ADDRESS

Allow generation of source address elements.

Type: `bool`

Default value: false

subcluster2.ete.TRACE_OUTPUT

File to which to write trace byte stream.

Type: `string`

Default value: N/A

subcluster2.ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

subcluster2.ext_abort_so_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 2

subcluster2.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

subcluster2.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

subcluster2.has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

subcluster2.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

subcluster2.has_mt_pmu_disable_feature

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, `0xF`: The feature is disabled and is represented by value `0xF` in ID_AA64DFR0_EL1.MTPMU.

Type: `uint8_t`

Default value: 0

subcluster2.has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type: `bool`

Default value: true

subcluster2.has_v8_7_spe_inverted_filtering

Where FEAT_SPEv1p2 is implemented, whether inverted filtering by events is implemented (represented by PMISDR.FnE).

Type: `bool`

Default value: false

subcluster2.has_v8_7_spe_previous_branch_target

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented (FEAT_SPE_PBT).

Type: `bool`

Default value: false

subcluster2.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster2.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

subcluster2.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

`subcluster2.icache-read_latency`

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.icache-size`

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

`subcluster2.instruction_tlb_size`

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

`subcluster2.invalidate_code_cache_on_icache_cmo`

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

`subcluster2.memory_tagging_support_level`

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster2.mpamidr_has_force_ns

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

subcluster2.mpamidr_has_sdeflt

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

subcluster2.mpamidr_has_tidr

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clearvalues of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

subcluster2.pmu-num_counters

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 31

subcluster2.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster2.stage12_tlb_size

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: `uint32_t`

Default value: `0x80`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster2.tcr_txsz_undersize_should_fault`

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

Type: `bool`

Default value: false

`subcluster2.tlb_latency`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`subcluster2.tlbi_stall_enabled`

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

`subcluster2.treat_PAC_as_NOP`

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

`subcluster2.walk_cache_latency`

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

3.34 ARMC1NanoCT_C1UltraCT

Defined in `LISA/ARMC1NanoCT_C1UltraCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
C1Nano r0p0	Preliminary support
C1Ultra r0p0	Preliminary support

For an explanation of the quality levels, see Quality level definitions.

About ARMC1NanoCT_C1UltraCT

The number of cores in each subcluster is configurable using the following parameters:

`subcluster0.NUM_CORES`
: Possible values are 1-13 (ARMC1NanoCT).

`subcluster1.NUM_CORES`
: Possible values are 1-13 (ARMC1UltraCT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port_name>[0-12] for cores in `subcluster0`.
- <port_name>[13-25] for cores in `subcluster1`.

Note

All instances in the Master cross trigger matrix port array, `cti[26]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu12` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu12` identify cores in `subcluster1`.

For information about the cores in this model, see:

- ARMC1NanoCT.
- ARMC1UltraCT.

Iris and MTI instances for ARMC1NanoCT_C1UltraCT

This model has the following Iris instances:

Name	Instance type
`ARMC1NanoCT_C1UltraCT`	Cluster_ARM_C1-Nano_C1-ULTRA_Heterogeneous
`ARMC1NanoCT_C1UltraCT.AMU`	PVBusLogger
`ARMC1NanoCT_C1UltraCT.AMU.mapper`	PVBusMapper
`ARMC1NanoCT_C1UltraCT.DAP`	PVBusLogger
`ARMC1NanoCT_C1UltraCT.DAP.mapper`	PVBusMapper

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
ARMC1NanoCT_C1UltraCT.DSU	C1-DSU
ARMC1NanoCT_C1UltraCT.DSU.PPU_cluster	PPUv1
ARMC1NanoCT_C1UltraCT.DSU.PPU_cluster.busslave	PVBusSlave
ARMC1NanoCT_C1UltraCT.DSU.PPU_coreZ (where *Z* = 0–1)	PPUv1
ARMC1NanoCT_C1UltraCT.DSU.PPU_coreZ.busslave (where *Z* = 0–1)	PVBusSlave
ARMC1NanoCT_C1UltraCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1NanoCT_C1UltraCT.DSU.mpam_busslave	PVBusSlave
ARMC1NanoCT_C1UltraCT.DSU.shared_cache	PVCache
ARMC1NanoCT_C1UltraCT.DSU.shared_cache.upstream[Z] (where *Z* = 0–6)	PVBusSlave
ARMC1NanoCT_C1UltraCT.DSU.utility_slave[0]	PVBusSlave
ARMC1NanoCT_C1UltraCT.MMAP	PVBusLogger
ARMC1NanoCT_C1UltraCT.MMAP.mapper	PVBusMapper
ARMC1NanoCT_C1UltraCT.RAS	PVBusLogger
ARMC1NanoCT_C1UltraCT.RAS.mapper	PVBusMapper
ARMC1NanoCT_C1UltraCT.cpuZ.debug_rom (where *Z* = 0–1)	debug_rom
ARMC1NanoCT_C1UltraCT.ext_bus	PVBusLogger
ARMC1NanoCT_C1UltraCT.ext_bus.mapper	PVBusMapper
ARMC1NanoCT_C1UltraCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMC1NanoCT_C1UltraCT.global_debug_rom	debug_rom
ARMC1NanoCT_C1UltraCT.secondary_debug_rom	debug_rom
ARMC1NanoCT_C1UltraCT.subcluster0	Subcluster_ARM_C1-Nano
ARMC1NanoCT_C1UltraCT.subcluster0.cpu0	ARM_C1-Nano
ARMC1NanoCT_C1UltraCT.subclusterZ.cpu0.UTLB (where *Z* = 0–1)	TLB
ARMC1NanoCT_C1UltraCT.subclusterZ.cpuU.dtlb (where *Z* = 0–1; *U* = 0–1)	TLB
ARMC1NanoCT_C1UltraCT.subclusterZ.cpu0.l1dcache (where *Z* = 0–1)	PVCache

ARMC1NanoCT_C1UltraCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1NanoCT_C1UltraCT.DSU.mpam_busslave	PVBusSlave
ARMC1NanoCT_C1UltraCT.DSU.shared_cache	PVCache
ARMC1NanoCT_C1UltraCT.DSU.shared_cache.upstream[Z] (where *Z* = 0–6)	PVBusSlave
ARMC1NanoCT_C1UltraCT.DSU.utility_slave[0]	PVBusSlave
ARMC1NanoCT_C1UltraCT.MMAP	PVBusLogger
ARMC1NanoCT_C1UltraCT.MMAP.mapper	PVBusMapper
ARMC1NanoCT_C1UltraCT.RAS	PVBusLogger
ARMC1NanoCT_C1UltraCT.RAS.mapper	PVBusMapper
ARMC1NanoCT_C1UltraCT.ext_bus	PVBusLogger
ARMC1NanoCT_C1UltraCT.ext_bus.mapper	PVBusMapper
ARMC1NanoCT_C1UltraCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMC1NanoCT_C1UltraCT.subcluster0.cpu0	ARM_C1-Nano
ARMC1NanoCT_C1UltraCT.subclusterZ.cpu0.UTLB (where *Z* = 0–1)	TLB
ARMC1NanoCT_C1UltraCT.subclusterZ.cpu0.l1dcache (where *Z* = 0–1)	PVCache
ARMC1NanoCT_C1UltraCT.subclusterZ.cpu0.l1dcache.upstream[0] (where *Z* = 0–1)	PVBusSlave
ARMC1NanoCT_C1UltraCT.subclusterZ.cpu0.l1icache (where *Z* = 0–1)	PVCache
ARMC1NanoCT_C1UltraCT.subclusterZ.cpu0.l1icache.upstream[0] (where *Z* = 0–1)	PVBusSlave
ARMC1NanoCT_C1UltraCT.subclusterZ.cpu0.l2cache (where *Z* = 0–1)	PVCache
ARMC1NanoCT_C1UltraCT.subclusterZ.cpu0.l2cache.upstream[W] (where *Z* = 0–1; *W* = 0–1)	PVBusSlave
ARMC1NanoCT_C1UltraCT.subcluster1.cpu0	ARM_C1-Ultra

Ports for ARMC1NanoCT_C1UltraCT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_ pcsm_pchannel	master	PChannel	Cluster PCSM signal
cluster_ powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
cme_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cmeerrirq	master	Signal	RAS cme err irq
cmefaultirq	master	Signal	RAS cme fault irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`core_clk_in`	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
`core_pcsm_pchannel`	master	PChannel	Core PCSM signals
`core_powerdown_out`	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
`core_ppu_hw_stat`	master	Value	Notify the power state change inside the PPU.
`coreerrirq`	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
`corefaultirq`	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
`coreinstrrun`	slave	Signal	Core Running State
`cryptodisable`	slave	Signal	Disable cryptography extensions after reset.
`cti`	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
`ctidbgirq`	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
`dbgen`	slave	Signal	External debug interface.
`dbgnopwrdwn`	master	Signal	No power-down request.
`dbgpwrupreq`	master	Signal	Debug power up request.
`defaultMP`	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
`dev_debug_s`	slave	PVBus	External debug interface.
`event`	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
`fiq`	slave	Signal	This signal drives the CPUs fast-interrupt handling.
`gicreset`	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
`gicv3_redistributor_s`	slave	GICv3Comms	GICv3 AXI-stream port.
`irq`	slave	Signal	This signal drives the CPUs interrupt handling.
`memorymapped_debug_s`	slave	PVBus	External debug interface.
`pmbirq`	master	Signal	Interrupt signal from the statistical profiling unit.
`pmuirq`	master	Signal	Interrupt signal from performance monitoring unit.
`ppu_cluster_irq`	master	Signal	PPU cluster interrupt.
`ppu_cluster_isolate`	master	Signal	PPU Cluster Domain isolation control.
`ppu_cluster_wakerequest`	slave	Signal	PPU cluster wake request signal.
`ppu_cme_irq`	master	Signal	PPU CME interrupt
`ppu_core_irq`	master	Signal	PPU core interrupt.
`ppu_core_isolate`	master	Signal	PPU Core Domain isolation control.
`ppu_core_wakerequest`	slave	Signal	PPU core wake request signal.
`presetdbg`	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
`pvbus_m0`	master	PVBus	The core will generate bus requests on this port.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`pvbus_periph_m`	master	PVBus	The core can generate peripheral bus request on this port.
`rei`	slave	Signal	Per core RAM Error Interrupt.
`reset`	slave	Signal	Reset signal to cluster.
`rvbaraddr`	slave	Value_64	Reset vector base address.
`sci_m`	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
`sei`	slave	Signal	Per core System Error physical pins.
`spiden`	slave	Signal	External debug interface.
`ticks`	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
`trbirq`	master	Signal	Interrupt signal from the trace buffer unit.
`utility_bus_s`	slave	PVBus	Utility bus subordinate
`vcpumntirq`	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
`vfiq`	slave	Signal	Virtualised FIQ.
`virq`	slave	Signal	Virtualised IRQ.
`virtio_s`	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
`vsei`	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMC1NanoCT_C1UltraCT

`AEND0_DEFAULT`

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND1_DEFAULT`

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND2_DEFAULT`

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: `0x0`

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: `bool`

Default value: false

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

NUM_CMES

Defines how many CMEs are associated with each cluster. This parameter must be in sync with SVE.ScalableVectorExtension SME configuration.

Type: `uint8_t`

Default value: 0

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

core_complex_mapping

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" :{"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: “{"complex0": { "cores": [0, 1], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex1": { "cores": [2, 3], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex2": { "cores": [4, 5], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex5": { "cores": [10, 11], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex6": { "cores": [12, 13], "l2-cache" :{"exists":1, "size":"16MB"}} }”

`core_power_on_by_default`

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

`dcache-state_modelled`

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

`enable_simulation_performance_optimizations`

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

`has_peripheral_port`

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

`icache-state_modelled`

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`l3cache-has_mpam`
L3 Cache has MPAM support.

Type: `bool`

Default value: true

`l3cache-hit_latency`
L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-maintenance_latency`
L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-miss_latency`
L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-mpamf.max_partid_ns`
Maximum value of non-secure PARTID supported for DSU L3Cache. Options are 7 or 63.

Type: `uint8_t`

Default value: 63

`l3cache-read_access_latency`
L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-read_bus_width_in_bytes

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-size

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 16

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-write_bus_width_in_bytes

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

num_nodes

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

scu_cache_protection

SCU-L3 is configured with ECC if true.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

`subcluster0.CPUCFR`

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.NUM_CORES`

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

`subcluster0.core_cache_protection`

core_cache_protection can change ERR0FR, ERR0PFGF and ERR0PFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: 1

`subcluster0.cpi_div`

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

`subcluster0.cpi_mul`

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

`subcluster0.cpu0.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu0.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu0.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu0.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu0.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu0.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu0.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu0.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu0.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu0.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu0.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu0.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu0.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu0.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu0.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu0.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu0.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu0.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu0.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu0.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu0.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu0.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster0.cpu0.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu1.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu1.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu1.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu1.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu1.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x80000`

subcluster0.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu1.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu1.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu1.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu1.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu1.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 171

subcluster0.cpu1.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu1.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu1.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu1.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu1.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu1.semihosting-stack_limit

Virtual address of stack limit.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu1.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu1.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu10.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu10.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu10.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu10.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x10`

`subcluster0.cpu10.l2cache-read_latency`

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu10.l2cache-size`

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

`subcluster0.cpu10.l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu10.l2cache-snoop_issue_latency`

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu10.l2cache-ways`

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

`subcluster0.cpu10.l2cache-write_access_latency`

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu10.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu10.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu10.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu10.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu10.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu10.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu10.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu10.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu10.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu10.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu10.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu10.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu10.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu10.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu10.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu10.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu11.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu11.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu11.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu11.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu11.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu11.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu11.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu11.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu11.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu11.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

`subcluster0.cpu11.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster0.cpu11.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu11.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu11.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu11.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu11.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu11.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu11.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu11.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu11.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu11.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu11.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu11.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu11.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu11.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu12.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu12.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu12.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu12.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu12.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu12.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu12.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu12.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu12.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu12.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu12.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu12.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu12.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu12.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster0.cpu12.semihosting-Thumb_SVC`
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu12.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu12.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu12.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu12.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu12.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu12.semihosting-stack_base`
Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu12.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu12.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu12.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu12.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu2.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.cpu2.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu2.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu2.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu2.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu2.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu2.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu2.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu2.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu2.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu2.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu2.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu2.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu2.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu2.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu2.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu2.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu2.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu2.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu2.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu2.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu2.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu2.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster0.cpu2.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu3.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu3.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu3.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu3.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu3.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu3.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu3.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

Default value: `0x0`

subcluster0.cpu3.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu3.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu3.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster0.cpu3.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu3.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu3.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu3.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu3.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu3.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu3.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu3.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu3.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu3.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu3.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu3.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu4.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu4.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu4.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu4.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu4.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu4.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu4.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu4.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu4.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu4.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu4.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu4.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu4.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

subcluster0.cpu4.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu4.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu4.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu4.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu4.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu4.semihosting-stack_base
Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu4.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu4.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu4.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster0.cpu4.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster0.cpu5.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster0.cpu5.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.cpu5.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu5.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu5.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu5.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu5.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu5.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu5.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu5.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu5.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu5.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu5.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu5.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu5.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu5.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu5.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu5.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu5.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu5.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu5.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu5.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu5.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu5.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu6.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu6.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu6.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu6.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu6.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu6.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu6.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu6.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu6.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu6.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster0.cpu6.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu6.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu6.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu6.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu6.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu6.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu6.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu6.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu6.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu6.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu6.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu6.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu7.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu7.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu7.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu7.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

Default value: `0x0`

subcluster0.cpu7.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu7.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu7.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

subcluster0.cpu7.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu7.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu7.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu7.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster0.cpu7.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu7.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu7.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu7.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu7.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu7.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu7.semihosting-stack_base`

Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu7.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu7.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu7.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu8.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu8.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.cpu8.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu8.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu8.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu8.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu8.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu8.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu8.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu8.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu8.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu8.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu8.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu8.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu8.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu8.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu8.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu8.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu8.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu8.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu8.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu8.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu8.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu8.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu9.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu9.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu9.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu9.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu9.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu9.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu9.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu9.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu9.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu9.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster0.cpu9.min_sync_level
Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu9.semihosting-A32_HLT
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu9.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu9.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu9.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster0.cpu9.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu9.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu9.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu9.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu9.semihosting-stack_base`
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu9.semihosting-stack_limit`
Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu9.trace_special_hlt_imm16`
For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu9.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

subcluster0.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

subcluster0.ete.PIDR_CMOD

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.PIDR_REVAND

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.PIDR_REVISION

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0x1`

subcluster0.ete.RES0_STATEFUL

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

subcluster0.ete.RETSTACK

Return stack depth.

Type: `uint8_t`

Default value: 3

subcluster0.ete.REVISION

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

subcluster0.ete.SOURCE_ADDRESS

Allow generation of source address elements.

Type: `bool`

Default value: false

subcluster0.ete.TRACE_OUTPUT

File to which to write trace byte stream.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `string`

Default value: N/A

subcluster0.ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

subcluster0.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

subcluster0.has_actlr2

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

Type: `bool`

Default value: true

subcluster0.has_dot_product

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

subcluster0.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

subcluster0.invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

subcluster0.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

subcluster0.pmu-num_counters

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster0.ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

subcluster0.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.CPUCFR`

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x1`

`subcluster1.NUM_CORES`

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

`subcluster1.cpi_div`

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

`subcluster1.cpi_mul`

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

`subcluster1.cpu0.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster1.cpu0.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`subcluster1.cpu0.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster1.cpu0.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu0.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.cpu0.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

`subcluster1.cpu0.l2cache-write_latency`

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.max_code_cache_mb`

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

`subcluster1.cpu0.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster1.cpu0.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu0.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu0.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu0.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu0.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu0.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu0.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu0.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu0.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu0.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu0.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu0.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu0.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu0.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu1.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu1.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu1.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu1.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu1.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu1.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu1.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu1.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu1.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu1.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu1.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu1.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu1.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu1.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu1.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu1.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu1.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu1.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu1.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu1.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster1.cpu10.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu10.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu10.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu10.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu10.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.cpu10.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu10.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu10.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

subcluster1.cpu10.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu10.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu10.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu10.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu10.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu10.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu10.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster1.cpu10.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu10.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu10.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu10.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu10.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu10.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu10.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu10.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu11.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu11.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu11.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu11.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster1.cpu11.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu11.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu11.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu11.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu11.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu11.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu11.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu11.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu11.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu11.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu11.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster1.cpu11.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu11.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu11.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu11.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu11.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu11.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster1.cpu11.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu11.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu11.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu12.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu12.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu12.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu12.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu12.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu12.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu12.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu12.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu12.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu12.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu12.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu12.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu12.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu12.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster1.cpu12.semihosting-Thumb_SVC`
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu12.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu12.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu12.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu12.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu12.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu12.semihosting-stack_base`
Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu12.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu12.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu12.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster1.cpu12.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster1.cpu2.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster1.cpu2.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster1.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu2.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu2.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu2.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu2.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 8

subcluster1.cpu2.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu2.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu2.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu2.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu2.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu2.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu2.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu2.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu2.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu2.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu2.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu2.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu2.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu2.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu2.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu2.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu2.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu3.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu3.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu3.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu3.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu3.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu3.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu3.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu3.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu3.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu3.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu3.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu3.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu3.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu3.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu3.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu3.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu3.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu3.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu3.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu3.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu3.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu3.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu3.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster1.cpu3.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu4.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu4.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu4.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu4.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu4.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x80000`

subcluster1.cpu4.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu4.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

`subcluster1.cpu4.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster1.cpu4.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu4.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu4.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu4.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu4.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu4.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster1.cpu4.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu4.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu4.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu4.semihosting-stack_base
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu4.semihosting-stack_limit
Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu4.trace_special_hlt_imm16
For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu4.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu4.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu5.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu5.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu5.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu5.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu5.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu5.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.cpu5.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu5.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu5.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.cpu5.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu5.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu5.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu5.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu5.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu5.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu5.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 171

`subcluster1.cpu5.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu5.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu5.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu5.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu5.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu5.semihosting-stack_base`
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu5.semihosting-stack_limit`
Virtual address of stack limit.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu5.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu5.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu5.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu6.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu6.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu6.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster1.cpu6.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu6.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Default value: `0x0`

subcluster1.cpu6.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu6.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu6.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

`subcluster1.cpu6.l2cache-write_latency`

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu6.max_code_cache_mb`

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

`subcluster1.cpu6.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster1.cpu6.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu6.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu6.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu6.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu6.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu6.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu6.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu6.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu6.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu6.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu6.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu6.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu6.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu6.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu6.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu7.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu7.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu7.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu7.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu7.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu7.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

subcluster1.cpu7.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu7.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu7.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu7.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu7.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu7.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu7.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu7.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu7.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu7.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu7.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu7.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu7.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu7.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu7.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu7.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu7.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster1.cpu8.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu8.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu8.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu8.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu8.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu8.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu8.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.cpu8.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu8.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu8.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

`subcluster1.cpu8.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu8.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu8.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu8.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu8.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu8.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu8.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster1.cpu8.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu8.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu8.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu8.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu8.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu8.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu8.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu8.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu9.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu9.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu9.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu9.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster1.cpu9.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu9.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu9.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu9.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu9.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu9.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu9.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu9.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu9.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster1.cpu9.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu9.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu9.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu9.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu9.semihosting-stack_base
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu9.semihosting-stack_limit
Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster1.cpu9.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu9.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu9.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.ecv_support_level

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

Type: `uint8_t`

Default value: 2

subcluster1.ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

subcluster1.ete.ETE_REVISION

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 1

subcluster1.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

subcluster1.ete.NumberOfRSPairs

Number of resource selector pairs.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 8

`subcluster1.ete.PIDR_CMOD`
TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

`subcluster1.ete.Q_CADENCE`
Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

`subcluster1.ete.RES0_STATEFUL`
Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

`subcluster1.ete.RETSTACK`
Return stack depth.

Type: `uint8_t`

Default value: 3

`subcluster1.ete.SIM_OVERFLOW_GRANULARITY`
Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

`subcluster1.ete.SIM_OVERFLOW_PERCENTAGE`
Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

`subcluster1.ete.SOURCE_ADDRESS`
Allow generation of source address elements.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`subcluster1.ete.TRACE_OUTPUT`

File to which to write trace byte stream.

Type: `string`

Default value: N/A

`subcluster1.ete.TRCRSRTA_FORCED_EXCEP`

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

`subcluster1.ext_abort_so_write_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 2

`subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks`

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

`subcluster1.force_zero_PSTATE_PAN`

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

`subcluster1.force_zero_mpam_partid_and_pmg`

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

subcluster1.has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

subcluster1.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

subcluster1.has_mt_pmu_disable_feature

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, `0xF`: The feature is disabled and is represented by value `0xF` in ID_AA64DFR0_EL1.MTPMU.

Type: `uint8_t`

Default value: 0

subcluster1.has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type: `bool`

Default value: true

subcluster1.has_v8_7_spe_inverted_filtering

Where FEAT_SPEv1p2 is implemented, whether inverted filtering by events is implemented (represented by PMISDR.FnE).

Type: `bool`

Default value: false

subcluster1.has_v8_7_spe_previous_branch_target

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented (FEAT_SPE_PBT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

subcluster1.instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

subcluster1.invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

subcluster1.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

subcluster1.mpamidr_has_force_ns

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

subcluster1.mpamidr_has_sdeflt

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

subcluster1.mpamidr_has_tidr

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clearvalues of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

subcluster1.pmu-num_counters

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 31

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster1.stage12_tlb_size

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: `uint32_t`

Default value: `0x80`

subcluster1.tcr_txsz_undersize_should_fault

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.tlb_latency`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.tlbi_stall_enabled`

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

`subcluster1.treat_PAC_as_NOP`

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

`subcluster1.walk_cache_latency`

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

3.35 ARMC1PremiumCT

Defined in `LISA/ARMC1PremiumCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see Quality level definitions.

About ARMC1PremiumCT

The following example platforms are available:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- FVP_Base_C1-Premium
- EVS_Dhrystone_C1-Premiumx1
- SVP_Base_C1-Premiumx1

The following functionality is supported in this release:

- C1-SME2 is supported with the following limitations:
  - The arbitration and assignment logic is not supported.
  - RAS error handling is supported in the first CME only.
  - It is assumed that C1-SME2 units are operating in dynamic mode, with a minimum power mode of OFF. Accompanying PPU registers may be read or written to, but they do not determine the behavior of the CME. The PPU interrupt signal for the C1-SME2 is also not modeled or exposed at this time.
- Pilatus DSU support for C1-SME2.
- L2Cache is supported at the per-core level only.
- BROADCASTPERSIST pin is implemented.
- Optional peripheral port is supported.
- L3Cache partition is supported.
- Per-core clock is supported.

Limitations

The following features are not yet supported, and will be added in a future release:

- No support for transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols yet.
- BROADCASTCACHEMAINTPOU pin is not implemented.
- COREINSTRRET signals are not implemented.
- MEM_RET power mode is not supported.

The following features are not implemented:

- DynamIQ features that are negligible to the programmers' view simulation will not be implemented in the Fast Model.
- 256-bit wide output transactions will not be supported.
- Error correction/detection features will not be supported.
- Self-test features (MBIST) will not be supported.
- Latency configuration will not be supported.
- Snoop filtering will not be supported.
- Cache stashing capability will not be supported.

Iris and MTI instances for ARMC1PremiumCT

This model has the following Iris instances:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
ARMC1PremiumCT	Cluster_ARM_C1-Premium
ARMC1PremiumCT.AMU	PVBusLogger
ARMC1PremiumCT.AMU.mapper	PVBusMapper
ARMC1PremiumCT.DAP	PVBusLogger
ARMC1PremiumCT.DAP.mapper	PVBusMapper
ARMC1PremiumCT.DSU	C1-DSU
ARMC1PremiumCT.DSU.PPU_cluster	PPUv1
ARMC1PremiumCT.DSU.PPU_cluster.busslave	PVBusSlave
ARMC1PremiumCT.DSU.PPU_core0	PPUv1
ARMC1PremiumCT.DSU.PPU_core0.busslave	PVBusSlave
ARMC1PremiumCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1PremiumCT.DSU.mpam_busslave	PVBusSlave
ARMC1PremiumCT.DSU.shared_cache	PVCache
ARMC1PremiumCT.DSU.shared_cache.upstream[Y] (where *Y* = 0–4)	PVBusSlave
ARMC1PremiumCT.DSU.utility_slave[0]	PVBusSlave
ARMC1PremiumCT.MMAP	PVBusLogger
ARMC1PremiumCT.MMAP.mapper	PVBusMapper
ARMC1PremiumCT.RAS	PVBusLogger
ARMC1PremiumCT.RAS.mapper	PVBusMapper
ARMC1PremiumCT.cpu0	ARM_C1-Premium
ARMC1PremiumCT.cpu0.UTLB	TLB
ARMC1PremiumCT.cpu0.debug_rom	debug_rom
ARMC1PremiumCT.cpu0.dtlb	TLB
ARMC1PremiumCT.cpu0.l1dcache	PVCache
ARMC1PremiumCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMC1PremiumCT.cpu0.l1icache	PVCache
ARMC1PremiumCT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMC1PremiumCT.cpu0.l2cache	PVCache
ARMC1PremiumCT.cpu0.l2cache.upstream[U] (where *U* = 0–1)	PVBusSlave
ARMC1PremiumCT.ext_bus	PVBusLogger
ARMC1PremiumCT.ext_bus.mapper	PVBusMapper
ARMC1PremiumCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMC1PremiumCT.global_debug_rom	debug_rom
ARMC1PremiumCT.secondary_debug_rom	debug_rom
ARMC1PremiumCT.sve	ScalableVectorExtension

This model has the following MTI trace components:

Name	Component type
ARMC1PremiumCT.AMU	PVBusLogger
ARMC1PremiumCT.AMU.mapper	PVBusMapper

ARMC1PremiumCT.ext_bus.mapper	PVBusMapper
ARMC1PremiumCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

Ports for ARMC1PremiumCT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_ pcsm_pchannel	master	PChannel	Cluster PCSM signal
cluster_ powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clustercriticalirq	master	Signal	Cluster Critical Irq
clustererrirq	master	Signal	Cluster Error Irq
clusterfaultirq	master	Signal	Cluster Fault Irq
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
cmeerrirq	master	Signal	RAS cme err irq
cmefaultirq	master	Signal	RAS cme fault irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsm_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	slave	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_ redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_ cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus subordinate
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMC1PremiumCT

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

cpuX.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

cpuX.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

cpuX.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

`cpuX.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`cpuX.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`cpuX.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`cpuX.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`AEND0_DEFAULT`

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND1_DEFAULT`

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

`AEND2_DEFAULT`

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND3_DEFAULT`

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

`ASTART0_DEFAULT`

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

`ASTART1_DEFAULT`

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

`ASTART2_DEFAULT`

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

`ASTART3_DEFAULT`

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x1`

DSU.cme.CMECFR

Value of CMECFR_EL1 fields (ECC, CHI) for all CMEs.

Type: `string`

Default value: “{"ECC": 0, "CHI": 0}”

DSU.cme.mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

DSU.cme.power_on_by_default

If true, CME PPUs will initialize in Dynamic mode out of reset, enabling the CME to power itself on/off automatically as it is used.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`GICDISABLE`

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

`NUM_CMES`

Defines how many CMEs are associated with each cluster. This parameter must be in sync with SVE.ScalableVectorExtension SME configuration.

Type: `uint8_t`

Default value: 0

`NUM_CORES`

Number of cores per cluster.

Type: `uint8_t`

Default value: 1

`bus_type`

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

`core_power_on_by_default`

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

`cpi_div`

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`cpi_mul`

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

`dcache-hit_latency`

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-maintenance_latency`

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-miss_latency`

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-prefetch_enabled`

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

`dcache-read_access_latency`

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`dcache-read_latency`

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-snoop_data_transfer_latency`

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-state_modelled`

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

`dcache-write_access_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-write_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`default_opmode`

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 4

diagnostics

Enable DynamIQ diagnostic messages.

Type: `bool`

Default value: false

ecv_support_level

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

Type: `uint8_t`

Default value: 2

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

ete.ETE_REVISION

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 1

ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x1`

`ete.NumberOfRSPairs`

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

`ete.PIDR_CMOD`

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

`ete.Q_CADENCE`

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

`ete.RES0_STATEFUL`

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

`ete.RETSTACK`

Return stack depth.

Type: `uint8_t`

Default value: 3

`ete.SIM_OVERFLOW_GRANULARITY`

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

`ete.SIM_OVERFLOW_PERCENTAGE`

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

ete.SOURCE_ADDRESS

Allow generation of source address elements.

Type: `bool`

Default value: false

ete.TRACE_OUTPUT

File to which to write trace byte stream.

Type: `string`

Default value: N/A

ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

ext_abort_so_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 2

force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

has_mt_pmu_disable_feature

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, `0xF`: The feature is disabled and is represented by value `0xF` in ID_AA64DFR0_EL1.MTPMU.

Type: `uint8_t`

Default value: 0

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`has_v8_7_spe_inverted_filtering`

Where FEAT_SPEv1p2 is implemented, whether inverted filtering by events is implemented (represented by PMISDR.FnE).

Type: `bool`

Default value: false

`has_v8_7_spe_previous_branch_target`

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented (FEAT_SPE_PBT).

Type: `bool`

Default value: false

`icache-hit_latency`

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`icache-maintenance_latency`

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`icache-miss_latency`

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`icache-prefetch_enabled`

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-state_modelled

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

l3cache-mpamf.max_partid_ns

Maximum value of non-secure PARTID supported for DSU L3Cache. Options are 7 or 63.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 63

l3cache-size

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

log2_trace_buffer_alignment

Log2 of trace buffer alignment constraint for output buffer (0->1B ... 11->2Kib).

Type: `uint8_t`

Default value: 6

memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

mpamidr_has_force_ns

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

mpamidr_has_sdeflt

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

mpamidr_has_tidr

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clearvalues of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

`mpmm_accumulator_multiplier`

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

`num_nodes`

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

`pmu-num_counters`

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 31

`ptw_latency`

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`stage12_tlb_size`

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: `uint32_t`

Default value: `0x80`

`tcr_txsz_undersize_should_fault`

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`tlb_latency`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`tlbi_stall_enabled`

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

`treat_PAC_as_NOP`

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

`walk_cache_latency`

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

3.36 ARMC1ProCT

Defined in `LISA/ARMC1ProCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see Quality level definitions.

About ARMC1ProCT

The following example platforms are available:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- FVP_Base_C1-Pro
- EVS_Dhrystone_C1-Prox1
- SVP_Base_C1-Prox1

The following functionality is supported in this release:

- C1-SME2 is supported with the following limitations:
    - The arbitration and assignment logic is not supported.
    - RAS error handling is supported in the first CME only.
    - The C1-SME2 auxiliary AMU counters are not supported.
    - It is assumed that C1-SME2 units are operating in dynamic mode, with a minimum power mode of OFF. Accompanying PPU registers may be read or written to, but they do not determine the behavior of the CME. The PPU interrupt signal for the C1-SME2 is also not modeled or exposed at this time.
- Pilatus DSU support for C1-SME2.
- L2Cache is supported at the per-core level only.
- BROADCASTPERSIST pin is implemented.
- Optional peripheral port is supported.
- L3Cache partition is supported.
- Per-core clock is supported.

Limitations

The following features are not yet supported, and will be added in a future release:

- No support for transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols yet.
- BROADCASTCACHEMAINTPOU pin is not implemented.
- COREINSTRRET signals are not implemented.
- MEM_RET power mode is not supported.

The following features are not implemented:

- DynamIQ features that are negligible to the programmers' view simulation will not be implemented in the Fast Model.
- 256-bit wide output transactions will not be supported.
- Error correction/detection features will not be supported.
- Self-test features (MBIST) will not be supported.
- Latency configuration will not be supported.
- Snoop filtering will not be supported.
- Cache stashing capability will not be supported.

Iris and MTI instances for ARMC1ProCT

This model has the following Iris instances:

Name	Instance type
ARMC1ProCT	Cluster_ARM_C1-Pro
ARMC1ProCT.AMU	PVBusLogger
ARMC1ProCT.AMU.mapper	PVBusMapper
ARMC1ProCT.DAP	PVBusLogger
ARMC1ProCT.DAP.mapper	PVBusMapper
ARMC1ProCT.DSU	C1-DSU
ARMC1ProCT.DSU.PPU_cluster	PPUv1
ARMC1ProCT.DSU.PPU_cluster.busslave	PVBusSlave
ARMC1ProCT.DSU.PPU_core0	PPUv1
ARMC1ProCT.DSU.PPU_core0.busslave	PVBusSlave
ARMC1ProCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1ProCT.DSU.mpam_busslave	PVBusSlave
ARMC1ProCT.DSU.shared_cache	PVCache
ARMC1ProCT.DSU.shared_cache.upstream[Y] (where *Y* = 0–4)	PVBusSlave
ARMC1ProCT.DSU.utility_slave[0]	PVBusSlave
ARMC1ProCT.MMAP	PVBusLogger
ARMC1ProCT.MMAP.mapper	PVBusMapper
ARMC1ProCT.RAS	PVBusLogger
ARMC1ProCT.RAS.mapper	PVBusMapper
ARMC1ProCT.cpu0	ARM_C1-Pro
ARMC1ProCT.cpu0.UTLB	TLB
ARMC1ProCT.cpu0.debug_rom	debug_rom
ARMC1ProCT.cpu0.dtlb	TLB
ARMC1ProCT.cpu0.l1dcache	PVCache
ARMC1ProCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMC1ProCT.cpu0.l1icache	PVCache
ARMC1ProCT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMC1ProCT.cpu0.l2cache	PVCache
ARMC1ProCT.cpu0.l2cache.upstream[U] (where *U* = 0–1)	PVBusSlave
ARMC1ProCT.ext_bus	PVBusLogger
ARMC1ProCT.ext_bus.mapper	PVBusMapper
ARMC1ProCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMC1ProCT.global_debug_rom	debug_rom
ARMC1ProCT.secondary_debug_rom	debug_rom
ARMC1ProCT.sve	ScalableVectorExtension

This model has the following MTI trace components:

ARMC1ProCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMC1ProCT.cpu0.l1icache	PVCache
ARMC1ProCT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMC1ProCT.cpu0.l2cache	PVCache
ARMC1ProCT.cpu0.l2cache.upstream[U] (where *U* = 0–1)	PVBusSlave
ARMC1ProCT.ext_bus	PVBusLogger
ARMC1ProCT.ext_bus.mapper	PVBusMapper
ARMC1ProCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

Ports for ARMC1ProCT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_ pcsm_pchannel	master	PChannel	Cluster PCSM signal
cluster_ powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
cme_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cmeerrirq	master	Signal	RAS cme err irq
cmefaultirq	master	Signal	RAS cme fault irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsm_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	slave	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_ redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_ cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_cme_irq	master	Signal	PPU CME interrupt
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus subordinate
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMC1ProCT

`cpuX.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`cpuX.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`cpuX.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

cpuX.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

cpuX.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

cpuX.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

cpuX.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

cpuX.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

cpuX.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

cpuX.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

cpuX.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x0`

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

DSU.cme.CMECFR

Value of CMECFR_EL1 fields (ECC, CHI) for all CMEs.

Type: `string`

Default value: “{"ECC": 0, "CHI": 0}”

DSU.cme.mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

DSU.cme.power_on_by_default

If true, CME PPUs will initialize in Dynamic mode out of reset, enabling the CME to power itself on/off automatically as it is used.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

NUM_CMES

Defines how many CMEs are associated with each cluster. This parameter must be in sync with SVE.ScalableVectorExtension SME configuration.

Type: `uint8_t`

Default value: 0

NUM_CORES

Number of cores per cluster.

Type: `uint8_t`

Default value: 1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

core_cache_protection

core_cache_protection can change ERR0FR, ERR0PFGF and ERR0PFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: 1

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-state_modelled

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be

used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`dcache-write_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`default_opmode`

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

Type: `uint8_t`

Default value: 4

`diagnostics`

Enable DynamIQ diagnostic messages.

Type: `bool`

Default value: false

`enable_simulation_performance_optimizations`

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

`ete.CLAIMTAGS`

Number of claim tags.

Type: `uint8_t`

Default value: 4

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ete.ETE_REVISION`

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 1

`ete.MAX_INST_PER_Q`

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

`ete.NumberOfRSPairs`

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

`ete.PIDR_CMOD`

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

`ete.PIDR_REVAND`

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

`ete.PIDR_REVISION`

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

`ete.Q_CADENCE`

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ete.RES0_STATEFUL`

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

`ete.RETSTACK`

Return stack depth.

Type: `uint8_t`

Default value: 1

`ete.REVISION`

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 1

`ete.SIM_OVERFLOW_GRANULARITY`

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

`ete.SIM_OVERFLOW_PERCENTAGE`

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

`ete.SOURCE_ADDRESS`

Allow generation of source address elements.

Type: `bool`

Default value: false

`ete.TRACE_OUTPUT`

File to which to write trace byte stream.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

ete.TSMARK

Whether timestamp markers are supported.

Type: `bool`

Default value: true

force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

icache-state_modelled

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

l3cache-has_mpam

L3 Cache has MPAM support.

Type: `bool`

Default value: true

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-mpamf.max_partid_ns

Maximum value of non-secure PARTID supported for DSU L3Cache. Options are 7 or 63.

Type: `uint8_t`

Default value: 63

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-size

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 16

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

pmu-num_counters

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ptw_latency`

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`scu_cache_protection`

SCU-L3 is configured with ECC if true.

Type: `bool`

Default value: true

`stage12_tlb_size`

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: `uint32_t`

Default value: `0x80`

`tlb_latency`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`tlbi_stall_enabled`

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

`treat_PAC_as_NOP`

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

3.37 ARMC1ProCT_C1UltraCT

Defined in `LISA/ARMC1ProCT_C1UltraCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
C1-Pro r0p0	Preliminary support
C1Ultra r0p0	Preliminary support

For an explanation of the quality levels, see Quality level definitions.

About ARMC1ProCT_C1UltraCT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-13 (ARMC1ProCT).

subcluster1.NUM_CORES

Possible values are 1-13 (ARMC1UltraCT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>`[0-12] for cores in `subcluster0`.
- `<port_name>`[13-25] for cores in `subcluster1`.

Note

All instances in the Master cross trigger matrix port array, `cti[26]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu12` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu12` identify cores in `subcluster1`.

For information about the cores in this model, see:

Iris and MTI instances for ARMC1ProCT_C1UltraCT

This model has the following Iris instances:

Name	Instance type
ARMC1ProCT_C1UltraCT	Cluster_ARM_C1_PRO_C1-ULTRA_Heterogeneous
ARMC1ProCT_C1UltraCT.AMU	PVBusLogger
ARMC1ProCT_C1UltraCT.AMU.mapper	PVBusMapper
ARMC1ProCT_C1UltraCT.DAP	PVBusLogger
ARMC1ProCT_C1UltraCT.DAP.mapper	PVBusMapper
ARMC1ProCT_C1UltraCT.DSU	C1-DSU
ARMC1ProCT_C1UltraCT.DSU.PPU_cluster	PPUv1
ARMC1ProCT_C1UltraCT.DSU.PPU_cluster.busslave	PVBusSlave
ARMC1ProCT_C1UltraCT.DSU.PPU_coreZ (where *Z* = 0–1)	PPUv1
ARMC1ProCT_C1UltraCT.DSU.PPU_coreZ.busslave (where *Z* = 0–1)	PVBusSlave
ARMC1ProCT_C1UltraCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1ProCT_C1UltraCT.DSU.mpam_busslave	PVBusSlave
ARMC1ProCT_C1UltraCT.DSU.shared_cache	PVCache
ARMC1ProCT_C1UltraCT.DSU.shared_cache.upstream[Z] (where *Z* = 0–6)	PVBusSlave
ARMC1ProCT_C1UltraCT.DSU.utility_slave[0]	PVBusSlave
ARMC1ProCT_C1UltraCT.MMAP	PVBusLogger
ARMC1ProCT_C1UltraCT.MMAP.mapper	PVBusMapper
ARMC1ProCT_C1UltraCT.RAS	PVBusLogger
ARMC1ProCT_C1UltraCT.RAS.mapper	PVBusMapper
ARMC1ProCT_C1UltraCT.cpuZ.debug_rom (where *Z* = 0–1)	debug_rom
ARMC1ProCT_C1UltraCT.ext_bus	PVBusLogger
ARMC1ProCT_C1UltraCT.ext_bus.mapper	PVBusMapper
ARMC1ProCT_C1UltraCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMC1ProCT_C1UltraCT.global_debug_rom	debug_rom
ARMC1ProCT_C1UltraCT.secondary_debug_rom	debug_rom
ARMC1ProCT_C1UltraCT.subcluster0	Subcluster_ARM_C1-Pro
ARMC1ProCT_C1UltraCT.subcluster0.cpu0	ARM_C1-Pro
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.UTLB (where *Z* = 0–1)	TLB
ARMC1ProCT_C1UltraCT.subclusterZ.cpuU.dtlb (where *Z* = 0–1; *U* = 0–1)	TLB
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l1dcache (where *Z* = 0–1)	PVCache
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l1dcache.upstream[0] (where *Z* = 0–1)	PVBusSlave
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l1icache (where *Z* = 0–1)	PVCache
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l1icache.upstream[0] (where *Z* = 0–1)	PVBusSlave

Name	Instance type
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l2cache (where *Z* = 0–1)	PVCache
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l2cache.upstream[W] (where *Z* = 0–1; *W* = 0–1)	PVBusSlave
ARMC1ProCT_C1UltraCT.subclusterZ.sve (where *Z* = 0–1)	ScalableVectorExtension
ARMC1ProCT_C1UltraCT.subcluster1	Subcluster_ARM_C1-Ultra
ARMC1ProCT_C1UltraCT.subcluster1.cpu0	ARM_C1-Ultra

This model has the following MTI trace components:

Name	Component type
ARMC1ProCT_C1UltraCT.AMU	PVBusLogger
ARMC1ProCT_C1UltraCT.AMU.mapper	PVBusMapper
ARMC1ProCT_C1UltraCT.DAP	PVBusLogger
ARMC1ProCT_C1UltraCT.DAP.mapper	PVBusMapper
ARMC1ProCT_C1UltraCT.DSU	C1-DSU
ARMC1ProCT_C1UltraCT.DSU.PPU_cluster	PPUv1
ARMC1ProCT_C1UltraCT.DSU.PPU_cluster.busslave	PVBusSlave
ARMC1ProCT_C1UltraCT.DSU.PPU_coreZ (where *Z* = 0–1)	PPUv1
ARMC1ProCT_C1UltraCT.DSU.PPU_coreZ.busslave (where *Z* = 0–1)	PVBusSlave
ARMC1ProCT_C1UltraCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1ProCT_C1UltraCT.DSU.mpam_busslave	PVBusSlave
ARMC1ProCT_C1UltraCT.DSU.shared_cache	PVCache
ARMC1ProCT_C1UltraCT.DSU.shared_cache.upstream[Z] (where *Z* = 0–6)	PVBusSlave
ARMC1ProCT_C1UltraCT.DSU.utility_slave[0]	PVBusSlave
ARMC1ProCT_C1UltraCT.MMAP	PVBusLogger
ARMC1ProCT_C1UltraCT.MMAP.mapper	PVBusMapper
ARMC1ProCT_C1UltraCT.RAS	PVBusLogger
ARMC1ProCT_C1UltraCT.RAS.mapper	PVBusMapper
ARMC1ProCT_C1UltraCT.ext_bus	PVBusLogger
ARMC1ProCT_C1UltraCT.ext_bus.mapper	PVBusMapper
ARMC1ProCT_C1UltraCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMC1ProCT_C1UltraCT.subcluster0.cpu0	ARM_C1-Pro
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.UTLB (where *Z* = 0–1)	TLB
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l1dcache (where *Z* = 0–1)	PVCache
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l1dcache.upstream[0] (where *Z* = 0–1)	PVBusSlave
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l1icache (where *Z* = 0–1)	PVCache
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l1icache.upstream[0] (where *Z* = 0–1)	PVBusSlave
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l2cache (where *Z* = 0–1)	PVCache
ARMC1ProCT_C1UltraCT.subclusterZ.cpu0.l2cache.upstream[W] (where *Z* = 0–1; *W* = 0–1)	PVBusSlave
ARMC1ProCT_C1UltraCT.subcluster1.cpu0	ARM_C1-Ultra

Ports for ARMC1ProCT_C1UltraCT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
cme_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cmeerrirq	master	Signal	RAS cme err irq

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
cmefaultirq	master	Signal	RAS cme fault irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsm_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	slave	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_ cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_cme_irq	master	Signal	PPU CME interrupt
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus subordinate
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMC1ProCT_C1UltraCT

`AEND0_DEFAULT`

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x0`

`CMO_broadcast_when_cache_state_modelling_disabled`

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

`GICDISABLE`

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

`NUM_CMES`

Defines how many CMEs are associated with each cluster. This parameter must be in sync with SVE.ScalableVectorExtension SME configuration.

Type: `uint8_t`

Default value: 0

`bus_type`

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

`core_power_on_by_default`

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

dcache-state_modelled

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

Type: `uint8_t`

Default value: 4

diagnostics

Enable DynamIQ diagnostic messages.

Type: `bool`

Default value: false

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

icache-state_modelled

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-has_mpam

L3 Cache has MPAM support.

Type: `bool`

Default value: true

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-mpamf.max_partid_ns

Maximum value of non-secure PARTID supported for DSU L3Cache. Options are 7 or 63.

Type: `uint8_t`

Default value: 63

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-size

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 16

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

`l3cache-write_latency`

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`mpmm_accumulator_multiplier`

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

`scu_cache_protection`

SCU-L3 is configured with ECC if true.

Type: `bool`

Default value: true

`subcluster0.CPUCFR`

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.NUM_CORES`

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

`subcluster0.core_cache_protection`

core_cache_protection can change ERR0FR, ERR0PFGF and ERR0PFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster0.cpu0.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu0.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster0.cpu0.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu0.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster0.cpu0.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster0.cpu0.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster0.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu0.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu0.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu0.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu0.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu0.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu0.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu0.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster0.cpu0.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu0.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu0.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu0.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu0.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu0.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster0.cpu0.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu0.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu0.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu1.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu1.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster0.cpu1.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu1.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu1.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster0.cpu1.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster0.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu1.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu1.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu1.semihosting-T32_HLT`
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu1.semihosting-Thumb_SVC`
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu1.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu1.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu1.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu1.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu1.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu1.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu1.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu1.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu1.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu10.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu10.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster0.cpu10.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu10.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu10.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster0.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster0.cpu10.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu10.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu10.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu10.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu10.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu10.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu10.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu10.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu10.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Non-Confidential

subcluster0.cpu10.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu10.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu10.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu10.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu10.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

`subcluster0.cpu11.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster0.cpu11.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`subcluster0.cpu11.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster0.cpu11.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu11.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster0.cpu11.force-fpsid`

Override the FPSID value.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu11.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100000`

subcluster0.cpu11.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu11.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

`subcluster0.cpu11.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu11.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu11.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu11.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu11.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu11.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu11.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu11.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu11.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu11.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu11.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu11.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu11.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu11.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster0.cpu11.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster0.cpu12.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster0.cpu12.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`subcluster0.cpu12.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster0.cpu12.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu12.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster0.cpu12.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster0.cpu12.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster0.cpu12.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu12.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu12.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu12.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu12.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu12.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu12.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu12.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster0.cpu12.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu12.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu12.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu12.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu12.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu12.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu12.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster0.cpu12.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu12.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu12.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu2.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu2.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster0.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu2.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu2.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster0.cpu2.force-fpsid`

Override the FPSID value.

Type: `bool`

Default value: true

`subcluster0.cpu2.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu2.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu2.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu2.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu2.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu2.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu2.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu2.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu2.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu2.semihosting-heap_limit`

Virtual address of top of heap.

`subcluster0.cpu3.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`subcluster0.cpu3.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster0.cpu3.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu3.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster0.cpu3.force-fpsid`

Override the FPSID value.

Type: `bool`

Default value: true

`subcluster0.cpu3.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu3.l2cache-maintenance_latency`

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu3.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu3.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu3.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu3.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu3.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu3.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu3.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu3.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu3.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Non-Confidential

subcluster0.cpu3.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu3.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu3.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu3.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu3.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu4.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu4.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster0.cpu4.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu4.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Default value: `0x0`

subcluster0.cpu4.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100000`

subcluster0.cpu4.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu4.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`subcluster0.cpu4.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu4.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu4.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu4.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu4.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu4.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu4.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu4.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu4.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu4.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu4.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu4.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu4.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu4.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu5.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu5.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster0.cpu5.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu5.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster0.cpu5.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster0.cpu5.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

Non-Confidential

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster0.cpu5.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Non-Confidential

subcluster0.cpu5.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu5.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu5.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu5.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu5.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu5.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu5.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster0.cpu5.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu5.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu5.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu5.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu5.semihosting-stack_base
Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu5.semihosting-stack_limit
Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster0.cpu5.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu5.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu5.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu6.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu6.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster0.cpu6.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu6.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu6.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster0.cpu6.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu6.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu6.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu6.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu6.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu6.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu6.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.semihosting-heap_limit
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu6.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu6.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu6.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu6.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu7.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster0.cpu7.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu7.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu7.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster0.cpu7.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.cpu7.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu7.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu7.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu7.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu7.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu7.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu7.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu7.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu7.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu7.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu7.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu7.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu8.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu8.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster0.cpu8.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu8.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu8.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

`subcluster0.cpu8.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu8.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu8.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu8.l2cache-read_access_latency`

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu8.l2cache-read_latency`

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu8.l2cache-size`

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100000`

subcluster0.cpu8.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu8.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

subcluster0.cpu8.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu8.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu8.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu8.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu8.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu8.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu8.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu8.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu8.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu8.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu8.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu8.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu8.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster0.cpu8.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster0.cpu9.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster0.cpu9.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`subcluster0.cpu9.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster0.cpu9.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu9.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster0.cpu9.force-fpsid

Override the FPSID value.

Type: `bool`

Default value: true

subcluster0.cpu9.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

subcluster0.cpu9.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu9.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu9.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu9.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu9.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu9.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

`subcluster0.cpu9.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu9.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu9.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu9.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu9.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu9.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu9.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster0.cpu9.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu9.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

subcluster0.ete.ETE_REVISION

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 1

subcluster0.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

subcluster0.ete.NumberOfRSPairs

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

subcluster0.ete.PIDR_CMOD

TRCPIDR CMOD value.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

subcluster0.ete.PIDR_REVAND

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.PIDR_REVISION

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

subcluster0.ete.RES0_STATEFUL

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

subcluster0.ete.RETSTACK

Return stack depth.

Type: `uint8_t`

Default value: 1

subcluster0.ete.REVISION

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 1

subcluster0.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x64`

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

subcluster0.ete.SOURCE_ADDRESS

Allow generation of source address elements.

Type: `bool`

Default value: false

subcluster0.ete.TRACE_OUTPUT

File to which to write trace byte stream.

Type: `string`

Default value: N/A

subcluster0.ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

subcluster0.ete.TSMARK

Whether timestamp markers are supported.

Type: `bool`

Default value: true

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

subcluster0.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

subcluster0.has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

subcluster0.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

subcluster0.has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

subcluster0.instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

subcluster0.invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

subcluster0.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

subcluster0.pmu-num_counters

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster0.stage12_tlb_size

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x80`

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

subcluster0.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster1.CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x1`

subcluster1.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster1.cpu0.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu0.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu0.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu0.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`subcluster1.cpu0.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.l2cache-read_access_latency`

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.l2cache-read_latency`

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu0.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu0.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu0.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu0.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu0.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu0.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu0.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu0.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

`subcluster1.cpu0.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu0.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu0.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu0.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu0.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu0.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster1.cpu0.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu0.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu0.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu1.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu1.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu1.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu1.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu1.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Non-Confidential

subcluster1.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.cpu1.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu1.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu1.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu1.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster1.cpu1.semihosting-Thumb_SVC`
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu1.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu1.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu1.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu1.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu1.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu1.semihosting-stack_base`
Virtual address of base of descending stack.

Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu1.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu1.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu1.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu10.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu10.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster1.cpu10.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu10.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu10.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 8

subcluster1.cpu10.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu10.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu10.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu10.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu10.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu10.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu10.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu10.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu10.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu10.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu10.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu10.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu10.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu10.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu10.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu10.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster1.cpu10.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu11.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu11.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu11.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu11.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu11.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu11.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu11.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu11.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu11.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu11.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu11.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu11.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu11.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu11.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu11.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu11.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu11.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu11.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu11.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu11.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu11.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu11.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu11.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu11.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster1.cpu11.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu12.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu12.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu12.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu12.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu12.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x80000`

subcluster1.cpu12.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu12.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu12.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster1.cpu12.min_sync_level
Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu12.semihosting-A32_HLT
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu12.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu12.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu12.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu12.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu12.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster1.cpu12.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu12.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu12.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu12.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu12.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu12.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu12.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu12.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu12.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu2.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu2.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu2.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu2.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu2.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Default value: `0x0`

subcluster1.cpu2.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu2.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu2.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Default value: `0x0`

subcluster1.cpu2.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu2.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu2.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu2.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu2.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu2.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu2.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 171

subcluster1.cpu2.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu2.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu2.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu2.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu2.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu2.semihosting-stack_limit

Virtual address of stack limit.

Non-Confidential

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu2.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu2.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu2.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu3.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu3.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu3.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`subcluster1.cpu3.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu3.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster1.cpu3.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu3.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu3.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu3.l2cache-read_access_latency`

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Default value: `0x0`

subcluster1.cpu3.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu3.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu3.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu3.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu3.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu3.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu3.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu3.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu3.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu3.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu3.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu3.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu3.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu3.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu3.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu3.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu4.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu4.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu4.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu4.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu4.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu4.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu4.l2cache-ways
L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu4.l2cache-write_access_latency
L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.l2cache-write_latency
L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.max_code_cache_mb
Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu4.min_sync_level
Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu4.semihosting-A32_HLT
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu4.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu4.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu4.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu4.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu4.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu4.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu4.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu4.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu4.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu4.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu4.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu4.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu4.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu4.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster1.cpu5.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu5.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu5.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu5.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu5.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu5.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu5.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.cpu5.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu5.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu5.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

`subcluster1.cpu5.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu5.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu5.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu5.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu5.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu5.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu5.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster1.cpu5.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu5.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu5.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu5.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu5.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu5.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu5.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu6.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu6.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu6.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu6.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster1.cpu6.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Non-Confidential

subcluster1.cpu6.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu6.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu6.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpu6.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu6.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu6.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu6.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu6.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu6.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu6.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster1.cpu6.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu6.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu6.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu6.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu6.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu6.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu6.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

subcluster1.cpu6.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu6.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu6.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu7.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu7.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu7.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu7.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu7.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.cpu7.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu7.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu7.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu7.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu7.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu7.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu7.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster1.cpu7.semihosting-Thumb_SVC`
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu7.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu7.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu7.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu7.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu7.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu7.semihosting-stack_base`
Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu7.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu7.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu7.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu7.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster1.cpu8.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu8.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu8.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu8.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu8.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu8.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu8.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 8

subcluster1.cpu8.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu8.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu8.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu8.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu8.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu8.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster1.cpu8.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu8.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu8.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu8.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu8.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu8.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu8.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu8.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster1.cpu8.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster1.cpu8.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`subcluster1.cpu8.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`subcluster1.cpu8.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu9.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

subcluster1.cpu9.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu9.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu9.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu9.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster1.cpu9.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu9.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.semihosting-A32_HLT
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu9.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu9.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu9.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu9.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu9.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu9.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu9.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu9.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu9.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu9.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu9.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu9.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu9.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`subcluster1.cpu9.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`subcluster1.dcache-hit_latency`

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.dcache-maintenance_latency`

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.dcache-miss_latency`

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.dcache-prefetch_enabled`

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

`subcluster1.dcache-read_access_latency`

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.ecv_support_level

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

Type: `uint8_t`

Default value: 2

subcluster1.ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

subcluster1.ete.ETE_REVISION

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 1

subcluster1.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

subcluster1.ete.NumberOfRSPairs

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

subcluster1.ete.PIDR_CMOD

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

subcluster1.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0x1`

subcluster1.ete.RES0_STATEFUL

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

subcluster1.ete.RETSTACK

Return stack depth.

Type: `uint8_t`

Default value: 3

subcluster1.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

subcluster1.ete.SOURCE_ADDRESS

Allow generation of source address elements.

Type: `bool`

Default value: false

subcluster1.ete.TRACE_OUTPUT

File to which to write trace byte stream.

Type: `string`

Default value: N/A

subcluster1.ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

`subcluster1.ext_abort_so_write_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 2

`subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks`

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

`subcluster1.force_zero_PSTATE_PAN`

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

`subcluster1.force_zero_mpam_partid_and_pmg`

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

`subcluster1.has_enhanced_pan`

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

subcluster1.has_mt_pmu_disable_feature

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, `0xF`: The feature is disabled and is represented by value `0xF` in ID_AA64DFR0_EL1.MTPMU.

Type: `uint8_t`

Default value: 0

subcluster1.has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type: `bool`

Default value: true

subcluster1.has_v8_7_spe_inverted_filtering

Where FEAT_SPEv1p2 is implemented, whether inverted filtering by events is implemented (represented by PMISDR.FnE).

Type: `bool`

Default value: false

subcluster1.has_v8_7_spe_previous_branch_target

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented (FEAT_SPE_PBT).

Type: `bool`

Default value: false

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.icache-size

L1 I-Cache size in bytes.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x10000`

subcluster1.instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

subcluster1.invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

subcluster1.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

subcluster1.mpamidr_has_force_ns

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

subcluster1.mpamidr_has_sdeflt

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

subcluster1.mpamidr_has_tidr

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clearvalues of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

subcluster1.pmu-num_counters

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 31

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster1.stage12_tlb_size

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: `uint32_t`

Default value: `0x80`

subcluster1.tcr_txsz_undersize_should_fault

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

Type: `bool`

Default value: false

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster1.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

3.38 ARMC1UltraCT

Defined in `LISA/ARMC1UltraCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see Quality level definitions.

About ARMC1UltraCT

The following example platforms are available:

- FVP_Base_C1-Ultra
- EVS_Dhrystone_C1-Ultrax1
- SVP_Base_C1-Ultrax1

The following functionality is supported in this release:

- C1-SME2 is supported with the following limitations:
    - The arbitration and assignment logic is not supported.
    - RAS error handling is supported in the first CME only.
    - The C1-SME2 auxiliary AMU counters are not supported.
    - It is assumed that C1-SME2 units are operating in dynamic mode, with a minimum power mode of OFF. Accompanying PPU registers may be read or written to, but they do not determine the behavior of the CME. The PPU interrupt signal for the C1-SME2 is also not modeled or exposed at this time.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- Pilatus DSU support for C1-SME2.
- L2Cache is supported at the per-core level only.
- BROADCASTPERSIST pin is implemented.
- Optional peripheral port is supported.
- L3Cache partition is supported.
- Per-core clock is supported.

Limitations

The following features are not yet supported, and will be added in a future release:

- No support for transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols yet.
- BROADCASTCACHEMAINTPOU pin is not implemented.
- COREINSTRRET signals are not implemented.
- MEM_RET power mode is not supported.

The following features are not implemented:

- DynamIQ features that are negligible to the programmers' view simulation will not be implemented in the Fast Model.
- 256-bit wide output transactions will not be supported.
- Error correction/detection features will not be supported.
- Self-test features (MBIST) will not be supported.
- Latency configuration will not be supported.
- Snoop filtering will not be supported.
- Cache stashing capability will not be supported.

Iris and MTI instances for ARMC1UltraCT

This model has the following Iris instances:

Name	Instance type
`ARMC1UltraCT`	Cluster_ARM_C1-Ultra
`ARMC1UltraCT.AMU`	PVBusLogger
`ARMC1UltraCT.AMU.mapper`	PVBusMapper
`ARMC1UltraCT.DAP`	PVBusLogger
`ARMC1UltraCT.DAP.mapper`	PVBusMapper
`ARMC1UltraCT.DSU`	C1-DSU
`ARMC1UltraCT.DSU.PPU_cluster`	PPUv1
`ARMC1UltraCT.DSU.PPU_cluster.busslave`	PVBusSlave
`ARMC1UltraCT.DSU.PPU_core0`	PPUv1
`ARMC1UltraCT.DSU.PPU_core0.busslave`	PVBusSlave

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
ARMC1UltraCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1UltraCT.DSU.mpam_busslave	PVBusSlave
ARMC1UltraCT.DSU.shared_cache	PVCache
ARMC1UltraCT.DSU.shared_cache.upstream[Y] (where *Y* = 0–4)	PVBusSlave
ARMC1UltraCT.DSU.utility_slave[0]	PVBusSlave
ARMC1UltraCT.MMAP	PVBusLogger
ARMC1UltraCT.MMAP.mapper	PVBusMapper
ARMC1UltraCT.RAS	PVBusLogger
ARMC1UltraCT.RAS.mapper	PVBusMapper
ARMC1UltraCT.cpu0	ARM_C1-Ultra
ARMC1UltraCT.cpu0.UTLB	TLB
ARMC1UltraCT.cpu0.debug_rom	debug_rom
ARMC1UltraCT.cpu0.dtlb	TLB
ARMC1UltraCT.cpu0.l1dcache	PVCache
ARMC1UltraCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMC1UltraCT.cpu0.l1icache	PVCache
ARMC1UltraCT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMC1UltraCT.cpu0.l2cache	PVCache
ARMC1UltraCT.cpu0.l2cache.upstream[U] (where *U* = 0–1)	PVBusSlave
ARMC1UltraCT.ext_bus	PVBusLogger
ARMC1UltraCT.ext_bus.mapper	PVBusMapper
ARMC1UltraCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMC1UltraCT.global_debug_rom	debug_rom
ARMC1UltraCT.secondary_debug_rom	debug_rom
ARMC1UltraCT.sve	ScalableVectorExtension

This model has the following MTI trace components:

Name	Component type
ARMC1UltraCT.AMU	PVBusLogger
ARMC1UltraCT.AMU.mapper	PVBusMapper
ARMC1UltraCT.DAP	PVBusLogger
ARMC1UltraCT.DAP.mapper	PVBusMapper
ARMC1UltraCT.DSU	C1-DSU
ARMC1UltraCT.DSU.PPU_cluster	PPUv1
ARMC1UltraCT.DSU.PPU_cluster.busslave	PVBusSlave
ARMC1UltraCT.DSU.PPU_core0	PPUv1
ARMC1UltraCT.DSU.PPU_core0.busslave	PVBusSlave
ARMC1UltraCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1UltraCT.DSU.mpam_busslave	PVBusSlave
ARMC1UltraCT.DSU.shared_cache	PVCache

Non-Confidential

Name	Component type
ARMC1UltraCT.DSU.shared_cache.upstream[Y] (where *Y* = 0–4)	PVBusSlave
ARMC1UltraCT.DSU.utility_slave[0]	PVBusSlave
ARMC1UltraCT.MMAP	PVBusLogger
ARMC1UltraCT.MMAP.mapper	PVBusMapper
ARMC1UltraCT.RAS	PVBusLogger
ARMC1UltraCT.RAS.mapper	PVBusMapper
ARMC1UltraCT.cpu0	ARM_C1-Ultra
ARMC1UltraCT.cpu0.UTLB	TLB
ARMC1UltraCT.cpu0.l1dcache	PVCache
ARMC1UltraCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMC1UltraCT.cpu0.l1icache	PVCache
ARMC1UltraCT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMC1UltraCT.cpu0.l2cache	PVCache
ARMC1UltraCT.cpu0.l2cache.upstream[U] (where *U* = 0–1)	PVBusSlave
ARMC1UltraCT.ext_bus	PVBusLogger
ARMC1UltraCT.ext_bus.mapper	PVBusMapper
ARMC1UltraCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

Ports for ARMC1UltraCT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
cme_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cmeerrirq	master	Signal	RAS cme err irq
cmefaultirq	master	Signal	RAS cme fault irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsm_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	slave	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_ redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_ cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_cme_irq	master	Signal	PPU CME interrupt
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a ‘visualisation' component, in order to display a running instruction count.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`trbirq`	master	Signal	Interrupt signal from the trace buffer unit.
`utility_bus_s`	slave	PVBus	Utility bus subordinate
`vcpumntirq`	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
`vfiq`	slave	Signal	Virtualised FIQ.
`virq`	slave	Signal	Virtualised IRQ.
`virtio_s`	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
`vsei`	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMC1UltraCT

`cpuX.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`cpuX.CFGTE`

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: false

`cpuX.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`cpuX.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`cpuX.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-size

L2 Cache size in bytes.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x80000`

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0x100`

cpuX.min_sync_level
Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

cpuX.semihosting-A32_HLT
A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

cpuX.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

cpuX.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

cpuX.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

cpuX.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

cpuX.semihosting-cmd_line
Command line available to semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `string`

Default value: N/A

`cpuX.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`cpuX.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`cpuX.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`cpuX.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`cpuX.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`cpuX.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`cpuX.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`cpuX.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`cpuX.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`AEND0_DEFAULT`

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND1_DEFAULT`

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND2_DEFAULT`

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: false

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x1`

DSU.cme.CMECFR

Value of CMECFR_EL1 fields (ECC, CHI) for all CMEs.

Type: `string`

Default value: “{"ECC": 0, "CHI": 0}”

DSU.cme.mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

DSU.cme.power_on_by_default

If true, CME PPUs will initialize in Dynamic mode out of reset, enabling the CME to power itself on/off automatically as it is used.

Type: `bool`

Default value: true

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

NUM_CMES

Defines how many CMEs are associated with each cluster. This parameter must be in sync with SVE.ScalableVectorExtension SME configuration.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

NUM_CORES

Number of cores per cluster.

Type: `uint8_t`

Default value: 1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x10000`

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-state_modelled

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

Type: `uint8_t`

Default value: 4

diagnostics

Enable DynamIQ diagnostic messages.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

ecv_support_level

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

Type: `uint8_t`

Default value: 2

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

ete.ETE_REVISION

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 1

ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

ete.NumberOfRSPairs

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ete.PIDR_CMOD
TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

ete.Q_CADENCE
Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

ete.RES0_STATEFUL
Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

ete.RETSTACK
Return stack depth.

Type: `uint8_t`

Default value: 3

ete.SIM_OVERFLOW_GRANULARITY
Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

ete.SIM_OVERFLOW_PERCENTAGE
Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

ete.SOURCE_ADDRESS
Allow generation of source address elements.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ete.TRACE_OUTPUT`

File to which to write trace byte stream.

Type: `string`

Default value: N/A

`ete.TRCRSRTA_FORCED_EXCEP`

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

`ext_abort_so_write_ras_type`

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 2

`force_mte_tag_access_razwi_and_ignore_tag_checks`

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

`force_zero_PSTATE_PAN`

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

`force_zero_mpam_partid_and_pmg`

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

has_mt_pmu_disable_feature

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, `0xF`: The feature is disabled and is represented by value `0xF` in ID_AA64DFR0_EL1.MTPMU.

Type: `uint8_t`

Default value: 0

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type: `bool`

Default value: true

has_v8_7_spe_inverted_filtering

Where FEAT_SPEv1p2 is implemented, whether inverted filtering by events is implemented (represented by PMISDR.FnE).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

has_v8_7_spe_previous_branch_target

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented (FEAT_SPE_PBT).

Type: `bool`

Default value: false

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

icache-state_modelled

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

l3cache-mpamf.max_partid_ns

Maximum value of non-secure PARTID supported for DSU L3Cache. Options are 7 or 63.

Type: `uint8_t`

Default value: 63

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-size

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

log2_trace_buffer_alignment

Log2 of trace buffer alignment constraint for output buffer (0->1B ... 11->2Kib).

Type: `uint8_t`

Default value: 6

memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

mpamidr_has_force_ns

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

mpamidr_has_sdeflt

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

mpamidr_has_tidr

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clearvalues of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`mpmm_accumulator_multiplier`

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

`num_nodes`

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

`pmu-num_counters`

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 31

`ptw_latency`

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

`stage12_tlb_size`

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: `uint32_t`

Default value: `0x80`

`tcr_txsz_undersize_should_fault`

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

3.39 ARMCortexA320CT

Defined in `LISA/ARMCortexA320CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see Quality level definitions.

Changes in 11.30.27

The following ports were added:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- `cluster_ppu_hw_stat`
- `complex_pcsm_pchannel`
- `core_ppu_hw_stat`
- `coreinstrrun`
- `ppu_cluster_isolate`
- `ppu_core_isolate`

About ARMCortexA320CT

The number of cores currently supported is 1,2,4. The following example platforms are available:

- FVP_Base_Cortex-A320
- EVS_Dhrystone_Cortex-A320x1
- SVP_Base_Cortex-A320x1

Limitations

The following features are not yet supported, and will be added in a future release:

- No support for transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols yet.
- No support for Core-Complex yet.
- BROADCASTCACHEMAINTPOU pin is not implemented.
- COREINSTRRET signals are not implemented.
- MEM_RET power mode is not supported.

The following features are not supported in this or future releases:

- DynamIQ features that are negligible to the programmers view simulation.
- 256-bit wide output transactions.
- Error correction/detection features.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Cache stashing capability.

Iris and MTI instances for ARMCortexA320CT

This model has the following Iris instances:

Name	Instance type
`ARMCortexA320CT`	Cluster_ARM_Cortex-A320
`ARMCortexA320CT.AMU`	PVBusLogger
`ARMCortexA320CT.AMU.mapper`	PVBusMapper

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
ARMCortexA320CT.DAP	PVBusLogger
ARMCortexA320CT.DAP.mapper	PVBusMapper
ARMCortexA320CT.DSU	DSU-120
ARMCortexA320CT.DSU.PPU_cluster	PPUv1
ARMCortexA320CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA320CT.DSU.PPU_core0	PPUv1
ARMCortexA320CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA320CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA320CT.DSU.shared_cache	PVCache
ARMCortexA320CT.DSU.shared_cache.upstream[Y] (where *Y* = 0–4)	PVBusSlave
ARMCortexA320CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA320CT.MMAP	PVBusLogger
ARMCortexA320CT.MMAP.mapper	PVBusMapper
ARMCortexA320CT.RAS	PVBusLogger
ARMCortexA320CT.RAS.mapper	PVBusMapper
ARMCortexA320CT.cpu0	ARM_Cortex-A320
ARMCortexA320CT.cpu0.UTLB	TLB
ARMCortexA320CT.cpu0.debug_rom	debug_rom
ARMCortexA320CT.cpu0.dtlb	TLB
ARMCortexA320CT.cpu0.l1dcache	PVCache
ARMCortexA320CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA320CT.cpu0.l1icache	PVCache
ARMCortexA320CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA320CT.ext_bus	PVBusLogger
ARMCortexA320CT.ext_bus.mapper	PVBusMapper
ARMCortexA320CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA320CT.global_debug_rom	debug_rom
ARMCortexA320CT.l2_cache	PVCache
ARMCortexA320CT.l2_cache.upstream[Z] (where *Z* = 0–16)	PVBusSlave
ARMCortexA320CT.secondary_debug_rom	debug_rom
ARMCortexA320CT.sve	ScalableVectorExtension

This model has the following MTI trace components:

Name	Component type
ARMCortexA320CT.AMU	PVBusLogger
ARMCortexA320CT.AMU.mapper	PVBusMapper
ARMCortexA320CT.DAP	PVBusLogger
ARMCortexA320CT.DAP.mapper	PVBusMapper
ARMCortexA320CT.DSU	DSU-120
ARMCortexA320CT.DSU.PPU_cluster	PPUv1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Component type
ARMCortexA320CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA320CT.DSU.PPU_core0	PPUv1
ARMCortexA320CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA320CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA320CT.DSU.shared_cache	PVCache
ARMCortexA320CT.DSU.shared_cache.upstream[Y] (where *Y* = 0–4)	PVBusSlave
ARMCortexA320CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA320CT.MMAP	PVBusLogger
ARMCortexA320CT.MMAP.mapper	PVBusMapper
ARMCortexA320CT.RAS	PVBusLogger
ARMCortexA320CT.RAS.mapper	PVBusMapper
ARMCortexA320CT.cpu0	ARM_Cortex-A320
ARMCortexA320CT.cpu0.UTLB	TLB
ARMCortexA320CT.cpu0.l1dcache	PVCache
ARMCortexA320CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA320CT.cpu0.l1icache	PVCache
ARMCortexA320CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA320CT.ext_bus	PVBusLogger
ARMCortexA320CT.ext_bus.mapper	PVBusMapper
ARMCortexA320CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA320CT.l2_cache	PVCache
ARMCortexA320CT.l2_cache.upstream[Z] (where *Z* = 0–16)	PVBusSlave

Ports for ARMCortexA320CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
complex_pcsm_pchannel	master	PChannel	Complex PCSM signals
complexerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
complexfaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsm_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	slave	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_ redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_ cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain

Port	Direction	Protocol	Description
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus subordinate
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMCortexA320CT

`cpuX.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`cpuX.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`cpuX.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`cpuX.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`cpuX.max_code_cache_mb`

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

`cpuX.min_sync_level`

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

`cpuX.semihosting-A32_HLT`

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`cpuX.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`cpuX.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`cpuX.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`cpuX.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

cpuX.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

cpuX.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

cpuX.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000000`

`cpuX.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

`cpuX.vfp-enable_at_reset`

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

`cpuX.vfp-present`

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

`AEND0_DEFAULT`

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND1_DEFAULT`

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

`AEND2_DEFAULT`

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

`BROADCASTCACHEMAINT`

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: false

`BROADCASTOUTER`

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: false

`BROADCASTPERSIST`

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

`CLUSTER_ID`

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

`CMO_broadcast_when_cache_state_modelling_disabled`

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 1

`CPUCFR`

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x80000`

`DBGROMADDR`

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: `0x0`

`DBGROMADDRV`

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: `bool`

Default value: false

`GICDISABLE`

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

`NUM_CORES`

Number of cores per cluster.

Type: `uint8_t`

Default value: 1

`bus_type`

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

core_cache_protection

core_cache_protection can change ERR0FR, ERR0PFGF and ERR0PFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: 1

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

dcache-state_modelled

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

`ete.PIDR_CMOD`

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

`ete.PIDR_REVAND`

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

`ete.PIDR_REVISION`

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

`ete.Q_CADENCE`

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

`ete.RES0_STATEFUL`

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

`ete.RETSTACK`

Return stack depth.

Type: `uint8_t`

Default value: 3

`ete.REVISION`

TRCIDR1 revision value.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

`ete.SIM_OVERFLOW_GRANULARITY`

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

`ete.SIM_OVERFLOW_PERCENTAGE`

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

`ete.SOURCE_ADDRESS`

Allow generation of source address elements.

Type: `bool`

Default value: false

`ete.TRACE_OUTPUT`

File to which to write trace byte stream.

Type: `string`

Default value: N/A

`ete.TRCRSRTA_FORCED_EXCEP`

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

`force_mte_tag_access_razwi_and_ignore_tag_checks`

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

has_actlr2

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

Type: `bool`

Default value: true

has_dot_product

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

icache-state_modelled

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

pmu-num_counters

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

ras_extra_configurations

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCn masks - these are 64 bit masks covering the 64 bit registers ERXMISCn_EL1. E.g. [{"Index": 0, "ERXMISC0_mask": `0x0`, "ERXMISC0_reset": `0x0`, "ERXMISC1_mask": `0x0`, "ERXMISC1_reset": `0x0`, "ERXMISC2_mask": `0x0`, "ERXMISC2_reset": `0x0`, "ERXMISC3_mask": `0x0`, "ERXMISC3_reset": `0x0`, "ERXCTLR_EL1_mask": `0x0`, "ERXCTLR_EL1_reset": `0x0`}, {"Index": 1, "ERXMISC0_mask": `0x0`, "ERXMISC0_reset": `0x0`, "ERXSTATUS_IERR_mask": `0x300`}].

Type: `string`

Default value: “[{ "Index": 0, "ERXMISC0_mask": `0xFFFFC0003FCF`, "ERXMISC1_mask": `0x03F87000FFF30F07`, "ERXPFGCTL_reset": `0x1000`}, { "Index": 1, "ERXMISC0_mask": `0xFFFFE007FFCF`, "ERXMISC0_reset": `0x2`, "ERXSTATUS_IERR_mask": `0x300` , "ERXMISC1_mask": `0x0FF8700FFFF31F0F`, "ERXPFGCTL_reset": `0x1000`}]”

ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 0

store_excl_fail_tag_check_action

Behavior of tag check by core when a store exclusive fails. 0, Tag check ignored, 1, Tag check done if exclusive fails by global monitor.

Type: `uint8_t`

Default value: 0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

`tlbi_stall_enabled`

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

`treat_PAC_as_NOP`

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

`walk_cache_latency`

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

3.40 ARMCortexA32CT

Defined in `LISA/ARMCortexA32CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see Quality level definitions.

About ARMCortexA32CT

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for the ArmÂ® CortexÂ®-A32 processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the Arm Developer website.
- The `semihosting-cwd` parameter sets the current working directory that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a PVBusDecoder to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. - ECC and parity schemes are hardware-specific so are not supported.

Iris and MTI instances for ARMCortexA32CT

This model has the following Iris instances:

Name	Instance type
`ARMCortexA32CT`	Cluster_ARM_Cortex-A32
`ARMCortexA32CT.AMU`	PVBusLogger
`ARMCortexA32CT.AMU.mapper`	PVBusMapper
`ARMCortexA32CT.DAP`	PVBusLogger
`ARMCortexA32CT.DAP.mapper`	PVBusMapper
`ARMCortexA32CT.DSU`	DSU
`ARMCortexA32CT.DSU.mpam_busslave`	PVBusSlave
`ARMCortexA32CT.MMAP`	PVBusLogger
`ARMCortexA32CT.MMAP.mapper`	PVBusMapper
`ARMCortexA32CT.RAS`	PVBusLogger
`ARMCortexA32CT.RAS.mapper`	PVBusMapper
`ARMCortexA32CT.acp_mapper`	PVBusMapper
`ARMCortexA32CT.cpu0`	ARM_Cortex-A32
`ARMCortexA32CT.cpu0.SZTLB` (where *Z* = 1–2)	TLB
`ARMCortexA32CT.cpu0.UTLB`	TLB
`ARMCortexA32CT.cpu0.dtlb`	TLB
`ARMCortexA32CT.cpu0.l1dcache`	PVCache
`ARMCortexA32CT.cpu0.l1dcache.upstream[0]`	PVBusSlave

Non-Confidential

Name	Instance type
ARMCortexA32CT.cpu0.l1icache	PVCache
ARMCortexA32CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA32CT.ext_bus	PVBusLogger
ARMCortexA32CT.ext_bus.mapper	PVBusMapper
ARMCortexA32CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA32CT.global_debug_rom	debug_rom
ARMCortexA32CT.l2_cache	PVCache
ARMCortexA32CT.l2_cache.upstream[Z] (where *Z* = 0–16)	PVBusSlave
ARMCortexA32CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Name	Component type
ARMCortexA32CT.AMU	PVBusLogger
ARMCortexA32CT.AMU.mapper	PVBusMapper
ARMCortexA32CT.DAP	PVBusLogger
ARMCortexA32CT.DAP.mapper	PVBusMapper
ARMCortexA32CT.DSU	DSU
ARMCortexA32CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA32CT.MMAP	PVBusLogger
ARMCortexA32CT.MMAP.mapper	PVBusMapper
ARMCortexA32CT.RAS	PVBusLogger
ARMCortexA32CT.RAS.mapper	PVBusMapper
ARMCortexA32CT.acp_mapper	PVBusMapper
ARMCortexA32CT.cpu0	ARM_Cortex-A32
ARMCortexA32CT.cpu0.SZTLB (where *Z* = 1–2)	TLB
ARMCortexA32CT.cpu0.UTLB	TLB
ARMCortexA32CT.cpu0.l1dcache	PVCache
ARMCortexA32CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA32CT.cpu0.l1icache	PVCache
ARMCortexA32CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA32CT.ext_bus	PVBusLogger
ARMCortexA32CT.ext_bus.mapper	PVBusMapper
ARMCortexA32CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA32CT.l2_cache	PVCache
ARMCortexA32CT.l2_cache.upstream[Z] (where *Z* = 0–16)	PVBusSlave
ARMCortexA32CT.l2_flusher	AsyncCacheFlushUnit

Ports for ARMCortexA32CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastinner	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
cfgend	slave	Signal	This signal if for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
cfgte	slave	Signal	This signal provides default exception handling state.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	master	Signal	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	slave	Signal	Signals the clearing of an external global exclusive monitor
clusterid	slave	Value	The port sets the value of the affinity levels 1 and 2; bits [23:16] and [15:8] of the MPIDR.
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
commrx	master	Signal	Receive portion of Data Transfer Register full.
commtx	master	Signal	Transmit portion of Data Transfer Register empty.
cp15sdisable2	slave	Signal	-
cp15sdisable	slave	Signal	This signal disables write access to some system control processor registers.
cpuporeset	slave	Signal	CPU power on reset.
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross trigger matrix port.
dbgack	master	Signal	External debug interface.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Processor powerup request.
dev_debug_s	slave	PVBus	External debug interface.
edbgrq	slave	Signal	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicv3_ redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`l2flushdone`	master	Signal	Flush of L2 memory system complete.
`l2flushreq`	slave	Signal	Request flush of L2 memory system.
`l2reset`	slave	Signal	Level2 reset.
`memorymapped_debug_s`	slave	PVBus	External debug interface.
`niden`	slave	Signal	External debug interface.
`periphbase`	slave	Value_64	This port sets the base address of private peripheral region.
`pmuirq`	master	Signal	Interrupt signal from performance monitoring unit.
`presetdbg`	slave	Signal	Debug reset.
`pvbus_m0`	master	PVBus	The core will generate bus requests on this port.
`rei`	slave	Signal	Per core RAM Error Interrupt
`reset`	slave	Signal	Reset.
`romaddr`	slave	Value_64	Debug ROM base address.
`romaddrv`	slave	Signal	Debug ROM base address valid.
`sei`	slave	Signal	Per core System Error physical pins.
`smpen`	master	Signal	This signals AMP or SMP mode for each core.
`spiden`	slave	Signal	External debug interface.
`spniden`	slave	Signal	External debug interface.
`standbywfe`	master	Signal	This signal indicates if a core is in WFE state.
`standbywfi`	master	Signal	This signal indicates if a core is in WFI state
`standbywfil2`	master	Signal	This signal indicated all cores and L2 are idles and in low power state.
`ticks`	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
`vcpumntirq`	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
`vfiq`	slave	Signal	Virtualised FIQ.
`vinithi`	slave	Signal	This signal controls of the location of the exception vectors at reset.
`virq`	slave	Signal	Virtualised IRQ.
`virtio_s`	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
`vsei`	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMCortexA32CT

`cpuX.CFGEND`

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.CFGTE

Type: `bool`

Default value: false

cpuX.CP15SDISABLE

Type: `bool`

Default value: false

cpuX.CP15SDISABLE2

Type: `bool`

Default value: false

cpuX.CRYPTODISABLE

Type: `bool`

Default value: false

cpuX.VINITHI

Type: `bool`

Default value: false

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint64_t`

Default value: 256

cpuX.min_sync_level

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint32_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.semihosting-A32_HLT

Type: `uint32_t`

Default value: `0xF000`

cpuX.semihosting-ARM_SVC

Type: `uint32_t`

Default value: `0x123456`

cpuX.semihosting-T32_HLT

Type: `uint32_t`

Default value: `0x3C`

cpuX.semihosting-Thumb_SVC

Type: `uint32_t`

Default value: `0xAB`

cpuX.semihosting-cmd_line

Type: `string`

Default value: “”

cpuX.semihosting-cwd

Type: `string`

Default value: “”

cpuX.semihosting-enable

Type: `bool`

Default value: true

cpuX.semihosting-heap_base

Type: `uint32_t`

Default value: `0x0`

cpuX.semihosting-heap_limit

Type: `uint32_t`

Default value: `0x0F000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.semihosting-stack_base

Type: `uint32_t`

Default value: `0x10000000`

cpuX.semihosting-stack_limit

Type: `uint32_t`

Default value: `0x0F000000`

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

cpuX.vfp-enable_at_reset

Type: `bool`

Default value: false

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

CLUSTER_ID

Type: `uint32_t`

Default value: 0

DBGROMADDR

Type: `uint64_t`

Default value: `0x22000000`

DBGROMADDRV

Type: `bool`

Default value: true

GICDISABLE

Type: `bool`

Default value: true

NUM_CORES

Number of cores in cluster.

Type: `uint8_t`

Default value: 1

PERIPHBASE

Type: `uint64_t`

Default value: `0x13080000`

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint32_t`

Default value: 0

cpi_div

divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`cpi_mul`

multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 1

`dcache-hit_latency`

L1 D-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

`dcache-maintenance_latency`

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`dcache-miss_latency`

L1 D-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

`dcache-read_access_latency`

L1 D-Cache timing annotation latency for read accesses given in ticks per access (based on the size of dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`dcache-read_latency`

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`dcache-size`

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

`dcache-snoop_data_transfer_latency`

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`dcache-state_modelled`

Type: `bool`

Default value: false

`dcache-write_access_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per access (based on the size of dcache-write_bus_width_in_bytes. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`dcache-write_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`icache-hit_latency`

L1 I-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: 0

icache-miss_latency

L1 I-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (based on the size of icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: 0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: 0

icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

icache-state_modelled

Type: `bool`

Default value: false

l2cache-hit_latency

L2 Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

l2cache-miss_latency

L2 Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access (based on the size of l2cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

l2cache-size

L2 Cache size in bytes.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: `0x80000`

`l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-snoop_issue_latency`

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-write_access_latency`

L2 Cache timing annotation latency for write accesses given in ticks per access (based on the size of l2cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-write_latency`

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`ptw_latency`

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint32_t`

Default value: 0

`tlb_latency`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint32_t`

Default value: 0

3.41 ARMCortexA34CT

Defined in `LISA/ARMCortexA34CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see Quality level definitions.

Changes in 11.30.27

Model quality level changes:

From	To
Preliminary support	Full support

About ARMCortexA34CT

The model has the following features:

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for this processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the Arm Developer website.
- The `semihosting-cwd` parameter sets the current working directory that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a PVBusDecoder to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems.
- This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- ECC and parity schemes are hardware-specific so are not supported.

Iris and MTI instances for ARMCortexA34CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA34CT	Cluster_ARM_Cortex-A34
ARMCortexA34CT.AMU	PVBusLogger
ARMCortexA34CT.AMU.mapper	PVBusMapper
ARMCortexA34CT.DAP	PVBusLogger
ARMCortexA34CT.DAP.mapper	PVBusMapper
ARMCortexA34CT.DSU	DSU
ARMCortexA34CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA34CT.MMAP	PVBusLogger
ARMCortexA34CT.MMAP.mapper	PVBusMapper
ARMCortexA34CT.RAS	PVBusLogger
ARMCortexA34CT.RAS.mapper	PVBusMapper
ARMCortexA34CT.acp_mapper	PVBusMapper
ARMCortexA34CT.cpu0	ARM_Cortex-A34
ARMCortexA34CT.cpu0.UTLB	TLB
ARMCortexA34CT.cpu0.dtlb	TLB
ARMCortexA34CT.cpu0.l1dcache	PVCache
ARMCortexA34CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA34CT.cpu0.l1icache	PVCache
ARMCortexA34CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA34CT.ext_bus	PVBusLogger
ARMCortexA34CT.ext_bus.mapper	PVBusMapper
ARMCortexA34CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA34CT.global_debug_rom	debug_rom
ARMCortexA34CT.l2_cache	PVCache
ARMCortexA34CT.l2_cache.upstream[Z] (where *Z* = 0–16)	PVBusSlave
ARMCortexA34CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Name	Component type
ARMCortexA34CT.AMU	PVBusLogger
ARMCortexA34CT.AMU.mapper	PVBusMapper
ARMCortexA34CT.DAP	PVBusLogger
ARMCortexA34CT.DAP.mapper	PVBusMapper

Non-Confidential

Port	Direction	Protocol	Description
commrx	master	Signal	Receive portion of Data Transfer Register full.
commtx	master	Signal	Transmit portion of Data Transfer Register empty.
cp15sdisable	slave	Signal	This signal disables write access to some system control processor registers.
cpuporeset	slave	Signal	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack	master	Signal	External debug interface.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Processor powerup request.
dev_debug_s	slave	PVBus	External debug interface.
edbgrq	slave	Signal	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicv3_ redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
l2flushdone	master	Signal	Flush of L2 memory system complete.
l2flushreq	slave	Signal	Request flush of L2 memory system.
l2reset	slave	Signal	This signal resets the shared L2 memory system, interrupt controller and timer logic.
memorymapped_debug_s	slave	PVBus	External debug interface.
niden	slave	Signal	External debug interface.
periphbase	slave	Value_64	This port sets the base address of private peripheral region.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Raising this signal will put the core into reset mode.
romaddr	slave	Value_64	Debug ROM base address.
romaddrv	slave	Signal	Debug ROM base address valid.
rvbaraddr	slave	Value_64	Reset vector base address.
sei	slave	Signal	Per core virtual System Error physical pins.
smpen	master	Signal	This signals AMP or SMP mode for each core.
spiden	slave	Signal	External debug interface.
spniden	slave	Signal	External debug interface.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`standbywfe`	master	Signal	This signal indicates if a core is in WFE state.
`standbywfi`	master	Signal	This signal indicates if a core is in WFI state.
`standbywfil2`	master	Signal	Indicate that all the individual processors and the L2 memory system are in a WFI state.
`ticks`	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
`vcpumntirq`	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
`vfiq`	slave	Signal	Virtualised FIQ.
`vinithi`	slave	Signal	This signal controls of the location of the exception vectors at reset.
`virq`	slave	Signal	Virtualised IRQ.
`virtio_s`	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
`vsei`	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMCortexA34CT

`cpuX.CFGEND`

Type: `bool`

Default value: false

`cpuX.CFGTE`

Type: `bool`

Default value: false

`cpuX.CP15SDISABLE`

Type: `bool`

Default value: false

`cpuX.CRYPTODISABLE`

Type: `bool`

Default value: false

`cpuX.RVBARADDR`

Type: `uint64_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.VINITHI

Type: `bool`

Default value: false

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint64_t`

Default value: 256

cpuX.min_sync_level

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint32_t`

Default value: 0

cpuX.semihosting-A32_HLT

Type: `uint32_t`

Default value: `0xF000`

cpuX.semihosting-A64_HLT

Type: `uint32_t`

Default value: `0xF000`

cpuX.semihosting-ARM_SVC

Type: `uint32_t`

Default value: `0x123456`

cpuX.semihosting-T32_HLT

Type: `uint32_t`

Default value: `0x3C`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.semihosting-Thumb_SVC

Type: `uint32_t`

Default value: `0xAB`

cpuX.semihosting-cmd_line

Type: `string`

Default value: “”

cpuX.semihosting-cwd

Type: `string`

Default value: “”

cpuX.semihosting-enable

Type: `bool`

Default value: true

cpuX.semihosting-heap_base

Type: `uint32_t`

Default value: `0x0`

cpuX.semihosting-heap_limit

Type: `uint32_t`

Default value: `0x0F000000`

cpuX.semihosting-stack_base

Type: `uint32_t`

Default value: `0x10000000`

cpuX.semihosting-stack_limit

Type: `uint32_t`

Default value: `0x0F000000`

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.vfp-enable_at_reset

Type: `bool`

Default value: false

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

Type: `uint32_t`

Default value: 0

DBGROMADDR

Type: `uint64_t`

Default value: `0x22000000`

DBGROMADDRV

Type: `bool`

Default value: true

GICDISABLE

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

`NUM_CORES`

Number of cores in cluster.

Type: `uint8_t`

Default value: 1

`PERIPHBASE`

Type: `uint64_t`

Default value: `0x13080000`

`bus_type`

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint32_t`

Default value: 0

`cpi_div`

divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 1

`cpi_mul`

multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 1

`dcache-hit_latency`

L1 D-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

`dcache-maintenance_latency`

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (based on the size of dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

dcache-state_modelled

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (based on the size of dcache-write_bus_width_in_bytes. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

icache-hit_latency

L1 I-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: 0

icache-miss_latency

L1 I-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`icache-read_access_latency`

L1 I-Cache timing annotation latency for read accesses given in ticks per access (based on the size of icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`icache-read_latency`

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`icache-size`

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

`icache-state_modelled`

Type: `bool`

Default value: false

`l2cache-hit_latency`

L2 Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

`l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-miss_latency`

L2 Cache timing annotation latency for miss.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: 0

`l2cache-read_access_latency`

L2 Cache timing annotation latency for read accesses given in ticks per access (based on the size of l2cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-read_latency`

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-size`

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

`l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-snoop_issue_latency`

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-write_access_latency`

L2 Cache timing annotation latency for write accesses given in ticks per access (based on the size of l2cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-write_latency`

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`ptw_latency`

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint32_t`

Default value: 0

`tlb_latency`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint32_t`

Default value: 0

3.42 ARMCortexA35CT

Defined in `LISA/ARMCortexA35CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see Quality level definitions.

About ARMCortexA35CT

The model has the following features:

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for this processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the Arm Developer website.
- The `semihosting-cwd` parameter sets the current working directory that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a PVBusDecoder to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems. This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.
- ECC and parity schemes are hardware-specific so are not supported.

Iris and MTI instances for ARMCortexA35CT

This model has the following Iris instances:

Name	Instance type
`ARMCortexA35CT`	Cluster_ARM_Cortex-A35
`ARMCortexA35CT.AMU`	PVBusLogger
`ARMCortexA35CT.AMU.mapper`	PVBusMapper
`ARMCortexA35CT.DAP`	PVBusLogger
`ARMCortexA35CT.DAP.mapper`	PVBusMapper
`ARMCortexA35CT.DSU`	DSU
`ARMCortexA35CT.DSU.mpam_busslave`	PVBusSlave
`ARMCortexA35CT.MMAP`	PVBusLogger
`ARMCortexA35CT.MMAP.mapper`	PVBusMapper
`ARMCortexA35CT.RAS`	PVBusLogger
`ARMCortexA35CT.RAS.mapper`	PVBusMapper
`ARMCortexA35CT.acp_mapper`	PVBusMapper
`ARMCortexA35CT.cpu0`	ARM_Cortex-A35
`ARMCortexA35CT.cpu0.UTLB`	TLB
`ARMCortexA35CT.cpu0.dtlb`	TLB
`ARMCortexA35CT.cpu0.l1dcache`	PVCache
`ARMCortexA35CT.cpu0.l1dcache.upstream[0]`	PVBusSlave
`ARMCortexA35CT.cpu0.l1icache`	PVCache
`ARMCortexA35CT.cpu0.l1icache.upstream[0]`	PVBusSlave
`ARMCortexA35CT.ext_bus`	PVBusLogger

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
ARMCortexA35CT.ext_bus.mapper	PVBusMapper
ARMCortexA35CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA35CT.global_debug_rom	debug_rom
ARMCortexA35CT.l2_cache	PVCache
ARMCortexA35CT.l2_cache.upstream[Z] (where *Z* = 0–16)	PVBusSlave
ARMCortexA35CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Name	Component type
ARMCortexA35CT.AMU	PVBusLogger
ARMCortexA35CT.AMU.mapper	PVBusMapper
ARMCortexA35CT.DAP	PVBusLogger
ARMCortexA35CT.DAP.mapper	PVBusMapper
ARMCortexA35CT.DSU	DSU
ARMCortexA35CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA35CT.MMAP	PVBusLogger
ARMCortexA35CT.MMAP.mapper	PVBusMapper
ARMCortexA35CT.RAS	PVBusLogger
ARMCortexA35CT.RAS.mapper	PVBusMapper
ARMCortexA35CT.acp_mapper	PVBusMapper
ARMCortexA35CT.cpu0	ARM_Cortex-A35
ARMCortexA35CT.cpu0.UTLB	TLB
ARMCortexA35CT.cpu0.l1dcache	PVCache
ARMCortexA35CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA35CT.cpu0.l1icache	PVCache
ARMCortexA35CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA35CT.ext_bus	PVBusLogger
ARMCortexA35CT.ext_bus.mapper	PVBusMapper
ARMCortexA35CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA35CT.l2_cache	PVCache
ARMCortexA35CT.l2_cache.upstream[Z] (where *Z* = 0–16)	PVBusSlave
ARMCortexA35CT.l2_flusher	AsyncCacheFlushUnit

Ports for ARMCortexA35CT

Port	Direction	Protocol	Description
aa64naa32	slave	Signal	Register width after reset.
acp_s	slave	PVBus	AXI ACP slave port.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastinner	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
cfgend	slave	Signal	This signal if for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
cfgte	slave	Signal	This signal provides default exception handling state.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	master	Signal	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	slave	Signal	Signals the clearing of an external global exclusive monitor
clusterid	slave	Value	The port sets the value of the affinity levels 1 and 2; bits [23:16] and [15:8] of the MPIDR.
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
commrx	master	Signal	Receive portion of Data Transfer Register full.
commtx	master	Signal	Transmit portion of Data Transfer Register empty.
cp15sdisable2	slave	Signal	This signal disables write access to some system control processor registers.
cp15sdisable	slave	Signal	This signal disables write access to some system control processor registers.
cpuporeset	slave	Signal	CPU power on reset.
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross trigger matrix port.
dbgack	master	Signal	External debug interface.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Processor powerup request.
dev_debug_s	slave	PVBus	External debug interface.
edbgrq	slave	Signal	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicv3_ redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
l2flushdone	master	Signal	Flush of L2 memory system complete.
l2flushreq	slave	Signal	Request flush of L2 memory system.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
`l2reset`	slave	Signal	Level2 reset.
`memorymapped_debug_s`	slave	PVBus	External debug interface.
`niden`	slave	Signal	External debug interface.
`periphbase`	slave	Value_64	This port sets the base address of private peripheral region.
`pmuirq`	master	Signal	Interrupt signal from performance monitoring unit.
`presetdbg`	slave	Signal	Debug reset.
`pvbus_m0`	master	PVBus	The core will generate bus requests on this port.
`rei`	slave	Signal	Per core RAM Error Interrupt
`reset`	slave	Signal	Reset.
`romaddr`	slave	Value_64	Debug ROM base address.
`romaddrv`	slave	Signal	Debug ROM base address valid.
`rvbaraddr`	slave	Value_64	Reset vector base address.
`sei`	slave	Signal	Per core System Error physical pins.
`smpen`	master	Signal	This signals AMP or SMP mode for each core.
`spiden`	slave	Signal	External debug interface.
`spniden`	slave	Signal	External debug interface.
`standbywfe`	master	Signal	This signal indicates if a core is in WFE state.
`standbywfi`	master	Signal	This signal indicates if a core is in WFI state
`standbywfil2`	master	Signal	This signal indicated all cores and L2 are idles and in low power state.
`ticks`	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
`vcpumntirq`	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
`vfiq`	slave	Signal	Virtualised FIQ.
`vinithi`	slave	Signal	This signal controls of the location of the exception vectors at reset.
`virq`	slave	Signal	Virtualised IRQ.
`virtio_s`	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
`vsei`	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMCortexA35CT

`cpuX.AA64nAA32`

Type: `bool`

Default value: true

`cpuX.CFGEND`

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`cpuX.CFGTE`

Type: `bool`

Default value: false

`cpuX.CP15SDISABLE`

Type: `bool`

Default value: false

`cpuX.CP15SDISABLE2`

Type: `bool`

Default value: false

`cpuX.CRYPTODISABLE`

Type: `bool`

Default value: false

`cpuX.RVBARADDR`

Type: `uint64_t`

Default value: 0

`cpuX.VINITHI`

Type: `bool`

Default value: false

`cpuX.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`cpuX.max_code_cache_mb`

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint64_t`

Default value: 256

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.min_sync_level

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint32_t`

Default value: 0

cpuX.semihosting-A32_HLT

Type: `uint32_t`

Default value: `0xF000`

cpuX.semihosting-A64_HLT

Type: `uint32_t`

Default value: `0xF000`

cpuX.semihosting-ARM_SVC

Type: `uint32_t`

Default value: `0x123456`

cpuX.semihosting-T32_HLT

Type: `uint32_t`

Default value: `0x3C`

cpuX.semihosting-Thumb_SVC

Type: `uint32_t`

Default value: `0xAB`

cpuX.semihosting-cmd_line

Type: `string`

Default value: “”

cpuX.semihosting-cwd

Type: `string`

Default value: “”

cpuX.semihosting-enable

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.semihosting-heap_base

Type: `uint32_t`

Default value: `0x0`

cpuX.semihosting-heap_limit

Type: `uint32_t`

Default value: `0x0F000000`

cpuX.semihosting-stack_base

Type: `uint32_t`

Default value: `0x10000000`

cpuX.semihosting-stack_limit

Type: `uint32_t`

Default value: `0x0F000000`

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

cpuX.vfp-enable_at_reset

Type: `bool`

Default value: false

cpuX.vfp-present

Set whether the model has VFP support.

Type: `bool`

Default value: true

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

Type: `uint32_t`

Default value: 0

DBGROMADDR

Type: `uint64_t`

Default value: `0x0`

DBGROMADDRV

Type: `bool`

Default value: true

GICDISABLE

Type: `bool`

Default value: true

NUM_CORES

Number of cores in cluster.

Type: `uint8_t`

Default value: 1

PERIPHBASE

Type: `uint64_t`

Default value: `0x13080000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`bus_type`

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint32_t`

Default value: 0

`cpi_div`

divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 1

`cpi_mul`

multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 1

`dcache-hit_latency`

L1 D-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

`dcache-maintenance_latency`

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`dcache-miss_latency`

L1 D-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

`dcache-read_access_latency`

L1 D-Cache timing annotation latency for read accesses given in ticks per access (based on the size of dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

be used instead of per-byte even if dcache-read_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

dcache-state_modelled

Type: `bool`

Default value: false

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (based on the size of dcache-write_bus_width_in_bytes. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: 0

`icache-hit_latency`

L1 I-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

`icache-maintenance_latency`

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`icache-miss_latency`

L1 I-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

`icache-prefetch_enabled`

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

`icache-read_access_latency`

L1 I-Cache timing annotation latency for read accesses given in ticks per access (based on the size of icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`icache-read_latency`

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when icache-state_modelled=true.

Non-Confidential

Type: `uint64_t`

Default value: 0

`icache-size`

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

`icache-state_modelled`

Type: `bool`

Default value: false

`l2cache-hit_latency`

L2 Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

`l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-miss_latency`

L2 Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

`l2cache-read_access_latency`

L2 Cache timing annotation latency for read accesses given in ticks per access (based on the size of l2cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

Non-Confidential

`l2cache-read_latency`

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-size`

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

`l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-snoop_issue_latency`

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-write_access_latency`

L2 Cache timing annotation latency for write accesses given in ticks per access (based on the size of l2cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

`l2cache-write_latency`

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ptw_latency`

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint32_t`

Default value: 0

`tlb_latency`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint32_t`

Default value: 0

3.43 ARMCortexA510CT

Defined in `LISA/ARMCortexA510CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Full support
r1p3	Full support

For an explanation of the quality levels, see Quality level definitions.

Changes in 11.30.27

The following ports were added:

- `cluster_ppu_hw_stat`
- `core_ppu_hw_stat`
- `coreinstrrun`
- `ppu_cluster_isolate`
- `ppu_core_isolate`

About ARMCortexA510CT

The model supports the following features:

- DynamIQ Shared Unit-110 (DSU-110) system registers.
- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- PChannel for the cluster and for each core.
- `BROADCASTPERSIST` pin.
- Optional peripheral port.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- L3Cache partition.
- Per-core clock.
- Utility bus.
- Revision R1 is the default configuration, with 32-bit support at EL0. R1 supports both configurations of EL0, with or without A32 support. For 64-bit only mode, set parameter `max_32bit_el=-1`.
- To configure revision R0, set parameter revision_number=0.

Support for the following features is planned for a future release:

- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (the Arm TLM2 extensions) bus protocols.
- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, and `nPMBIRQ` signals.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
    - Automatic CPU retention mode.
    - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- Error correction or detection features.
- Self-test features (MBIST).
- Snoop filtering.
- Latency configuration.
- Cache stashing capability.

This model supports the ArmÂ®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the Arm Developer website.

Iris and MTI instances for ARMCortexA510CT

This model has the following Iris instances:

Name	Instance type
`ARMCortexA510CT`	Cluster_ARM_Cortex-A510
`ARMCortexA510CT.AMU`	PVBusLogger
`ARMCortexA510CT.AMU.mapper`	PVBusMapper
`ARMCortexA510CT.DAP`	PVBusLogger
`ARMCortexA510CT.DAP.mapper`	PVBusMapper
`ARMCortexA510CT.DSU`	DSU-110
`ARMCortexA510CT.DSU.PPU_cluster`	PPUv1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Name	Instance type
ARMCortexA510CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT.DSU.PPU_core0	PPUv1
ARMCortexA510CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA510CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA510CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT.DSU.shared_cache	PVCache
ARMCortexA510CT.DSU.shared_cache.upstream[Y] (where *Y* = 0–3)	PVBusSlave
ARMCortexA510CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA510CT.MMAP	PVBusLogger
ARMCortexA510CT.MMAP.mapper	PVBusMapper
ARMCortexA510CT.RAS	PVBusLogger
ARMCortexA510CT.RAS.mapper	PVBusMapper
ARMCortexA510CT.cpu0	ARM_Cortex-A510
ARMCortexA510CT.cpu0.UTLB	TLB
ARMCortexA510CT.cpu0.debug_rom	debug_rom
ARMCortexA510CT.cpu0.dtlb	TLB
ARMCortexA510CT.cpu0.l1dcache	PVCache
ARMCortexA510CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA510CT.cpu0.l1icache	PVCache
ARMCortexA510CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA510CT.cpu0.l2cache	PVCache
ARMCortexA510CT.cpu0.l2cache.upstream[U] (where *U* = 0–1)	PVBusSlave
ARMCortexA510CT.ext_bus	PVBusLogger
ARMCortexA510CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA510CT.global_debug_rom	debug_rom
ARMCortexA510CT.secondary_debug_rom	debug_rom
ARMCortexA510CT.sve	ScalableVectorExtension

This model has the following MTI trace components:

Name	Component type
ARMCortexA510CT.AMU	PVBusLogger
ARMCortexA510CT.AMU.mapper	PVBusMapper
ARMCortexA510CT.DAP	PVBusLogger
ARMCortexA510CT.DAP.mapper	PVBusMapper
ARMCortexA510CT.DSU	DSU-110
ARMCortexA510CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT.DSU.PPU_core0	PPUv1
ARMCortexA510CT.DSU.PPU_core0.busslave	PVBusSlave

ARMCortexA510CT.RAS.mapper	PVBusMapper
ARMCortexA510CT.cpu0	ARM_Cortex-A510
ARMCortexA510CT.cpu0.UTLB	TLB
ARMCortexA510CT.cpu0.l1dcache	PVCache
ARMCortexA510CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA510CT.cpu0.l1icache	PVCache
ARMCortexA510CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA510CT.cpu0.l2cache	PVCache
ARMCortexA510CT.cpu0.l2cache.upstream[U] (where *U* = 0–1)	PVBusSlave
ARMCortexA510CT.ext_bus	PVBusLogger
ARMCortexA510CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

Ports for ARMCortexA510CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsm_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsm_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	slave	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_ redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_ cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU Core wake request signals.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMCortexA510CT

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x80000`

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

cpuX.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 171

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

cpuX.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

cpuX.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

cpuX.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0xf000000`

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

cpuX.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

`BROADCASTCACHEMAINT`

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: false

`BROADCASTOUTER`

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: false

`BROADCASTPERSIST`

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

`CLUSTER_ID`

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

`CMO_broadcast_when_cache_state_modelling_disabled`

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 1

CPUCFR

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: true

NUM_CORES

Number of cores per cluster.

Type: `uint8_t`

Default value: 1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Default value: false

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-size

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-state_modelled

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

`enable_simulation_performance_optimizations`

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

`ete.CLAIMTAGS`

Number of claim tags.

Type: `uint8_t`

Default value: 4

`ete.MAX_INST_PER_Q`

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

`ete.NumberOfRSPairs`

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

`ete.PIDR_CMOD`

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

`ete.PIDR_REVAND`

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`ete.PIDR_REVISION`

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

`ete.Q_CADENCE`

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

`ete.RES0_STATEFUL`

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

`ete.RETSTACK`

Return stack depth.

Type: `uint8_t`

Default value: 3

`ete.REVISION`

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

`ete.SIM_OVERFLOW_GRANULARITY`

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

`ete.SIM_OVERFLOW_PERCENTAGE`

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

ete.SOURCE_ADDRESS

Allow generation of source address elements.

Type: `bool`

Default value: false

ete.TRACE_OUTPUT

File to which to write trace byte stream.

Type: `string`

Default value: N/A

ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`has_dot_product`

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

`has_ete`

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

`has_peripheral_port`

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

`icache-hit_latency`

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`icache-maintenance_latency`

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`icache-miss_latency`

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Default value: false

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

icache-state_modelled

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

l3cache-has_mpam

L3 Cache has MPAM support.

Type: `bool`

Default value: true

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-size`

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

`l3cache-snoop_data_transfer_latency`

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-snoop_issue_latency`

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-ways`

L3 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 16

`l3cache-write_access_latency`

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

max_32bit_el

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when revision_number = 0.

Type: `int8_t`

Default value: 0

memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

num_nodes

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

patch_level

Patch level of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Revision field in MIDR/MIDR_EL1. Corresponds to the patch number Y in rXpY.

Type: `uint8_t`

Default value: 3

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 1

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`treat_PAC_as_NOP`

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

`walk_cache_latency`

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

3.44 ARMCortexA510CT_CortexA710CT

Defined in `LISA/ARMCortexA510CT_CortexA710CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA710 r2p0	Full support

For an explanation of the quality levels, see Quality level definitions.

Changes in 11.30.27

The following parameters were removed:

- `pchannel_treat_simreset_as_poreset`

The following ports were added:

- `cluster_ppu_hw_stat`
- `core_ppu_hw_stat`
- `coreinstrrun`
- `ppu_cluster_isolate`
- `ppu_core_isolate`

About ARMCortexA510CT_CortexA710CT

The number of cores in each subcluster is configurable using the following parameters:

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.NUM_CORES

Possible values are 1-11 (ARMCortexA510CT).

subcluster1.NUM_CORES

Possible values are 1-11 (ARMCortexA710CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port_name>[0-10] for cores in `subcluster0`.
- <port_name>[11-21] for cores in `subcluster1`.

Note

All instances in the Master cross trigger matrix port array `cti[22]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu10` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu10` identify cores in `subcluster1`.

For information about the cores in this model, see:

- ARMCortexA510CT.
- ARMCortexA710CT.

Iris and MTI instances for ARMCortexA510CT_CortexA710CT

This model has the following Iris instances:

Name	Instance type
`ARMCortexA510CT_CortexA710CT`	Cluster_ARM_Cortex510_CortexA710_Heterogeneous
`ARMCortexA510CT_CortexA710CT.AMU`	PVBusLogger
`ARMCortexA510CT_CortexA710CT.AMU.mapper`	PVBusMapper
`ARMCortexA510CT_CortexA710CT.DAP`	PVBusLogger
`ARMCortexA510CT_CortexA710CT.DAP.mapper`	PVBusMapper
`ARMCortexA510CT_CortexA710CT.DSU`	DSU-110
`ARMCortexA510CT_CortexA710CT.DSU.PPU_cluster`	PPUv1
`ARMCortexA510CT_CortexA710CT.DSU.PPU_cluster.busslave`	PVBusSlave
`ARMCortexA510CT_CortexA710CT.DSU.PPU_coreZ` (where *Z* = 0–1)	PPUv1
`ARMCortexA510CT_CortexA710CT.DSU.PPU_coreZ.busslave` (where *Z* = 0–1)	PVBusSlave
`ARMCortexA510CT_CortexA710CT.DSU.mpam_busslave`	PVBusSlave

Ports for ARMCortexA510CT_CortexA710CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_ pcsm_pchannel	master	PChannel	Cluster PCSM signal
cluster_ powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamIQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsm_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	slave	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdwn	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU Core wake request signals.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Port	Direction	Protocol	Description
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

Parameters for ARMCortexA510CT_CortexA710CT

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: true

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: true

CLUSTER_ID

The Cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation.this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certaineven when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: false

dcache-state_modelled

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: false

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

Type: `uint8_t`

Default value: 4

diagnostics

Enable DynamIQ diagnostic messages.

Type: `bool`

Default value: false

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type: `bool`

Default value: true

has_acp

If true, Accelerator Coherency Port is configured.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`has_peripheral_port`

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: false

`icache-state_modelled`

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: false

`l3cache-has_mpam`

L3 Cache has MPAM support.

Type: `bool`

Default value: false

`l3cache-hit_latency`

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-maintenance_latency`

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-miss_latency`

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-size

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x0`

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`l3cache-write_latency`

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`mpmm_accumulator_multiplier`

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

`num_nodes`

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

`periph_address_end`

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type: `uint64_t`

Default value: `0x0`

`periph_address_start`

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.CPUCFR`

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.NUM_CORES`

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

Type: `uint8_t`

Default value: 1

`subcluster0.cpi_div`

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

`subcluster0.cpi_mul`

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

`subcluster0.cpu0.CFGEND`

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

`subcluster0.cpu0.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster0.cpu0.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu0.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu0.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x10`

subcluster0.cpu0.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu0.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu0.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu0.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu0.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu0.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu0.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu0.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu0.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu0.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu0.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu0.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu0.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu0.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu0.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu0.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu0.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu0.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu0.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu0.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu1.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu1.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu1.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu1.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu1.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu1.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster0.cpu1.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu1.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu1.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu1.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu1.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu1.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu1.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu1.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu1.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu1.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu1.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu1.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu1.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu1.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu10.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu10.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu10.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu10.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu10.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu10.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu10.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu10.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu10.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu10.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu10.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

subcluster0.cpu10.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu10.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu10.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu10.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu10.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu10.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu10.semihosting-stack_base

Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu10.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu10.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu10.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu10.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu2.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.cpu2.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu2.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu2.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu2.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu2.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu2.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu2.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu2.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu2.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu2.semihosting-A64_HLT
A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu2.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu2.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu2.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu2.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu2.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu2.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu2.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu2.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu2.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu2.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu2.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu2.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu2.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu3.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu3.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu3.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu3.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu3.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu3.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu3.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu3.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu3.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu3.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu3.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster0.cpu3.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu3.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu3.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu3.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu3.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster0.cpu3.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu3.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu3.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu3.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu3.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu3.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu3.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu3.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu3.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu4.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu4.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu4.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu4.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu4.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu4.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu4.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu4.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu4.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu4.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu4.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu4.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu4.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu4.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu4.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

`subcluster0.cpu4.semihosting-Thumb_SVC`
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu4.semihosting-cmd_line`
Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu4.semihosting-cwd`
Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu4.semihosting-enable`
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu4.semihosting-heap_base`
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu4.semihosting-heap_limit`
Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu4.semihosting-stack_base`
Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu4.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu4.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu4.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu4.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu5.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu5.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.cpu5.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu5.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu5.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu5.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu5.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu5.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu5.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu5.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu5.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu5.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu5.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu5.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu5.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu5.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu5.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu5.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu5.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu5.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu5.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu5.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu5.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu5.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu5.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu6.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu6.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu6.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu6.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu6.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu6.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu6.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu6.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu6.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu6.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster0.cpu6.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu6.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu6.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu6.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu6.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster0.cpu6.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu6.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu6.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu6.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu6.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu6.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu6.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu6.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu6.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu7.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu7.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu7.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu7.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

`subcluster0.cpu7.l2cache-size`

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

`subcluster0.cpu7.l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu7.l2cache-snoop_issue_latency`

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu7.l2cache-ways`

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

`subcluster0.cpu7.l2cache-write_access_latency`

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu7.l2cache-write_bus_width_in_bytes`

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu7.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu7.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu7.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu7.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 60

subcluster0.cpu7.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu7.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster0.cpu7.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster0.cpu7.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster0.cpu7.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu7.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu7.semihosting-stack_base

Virtual address of base of descending stack.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu7.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu7.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu7.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu7.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.cpu8.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu8.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.cpu8.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu8.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu8.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu8.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu8.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu8.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu8.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster0.cpu8.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu8.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster0.cpu8.semihosting-A64_HLT`

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

`subcluster0.cpu8.semihosting-ARM_SVC`

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

`subcluster0.cpu8.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster0.cpu8.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster0.cpu8.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster0.cpu8.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu8.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu8.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu8.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu8.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster0.cpu8.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster0.cpu8.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu8.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu8.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

subcluster0.cpu9.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster0.cpu9.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster0.cpu9.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster0.cpu9.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.cpu9.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

subcluster0.cpu9.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster0.cpu9.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster0.cpu9.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

subcluster0.cpu9.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x20`

subcluster0.cpu9.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.cpu9.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x100`

subcluster0.cpu9.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster0.cpu9.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster0.cpu9.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster0.cpu9.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster0.cpu9.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

`subcluster0.cpu9.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster0.cpu9.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster0.cpu9.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.cpu9.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu9.semihosting-stack_base`

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

`subcluster0.cpu9.semihosting-stack_limit`

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

`subcluster0.cpu9.trace_special_hlt_imm16`

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint16_t`

Default value: `0xf000`

subcluster0.cpu9.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster0.cpu9.vfp-present

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: true

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

`subcluster0.dcache-read_access_latency`

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.dcache-read_latency`

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.dcache-size`

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

`subcluster0.dcache-snoop_data_transfer_latency`

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.dcache-write_access_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.ete.CLAIMTAGS

Number of claim tags.

Type: `uint8_t`

Default value: 4

subcluster0.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

subcluster0.ete.NumberOfRSPairs

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

subcluster0.ete.PIDR_CMOD

TRCPIDR CMOD value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.PIDR_REVAND

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

subcluster0.ete.PIDR_REVISION

TRCPIDR REVISION value.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint8_t`

Default value: 0

`subcluster0.ete.Q_CADENCE`

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

`subcluster0.ete.RES0_STATEFUL`

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: false

`subcluster0.ete.RETSTACK`

Return stack depth.

Type: `uint8_t`

Default value: 3

`subcluster0.ete.REVISION`

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

`subcluster0.ete.SIM_OVERFLOW_GRANULARITY`

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

`subcluster0.ete.SIM_OVERFLOW_PERCENTAGE`

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

`subcluster0.ete.SOURCE_ADDRESS`

Allow generation of source address elements.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: false

subcluster0.ete.TRACE_OUTPUT

File to which to write trace byte stream.

Type: `string`

Default value: N/A

subcluster0.ete.TRCRSRTA_FORCED_EXCEP

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: false

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: false

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: false

subcluster0.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type: `uint8_t`

Default value: 0

subcluster0.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `bool`

Default value: true

`subcluster0.has_dot_product`

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

`subcluster0.has_ete`

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (–plugin or -P).

Type: `bool`

Default value: false

`subcluster0.icache-hit_latency`

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.icache-maintenance_latency`

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.icache-miss_latency`

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster0.icache-prefetch_enabled`

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: false

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster0.icache-size

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

subcluster0.invalidate_code_cache_on_icache_cmo

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

subcluster0.max_32bit_el

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when revision_number = 0.

Type: `int8_t`

Default value: 0

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type: `uint8_t`

Default value: 3

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster0.ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

subcluster0.revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 1

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster0.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behavour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type: `bool`

Default value: false

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

subcluster1.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

Type: `uint8_t`

Default value: 1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

subcluster1.cpu0.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu0.CRYPTODISABLE`

Disable cryptographic features.

Type: `bool`

Default value: false

`subcluster1.cpu0.RVBARADDR`

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.enable_trace_special_hlt_imm16`

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

`subcluster1.cpu0.l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu0.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu0.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu0.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu0.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu0.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu0.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu0.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

`subcluster1.cpu0.semihosting-T32_HLT`

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

`subcluster1.cpu0.semihosting-Thumb_SVC`

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

`subcluster1.cpu0.semihosting-cmd_line`

Command line available to semihosting calls.

Type: `string`

Default value: N/A

`subcluster1.cpu0.semihosting-cwd`

Base directory for semihosting file access.

Type: `string`

Default value: N/A

`subcluster1.cpu0.semihosting-enable`

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

`subcluster1.cpu0.semihosting-heap_base`

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

`subcluster1.cpu0.semihosting-heap_limit`

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu0.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu0.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu0.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu0.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu1.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu1.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu1.RVBARADDR

Value of RVBAR_ELx register.

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu1.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu1.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu1.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu1.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu1.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu1.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu1.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 171

subcluster1.cpu1.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu1.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu1.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu1.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu1.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu1.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu1.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Non-Confidential

Default value: `0xf000000`

subcluster1.cpu1.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu1.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu10.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu10.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu10.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu10.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x80000`

subcluster1.cpu10.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu10.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: 0

subcluster1.cpu10.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu10.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu10.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu10.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu10.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu10.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu10.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: N/A

subcluster1.cpu10.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu10.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu10.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu10.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu10.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu10.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu10.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu2.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu2.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu2.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu2.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu2.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-size

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

subcluster1.cpu2.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0x0`

subcluster1.cpu2.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

subcluster1.cpu2.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

subcluster1.cpu2.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type: `uint16_t`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: `0xf000`

subcluster1.cpu2.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu2.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu2.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu2.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu2.semihosting-cmd_line

Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu2.semihosting-cwd

Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu2.semihosting-enable

Enable semihosting SVC/HLT traps.

Type: `bool`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

Default value: true

subcluster1.cpu2.semihosting-heap_base

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu2.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu2.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu2.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu2.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu2.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu3.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu3.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu3.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu3.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu3.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu3.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Default value: `0xf000`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu3.semihosting-ARM_SVC
A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

subcluster1.cpu3.semihosting-T32_HLT
T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

subcluster1.cpu3.semihosting-Thumb_SVC
T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

subcluster1.cpu3.semihosting-cmd_line
Command line available to semihosting calls.

Type: `string`

Default value: N/A

subcluster1.cpu3.semihosting-cwd
Base directory for semihosting file access.

Type: `string`

Default value: N/A

subcluster1.cpu3.semihosting-enable
Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: true

subcluster1.cpu3.semihosting-heap_base
Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu3.semihosting-heap_limit

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu3.semihosting-stack_base

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu3.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu3.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu3.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu4.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu4.CRYPTODISABLE

Disable cryptographic features.

Non-Confidential

Type: `uint64_t`

Default value: `0x10000000`

subcluster1.cpu4.semihosting-stack_limit

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

subcluster1.cpu4.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

subcluster1.cpu4.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: false

subcluster1.cpu5.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: false

subcluster1.cpu5.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: false

subcluster1.cpu5.RVBARADDR

Value of RVBAR_ELx register.

Type: `uint64_t`

Default value: `0x0`

Copyright © 2017–2025 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

subcluster1.cpu5.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16.

Type: `bool`

Default value: false

subcluster1.cpu5.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type: `uint64_t`

Default value: `0x0`

subcluster1.cpu5.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
