Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

Fields:

FIELD1 enum
Field name
FIELD2 enum
Field name

ArchMsg.Warning.decode_invalidvalue

Fields:

FIELD enum
Field name

ArchMsg.Warning.decode_mem_hint_unallocated

There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

Fields:

FIELD1 enum
Field name
FIELD2 enum
Field name

ArchMsg.Warning.decode_registermismatch

Fields:

FIELD1 enum
Field name
FIELD2 enum
Field name

ArchMsg.Warning.decode_registeroutofrange

Float point instruction is unpredictable indexing beyond the end of the register bank.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.decode_sbzsbo

Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13inreglist

Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

Instruction is unpredictable when no registers are to be transfered.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. Fields:

PC unsigned int
: Address of instruction causing the branch

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. Fields:

CPSR unsigned int
: Processor state

PC unsigned int
: Address of instruction causing the exception

TYPE enum
: Type of exception

ArchMsg.Warning.reentrant_vector_catch

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ADDR unsigned int
vector address

ArchMsg.Warning.reserved_it_state

Fields:

ITSTATE unsigned int
reserved IT state

ArchMsg.Warning.secure_vector_fetch_from_nonsecure

Secure vector table is being fetched from Non-secure memory .

ArchMsg.Warning.unpredictable_a32_breakpoint

Fields:

ADDR1 unsigned int
Address
ADDR2 unsigned int
Breakpoint address
BAS unsigned int
BAS Field
IS_ADDRESS_MISMATCH_BREAKPOINT bool
Is Mismatch breakpoint, not a match breakpoint
N unsigned int
Breakpoint number
OFFSET unsigned int
Indicates which halfword actually considering into the A32 instruction

ArchMsg.Warning.unpredictable_banked_register_access

Fields:

R unsigned int
R bit
SYSM unsigned int
SYSm

ArchMsg.Warning.unpredictable_ccfail_undef

Fields:

OPCODE unsigned int
opcode of the instruction
VADDR unsigned int
Virtual address of the instruction being executed

ArchMsg.Warning.unpredictable_ici_bits

ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

Fields:

ADDR1 unsigned int
Address
ADDR2 unsigned int
Breakpoint address
BAS unsigned int
BAS Field

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

IS_ADDRESS_MISMATCH_BREAKPOINT bool
: Is Mismatch breakpoint, not a match breakpoint

N unsigned int
: Breakpoint number

OFFSET unsigned int
: Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_t32_vector_catch

Fields:

ADDR unsigned int
: Address

OFFSET unsigned int
: Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_watchpoint_far

Fields:

LOWER_BOUND unsigned int
: the lowest address accessed by the instruction that triggered the watchpoint

UPPER_BOUND unsigned int
: the highest watchpointed address accessed by that instruction

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

AdvSIMDExpandImm may treat this immediate value as UNPREDICTABLE.

ArchMsg.Warning.warning_ConditionalSMC

SMC instruction has UNPREDICTABLE effects when conditional when combined with traps.

ArchMsg.Warning.warning_access_crosses_page_boundary

Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

Fields:

ADDR unsigned int
: address of access crossing page

MEMTYPE_PAGE1 signed int
: First Page's memory type (0-Normal, 1-Non-Normal)

MEMTYPE_PAGE2 signed int
: Second Page's memory type (0-Normal, 1-Non-Normal)

ArchMsg.Warning.warning_access_wraps_around_memory

Fields:

WIDTH unsigned int
: Address width

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_bx_from_thumbee

Fields:

ADDR unsigned int
: Destination address

ArchMsg.Warning.warning_ccsidr_unimplemented_level

Fields:

CSSELR unsigned int
: current effective value of CSSELR

ArchMsg.Warning.warning_change_to_ns_when_tge_set

Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

Fields:

ENTRY_ADDR unsigned int
: address of conflicting TLB entry

ArchMsg.Warning.warning_contiguous_bit_error

Fields:

CONTIG_ADDR unsigned int
: address of the TLB first read, with which this entry is expected to be contiguous

CONTIG_DATA unsigned int
: expected contents based on the entry at CONTIG_ADDR

ENTRY_ADDR unsigned int
: address of conflicting TLB entry

ENTRY_DATA unsigned int
: contents of conflicting TLB entry

ArchMsg.Warning.warning_cp10_cp11_mismatch

Fields:

EL unsigned int
: EL owning the control

ArchMsg.Warning.warning_cp10_cp11_reserved_value

Fields:

CP10 unsigned int
: CP10 access

CP11 unsigned int
: CP11 access

ArchMsg.Warning.warning_csselr_level_out_of_range

Fields:

IMPLEMENTED unsigned int
: number of cache levels implemented

LEVEL unsigned int
: written value of CSSELR.Level

TYPE enum
: The type of cache selected by CSSELR.InD and TnD

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

Fields:

ERROR enum
: type of error resulting

REGISTER enum
: register under consideration

ArchMsg.Warning.warning_debug_register_access_during_reset

Fields:

IS_WRITE unsigned int
: Write Not Read

OFFSET unsigned int
: Register Offset

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

Fields:

N unsigned int
: index

WVR unsigned int
: DBGWVR

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET.

ArchMsg.Warning.warning_exclusive_to_non_normal

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_exclusive_to_non_writeback

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_execute_from_device_memory

An attempt was made to execute from Device memory.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_illegal_cpsr_mode

Fields:

NEW_MODE unsigned int
: New value of CPSR.M

ArchMsg.Warning.warning_illegal_srs_mode

Fields:

MODE unsigned int
: mode for Banked SP

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

PPB_OFFSET unsigned int
: debug register offset

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behaviour of a sequential instruction fetches that cross from non-secure to secure memory and contain SG instruction is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for the this instructions. Fields:

ADDRESS unsigned int
: Address of instruction

OPCODE unsigned int
: instruction opcode

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

DATA unsigned int
: data attempted to be written

PPB_OFFSET unsigned int
: debug register offset

ArchMsg.Warning.warning_invalid_tcr_granule

Fields:

REQUEST signed int
: page size requested (or 0 for reserved)

SUBSTITUTE signed int
: best guess available page size

TG_ID bool
: bits TG0 or TG1

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_load_pc_from_unaligned

PC loaded from an unaligned location.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

Fields:

ATTR unsigned int
: Memory attribute

ArchMsg.Warning.warning_reserved_breakpoint_state_match

Fields:

IS_BREAKPOINT unsigned int
: Is breakpoint, not watchpoint

ArchMsg.Warning.warning_shareability

Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

Thumb instruction warps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

Fields:

MSB unsigned int
: x-1

TTBR enum
: which TTBR register

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_unaligned_to_device

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_unknown_sau_rnr

SAU_RNR was set to an unsupported value.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIP_and_BFHFNMINP

The effect of setting both AIRCR.BFHFNMINP and AIRCR.PRIP to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_EXE_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are UNPREDICTABLE. Fields:

EXC_RETURN `unsigned int`
: Special PC value

SBO_MASK `unsigned int`
: Which bits Should Be One to not UNPRED

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

Fields:

DRVEXC_TAKEN `unsigned int`
: derived exception taken not pended

REACHED_LAST_STORE `unsigned int`
: only the last faulted

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

state on exception return is unpredictable.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

Fields:

ATTR unsigned int
: Memory attribute

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

Fields:

TCR enum
: Which TCR

TSIZE signed int
: Value of TSize

TSIZE_MAX signed int
: The maximum allowed value

TTBR unsigned int
: Which TTBR region

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

The PC value must be word-aligned, otherwise the behavior of the instruction is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

Fields:

FRAME_ADDR unsigned int
: unaligned stack frame address

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

Fields:

TEXCB unsigned int
: texcb value

TEX_REMAP bool
: use tex remap

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

Fields:

SL0 signed int
: VTCR.SL0, starting level for stage 2 translation table walks

T0SZ signed int
: VTCR.T0SZ, required input address range

ArchMsg.Warning.warning_unpredictable_write_DHCSR

Fields:

NEW unsigned int
: data attempted to be written

OLD unsigned int
: previous value

ArchMsg.Warning.warning_unpredictable_write_SHCSR

UNPREDICTABLE setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

Fields:

WRITE unsigned int
: access is write

ArchMsg.Warning.warning_wcr_mask_and_bas

DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
: Origin address (or 0 if unavailable)

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branche return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

DATA unsigned int
: Specified MVA or Set/way

FUNCTION enum
: Clean / Invalidate

SCOPE enum
: Affected region

SIDE enum
: Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int
: Inclusive end addres for by VA or PA requests

NS bool
: Non-secure world for PA

START unsigned int
: Start address for by VA or PA requests

TYPE enum
: Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int
: Address of next instruction after this basic block

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VADDR unsigned int
: Address of first instruction in basic block

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string
: Disassembly of the instruction.

ISET enum
: The instruction set of this instruction.

ITSTATE unsigned int
: The ITSTATE current for the instruction.

OPCODE unsigned int
: The opcode of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

NS bool
: Secure or nonsecure banked register is accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool
: Architectural Context Synchronization Event

SYSREG_SYNC bool
: System register synchronization event

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool
: Core BE8 Big-Endian state

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum
: The architecture profile of the core.

CLUSTER_ID unsigned int
: The cluster ID of this processor.

CORE_NUM unsigned int
: The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum
: Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

FPU_VERSION enum
: The VFP version implemented by the core.

MEM_ARCH enum
: The memory architecture of the core.

MIDR_EL1 unsigned int
: MIDR_EL1 value

NUM_CORES unsigned int
: The number of cores in this MP processor.

QUANTUM_SIZE unsigned int
: The default quantum size of the core.

SECURITY_FEATURES bool
: Does the core have security features?

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number, 0 to 14.

MODE enum
: Bank of the register accessed.

OLD_VALUE unsigned int
: The old value overwritten.

PHYS_ID enum
: The physical register accessed.

VALUE unsigned int
: The new value written to the register.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP14 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP14 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc unsigned int
: opcode 1

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc1 unsigned int
: opcode 1

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

opc2 unsigned int
: opcode 2

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc unsigned int
: opcode 1

CPSR

CPSR change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

OLD_VALUE unsigned int
: The old CPSR value

UNKNOWN unsigned int
: Bits within the register that have unknown value.

VALUE unsigned int
: The new CPSR value

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. Fields:

PU bool
: Whether the core powered up

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of memory in bytes.

TAG unsigned int
: The value of the tag being set.

VADDR unsigned int
: Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of zero'd memory in bytes.

VADDR unsigned int
: Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum
: Description of event

VALUE unsigned int
: data value

DTCM_ACCESS

Trace TCM accesses.

DTCM_ACCESS_RAZ_WI

Trace TCM accesses. Fields:

ADDR unsigned int
: Address of the RAZ/WI access.

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int
: Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int
: Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int
: Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int
: Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PAGE_STRADDLE_COUNT unsigned int
: Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

IS_PHYSICAL bool
: Physical or Virtual exception

LR unsigned int
: The value assigned to the link register.

PC unsigned int
: The location where the exception occurred.

PREFERRED_RETURN unsigned int
: The preferred return address for the exception.

TARGET_ISET enum
: The instruction set of the exception handler code.

TARGET_PC unsigned int
: The address the exception branches to.

VECTOR enum
: The exception vector.

VECTOR_OFFSET unsigned int
: The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EXCEPTION_START

Every exception started.

FP_STATE

Floating point state. Fields:

FPSR `unsigned int`
: FPSR register value.

MASK `unsigned int`
: The mask indicating updated cumulative bits.

HLT

HLT instruction occurred. Fields:

IMM16 `unsigned int`
: The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM `unsigned int`
: Core number in a multi processor.

CURRENT_TIME `unsigned int`
: The core's current time, as simulated time plus local time.

DEBUG_STATE `bool`
: The instruction is executed in debug state.

DISASS `string`
: Disassembly of instruction.

INST_COUNT `unsigned int`
: The core's instruction counter, starting at 1 for the first instruction.

ISET `enum`
: The current instruction set.

ITSTATE `unsigned int`
: The current ITSTATE.

LOCAL_TIME `unsigned int`
: The core's local time, relative to the current quantum.

MODE `enum`
: The mode the core is in.

NSDESC `unsigned int`
: The physical address non-secure bit.

NSDESC2 `unsigned int`
: The second page physical address non-secure bit.

OPCODE `unsigned int`
: The opcode of the instruction.

PADDR `unsigned int`
: The physical address of the instruction.

PADDR2 `unsigned int`
: If different from PADDR, the physical address of the second page of the instruction.

PC `unsigned int`
: The address of the instruction.

SIZE `unsigned int`
: The size of the instruction in bytes.

INST_END

Every instruction completed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

INST_START

Every instruction started. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

INST_STRADDLE

Instruction straddles boundary. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

ISB

ISB instruction occurred.

ITCM_ACCESS

Trace TCM accesses.

ITCM_ACCESS_RAZ_WI

Trace TCM accesses. Fields:

ADDR unsigned int
: Address of the RAZ/WI access.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string
: Register to add into the list

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int
: Local Monitor Address

State enum
: State of the monitor (Open/Exclusive)

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int
: address

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

EXT bool
: Whether access is from an external device (such as the DAP)

NS enum
: Secure state of the access

REG_NAME string
: Name of the debug register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int
: address

CORE_NUM unsigned int
: Core number in a multi processor.

EXT bool
: Whether access is from an external device (such as the DAP)

NS enum
: Secure state of the access

REG_NAME string
: Name of the debug register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: The new mode.

OLD_MODE enum
: The old mode.

MPU_TRANS

Address translation information. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

EXEC_PERM enum
: Execution Permission

INNERCACHE_RA bool
: Is the inner cache allocate on read

INNERCACHE_TYPE enum
: Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool
: Is the inner cache allocate on write

MEMTYPE enum
: Memory type.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OUTERCACHE_RA bool
: Is the outer cache allocate on read

OUTERCACHE_TYPE enum
: Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool
: Is the outer cache allocate on write

PADDR unsigned int
: Address of the access.

PAGESIZE unsigned int
: Page size as log2(size).

READ_PERM enum
: Read Permission

REG_NUM signed int
: MPU region-number 0-15 (else 0xFF=none, 0xBB/0xDD=background/default)

SH enum
: Shareability

SIDE enum
: Inst / Data.

WRITE_PERM enum
: Write Permission

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

PC unsigned int
: The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

EVENT_ID unsigned int
: Event Identifier

INDEX unsigned int
: Counter index (as selected by PMSELR).

INTERRUPT bool
: Is interrupt enabled on overflow for this counter

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int
: Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int
: Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Operating mode after the transition

OLD_STATE enum
: Operating mode before the transition

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Operating mode after the transition

OLD_STATE enum
: Operating mode before the transition

REASON string
: Reason for the transition being denied

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Power mode after the transition

OLD_STATE enum
: Power mode before the transition

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Power mode after the transition

OLD_STATE enum
: Power mode before the transition

REASON string
: Reason for the transition being denied

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Operating mode after the transition

OLD_STATE enum
: Operating mode before the transition

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int
: Ticks count at point of transition.

NEW enum
: New run state.

OLD enum
: Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int
: The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool
: Use EL2 translation regime.

NS bool
: Is Non-Secure.

REG_WIDTH unsigned int
: The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum
: Signal that changed

STATE bool
: Signal asserted state

SPSR

SPSR change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: Which of the banked SPSR registers is written.

OLD_VALUE unsigned int
: The old SPSR value

VALUE unsigned int
: The new SPSR value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

START_COMPILE

Compilation started. Fields:

VADDR unsigned int
: Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...)

OPTIMAL_ALIGN_SELECTOR unsigned int
: Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes)

VADDR unsigned int
: The virtual address of the access

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

LOCAL_QUANTUM unsigned int
: The local quantum of this CPU.

LOCAL_TIME unsigned int
: The local time of this CPU.

SYNC_REASON enum
: Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int
: Immediate value of the system call instruction.

TYPE enum
: System call type.

VADDR unsigned int
: Instruction that caused the system call.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REGNUM enum
: Internal register number

REGNUM_PHYS enum
: Internal register number physically accessed (e.g. in presense of VHE redirection)

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int
: CRm

CRn unsigned int
: CRn

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NS bool
: Secure or nonsecure banked register is accessed.

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REGNUM enum
: Internal register number

REGNUM_PHYS enum
: Internal register number physically accessed (e.g. in presense of VHE redirection)

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...)

NUMBER_OF_BEATS unsigned int
: Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS)

VADDR unsigned int
: The virtual address of the access

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ALIASING enum
: Type of register aliasing used

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum
: Type of register aliasing used

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID enum
: Which VFP system register is written.

MASK unsigned int
: The mask indicating updated cumulative bits.

OLD_VALUE unsigned int
: The register's old value overwritten.

VALUE unsigned int
: The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum
: Type of register aliasing used.

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MASK unsigned int
: Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ISET enum
: Origin instructions set

IS_COND bool
: Indicates if this is a conditional waypoint.

PC unsigned int
: Origin address (or 0 if unavailable)

TAKEN bool
: Indicates if this waypoint was taken.

TARGET unsigned int
: Destination address

TARGET_ISET enum
: Destination instructions set

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int
: Ticks count.

REASON enum
: Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool
: This WFE was ignored because the event register was set.

INST_COUNT unsigned int
: Ticks count when ignoring WFE.

TRAPPED bool
: This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFE.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool
: This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int
: Ticks count when ignoring WFI.

REASON enum
: specifies reason why WFI trace was ignored

TRAPPED bool
: This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int
: Ticks count when WFI wakeup occurred.

REASON enum
: Reason for wakeup.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.42 ARM_Cortex-X1 - trace

This section describes the trace sources.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int
: Fault status in ESR format

PADDR unsigned int
: Physical Address (or 0 if unavailable)

VADDR signed int
: Virtual Address (or 0 if unavailable)

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool
: Memory access failed

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

LOAD_VALUE unsigned int
: Loaded values

NSDESC unsigned int
: The security state of the access.

OPERAND_VALUE unsigned int
: Operation's operand

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

NSDESC unsigned int
: The security state of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OPERAND_VALUE unsigned int
: Operation's operand

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ArchMsg.Error.exit_code

Fields:

EXITCODE signed int
: Exit code to be returned

KIND string
: Component kind that invoked the exit code trace

REASON string
: Reason why the exit code trace was invoked (optional)

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

Fields:

REG_NAME string
: Name of register being written.

ArchMsg.Warning.TarmacReconstructor

Unexpected event happened during Tarmac reconstruction. Fields:

REASON string
: Reason

ArchMsg.Warning.Unpredictably Indexed PM Event Register

Fields:

IsDirect unsigned int
: Direct Access rather than indirect

N unsigned int
: Number of Accessible Registers

SEL unsigned int
: Selector

ArchMsg.Warning.branch_to_unaligned_address

Fields:

ADDR unsigned int
: Unaligned branch address

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain UNKNOWN content. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REGIME unsigned int
: Current translation regime

SIDE unsigned int
: 0 d-side cache or unified cache, 1 i-side

ArchMsg.Warning.dcimvac_matches_watchpoint

Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_fracbitsnegative

VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_invalidvalue

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_mem_hint_unallocated

There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.decode_registermismatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_registeroutofrange

Float point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13inreglist

Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

Instruction is unpredictable when no registers are to be transfered.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. Fields:

PC unsigned int
: Address of instruction causing the branch

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CPSR unsigned int
: Processor state

PC unsigned int
: Address of instruction causing the exception

TYPE enum
: Type of exception

ArchMsg.Warning.reentrant_vector_catch

Fields:

ADDR unsigned int
: vector address

ArchMsg.Warning.reserved_it_state

Fields:

ITSTATE unsigned int
: reserved IT state

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. Fields:

EL unsigned int
: Exception level of translation regime

INVALIDITY unsigned int
: Which TLB may be invalid (if TLBs are separate)

NON_SECURE unsigned int
: Security state of translation regime

VMID unsigned int
: Current VMID, if applicable

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpredictable_a32_breakpoint

Fields:

ADDR1 unsigned int
: Address

ADDR2 unsigned int
: Breakpoint address

BAS unsigned int
: BAS Field

IS_ADDRESS_MISMATCH_BREAKPOINT bool
: Is Mismatch breakpoint, not a match breakpoint

N unsigned int
: Breakpoint number

OFFSET unsigned int
: Indicates which halfword actually considering into the A32 instruction

ArchMsg.Warning.unpredictable_banked_register_access

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

R unsigned int
R bit
SYSM unsigned int
SYSm

ArchMsg.Warning.unpredictable_ccfail_undef

Fields:

OPCODE unsigned int
opcode of the instruction
VADDR unsigned int
Virtual address of the instruction being executed

ArchMsg.Warning.unpredictable_ici_bits

ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

Fields:

ADDR1 unsigned int
Address
ADDR2 unsigned int
Breakpoint address
BAS unsigned int
BAS Field
IS_ADDRESS_MISMATCH_BREAKPOINT bool
Is Mismatch breakpoint, not a match breakpoint
N unsigned int
Breakpoint number
OFFSET unsigned int
Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_t32_vector_catch

Fields:

ADDR unsigned int
Address
OFFSET unsigned int
Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_watchpoint_far

Fields:

LOWER_BOUND unsigned int
the lowest address accessed by the instruction that triggered the watchpoint
UPPER_BOUND unsigned int
the highest watchpointed address accessed by that instruction

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

AdvSIMDExpandImm may treat this immediate value as UNPREDICTABLE.

ArchMsg.Warning.warning_ConditionalSMC

SMC instruction has UNPREDICTABLE effects when conditional when combined with traps.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_access_crosses_page_boundary

Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

Fields:

ADDR unsigned int
: address of access crossing page

MEMTYPE_PAGE1 signed int
: First Page's memory type (0-Normal, 1-Non-Normal)

MEMTYPE_PAGE2 signed int
: Second Page's memory type (0-Normal, 1-Non-Normal)

ArchMsg.Warning.warning_access_wraps_around_memory

Fields:

WIDTH unsigned int
: Address width

ArchMsg.Warning.warning_bx_from_thumbee

Fields:

ADDR unsigned int
: Destination address

ArchMsg.Warning.warning_ccsidr_unimplemented_level

Fields:

CSSELR unsigned int
: current effective value of CSSELR

ArchMsg.Warning.warning_change_to_ns_when_tge_set

Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

Fields:

ENTRY_ADDR unsigned int
: address of conflicting TLB entry

ArchMsg.Warning.warning_contiguous_bit_error

Fields:

CONTIG_ADDR unsigned int
: address of the TLB first read, with which this entry is expected to be contiguous

CONTIG_DATA unsigned int
: expected contents based on the entry at CONTIG_ADDR

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ENTRY_ADDR unsigned int
address of conflicting TLB entry
ENTRY_DATA unsigned int
contents of conflicting TLB entry

ArchMsg.Warning.warning_cp10_cp11_mismatch

Fields:

EL unsigned int
EL owning the control

ArchMsg.Warning.warning_cp10_cp11_reserved_value

Fields:

CP10 unsigned int
CP10 access
CP11 unsigned int
CP11 access

ArchMsg.Warning.warning_csselr_level_out_of_range

Fields:

IMPLEMENTED unsigned int
number of cache levels implemented
LEVEL unsigned int
written value of CSSELR.Level
TYPE enum
The type of cache selected by CSSELR.InD and TnD

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

Fields:

ERROR enum
type of error resulting
REGISTER enum
register under consideration

ArchMsg.Warning.warning_debug_register_access_during_reset

Fields:

IS_WRITE unsigned int
Write Not Read
OFFSET unsigned int
Register Offset

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_default_cacheable_vmmu_off

Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

Fields:

N unsigned int
: index

WVR unsigned int
: DBGWVR

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET.

ArchMsg.Warning.warning_exclusive_to_non_normal

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_exclusive_to_non_writeback

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_execute_from_device_memory

An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

Fields:

NEW_MODE unsigned int
: New value of CPSR.M

ArchMsg.Warning.warning_illegal_srs_mode

Fields:

MODE unsigned int
: mode for Banked SP

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

PPB_OFFSET unsigned int
: debug register offset

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behaviour of a sequential instruction fetches that cross from non-secure to secure memory and contain SG instruction is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for the this instructions. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ADDRESS unsigned int
: Address of instruction

OPCODE unsigned int
: instruction opcode

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

DATA unsigned int
: data attempted to be written

PPB_OFFSET unsigned int
: debug register offset

ArchMsg.Warning.warning_invalid_tcr_granule

Fields:

REQUEST signed int
: page size requested (or 0 for reserved)

SUBSTITUTE signed int
: best guess available page size

TG_ID bool
: bits TG0 or TG1

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_load_pc_from_unaligned

PC loaded from an unaligned location.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

Fields:

ATTR unsigned int
: Memory attribute

ArchMsg.Warning.warning_reserved_breakpoint_state_match

Fields:

IS_BREAKPOINT unsigned int
: Is breakpoint, not watchpoint

ArchMsg.Warning.warning_shareability

Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

Thumb instruction warps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MSB unsigned int
x-1
TTBR enum
which TTBR register

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_to_device

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unknown_sau_rnr

SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIP_and_BFHFNMINP

The effect of setting both AIRCR.BFHFNMINP and AIRCR.PRIP to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_EXE_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are UNPREDICTABLE. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EXC_RETURN unsigned int
Special PC value
SBO_MASK unsigned int
Which bits Should Be One to not UNPRED

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

Fields:

DRVEXC_TAKEN unsigned int
derived exception taken not pended
REACHED_LAST_STORE unsigned int
only the last faulted

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

Fields:

ATTR unsigned int
Memory attribute

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

UNPREDICTABLE state on context switch.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

Fields:

TCR enum
: Which TCR

TSIZE signed int
: Value of TSize

TSIZE_MAX signed int
: The maximum allowed value

TTBR unsigned int
: Which TTBR region

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

The PC value must be word-aligned, otherwise the behavior of the instruction is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

Fields:

FRAME_ADDR unsigned int
: unaligned stack frame address

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

Fields:

TEXCB unsigned int
: texcb value

TEX_REMAP bool
: use tex remap

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

Fields:

SL0 signed int
: VTCR.SL0, starting level for stage 2 translation table walks

T0SZ signed int
: VTCR.T0SZ, required input address range

ArchMsg.Warning.warning_unpredictable_write_DHCSR

Fields:

NEW unsigned int
: data attempted to be written

OLD unsigned int
: previous value

ArchMsg.Warning.warning_unpredictable_write_SHCSR

UNPREDICTABLE setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

Fields:

WRITE unsigned int
: access is write

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_wcr_mask_and_bas

DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. Fields:

BTYPE unsigned int
: pstate.BTYPE at time branch taken

OPCODE unsigned int
: opcode at branch target

PC unsigned int
: Virtual Address of branch target

ArchMsg.Why.why_illegal_state

An illegal mode change has occured. Fields:

MESSAGE string
: The message

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
: Origin address (or 0 if unavailable)

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branche return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

DATA unsigned int
: Specified MVA or Set/way

FUNCTION enum
: Clean / Invalidate

SCOPE enum
: Affected region

SIDE enum
: Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int
: Inclusive end addres for by VA or PA requests

NS bool
: Non-secure world for PA

START unsigned int
: Start address for by VA or PA requests

TYPE enum
: Request type.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int
: Address of next instruction after this basic block

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int
: Address of first instruction in basic block

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string
: Disassembly of the instruction.

ISET enum
: The instruction set of this instruction.

ITSTATE unsigned int
: The ITSTATE current for the instruction.

OPCODE unsigned int
: The opcode of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

NS bool
: Secure or nonsecure banked register is accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool
: Architectural Context Synchronization Event

SYSREG_SYNC bool
: System register synchronization event

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool
: Core BE8 Big-Endian state

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARCH_PROFILE enum
: The architecture profile of the core.

CLUSTER_ID unsigned int
: The cluster ID of this processor.

CORE_NUM unsigned int
: The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum
: Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field

FPU_VERSION enum
: The VFP version implemented by the core.

MEM_ARCH enum
: The memory architecture of the core.

MIDR_EL1 unsigned int
: MIDR_EL1 value

NUM_CORES unsigned int
: The number of cores in this MP processor.

QUANTUM_SIZE unsigned int
: The default quantum size of the core.

SECURITY_FEATURES bool
: Does the core have security features?

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number, 0 to 14.

MODE enum
: Bank of the register accessed.

OLD_VALUE unsigned int
: The old value overwritten.

PHYS_ID enum
: The physical register accessed.

VALUE unsigned int
: The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID enum
: The register number, 0..30 for X0..X30, >=32 for SP_ELn.

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP14 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP14 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc unsigned int
: opcode 1

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc unsigned int
: opcode 1

CPSR

CPSR change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

OLD_VALUE unsigned int
: The old CPSR value

UNKNOWN unsigned int
: Bits within the register that have unknown value.

VALUE unsigned int
: The new CPSR value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. Fields:

PU bool
: Whether the core powered up

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of memory in bytes.

TAG unsigned int
: The value of the tag being set.

VADDR unsigned int
: Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of zero'd memory in bytes.

VADDR unsigned int
: Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum
: Description of event

VALUE unsigned int
: data value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int
: Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int
: Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int
: Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int
: Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int
: Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool
: ESB is async

IMPLICIT bool
: ESB is implicit

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

IS_PHYSICAL bool
: Physical or Virtual exception

LR unsigned int
: The value assigned to the link register.

PC unsigned int
: The location where the exception occurred.

PREFERRED_RETURN unsigned int
: The preferred return address for the exception.

TARGET_ISET enum
: The instruction set of the exception handler code.

TARGET_PC unsigned int
: The address the exception branches to.

VECTOR enum
: The exception vector.

VECTOR_OFFSET unsigned int
: The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_STATE

Floating point state. Fields:

FPSR unsigned int
: FPSR register value.

MASK unsigned int
: The mask indicating updated cumulative bits.

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int
: The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DEBUG_STATE bool
: The instruction is executed in debug state.

DISASS string
: Disassembly of instruction.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The current instruction set.

ITSTATE unsigned int
: The current ITSTATE.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

MODE enum
: The mode the core is in.

NS unsigned int
: The core's non-secure bit.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

OPCODE unsigned int
: The opcode of the instruction.

PADDR unsigned int
: The physical address of the instruction.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

INST_STRADDLE

Instruction straddles boundary. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string
: Register to add into the list

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int
: Local Monitor Address

State enum
: State of the monitor (Open/Exclusive)

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int
: address

CORE_NUM unsigned int
: Core number in a multi processor.

EXT bool
: Whether access is from an external device (such as the DAP)

NS enum
: Secure state of the access

REG_NAME string
: Name of the debug register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int
: address

CORE_NUM unsigned int
: Core number in a multi processor.

EXT bool
: Whether access is from an external device (such as the DAP)

NS enum
: Secure state of the access

REG_NAME string
: Name of the debug register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int
: Address space identifier.

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Hyp bool
: Entry matches in Hyp state only

INNERCACHE_RA bool
: Is the inner cache allocate on read

INNERCACHE_TRANSIENT bool
: Is the inner write-through transient

INNERCACHE_TYPE enum
: Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool
: Is the inner cache allocate on write

MEMTYPE enum
: Memory type.

NSDESC enum
: Is secure side supposed to access secure or nonsecure memory

OUTERCACHE_RA bool
: Is the outer cache allocate on read

OUTERCACHE_TRANSIENT bool
: Is the outer write-through transient

OUTERCACHE_TYPE enum
: Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool
: Is the outer cache allocate on write

PADDR unsigned int
: Physical address of the access.

PAGESIZE unsigned int
: Page size as log2(size).

SH enum
: Shareability

SIDE enum
: Inst / Data.

STAGE1_PERM unsigned int
: Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR)

STAGE2_PERM unsigned int
: Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR)

VADDR unsigned int
: Virtual address of the access.

VMID unsigned int
: Virtual machine identifier.

XS bool
: XS Attribute

nG enum
: Flag indicating whether ASID will be matched

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool
: Was the walk successful.

DATA unsigned int
: The data read.

IPA unsigned int
: For stage 1, the IPA of the read.

LEVEL unsigned int
: Translation table level

LPAE bool
: Is this for an LPAE translation

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NSmem bool
: Non secure memory access

NSreq bool
: Non secure request

OUTADDR unsigned int
: The output physical address.

PADDR unsigned int
: The physical address of the read.

SIDE enum
: Inst / Data.

STAGE unsigned int
: Translation stage

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool
: Was the walk successful.

DATA unsigned int
: The data written.

IPA unsigned int
: For stage 1, the IPA of the write.

LEVEL unsigned int
: Translation table level

LPAE bool
: Is this for an LPAE translation

NSmem bool
: Non secure memory access

NSreq bool
: Non secure request

PADDR unsigned int
: The physical address of the write.

SIDE enum
: Inst / Data.

STAGE unsigned int
: Translation stage

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: The new mode.

NON_SECURE enum
: The new security state

OLD_MODE enum
: The old mode.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

PC unsigned int
: The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

EVENT_ID unsigned int
: Event Identifier

INDEX unsigned int
: Counter index (as selected by PMSELR).

INTERRUPT bool
: Is interrupt enabled on overflow for this counter

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP unsigned int
: Prefetch hint

VADDR unsigned int
: Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int
: Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int
: Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ADDR unsigned int
The physical address of the read.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition
REASON string
Reason for the transition being denied

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Power mode after the transition
OLD_STATE enum
Power mode before the transition

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Power mode after the transition
OLD_STATE enum
Power mode before the transition
REASON string
Reason for the transition being denied

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int
: Ticks count at point of transition.

NEW enum
: New run state.

OLD enum
: Old run state.

SBP_SAMPLE_COLLISION

Statistical profiling samples collided .

SBP_SAMPLE_DISCARDED

Fields:

BUFFER_POINTER unsigned int
: Value of buffer pointer

DATA unsigned int
: Data discarded

SIZE unsigned int
: Size of sample, in bytes

SBP_SAMPLE_END

Statistical profiling of an operation ended.

SBP_SAMPLE_POP

Operation which might be sampled by statistical profiling.

SBP_SAMPLE_RECORDED

Fields:

BUFFER_ADDRESS unsigned int
: Virtual Address of start of buffer write

DATA unsigned int
: Data written to the buffer

SIZE unsigned int
: Size of sample written to buffer, in bytes

SBP_SAMPLE_START

Statistical profiling of an operation started.

SBP_SAMPLE_TAKEN

Operation sampled by statistical profiling after filtering.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int
: The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EL2 bool
: Use EL2 translation regime.

NS bool
: Is Non-Secure.

REG_WIDTH unsigned int
: The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum
: Signal that changed

STATE bool
: Signal asserted state

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum
: Software Step state

SPSR

SPSR change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: Which of the banked SPSR registers is written.

OLD_VALUE unsigned int
: The old SPSR value

VALUE unsigned int
: The new SPSR value

START_COMPILE

Compilation started. Fields:

VADDR unsigned int
: Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...)

OPTIMAL_ALIGN_SELECTOR unsigned int
: Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes)

VADDR unsigned int
: The virtual address of the access

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

LOCAL_QUANTUM unsigned int
: The local quantum of this CPU.

LOCAL_TIME unsigned int
: The local time of this CPU.

SYNC_REASON enum
: Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int
: Immediate value of the system call instruction.

TYPE enum
: System call type.

VADDR unsigned int
: Instruction that caused the system call.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REGNUM enum
: Internal register number

REGNUM_PHYS enum
: Internal register number physically accessed (e.g. in presense of VHE redirection)

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

opc2 unsigned int
: opcode 2

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NS bool
: Secure or nonsecure banked register is accessed.

REGNUM enum
: Internal register number

REGNUM_PHYS enum
: Internal register number physically accessed (e.g. in presense of VHE redirection)

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...)

NUMBER_OF_BEATS unsigned int
: Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS)

VADDR unsigned int
: The virtual address of the access

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum
: Type of register aliasing used

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum
: Type of register aliasing used

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MASK unsigned int
: Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID enum
: Which VFP system register is written.

MASK unsigned int
: The mask indicating updated cumulative bits.

OLD_VALUE unsigned int
: The register's old value overwritten.

VALUE unsigned int
: The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum
: Type of register aliasing used.

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ISET enum
: Origin instructions set

IS_COND bool
: Indicates if this is a conditional waypoint.

PC unsigned int
: Origin address (or 0 if unavailable)

TAKEN bool
: Indicates if this waypoint was taken.

TARGET unsigned int
: Destination address

TARGET_ISET enum
: Destination instructions set

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int
: Ticks count.

REASON enum
: Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool
: This WFE was ignored because the event register was set.

INST_COUNT unsigned int
: Ticks count when ignoring WFE.

TRAPPED bool
: This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool
: This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int
: Ticks count when ignoring WFI.

REASON enum
: specifies reason why WFI trace was ignored

TRAPPED bool
: This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

INST_COUNT unsigned int
: Ticks count when WFI wakeup occurred.

REASON enum
: Reason for wakeup.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.43 ARM_CortexR52 - trace

This section describes the trace sources.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int
: Fault status in ESR format

PADDR unsigned int
: Physical Address (or 0 if unavailable)

VADDR signed int
: Virtual Address (or 0 if unavailable)

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool
: Memory access failed

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

LOAD_VALUE unsigned int
: Loaded values

NSDESC unsigned int
: The security state of the access.

OPERAND_VALUE unsigned int
: Operation's operand

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

NSDESC unsigned int
: The security state of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OPERAND_VALUE unsigned int
: Operation's operand

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ArchMsg.Error.exit_code

Fields:

EXITCODE signed int
: Exit code to be returned

KIND string
: Component kind that invoked the exit code trace

REASON string
: Reason why the exit code trace was invoked (optional)

ArchMsg.Info.invalid_region_programmed

Fields:

BASE_ADDR unsigned int
: Base Address

END_ADDR unsigned int
: End Address

REGION_ID unsigned int
: Region ID

STAGE unsigned int
: MPU Stage

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.TarmacReconstructor

Unexpected event happened during Tarmac reconstruction. Fields:

REASON string
: Reason

ArchMsg.Warning.Unpredictably Indexed PM Event Register

Fields:

IsDirect unsigned int
: Direct Access rather than indirect

N unsigned int
: Number of Accessible Registers

SEL unsigned int
: Selector

ArchMsg.Warning.branch_to_unaligned_address

Fields:

ADDR unsigned int
: Unaligned branch address

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.cache_contents_unknown

Fields:

REGIME unsigned int
: Current translation regime

SIDE unsigned int
: 0 d-side cache or unified cache, 1 i-side

ArchMsg.Warning.dcimvac_matches_watchpoint

Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_fracbitsnegative

VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_invalidvalue

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_mem_hint_unallocated

There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.decode_registermismatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_registeroutofrange

Float point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13inreglist

Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

Instruction is unpredictable when no registers are to be transfered.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. Fields:

PC unsigned int
: Address of instruction causing the branch

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CPSR unsigned int
: Processor state

PC unsigned int
: Address of instruction causing the exception

TYPE enum
: Type of exception

ArchMsg.Warning.reentrant_vector_catch

Fields:

ADDR unsigned int
: vector address

ArchMsg.Warning.reserved_it_state

Fields:

ITSTATE unsigned int
: reserved IT state

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. Fields:

EL unsigned int
: Exception level of translation regime

INVALIDITY unsigned int
: Which TLB may be invalid (if TLBs are separate)

NON_SECURE unsigned int
: Security state of translation regime

VMID unsigned int
: Current VMID, if applicable

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpredictable_a32_breakpoint

Fields:

ADDR1 unsigned int
: Address

ADDR2 unsigned int
: Breakpoint address

BAS unsigned int
: BAS Field

IS_ADDRESS_MISMATCH_BREAKPOINT bool
: Is Mismatch breakpoint, not a match breakpoint

N unsigned int
: Breakpoint number

OFFSET unsigned int
: Indicates which halfword actually considering into the A32 instruction

ArchMsg.Warning.unpredictable_banked_register_access

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

R unsigned int
R bit
SYSM unsigned int
SYSm

ArchMsg.Warning.unpredictable_ccfail_undef

Fields:

OPCODE unsigned int
opcode of the instruction
VADDR unsigned int
Virtual address of the instruction being executed

ArchMsg.Warning.unpredictable_ici_bits

ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

Fields:

ADDR1 unsigned int
Address
ADDR2 unsigned int
Breakpoint address
BAS unsigned int
BAS Field
IS_ADDRESS_MISMATCH_BREAKPOINT bool
Is Mismatch breakpoint, not a match breakpoint
N unsigned int
Breakpoint number
OFFSET unsigned int
Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_t32_vector_catch

Fields:

ADDR unsigned int
Address
OFFSET unsigned int
Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_watchpoint_far

Fields:

LOWER_BOUND unsigned int
the lowest address accessed by the instruction that triggered the watchpoint
UPPER_BOUND unsigned int
the highest watchpointed address accessed by that instruction

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

AdvSIMDExpandImm may treat this immediate value as UNPREDICTABLE.

ArchMsg.Warning.warning_ConditionalSMC

SMC instruction has UNPREDICTABLE effects when conditional when combined with traps.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_access_crosses_page_boundary

Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

Fields:

ADDR unsigned int
: address of access crossing page

MEMTYPE_PAGE1 signed int
: First Page's memory type (0-Normal, 1-Non-Normal)

MEMTYPE_PAGE2 signed int
: Second Page's memory type (0-Normal, 1-Non-Normal)

ArchMsg.Warning.warning_access_wraps_around_memory

Fields:

WIDTH unsigned int
: Address width

ArchMsg.Warning.warning_bx_from_thumbee

Fields:

ADDR unsigned int
: Destination address

ArchMsg.Warning.warning_ccsidr_unimplemented_level

Fields:

CSSELR unsigned int
: current effective value of CSSELR

ArchMsg.Warning.warning_change_to_ns_when_tge_set

Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

Fields:

ENTRY_ADDR unsigned int
: address of conflicting TLB entry

ArchMsg.Warning.warning_contiguous_bit_error

Fields:

CONTIG_ADDR unsigned int
: address of the TLB first read, with which this entry is expected to be contiguous

CONTIG_DATA unsigned int
: expected contents based on the entry at CONTIG_ADDR

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ENTRY_ADDR unsigned int
address of conflicting TLB entry
ENTRY_DATA unsigned int
contents of conflicting TLB entry

ArchMsg.Warning.warning_cp10_cp11_mismatch

Fields:

EL unsigned int
EL owning the control

ArchMsg.Warning.warning_cp10_cp11_reserved_value

Fields:

CP10 unsigned int
CP10 access
CP11 unsigned int
CP11 access

ArchMsg.Warning.warning_csselr_level_out_of_range

Fields:

IMPLEMENTED unsigned int
number of cache levels implemented
LEVEL unsigned int
written value of CSSELR.Level
TYPE enum
The type of cache selected by CSSELR.InD and TnD

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

Fields:

ERROR enum
type of error resulting
REGISTER enum
register under consideration

ArchMsg.Warning.warning_debug_register_access_during_reset

Fields:

IS_WRITE unsigned int
Write Not Read
OFFSET unsigned int
Register Offset

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_default_cacheable_vmmu_off

Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

Fields:

N unsigned int
: index

WVR unsigned int
: DBGWVR

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET.

ArchMsg.Warning.warning_exclusive_to_non_normal

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_exclusive_to_non_writeback

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_execute_from_device_memory

An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

Fields:

NEW_MODE unsigned int
: New value of CPSR.M

ArchMsg.Warning.warning_illegal_srs_mode

Fields:

MODE unsigned int
: mode for Banked SP

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

PPB_OFFSET unsigned int
: debug register offset

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behaviour of a sequential instruction fetches that cross from non-secure to secure memory and contain SG instruction is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for the this instructions. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ADDRESS unsigned int
: Address of instruction

OPCODE unsigned int
: instruction opcode

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

DATA unsigned int
: data attempted to be written

PPB_OFFSET unsigned int
: debug register offset

ArchMsg.Warning.warning_invalid_tcr_granule

Fields:

REQUEST signed int
: page size requested (or 0 for reserved)

SUBSTITUTE signed int
: best guess available page size

TG_ID bool
: bits TG0 or TG1

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_load_pc_from_unaligned

PC loaded from an unaligned location.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

Fields:

ATTR unsigned int
: Memory attribute

ArchMsg.Warning.warning_reserved_breakpoint_state_match

Fields:

IS_BREAKPOINT unsigned int
: Is breakpoint, not watchpoint

ArchMsg.Warning.warning_shareability

Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

Thumb instruction warps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MSB unsigned int
x-1
TTBR enum
which TTBR register

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_to_device

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unknown_sau_rnr

SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIP_and_BFHFNMINP

The effect of setting both AIRCR.BFHFNMINP and AIRCR.PRIP to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_EXE_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are UNPREDICTABLE. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EXC_RETURN unsigned int
Special PC value
SBO_MASK unsigned int
Which bits Should Be One to not UNPRED

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

Fields:

DRVEXC_TAKEN unsigned int
derived exception taken not pended
REACHED_LAST_STORE unsigned int
only the last faulted

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

Fields:

ATTR unsigned int
Memory attribute

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

UNPREDICTABLE state on context switch.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

Fields:

TCR enum
: Which TCR

TSIZE signed int
: Value of TSize

TSIZE_MAX signed int
: The maximum allowed value

TTBR unsigned int
: Which TTBR region

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

The PC value must be word-aligned, otherwise the behavior of the instruction is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

Fields:

FRAME_ADDR unsigned int
: unaligned stack frame address

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

Fields:

TEXCB unsigned int
: texcb value

TEX_REMAP bool
: use tex remap

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

Fields:

SL0 signed int
: VTCR.SL0, starting level for stage 2 translation table walks

T0SZ signed int
: VTCR.T0SZ, required input address range

ArchMsg.Warning.warning_unpredictable_write_DHCSR

Fields:

NEW unsigned int
: data attempted to be written

OLD unsigned int
: previous value

ArchMsg.Warning.warning_unpredictable_write_SHCSR

UNPREDICTABLE setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

Fields:

WRITE unsigned int
: access is write

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_wcr_mask_and_bas

DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. Fields:

BTYPE unsigned int
: pstate.BTYPE at time branch taken

OPCODE unsigned int
: opcode at branch target

PC unsigned int
: Virtual Address of branch target

ArchMsg.Why.why_illegal_state

An illegal mode change has occured. Fields:

MESSAGE string
: The message

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
: Origin address (or 0 if unavailable)

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branche return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

DATA unsigned int
: Specified MVA or Set/way

FUNCTION enum
: Clean / Invalidate

SCOPE enum
: Affected region

SIDE enum
: Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int
: Inclusive end addres for by VA or PA requests

NS bool
: Non-secure world for PA

START unsigned int
: Start address for by VA or PA requests

TYPE enum
: Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int
: Address of next instruction after this basic block

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int
: Address of first instruction in basic block

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string
: Disassembly of the instruction.

ISET enum
: The instruction set of this instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ITSTATE unsigned int
: The ITSTATE current for the instruction.

OPCODE unsigned int
: The opcode of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

NS bool
: Secure or nonsecure banked register is accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool
: Architectural Context Synchronization Event

SYSREG_SYNC bool
: System register synchronization event

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool
: Core BE8 Big-Endian state

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum
: The architecture profile of the core.

CLUSTER_ID unsigned int
: The cluster ID of this processor.

CORE_NUM unsigned int
: The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum
: Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field

FPU_VERSION enum
: The VFP version implemented by the core.

MEM_ARCH enum
: The memory architecture of the core.

MIDR_EL1 unsigned int
: MIDR_EL1 value

NUM_CORES unsigned int
: The number of cores in this MP processor.

QUANTUM_SIZE unsigned int
: The default quantum size of the core.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SECURITY_FEATURES bool
: Does the core have security features?

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number, 0 to 14.

MODE enum
: Bank of the register accessed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OLD_VALUE unsigned int
: The old value overwritten.

PHYS_ID enum
: The physical register accessed.

VALUE unsigned int
: The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID enum
: The register number, 0..30 for X0..X30, >=32 for SP_ELn.

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP14 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP14 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_READ

System Coprocessor register read. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc unsigned int
: opcode 1

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc unsigned int
: opcode 1

CPSR

CPSR change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

OLD_VALUE unsigned int
: The old CPSR value

UNKNOWN unsigned int
: Bits within the register that have unknown value.

VALUE unsigned int
: The new CPSR value

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. Fields:

PU bool
: Whether the core powered up

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of memory in bytes.

TAG unsigned int
: The value of the tag being set.

VADDR unsigned int
: Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of zero'd memory in bytes.

VADDR unsigned int
: Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum
: Description of event

VALUE unsigned int
: data value

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int
: Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int
: Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int
: Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int
: Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int
: Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ASYNC bool
: ESB is async

IMPLICIT bool
: ESB is implicit

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

IS_PHYSICAL bool
: Physical or Virtual exception

LR unsigned int
: The value assigned to the link register.

PC unsigned int
: The location where the exception occurred.

PREFERRED_RETURN unsigned int
: The preferred return address for the exception.

TARGET_ISET enum
: The instruction set of the exception handler code.

TARGET_PC unsigned int
: The address the exception branches to.

VECTOR enum
: The exception vector.

VECTOR_OFFSET unsigned int
: The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_STATE

Floating point state. Fields:

FPSR unsigned int
: FPSR register value.

MASK unsigned int
: The mask indicating updated cumulative bits.

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int
: The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DEBUG_STATE bool
: The instruction is executed in debug state.

DISASS string
: Disassembly of instruction.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The current instruction set.

ITSTATE unsigned int
: The current ITSTATE.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

MODE enum
: The mode the core is in.

NS unsigned int
: The core's non-secure bit.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

OPCODE unsigned int
: The opcode of the instruction.

PADDR unsigned int
: The physical address of the instruction.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the instruction.

PC unsigned int
: The address of the instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SIZE unsigned int
: The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

INST_STRADDLE

Instruction straddles boundary. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string
: Register to add into the list

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int
: Local Monitor Address

State enum
: State of the monitor (Open/Exclusive)

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int
: address

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

EXT bool
: Whether access is from an external device (such as the DAP)

NS enum
: Secure state of the access

REG_NAME string
: Name of the debug register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int
: address

CORE_NUM unsigned int
: Core number in a multi processor.

EXT bool
: Whether access is from an external device (such as the DAP)

NS enum
: Secure state of the access

REG_NAME string
: Name of the debug register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int
: Address space identifier.

CORE_NUM unsigned int
: Core number in a multi processor.

Hyp bool
: Entry matches in Hyp state only

INNERCACHE_RA bool
: Is the inner cache allocate on read

INNERCACHE_TRANSIENT bool
: Is the inner write-through transient

INNERCACHE_TYPE enum
: Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool
: Is the inner cache allocate on write

MEMTYPE enum
: Memory type.

NSDESC enum
: Is secure side supposed to access secure or nonsecure memory

OUTERCACHE_RA bool
: Is the outer cache allocate on read

OUTERCACHE_TRANSIENT bool
: Is the outer write-through transient

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OUTERCACHE_TYPE enum
: Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool
: Is the outer cache allocate on write

PADDR unsigned int
: Physical address of the access.

PAGESIZE unsigned int
: Page size as log2(size).

SH enum
: Shareability

SIDE enum
: Inst / Data.

STAGE1_PERM unsigned int
: Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR)

STAGE2_PERM unsigned int
: Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR)

VADDR unsigned int
: Virtual address of the access.

VMID unsigned int
: Virtual machine identifier.

XS bool
: XS Attribute

nG enum
: Flag indicating whether ASID will be matched

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool
: Was the walk successful.

DATA unsigned int
: The data read.

IPA unsigned int
: For stage 1, the IPA of the read.

LEVEL unsigned int
: Translation table level

LPAE bool
: Is this for an LPAE translation

NSmem bool
: Non secure memory access

NSreq bool
: Non secure request

OUTADDR unsigned int
: The output physical address.

PADDR unsigned int
: The physical address of the read.

SIDE enum
: Inst / Data.

STAGE unsigned int
: Translation stage

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool
: Was the walk successful.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DATA unsigned int
: The data written.

IPA unsigned int
: For stage 1, the IPA of the write.

LEVEL unsigned int
: Translation table level

LPAE bool
: Is this for an LPAE translation

NSmem bool
: Non secure memory access

NSreq bool
: Non secure request

PADDR unsigned int
: The physical address of the write.

SIDE enum
: Inst / Data.

STAGE unsigned int
: Translation stage

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: The new mode.

OLD_MODE enum
: The old mode.

MPU_TRANS

Address translation information. Fields:

ACCESS_STATUS enum
: Access status(0xAA/0xBB/0xDD/0xEE=overlap/bg hit/default/bg fault)

CORE_NUM unsigned int
: Core number in a multi processor.

EXEC_PERM enum
: Execution Permission

INNERCACHE_RA bool
: Is the inner cache allocate on read

INNERCACHE_TYPE enum
: Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool
: Is the inner cache allocate on write

MEMTYPE enum
: Memory type.

NSDESC enum
: Is non secure access

OUTERCACHE_RA bool
: Is the outer cache allocate on read

OUTERCACHE_TYPE enum
: Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool
: Is the outer cache allocate on write

PADDR unsigned int
: Address of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PAGESIZE unsigned int
: Page size as log2(size).

READ_PERM enum
: Read Permission

REG_NUM unsigned int
: MPU region-number 0-31

SH enum
: Shareability

SIDE enum
: Inst / Data.

STAGE unsigned int
: The translation stage

WRITE_PERM enum
: Write Permission

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

PC unsigned int
: The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

EVENT_ID unsigned int
: Event Identifier

INDEX unsigned int
: Counter index (as selected by PMSELR).

INTERRUPT bool
: Is interrupt enabled on overflow for this counter

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP unsigned int
: Prefetch hint

VADDR unsigned int
: Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int
: Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VADDR unsigned int
Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int
The core's current time, as simulated time plus local time.
LOCAL_TIME unsigned int
The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int
The core's current time, as simulated time plus local time.
LOCAL_TIME unsigned int
The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int
The physical address of the read.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition
REASON string
Reason for the transition being denied

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Power mode after the transition
OLD_STATE enum
Power mode before the transition

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Power mode after the transition

OLD_STATE enum
: Power mode before the transition

REASON string
: Reason for the transition being denied

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Operating mode after the transition

OLD_STATE enum
: Operating mode before the transition

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int
: Ticks count at point of transition.

NEW enum
: New run state.

OLD enum
: Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int
: The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool
: Use EL2 translation regime.

NS bool
: Is Non-Secure.

REG_WIDTH unsigned int
: The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum
: Signal that changed

STATE bool
: Signal asserted state

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum
: Software Step state

SPSR

SPSR change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: Which of the banked SPSR registers is written.

OLD_VALUE unsigned int
: The old SPSR value

VALUE unsigned int
: The new SPSR value

START_COMPILE

Compilation started. Fields:

VADDR unsigned int
: Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...)

OPTIMAL_ALIGN_SELECTOR unsigned int
: Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes)

VADDR unsigned int
: The virtual address of the access

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

INST_COUNT unsigned int
: The instruction count of this CPU.

LOCAL_QUANTUM unsigned int
: The local quantum of this CPU.

LOCAL_TIME unsigned int
: The local time of this CPU.

SYNC_REASON enum
: Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int
: Immediate value of the system call instruction.

TYPE enum
: System call type.

VADDR unsigned int
: Instruction that caused the system call.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REGNUM enum
: Internal register number

REGNUM_PHYS enum
: Internal register number physically accessed (e.g. in presense of VHE redirection)

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG enum
: Register number.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REGNUM enum
: Internal register number

REGNUM_PHYS enum
: Internal register number physically accessed (e.g. in presense of VHE redirection)

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc unsigned int
: opcode 1

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...)

NUMBER_OF_BEATS unsigned int
: Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS)

VADDR unsigned int
: The virtual address of the access

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum
: Type of register aliasing used

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum
: Type of register aliasing used

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID enum
: Which VFP system register is written.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MASK unsigned int
: The mask indicating updated cumulative bits.

OLD_VALUE unsigned int
: The register's old value overwritten.

VALUE unsigned int
: The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum
: Type of register aliasing used.

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ISET enum
: Origin instructions set

IS_COND bool
: Indicates if this is a conditional waypoint.

PC unsigned int
: Origin address (or 0 if unavailable)

TAKEN bool
: Indicates if this waypoint was taken.

TARGET unsigned int
: Destination address

TARGET_ISET enum
: Destination instructions set

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int
: Ticks count.

REASON enum
: Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

WFE_IGNORED

WFE ignored. Fields:

EVENT bool
: This WFE was ignored because the event register was set.

INST_COUNT unsigned int
: Ticks count when ignoring WFE.

TRAPPED bool
: This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool
: This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int
: Ticks count when ignoring WFI.

REASON enum
: specifies reason why WFI trace was ignored

TRAPPED bool
: This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int
: Ticks count when WFI wakeup occurred.

REASON enum
: Reason for wakeup.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.44 ARM_Neoverse-E1 - trace

This section describes the trace sources.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int
: Fault status in ESR format

PADDR unsigned int
: Physical Address (or 0 if unavailable)

VADDR signed int
: Virtual Address (or 0 if unavailable)

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool
: Memory access failed

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

LOAD_VALUE unsigned int
: Loaded values

NSDESC unsigned int
: The security state of the access.

OPERAND_VALUE unsigned int
: Operation's operand

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

NSDESC unsigned int
: The security state of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OPERAND_VALUE unsigned int
: Operation's operand

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ArchMsg.Error.exit_code

Fields:

EXITCODE signed int
: Exit code to be returned

KIND string
: Component kind that invoked the exit code trace

REASON string
: Reason why the exit code trace was invoked (optional)

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

Fields:

REG_NAME string
: Name of register being written.

ArchMsg.Warning.TarmacReconstructor

Unexpected event happened during Tarmac reconstruction. Fields:

REASON string
: Reason

ArchMsg.Warning.Unpredictably Indexed PM Event Register

Fields:

IsDirect unsigned int
: Direct Access rather than indirect

N unsigned int
: Number of Accessible Registers

SEL unsigned int
: Selector

ArchMsg.Warning.branch_to_unaligned_address

Fields:

ADDR unsigned int
: Unaligned branch address

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain UNKNOWN content. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REGIME unsigned int
: Current translation regime

SIDE unsigned int
: 0 d-side cache or unified cache, 1 i-side

ArchMsg.Warning.dcimvac_matches_watchpoint

Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_fracbitsnegative

VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_invalidvalue

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_mem_hint_unallocated

There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.decode_registermismatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_registeroutofrange

Float point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13inreglist

Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

Instruction is unpredictable when no registers are to be transfered.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. Fields:

PC unsigned int
: Address of instruction causing the branch

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CPSR unsigned int
: Processor state

PC unsigned int
: Address of instruction causing the exception

TYPE enum
: Type of exception

ArchMsg.Warning.reentrant_vector_catch

Fields:

ADDR unsigned int
: vector address

ArchMsg.Warning.reserved_it_state

Fields:

ITSTATE unsigned int
: reserved IT state

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. Fields:

EL unsigned int
: Exception level of translation regime

INVALIDITY unsigned int
: Which TLB may be invalid (if TLBs are separate)

NON_SECURE unsigned int
: Security state of translation regime

VMID unsigned int
: Current VMID, if applicable

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpredictable_a32_breakpoint

Fields:

ADDR1 unsigned int
: Address

ADDR2 unsigned int
: Breakpoint address

BAS unsigned int
: BAS Field

IS_ADDRESS_MISMATCH_BREAKPOINT bool
: Is Mismatch breakpoint, not a match breakpoint

N unsigned int
: Breakpoint number

OFFSET unsigned int
: Indicates which halfword actually considering into the A32 instruction

ArchMsg.Warning.unpredictable_banked_register_access

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

R unsigned int
: R bit

SYSM unsigned int
: SYSm

ArchMsg.Warning.unpredictable_ccfail_undef

Fields:

OPCODE unsigned int
: opcode of the instruction

VADDR unsigned int
: Virtual address of the instruction being executed

ArchMsg.Warning.unpredictable_ici_bits

ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

Fields:

ADDR1 unsigned int
: Address

ADDR2 unsigned int
: Breakpoint address

BAS unsigned int
: BAS Field

IS_ADDRESS_MISMATCH_BREAKPOINT bool
: Is Mismatch breakpoint, not a match breakpoint

N unsigned int
: Breakpoint number

OFFSET unsigned int
: Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_t32_vector_catch

Fields:

ADDR unsigned int
: Address

OFFSET unsigned int
: Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_watchpoint_far

Fields:

LOWER_BOUND unsigned int
: the lowest address accessed by the instruction that triggered the watchpoint

UPPER_BOUND unsigned int
: the highest watchpointed address accessed by that instruction

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

AdvSIMDExpandImm may treat this immediate value as UNPREDICTABLE.

ArchMsg.Warning.warning_ConditionalSMC

SMC instruction has UNPREDICTABLE effects when conditional when combined with traps.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_access_crosses_page_boundary

Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

Fields:

ADDR `unsigned int`
: address of access crossing page

MEMTYPE_PAGE1 `signed int`
: First Page's memory type (0-Normal, 1-Non-Normal)

MEMTYPE_PAGE2 `signed int`
: Second Page's memory type (0-Normal, 1-Non-Normal)

ArchMsg.Warning.warning_access_wraps_around_memory

Fields:

WIDTH `unsigned int`
: Address width

ArchMsg.Warning.warning_bx_from_thumbee

Fields:

ADDR `unsigned int`
: Destination address

ArchMsg.Warning.warning_ccsidr_unimplemented_level

Fields:

CSSELR `unsigned int`
: current effective value of CSSELR

ArchMsg.Warning.warning_change_to_ns_when_tge_set

Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

Fields:

ENTRY_ADDR `unsigned int`
: address of conflicting TLB entry

ArchMsg.Warning.warning_contiguous_bit_error

Fields:

CONTIG_ADDR `unsigned int`
: address of the TLB first read, with which this entry is expected to be contiguous

CONTIG_DATA `unsigned int`
: expected contents based on the entry at CONTIG_ADDR

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ENTRY_ADDR unsigned int
: address of conflicting TLB entry

ENTRY_DATA unsigned int
: contents of conflicting TLB entry

ArchMsg.Warning.warning_cp10_cp11_mismatch

Fields:

EL unsigned int
: EL owning the control

ArchMsg.Warning.warning_cp10_cp11_reserved_value

Fields:

CP10 unsigned int
: CP10 access

CP11 unsigned int
: CP11 access

ArchMsg.Warning.warning_csselr_level_out_of_range

Fields:

IMPLEMENTED unsigned int
: number of cache levels implemented

LEVEL unsigned int
: written value of CSSELR.Level

TYPE enum
: The type of cache selected by CSSELR.InD and TnD

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

Fields:

ERROR enum
: type of error resulting

REGISTER enum
: register under consideration

ArchMsg.Warning.warning_debug_register_access_during_reset

Fields:

IS_WRITE unsigned int
: Write Not Read

OFFSET unsigned int
: Register Offset

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_default_cacheable_vmmu_off

Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

Fields:

N unsigned int
: index

WVR unsigned int
: DBGWVR

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET.

ArchMsg.Warning.warning_exclusive_to_non_normal

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_exclusive_to_non_writeback

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_execute_from_device_memory

An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

Fields:

NEW_MODE unsigned int
: New value of CPSR.M

ArchMsg.Warning.warning_illegal_srs_mode

Fields:

MODE unsigned int
: mode for Banked SP

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

PPB_OFFSET unsigned int
: debug register offset

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behaviour of a sequential instruction fetches that cross from non-secure to secure memory and contain SG instruction is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for the this instructions. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ADDRESS unsigned int
: Address of instruction

OPCODE unsigned int
: instruction opcode

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

DATA unsigned int
: data attempted to be written

PPB_OFFSET unsigned int
: debug register offset

ArchMsg.Warning.warning_invalid_tcr_granule

Fields:

REQUEST signed int
: page size requested (or 0 for reserved)

SUBSTITUTE signed int
: best guess available page size

TG_ID bool
: bits TG0 or TG1

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_load_pc_from_unaligned

PC loaded from an unaligned location.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

Fields:

ATTR unsigned int
: Memory attribute

ArchMsg.Warning.warning_reserved_breakpoint_state_match

Fields:

IS_BREAKPOINT unsigned int
: Is breakpoint, not watchpoint

ArchMsg.Warning.warning_shareability

Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

Thumb instruction warps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MSB unsigned int
x-1
TTBR enum
which TTBR register

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_to_device

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unknown_sau_rnr

SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIP_and_BFHFNMINP

The effect of setting both AIRCR.BFHFNMINP and AIRCR.PRIP to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_EXE_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are UNPREDICTABLE. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EXC_RETURN unsigned int
: Special PC value

SBO_MASK unsigned int
: Which bits Should Be One to not UNPRED

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

Fields:

DRVEXC_TAKEN unsigned int
: derived exception taken not pended

REACHED_LAST_STORE unsigned int
: only the last faulted

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

Fields:

ATTR unsigned int
: Memory attribute

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

UNPREDICTABLE state on context switch.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

Fields:

TCR enum
: Which TCR

TSIZE signed int
: Value of TSize

TSIZE_MAX signed int
: The maximum allowed value

TTBR unsigned int
: Which TTBR region

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

The PC value must be word-aligned, otherwise the behavior of the instruction is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

Fields:

FRAME_ADDR unsigned int
: unaligned stack frame address

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

Fields:

TEXCB unsigned int
: texcb value

TEX_REMAP bool
: use tex remap

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

Fields:

SL0 signed int
: VTCR.SL0, starting level for stage 2 translation table walks

T0SZ signed int
: VTCR.T0SZ, required input address range

ArchMsg.Warning.warning_unpredictable_write_DHCSR

Fields:

NEW unsigned int
: data attempted to be written

OLD unsigned int
: previous value

ArchMsg.Warning.warning_unpredictable_write_SHCSR

UNPREDICTABLE setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

Fields:

WRITE unsigned int
: access is write

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_wcr_mask_and_bas

DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. Fields:

BTYPE unsigned int
: pstate.BTYPE at time branch taken

OPCODE unsigned int
: opcode at branch target

PC unsigned int
: Virtual Address of branch target

ArchMsg.Why.why_illegal_state

An illegal mode change has occured. Fields:

MESSAGE string
: The message

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
: Origin address (or 0 if unavailable)

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branche return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

DATA unsigned int
: Specified MVA or Set/way

FUNCTION enum
: Clean / Invalidate

SCOPE enum
: Affected region

SIDE enum
: Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int
: Inclusive end addres for by VA or PA requests

NS bool
: Non-secure world for PA

START unsigned int
: Start address for by VA or PA requests

TYPE enum
: Request type.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int
: Address of next instruction after this basic block

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int
: Address of first instruction in basic block

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string
: Disassembly of the instruction.

ISET enum
: The instruction set of this instruction.

ITSTATE unsigned int
: The ITSTATE current for the instruction.

OPCODE unsigned int
: The opcode of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

NS bool
: Secure or nonsecure banked register is accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool
: Architectural Context Synchronization Event

SYSREG_SYNC bool
: System register synchronization event

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool
: Core BE8 Big-Endian state

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARCH_PROFILE enum
: The architecture profile of the core.

CLUSTER_ID unsigned int
: The cluster ID of this processor.

CORE_NUM unsigned int
: The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum
: Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field

FPU_VERSION enum
: The VFP version implemented by the core.

MEM_ARCH enum
: The memory architecture of the core.

MIDR_EL1 unsigned int
: MIDR_EL1 value

NUM_CORES unsigned int
: The number of cores in this MP processor.

QUANTUM_SIZE unsigned int
: The default quantum size of the core.

SECURITY_FEATURES bool
: Does the core have security features?

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number, 0 to 14.

MODE enum
: Bank of the register accessed.

OLD_VALUE unsigned int
: The old value overwritten.

PHYS_ID enum
: The physical register accessed.

VALUE unsigned int
: The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID enum
: The register number, 0..30 for X0..X30, >=32 for SP_ELn.

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP14 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP14 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc unsigned int
: opcode 1

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc unsigned int
: opcode 1

CPSR

CPSR change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

OLD_VALUE unsigned int
: The old CPSR value

UNKNOWN unsigned int
: Bits within the register that have unknown value.

VALUE unsigned int
: The new CPSR value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. Fields:

PU bool
: Whether the core powered up

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of memory in bytes.

TAG unsigned int
: The value of the tag being set.

VADDR unsigned int
: Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of zero'd memory in bytes.

VADDR unsigned int
: Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum
: Description of event

VALUE unsigned int
: data value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int
: Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int
: Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int
: Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int
: Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int
: Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool
: ESB is async

IMPLICIT bool
: ESB is implicit

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

IS_PHYSICAL bool
: Physical or Virtual exception

LR unsigned int
: The value assigned to the link register.

PC unsigned int
: The location where the exception occurred.

PREFERRED_RETURN unsigned int
: The preferred return address for the exception.

TARGET_ISET enum
: The instruction set of the exception handler code.

TARGET_PC unsigned int
: The address the exception branches to.

VECTOR enum
: The exception vector.

VECTOR_OFFSET unsigned int
: The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_STATE

Floating point state. Fields:

FPSR unsigned int
: FPSR register value.

MASK unsigned int
: The mask indicating updated cumulative bits.

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int
: The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DEBUG_STATE bool
: The instruction is executed in debug state.

DISASS string
: Disassembly of instruction.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The current instruction set.

ITSTATE unsigned int
: The current ITSTATE.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

MODE enum
: The mode the core is in.

NS unsigned int
: The core's non-secure bit.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

OPCODE unsigned int
: The opcode of the instruction.

PADDR unsigned int
: The physical address of the instruction.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

INST_STRADDLE

Instruction straddles boundary. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string
: Register to add into the list

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int
: Local Monitor Address

State enum
: State of the monitor (Open/Exclusive)

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int
: address

CORE_NUM unsigned int
: Core number in a multi processor.

EXT bool
: Whether access is from an external device (such as the DAP)

NS enum
: Secure state of the access

REG_NAME string
: Name of the debug register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int
: address

CORE_NUM unsigned int
: Core number in a multi processor.

EXT bool
: Whether access is from an external device (such as the DAP)

NS enum
: Secure state of the access

REG_NAME string
: Name of the debug register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int
: Address space identifier.

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Hyp bool
: Entry matches in Hyp state only

INNERCACHE_RA bool
: Is the inner cache allocate on read

INNERCACHE_TRANSIENT bool
: Is the inner write-through transient

INNERCACHE_TYPE enum
: Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool
: Is the inner cache allocate on write

MEMTYPE enum
: Memory type.

NSDESC enum
: Is secure side supposed to access secure or nonsecure memory

OUTERCACHE_RA bool
: Is the outer cache allocate on read

OUTERCACHE_TRANSIENT bool
: Is the outer write-through transient

OUTERCACHE_TYPE enum
: Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool
: Is the outer cache allocate on write

PADDR unsigned int
: Physical address of the access.

PAGESIZE unsigned int
: Page size as log2(size).

SH enum
: Shareability

SIDE enum
: Inst / Data.

STAGE1_PERM unsigned int
: Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR)

STAGE2_PERM unsigned int
: Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR)

VADDR unsigned int
: Virtual address of the access.

VMID unsigned int
: Virtual machine identifier.

XS bool
: XS Attribute

nG enum
: Flag indicating whether ASID will be matched

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool
: Was the walk successful.

DATA unsigned int
: The data read.

IPA unsigned int
: For stage 1, the IPA of the read.

LEVEL unsigned int
: Translation table level

LPAE bool
: Is this for an LPAE translation

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NSmem bool
: Non secure memory access

NSreq bool
: Non secure request

OUTADDR unsigned int
: The output physical address.

PADDR unsigned int
: The physical address of the read.

SIDE enum
: Inst / Data.

STAGE unsigned int
: Translation stage

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool
: Was the walk successful.

DATA unsigned int
: The data written.

IPA unsigned int
: For stage 1, the IPA of the write.

LEVEL unsigned int
: Translation table level

LPAE bool
: Is this for an LPAE translation

NSmem bool
: Non secure memory access

NSreq bool
: Non secure request

PADDR unsigned int
: The physical address of the write.

SIDE enum
: Inst / Data.

STAGE unsigned int
: Translation stage

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: The new mode.

NON_SECURE enum
: The new security state

OLD_MODE enum
: The old mode.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

PC unsigned int
: The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

EVENT_ID unsigned int
: Event Identifier

INDEX unsigned int
: Counter index (as selected by PMSELR).

INTERRUPT bool
: Is interrupt enabled on overflow for this counter

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP unsigned int
: Prefetch hint

VADDR unsigned int
: Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int
: Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int
: Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ADDR unsigned int
The physical address of the read.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition
REASON string
Reason for the transition being denied

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Power mode after the transition
OLD_STATE enum
Power mode before the transition

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Power mode after the transition
OLD_STATE enum
Power mode before the transition
REASON string
Reason for the transition being denied

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int
: Ticks count at point of transition.

NEW enum
: New run state.

OLD enum
: Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int
: The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool
: Use EL2 translation regime.

NS bool
: Is Non-Secure.

REG_WIDTH unsigned int
: The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum
: Signal that changed

STATE bool
: Signal asserted state

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum
: Software Step state

SPSR

SPSR change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: Which of the banked SPSR registers is written.

OLD_VALUE unsigned int
: The old SPSR value

VALUE unsigned int
: The new SPSR value

START_COMPILE

Compilation started. Fields:

VADDR unsigned int
: Instruction where compilation begins.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...)

OPTIMAL_ALIGN_SELECTOR unsigned int
: Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes)

VADDR unsigned int
: The virtual address of the access

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

LOCAL_QUANTUM unsigned int
: The local quantum of this CPU.

LOCAL_TIME unsigned int
: The local time of this CPU.

SYNC_REASON enum
: Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int
: Immediate value of the system call instruction.

TYPE enum
: System call type.

VADDR unsigned int
: Instruction that caused the system call.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REGNUM enum
: Internal register number

REGNUM_PHYS enum
: Internal register number physically accessed (e.g. in presense of VHE redirection)

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VALUE unsigned int
: Value written to the register.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REGNUM enum
: Internal register number

REGNUM_PHYS enum
: Internal register number physically accessed (e.g. in presense of VHE redirection)

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...)

NUMBER_OF_BEATS unsigned int
: Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS)

VADDR unsigned int
: The virtual address of the access

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum
: Type of register aliasing used

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum
: Type of register aliasing used

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID enum
: Which VFP system register is written.

MASK unsigned int
: The mask indicating updated cumulative bits.

OLD_VALUE unsigned int
: The register's old value overwritten.

VALUE unsigned int
: The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum
: Type of register aliasing used.

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0]

OLD_VALUE unsigned int
: The old value overwritten.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VALUE unsigned int
: The new value written to the register.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ISET enum
: Origin instructions set

IS_COND bool
: Indicates if this is a conditional waypoint.

PC unsigned int
: Origin address (or 0 if unavailable)

TAKEN bool
: Indicates if this waypoint was taken.

TARGET unsigned int
: Destination address

TARGET_ISET enum
: Destination instructions set

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int
: Ticks count.

REASON enum
: Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool
: This WFE was ignored because the event register was set.

INST_COUNT unsigned int
: Ticks count when ignoring WFE.

TRAPPED bool
: This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFI.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool
: This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int
: Ticks count when ignoring WFI.

REASON enum
: specifies reason why WFI trace was ignored

TRAPPED bool
: This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int
: Ticks count when WFI wakeup occurred.

REASON enum
: Reason for wakeup.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.45 ARM_Neoverse-N1 - trace

This section describes the trace sources.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int
: Fault status in ESR format

PADDR unsigned int
: Physical Address (or 0 if unavailable)

VADDR signed int
: Virtual Address (or 0 if unavailable)

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool
: Memory access failed

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

LOAD_VALUE unsigned int
: Loaded values

NSDESC unsigned int
: The security state of the access.

OPERAND_VALUE unsigned int
: Operation's operand

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

NSDESC unsigned int
: The security state of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OPERAND_VALUE unsigned int
: Operation's operand

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ArchMsg.Error.exit_code

Fields:

EXITCODE signed int
: Exit code to be returned

KIND string
: Component kind that invoked the exit code trace

REASON string
: Reason why the exit code trace was invoked (optional)

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

Fields:

REG_NAME string
: Name of register being written.

ArchMsg.Warning.TarmacReconstructor

Unexpected event happened during Tarmac reconstruction. Fields:

REASON string
: Reason

ArchMsg.Warning.Unpredictably Indexed PM Event Register

Fields:

IsDirect unsigned int
: Direct Access rather than indirect

N unsigned int
: Number of Accessible Registers

SEL unsigned int
: Selector

ArchMsg.Warning.branch_to_unaligned_address

Fields:

ADDR unsigned int
: Unaligned branch address

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain UNKNOWN content. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REGIME unsigned int
: Current translation regime

SIDE unsigned int
: 0 d-side cache or unified cache, 1 i-side

ArchMsg.Warning.dcimvac_matches_watchpoint

Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_fracbitsnegative

VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_invalidvalue

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_mem_hint_unallocated

There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.decode_registermismatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_registeroutofrange

Float point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13inreglist

Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

Instruction is unpredictable when no registers are to be transfered.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. Fields:

PC unsigned int
: Address of instruction causing the branch

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CPSR unsigned int
Processor state
PC unsigned int
Address of instruction causing the exception
TYPE enum
Type of exception

ArchMsg.Warning.reentrant_vector_catch

Fields:

ADDR unsigned int
vector address

ArchMsg.Warning.reserved_it_state

Fields:

ITSTATE unsigned int
reserved IT state

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. Fields:

EL unsigned int
Exception level of translation regime
INVALIDITY unsigned int
Which TLB may be invalid (if TLBs are separate)
NON_SECURE unsigned int
Security state of translation regime
VMID unsigned int
Current VMID, if applicable

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpredictable_a32_breakpoint

Fields:

ADDR1 unsigned int
Address
ADDR2 unsigned int
Breakpoint address
BAS unsigned int
BAS Field
IS_ADDRESS_MISMATCH_BREAKPOINT bool
Is Mismatch breakpoint, not a match breakpoint
N unsigned int
Breakpoint number
OFFSET unsigned int
Indicates which halfword actually considering into the A32 instruction

ArchMsg.Warning.unpredictable_banked_register_access

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

R unsigned int
R bit
SYSM unsigned int
SYSm

ArchMsg.Warning.unpredictable_ccfail_undef

Fields:

OPCODE unsigned int
opcode of the instruction
VADDR unsigned int
Virtual address of the instruction being executed

ArchMsg.Warning.unpredictable_ici_bits

ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

Fields:

ADDR1 unsigned int
Address
ADDR2 unsigned int
Breakpoint address
BAS unsigned int
BAS Field
IS_ADDRESS_MISMATCH_BREAKPOINT bool
Is Mismatch breakpoint, not a match breakpoint
N unsigned int
Breakpoint number
OFFSET unsigned int
Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_t32_vector_catch

Fields:

ADDR unsigned int
Address
OFFSET unsigned int
Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_watchpoint_far

Fields:

LOWER_BOUND unsigned int
the lowest address accessed by the instruction that triggered the watchpoint
UPPER_BOUND unsigned int
the highest watchpointed address accessed by that instruction

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

AdvSIMDExpandImm may treat this immediate value as UNPREDICTABLE.

ArchMsg.Warning.warning_ConditionalSMC

SMC instruction has UNPREDICTABLE effects when conditional when combined with traps.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_access_crosses_page_boundary

Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

Fields:

ADDR `unsigned int`
: address of access crossing page

MEMTYPE_PAGE1 `signed int`
: First Page's memory type (0-Normal, 1-Non-Normal)

MEMTYPE_PAGE2 `signed int`
: Second Page's memory type (0-Normal, 1-Non-Normal)

ArchMsg.Warning.warning_access_wraps_around_memory

Fields:

WIDTH `unsigned int`
: Address width

ArchMsg.Warning.warning_bx_from_thumbee

Fields:

ADDR `unsigned int`
: Destination address

ArchMsg.Warning.warning_ccsidr_unimplemented_level

Fields:

CSSELR `unsigned int`
: current effective value of CSSELR

ArchMsg.Warning.warning_change_to_ns_when_tge_set

Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

Fields:

ENTRY_ADDR `unsigned int`
: address of conflicting TLB entry

ArchMsg.Warning.warning_contiguous_bit_error

Fields:

CONTIG_ADDR `unsigned int`
: address of the TLB first read, with which this entry is expected to be contiguous

CONTIG_DATA `unsigned int`
: expected contents based on the entry at CONTIG_ADDR

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ENTRY_ADDR unsigned int
: address of conflicting TLB entry

ENTRY_DATA unsigned int
: contents of conflicting TLB entry

ArchMsg.Warning.warning_cp10_cp11_mismatch

Fields:

EL unsigned int
: EL owning the control

ArchMsg.Warning.warning_cp10_cp11_reserved_value

Fields:

CP10 unsigned int
: CP10 access

CP11 unsigned int
: CP11 access

ArchMsg.Warning.warning_csselr_level_out_of_range

Fields:

IMPLEMENTED unsigned int
: number of cache levels implemented

LEVEL unsigned int
: written value of CSSELR.Level

TYPE enum
: The type of cache selected by CSSELR.InD and TnD

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

Fields:

ERROR enum
: type of error resulting

REGISTER enum
: register under consideration

ArchMsg.Warning.warning_debug_register_access_during_reset

Fields:

IS_WRITE unsigned int
: Write Not Read

OFFSET unsigned int
: Register Offset

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_default_cacheable_vmmu_off

Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

Fields:

N unsigned int
: index

WVR unsigned int
: DBGWVR

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET.

ArchMsg.Warning.warning_exclusive_to_non_normal

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_exclusive_to_non_writeback

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_execute_from_device_memory

An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

Fields:

NEW_MODE unsigned int
: New value of CPSR.M

ArchMsg.Warning.warning_illegal_srs_mode

Fields:

MODE unsigned int
: mode for Banked SP

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

PPB_OFFSET unsigned int
: debug register offset

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behaviour of a sequential instruction fetches that cross from non-secure to secure memory and contain SG instruction is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for the this instructions. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ADDRESS unsigned int
: Address of instruction

OPCODE unsigned int
: instruction opcode

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

DATA unsigned int
: data attempted to be written

PPB_OFFSET unsigned int
: debug register offset

ArchMsg.Warning.warning_invalid_tcr_granule

Fields:

REQUEST signed int
: page size requested (or 0 for reserved)

SUBSTITUTE signed int
: best guess available page size

TG_ID bool
: bits TG0 or TG1

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_load_pc_from_unaligned

PC loaded from an unaligned location.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

Fields:

ATTR unsigned int
: Memory attribute

ArchMsg.Warning.warning_reserved_breakpoint_state_match

Fields:

IS_BREAKPOINT unsigned int
: Is breakpoint, not watchpoint

ArchMsg.Warning.warning_shareability

Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

Thumb instruction warps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MSB unsigned int
x-1
TTBR enum
which TTBR register

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_to_device

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unknown_sau_rnr

SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIP_and_BFHFNMINP

The effect of setting both AIRCR.BFHFNMINP and AIRCR.PRIP to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_EXE_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are UNPREDICTABLE. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EXC_RETURN unsigned int
Special PC value
SBO_MASK unsigned int
Which bits Should Be One to not UNPRED

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

Fields:

DRVEXC_TAKEN unsigned int
derived exception taken not pended
REACHED_LAST_STORE unsigned int
only the last faulted

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

Fields:

ATTR unsigned int
Memory attribute

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

UNPREDICTABLE state on context switch.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

Fields:

TCR enum
: Which TCR

TSIZE signed int
: Value of TSize

TSIZE_MAX signed int
: The maximum allowed value

TTBR unsigned int
: Which TTBR region

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

The PC value must be word-aligned, otherwise the behavior of the instruction is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

Fields:

FRAME_ADDR unsigned int
: unaligned stack frame address

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

Fields:

TEXCB unsigned int
: texcb value

TEX_REMAP bool
: use tex remap

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

Fields:

SL0 signed int
: VTCR.SL0, starting level for stage 2 translation table walks

T0SZ signed int
: VTCR.T0SZ, required input address range

ArchMsg.Warning.warning_unpredictable_write_DHCSR

Fields:

NEW unsigned int
: data attempted to be written

OLD unsigned int
: previous value

ArchMsg.Warning.warning_unpredictable_write_SHCSR

UNPREDICTABLE setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

Fields:

WRITE unsigned int
: access is write

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_wcr_mask_and_bas

DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. Fields:

BTYPE unsigned int
: pstate.BTYPE at time branch taken

OPCODE unsigned int
: opcode at branch target

PC unsigned int
: Virtual Address of branch target

ArchMsg.Why.why_illegal_state

An illegal mode change has occured. Fields:

MESSAGE string
: The message

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
: Origin address (or 0 if unavailable)

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branche return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

DATA unsigned int
: Specified MVA or Set/way

FUNCTION enum
: Clean / Invalidate

SCOPE enum
: Affected region

SIDE enum
: Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int
: Inclusive end addres for by VA or PA requests

NS bool
: Non-secure world for PA

START unsigned int
: Start address for by VA or PA requests

TYPE enum
: Request type.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int
: Address of next instruction after this basic block

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int
: Address of first instruction in basic block

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string
: Disassembly of the instruction.

ISET enum
: The instruction set of this instruction.

ITSTATE unsigned int
: The ITSTATE current for the instruction.

OPCODE unsigned int
: The opcode of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

NS bool
: Secure or nonsecure banked register is accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool
: Architectural Context Synchronization Event

SYSREG_SYNC bool
: System register synchronization event

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool
: Core BE8 Big-Endian state

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARCH_PROFILE enum
: The architecture profile of the core.

CLUSTER_ID unsigned int
: The cluster ID of this processor.

CORE_NUM unsigned int
: The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum
: Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field

FPU_VERSION enum
: The VFP version implemented by the core.

MEM_ARCH enum
: The memory architecture of the core.

MIDR_EL1 unsigned int
: MIDR_EL1 value

NUM_CORES unsigned int
: The number of cores in this MP processor.

QUANTUM_SIZE unsigned int
: The default quantum size of the core.

SECURITY_FEATURES bool
: Does the core have security features?

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number, 0 to 14.

MODE enum
: Bank of the register accessed.

OLD_VALUE unsigned int
: The old value overwritten.

PHYS_ID enum
: The physical register accessed.

VALUE unsigned int
: The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID enum
: The register number, 0..30 for X0..X30, >=32 for SP_ELn.

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP14 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP14 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc unsigned int
: opcode 1

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc1 unsigned int
: opcode 1

opc2 unsigned int
: opcode 2

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

NS bool
: Secure or nonsecure banked register is accessed.

REG_NAME string
: Name of the CP15 register accessed.

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc unsigned int
: opcode 1

CPSR

CPSR change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

OLD_VALUE unsigned int
: The old CPSR value

UNKNOWN unsigned int
: Bits within the register that have unknown value.

VALUE unsigned int
: The new CPSR value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. Fields:

PU bool
: Whether the core powered up

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of memory in bytes.

TAG unsigned int
: The value of the tag being set.

VADDR unsigned int
: Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of zero'd memory in bytes.

VADDR unsigned int
: Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum
: Description of event

VALUE unsigned int
: data value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int
: Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int
: Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int
: Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int
: Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int
: Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool
: ESB is async

IMPLICIT bool
: ESB is implicit

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

IS_PHYSICAL bool
: Physical or Virtual exception

LR unsigned int
: The value assigned to the link register.

PC unsigned int
: The location where the exception occurred.

PREFERRED_RETURN unsigned int
: The preferred return address for the exception.

TARGET_ISET enum
: The instruction set of the exception handler code.

TARGET_PC unsigned int
: The address the exception branches to.

VECTOR enum
: The exception vector.

VECTOR_OFFSET unsigned int
: The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_STATE

Floating point state. Fields:

FPSR unsigned int
: FPSR register value.

MASK unsigned int
: The mask indicating updated cumulative bits.

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int
: The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DEBUG_STATE bool
: The instruction is executed in debug state.

DISASS string
: Disassembly of instruction.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The current instruction set.

ITSTATE unsigned int
: The current ITSTATE.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

MODE enum
: The mode the core is in.

NS unsigned int
: The core's non-secure bit.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

OPCODE unsigned int
: The opcode of the instruction.

PADDR unsigned int
: The physical address of the instruction.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

INST_STRADDLE

Instruction straddles boundary. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string
: Register to add into the list

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int
: Local Monitor Address

State enum
: State of the monitor (Open/Exclusive)

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int
: address

CORE_NUM unsigned int
: Core number in a multi processor.

EXT bool
: Whether access is from an external device (such as the DAP)

NS enum
: Secure state of the access

REG_NAME string
: Name of the debug register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int
: address

CORE_NUM unsigned int
: Core number in a multi processor.

EXT bool
: Whether access is from an external device (such as the DAP)

NS enum
: Secure state of the access

REG_NAME string
: Name of the debug register accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int
: Address space identifier.

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Hyp bool
: Entry matches in Hyp state only

INNERCACHE_RA bool
: Is the inner cache allocate on read

INNERCACHE_TRANSIENT bool
: Is the inner write-through transient

INNERCACHE_TYPE enum
: Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool
: Is the inner cache allocate on write

MEMTYPE enum
: Memory type.

NSDESC enum
: Is secure side supposed to access secure or nonsecure memory

OUTERCACHE_RA bool
: Is the outer cache allocate on read

OUTERCACHE_TRANSIENT bool
: Is the outer write-through transient

OUTERCACHE_TYPE enum
: Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool
: Is the outer cache allocate on write

PADDR unsigned int
: Physical address of the access.

PAGESIZE unsigned int
: Page size as log2(size).

SH enum
: Shareability

SIDE enum
: Inst / Data.

STAGE1_PERM unsigned int
: Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR)

STAGE2_PERM unsigned int
: Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR)

VADDR unsigned int
: Virtual address of the access.

VMID unsigned int
: Virtual machine identifier.

XS bool
: XS Attribute

nG enum
: Flag indicating whether ASID will be matched

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool
: Was the walk successful.

DATA unsigned int
: The data read.

IPA unsigned int
: For stage 1, the IPA of the read.

LEVEL unsigned int
: Translation table level

LPAE bool
: Is this for an LPAE translation

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NSmem bool
: Non secure memory access

NSreq bool
: Non secure request

OUTADDR unsigned int
: The output physical address.

PADDR unsigned int
: The physical address of the read.

SIDE enum
: Inst / Data.

STAGE unsigned int
: Translation stage

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool
: Was the walk successful.

DATA unsigned int
: The data written.

IPA unsigned int
: For stage 1, the IPA of the write.

LEVEL unsigned int
: Translation table level

LPAE bool
: Is this for an LPAE translation

NSmem bool
: Non secure memory access

NSreq bool
: Non secure request

PADDR unsigned int
: The physical address of the write.

SIDE enum
: Inst / Data.

STAGE unsigned int
: Translation stage

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: The new mode.

NON_SECURE enum
: The new security state

OLD_MODE enum
: The old mode.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

PC unsigned int
: The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

EVENT_ID unsigned int
: Event Identifier

INDEX unsigned int
: Counter index (as selected by PMSELR).

INTERRUPT bool
: Is interrupt enabled on overflow for this counter

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP unsigned int
: Prefetch hint

VADDR unsigned int
: Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int
: Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int
: Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ADDR unsigned int
The physical address of the read.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition
REASON string
Reason for the transition being denied

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Power mode after the transition
OLD_STATE enum
Power mode before the transition

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Power mode after the transition
OLD_STATE enum
Power mode before the transition
REASON string
Reason for the transition being denied

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int
Integer representation of DEVPACTIVE[] signals
NEW_STATE enum
Operating mode after the transition
OLD_STATE enum
Operating mode before the transition

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int
: Ticks count at point of transition.

NEW enum
: New run state.

OLD enum
: Old run state.

SBP_SAMPLE_COLLISION

Statistical profiling samples collided .

SBP_SAMPLE_DISCARDED

Fields:

BUFFER_POINTER unsigned int
: Value of buffer pointer

DATA unsigned int
: Data discarded

SIZE unsigned int
: Size of sample, in bytes

SBP_SAMPLE_END

Statistical profiling of an operation ended.

SBP_SAMPLE_POP

Operation which might be sampled by statistical profiling.

SBP_SAMPLE_RECORDED

Fields:

BUFFER_ADDRESS unsigned int
: Virtual Address of start of buffer write

DATA unsigned int
: Data written to the buffer

SIZE unsigned int
: Size of sample written to buffer, in bytes

SBP_SAMPLE_START

Statistical profiling of an operation started.

SBP_SAMPLE_TAKEN

Operation sampled by statistical profiling after filtering.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int
: The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EL2 bool
: Use EL2 translation regime.

NS bool
: Is Non-Secure.

REG_WIDTH unsigned int
: The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum
: Signal that changed

STATE bool
: Signal asserted state

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum
: Software Step state

SPSR

SPSR change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: Which of the banked SPSR registers is written.

OLD_VALUE unsigned int
: The old SPSR value

VALUE unsigned int
: The new SPSR value

START_COMPILE

Compilation started. Fields:

VADDR unsigned int
: Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...)

OPTIMAL_ALIGN_SELECTOR unsigned int
: Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes)

VADDR unsigned int
: The virtual address of the access

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

LOCAL_QUANTUM unsigned int
: The local quantum of this CPU.

LOCAL_TIME unsigned int
: The local time of this CPU.

SYNC_REASON enum
: Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int
: Immediate value of the system call instruction.

TYPE enum
: System call type.

VADDR unsigned int
: Instruction that caused the system call.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REGNUM enum
: Internal register number

REGNUM_PHYS enum
: Internal register number physically accessed (e.g. in presense of VHE redirection)

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The value read.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

opc2 unsigned int
: opcode 2

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int
: CRm

CRn unsigned int
: CRn

NS bool
: Secure or nonsecure banked register is accessed.

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CRm unsigned int
: CRm

CRn unsigned int
: CRn

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NS bool
: Secure or nonsecure banked register is accessed.

REGNUM enum
: Internal register number

REGNUM_PHYS enum
: Internal register number physically accessed (e.g. in presense of VHE redirection)

UNDEF bool
: The register accessed is undefined.

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: The new value written.

opc unsigned int
: opcode 1

opc0 unsigned int
: opcode 0

opc2 unsigned int
: opcode 2

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...)

NUMBER_OF_BEATS unsigned int
: Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS)

VADDR unsigned int
: The virtual address of the access

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum
: Type of register aliasing used

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum
: Type of register aliasing used

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MASK unsigned int
: Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID enum
: Which VFP system register is written.

MASK unsigned int
: The mask indicating updated cumulative bits.

OLD_VALUE unsigned int
: The register's old value overwritten.

VALUE unsigned int
: The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum
: Type of register aliasing used.

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number.

MASK unsigned int
: Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0]

OLD_VALUE unsigned int
: The old value overwritten.

VALUE unsigned int
: The new value written to the register.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ISET enum
: Origin instructions set

IS_COND bool
: Indicates if this is a conditional waypoint.

PC unsigned int
: Origin address (or 0 if unavailable)

TAKEN bool
: Indicates if this waypoint was taken.

TARGET unsigned int
: Destination address

TARGET_ISET enum
: Destination instructions set

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int
: Ticks count.

REASON enum
: Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool
: This WFE was ignored because the event register was set.

INST_COUNT unsigned int
: Ticks count when ignoring WFE.

TRAPPED bool
: This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool
: This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int
: Ticks count when ignoring WFI.

REASON enum
: specifies reason why WFI trace was ignored

TRAPPED bool
: This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

INST_COUNT `unsigned int`
: Ticks count when WFI wakeup occurred.

REASON `enum`
: Reason for wakeup.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.46 ARM_SC000 - trace

This section describes the trace sources.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int
: Fault status

PADDR unsigned int
: Physical Address (or 0 if unavailable)

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool
: Memory access failed

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

LOAD_VALUE unsigned int
: Loaded values

NSDESC unsigned int
: The security state of the access.

OPERAND_VALUE unsigned int
: Operation's operand

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

NSDESC unsigned int
: The security state of the access.

OPERAND_VALUE unsigned int
: Operation's operand

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ArchMsg.Error.exit_code

Fields:

EXITCODE signed int
: Exit code to be returned

KIND string
: Component kind that invoked the exit code trace

REASON string
: Reason why the exit code trace was invoked (optional)

ArchMsg.Warning.TarmacReconstructor

Unexpected event happened during Tarmac reconstruction. Fields:

REASON string
: Reason

ArchMsg.Warning.Unpredictably Indexed PM Event Register

Fields:

IsDirect unsigned int
: Direct Access rather than indirect

N unsigned int
: Number of Accessible Registers

SEL unsigned int
: Selector

ArchMsg.Warning.branch_to_unaligned_address

Fields:

ADDR unsigned int
: Unaligned branch address

ArchMsg.Warning.dap_csw_bad_size

A write to CM3DAP CSW has an invalid size field. Fields:

DATA unsigned int
: bits[2:0] are size

ArchMsg.Warning.dcimvac_matches_watchpoint

Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.decode_fracbitsnegative

VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_invalidvalue

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_mem_hint_unallocated

There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_registermismatch

Fields:

FIELD1 enum
: Field name

FIELD2 enum
: Field name

ArchMsg.Warning.decode_registeroutofrange

Float point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

Attempt to perform a memory transaction of more than 128 bytes.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.decode_unpred_other

Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13

Fields:

FIELD enum
: Field name

ArchMsg.Warning.decode_unpreduseofr13inreglist

Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

Instruction is unpredictable when no registers are to be transfered.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. Fields:

PC unsigned int
: Address of instruction causing the branch

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. Fields:

CPSR unsigned int
: Processor state

PC unsigned int
: Address of instruction causing the exception

TYPE enum
: Type of exception

ArchMsg.Warning.reentrant_vector_catch

Fields:

ADDR unsigned int
: vector address

ArchMsg.Warning.reserved_it_state

Fields:

ITSTATE unsigned int
: reserved IT state

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.secure_vector_fetch_from_nonsecure

Secure vector table is being fetched from Non-secure memory .

ArchMsg.Warning.sg_in_it_block

Arm recommends that software does not place SG (security gate instruction) inside an IT instruction block.

ArchMsg.Warning.unpredictable_a32_breakpoint

Fields:

ADDR1 unsigned int
: Address

ADDR2 unsigned int
: Breakpoint address

BAS unsigned int
: BAS Field

IS_ADDRESS_MISMATCH_BREAKPOINT bool
: Is Mismatch breakpoint, not a match breakpoint

N unsigned int
: Breakpoint number

OFFSET unsigned int
: Indicates which halfword actually considering into the A32 instruction

ArchMsg.Warning.unpredictable_banked_register_access

Fields:

R unsigned int
: R bit

SYSM unsigned int
: SYSm

ArchMsg.Warning.unpredictable_ccfail_undef

Fields:

OPCODE unsigned int
: opcode of the instruction

VADDR unsigned int
: Virtual address of the instruction being executed

ArchMsg.Warning.unpredictable_ici_bits

ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

Fields:

ADDR1 unsigned int
: Address

ADDR2 unsigned int
: Breakpoint address

BAS unsigned int
: BAS Field

IS_ADDRESS_MISMATCH_BREAKPOINT bool
: Is Mismatch breakpoint, not a match breakpoint

N unsigned int
: Breakpoint number

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OFFSET unsigned int
Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_t32_vector_catch

Fields:

ADDR unsigned int
Address
OFFSET unsigned int
Indicates which halfword actually considering into the T32 instruction

ArchMsg.Warning.unpredictable_watchpoint_far

Fields:

LOWER_BOUND unsigned int
the lowest address accessed by the instruction that triggered the watchpoint
UPPER_BOUND unsigned int
the highest watchpointed address accessed by that instruction

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

AdvSIMDExpandImm may treat this immediate value as UNPREDICTABLE.

ArchMsg.Warning.warning_ConditionalSMC

SMC instruction has UNPREDICTABLE effects when conditional when combined with traps.

ArchMsg.Warning.warning_access_crosses_page_boundary

Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

Access crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

Fields:

ADDR unsigned int
address of access crossing page
MEMTYPE_PAGE1 signed int
First Page's memory type (0-Normal, 1-Non-Normal)
MEMTYPE_PAGE2 signed int
Second Page's memory type (0-Normal, 1-Non-Normal)

ArchMsg.Warning.warning_access_wraps_around_memory

Fields:

WIDTH unsigned int
Address width

ArchMsg.Warning.warning_bx_from_thumbee

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ADDR unsigned int
Destination address

ArchMsg.Warning.warning_ccsidr_unimplemented_level

Fields:

CSSELR unsigned int
current effective value of CSSELR

ArchMsg.Warning.warning_change_to_ns_when_tge_set

Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

Fields:

ENTRY_ADDR unsigned int
address of conflicting TLB entry

ArchMsg.Warning.warning_contiguous_bit_error

Fields:

CONTIG_ADDR unsigned int
address of the TLB first read, with which this entry is expected to be contiguous
CONTIG_DATA unsigned int
expected contents based on the entry at CONTIG_ADDR
ENTRY_ADDR unsigned int
address of conflicting TLB entry
ENTRY_DATA unsigned int
contents of conflicting TLB entry

ArchMsg.Warning.warning_cp10_cp11_mismatch

Fields:

EL unsigned int
EL owning the control

ArchMsg.Warning.warning_cp10_cp11_reserved_value

Fields:

CP10 unsigned int
CP10 access
CP11 unsigned int
CP11 access

ArchMsg.Warning.warning_csselr_level_out_of_range

Fields:

IMPLEMENTED unsigned int
number of cache levels implemented
LEVEL unsigned int
written value of CSSELR.Level
TYPE enum
The type of cache selected by CSSELR.InD and TnD

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ERROR enum
: type of error resulting

REGISTER enum
: register under consideration

ArchMsg.Warning.warning_debug_register_access_during_reset

Fields:

IS_WRITE unsigned int
: Write Not Read

OFFSET unsigned int
: Register Offset

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

Fields:

N unsigned int
: index

WVR unsigned int
: DBGWVR

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET.

ArchMsg.Warning.warning_exclusive_to_non_normal

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_exclusive_to_non_writeback

Fields:

ADDR unsigned int
: Address

ArchMsg.Warning.warning_execute_from_device_memory

An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NEW_MODE unsigned int
New value of CPSR.M

ArchMsg.Warning.warning_illegal_srs_mode

Fields:

MODE unsigned int
mode for Banked SP

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

PPB_OFFSET unsigned int
debug register offset

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behaviour of a sequential instruction fetches that cross from non-secure to secure memory and contain SG instruction is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for the this instructions. Fields:

ADDRESS unsigned int
Address of instruction
OPCODE unsigned int
instruction opcode

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED. Fields:

DATA unsigned int
data attempted to be written
PPB_OFFSET unsigned int
debug register offset

ArchMsg.Warning.warning_invalid_tcr_granule

Fields:

REQUEST signed int
page size requested (or 0 for reserved)
SUBSTITUTE signed int
best guess available page size
TG_ID bool
bits TG0 or TG1

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_load_pc_from_unaligned

PC loaded from an unaligned location.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ATTR unsigned int
Memory attribute

ArchMsg.Warning.warning_reserved_breakpoint_state_match

Fields:

IS_BREAKPOINT unsigned int
Is breakpoint, not watchpoint

ArchMsg.Warning.warning_shareability

Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

Thumb instruction warps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

Fields:

MSB unsigned int
x-1
TTBR enum
which TTBR register

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_to_device

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

Fields:

ADDR unsigned int
Address

ArchMsg.Warning.warning_unknown_sau_rnr

SAU_RNR was set to an unsupported value.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIP_and_BFHFNMINP

The effect of setting both AIRCR.BFHFNMINP and AIRCR.PRIP to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_EXE_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are UNPREDICTABLE. Fields:

EXC_RETURN `unsigned int`
: Special PC value

SBO_MASK `unsigned int`
: Which bits Should Be One to not UNPRED

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is CONSTRAINED UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

Fields:

DRVEXC_TAKEN `unsigned int`
: derived exception taken not pended

REACHED_LAST_STORE `unsigned int`
: only the last faulted

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

state on exception return is unpredictable.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

Fields:

ATTR unsigned int
: Memory attribute

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

Fields:

TCR enum
: Which TCR

TSIZE signed int
: Value of TSize

TSIZE_MAX signed int
: The maximum allowed value

TTBR unsigned int
: Which TTBR region

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

The PC value must be word-aligned, otherwise the behavior of the instruction is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

Fields:

FRAME_ADDR unsigned int
: unaligned stack frame address

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

Fields:

TEXCB unsigned int
: texcb value

TEX_REMAP bool
: use tex remap

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

Fields:

SL0 signed int
: VTCR.SL0, starting level for stage 2 translation table walks

T0SZ signed int
: VTCR.T0SZ, required input address range

ArchMsg.Warning.warning_unpredictable_write_DHCSR

Fields:

NEW unsigned int
: data attempted to be written

OLD unsigned int
: previous value

ArchMsg.Warning.warning_unpredictable_write_SHCSR

UNPREDICTABLE setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

Fields:

WRITE unsigned int
: access is write

ArchMsg.Warning.warning_wcr_mask_and_bas

DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.warning_unpred_system_register_access

Fields:

IS_WRITE unsigned int
: Write Not Read

OFFSET unsigned int
: Register Offset

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
: Origin address (or 0 if unavailable)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branche return fail, perhaps to a register.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int
: Inclusive end addres for by VA or PA requests

NS bool
: Non-secure world for PA

START unsigned int
: Start address for by VA or PA requests

TYPE enum
: Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int
: Address of next instruction after this basic block

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int
: Address of first instruction in basic block

COMPILE_INST

ARM instruction compiled. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DISASS string
: Disassembly of the instruction.

ISET enum
: The instruction set of this instruction.

ITSTATE unsigned int
: The ITSTATE current for the instruction.

OPCODE unsigned int
: The opcode of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

NS bool
: Secure or nonsecure banked register is accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool
: Architectural Context Synchronization Event

SYSREG_SYNC bool
: System register synchronization event

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool
: Core BE8 Big-Endian state

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum
: The architecture profile of the core.

CLUSTER_ID unsigned int
: The cluster ID of this processor.

CORE_NUM unsigned int
: The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum
: Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field

FPU_VERSION enum
: The VFP version implemented by the core.

MEM_ARCH enum
: The memory architecture of the core.

MIDR_EL1 unsigned int
: MIDR_EL1 value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NUM_CORES unsigned int
: The number of cores in this MP processor.

QUANTUM_SIZE unsigned int
: The default quantum size of the core.

SECURITY_FEATURES bool
: Does the core have security features?

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ID unsigned int
: The register number, 0 to 14.

OLD_VALUE unsigned int
: The old value overwritten.

PHYS_ID enum
: The physical register accessed.

VALUE unsigned int
: The new value written to the register.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of memory in bytes.

TAG unsigned int
: The value of the tag being set.

VADDR unsigned int
: Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of zero'd memory in bytes.

VADDR unsigned int
: Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum
: Description of event

VALUE unsigned int
: data value

DWT_MATCH

DWT comparator matches. Fields:

NUM unsigned int
: DWT comparator number

TYPE enum
: DWT comparator configuration

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int
: Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int
: Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int
: Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int
: Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int
: Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

EXCEPTION

Exceptions which are taken. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ISET enum
: The instruction set of the processor when the exception occurred.

LR unsigned int
: The value assigned to the link register.

PC unsigned int
: The location where the exception occurred.

TARGET_ISET enum
: The instruction set of the exception handler code.

TARGET_PC unsigned int
: The address the exception branches to.

VECTOR enum
: The exception vector.

EXCEPTION_END

Every exception completed.

EXCEPTION_ENTRY

Event marking the entry of an exception. All pushes of register to the stack will follow this event. Fields:

PC unsigned int
: The location where the exception occurred.

VECTOR enum
: The exception that occurred.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Marks the end of an exception, but on an M core does not indicate a program flow change (branch). In most situations it will be followed by an indirect branch. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ISET enum
: The instructions set of the branch instruction.

PC unsigned int
: The address of the branch instruction.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

EXCEPTION_VECTOR_FETCH

I-side vector fetch for M-class exception. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

DATA unsigned int
: Result of fetch if OK

RESPONSE enum
: 0=Aborted, 1=OK

VADDR unsigned int
: Where the vector is fetched from (including VTOR)

FP_STATE

Floating point state. Fields:

FPSR unsigned int
: FPSR register value.

MASK unsigned int
: The mask indicating updated cumulative bits.

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int
: The 16-bit immediate value encoded in HLT instruction.

INFO_EXCEPTION_REASON

Provide information of real cause of exception. Fields:

FaultCause enum
: Which bit of which V7M/V8M-mainline FSR/HFSR would have been set.

PC unsigned int
: The location where the exception occurred.

PHASE enum
: What we are doing with the exception.

REASONS enum
: Why we are doing it.

VECTOR enum
: The exception that occurred.

INFO_STACKING

Provide information of real cause of exception. Fields:

PHASE enum
: Are we starting or ending a sequence of stack writes.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REASONS enum
: Why we are doing it.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DEBUG_STATE bool
: The instruction is executed in debug state.

DISASS string
: Disassembly of instruction.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The current instruction set.

ITSTATE unsigned int
: The current ITSTATE.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

MODE enum
: The mode the core is in.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

OPCODE unsigned int
: The opcode of the instruction.

PADDR unsigned int
: The physical address of the instruction.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

INST_STRADDLE

Instruction straddles boundary. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

ISB

ISB instruction occurred.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string
: Register to add into the list

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int
: Local Monitor Address

State enum
: State of the monitor (Open/Exclusive)

LOCKUP_CYCLE

This event is triggered if the core enters or stays in the lock-up state. Fields:

CAUSE enum
: What causes the lockup?.

LOCKUP_ENTRY

This event is triggered if the core enters the lock-up state. Fields:

PC unsigned int
: The PC when the lockup state is entered.

LOCKUP_EXIT

This event is triggered if the core leaves the lock-up state.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: The new mode.

OLD_MODE enum
: The old mode.

MPU_TRANS

Address translation information. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EXEC_PERM enum
: Execution Permission

INNERCACHE_RA bool
: Is the inner cache allocate on read

INNERCACHE_TYPE enum
: Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool
: Is the inner cache allocate on write

MEMTYPE enum
: Memory type.

OUTERCACHE_RA bool
: Is the outer cache allocate on read

OUTERCACHE_TYPE enum
: Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool
: Is the outer cache allocate on write

PADDR unsigned int
: Address of the access.

PAGESIZE unsigned int
: Page size as log2(size).

READ_PERM enum
: Read Permission

REG_NUM signed int
: MPU region-number 0-15 (else 0xFF=none, 0xBB/0xDD=background/default)

SH enum
: Shareability

SIDE enum
: Inst / Data.

WRITE_PERM enum
: Write Permission

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

PC unsigned int
: The address of the next instruction to be executed on this CPU.

PPB_READ_ACCESS

Trace reads from the core to memory mapped registers in the PPB (private peripheral bus) address range. Fields:

ACCESS_SIZE unsigned int
: Logarithm of the access size: 0=byte, 1=halfword, 2=word, 3=doubleword, ...

BURST_LEN unsigned int
: The number of data transfers (beats) in this burst.

DATA unsigned int
: The data transferred.

INNER_ATTRIBUTES unsigned int
: The inner attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

INST bool
: Is an instruction fetch.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LOCK enum
: Normal / Locked / Exclusive.

MASTER_ID unsigned int
: The AXI master ID.

NS bool
: Is a nonsecure access.

OUTER_ATTRIBUTES unsigned int
: The outer attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

PADDR unsigned int
: Physical address of access.

PRIV bool
: Is privileged access.

RESPONSE enum
: Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int
: Core specific additional signals.

PPB_WRITE_ACCESS

Trace writes from the core to memory mapped registers in the PPB (private peripheral bus) address range. Fields:

ACCESS_SIZE unsigned int
: Logarithm of the access size: 0=byte, 1=halfword, 2=word, 3=doubleword, ...

BURST_LEN unsigned int
: The number of data transfers (beats) in this burst.

DATA unsigned int
: The data transferred.

INNER_ATTRIBUTES unsigned int
: The inner attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

INST bool
: Is an instruction fetch.

LOCK enum
: Normal / Locked / Exclusive.

MASTER_ID unsigned int
: The AXI master ID.

NS bool
: Is a nonsecure access.

OUTER_ATTRIBUTES unsigned int
: The outer attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

PADDR unsigned int
: Physical address of access.

PRIV bool
: Is privileged access.

RESPONSE enum
: Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int
: Core specific additional signals.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int
: Virtual address of the data that should be preloaded.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int
: Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Operating mode after the transition

OLD_STATE enum
: Operating mode before the transition

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Operating mode after the transition

OLD_STATE enum
: Operating mode before the transition

REASON string
: Reason for the transition being denied

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Power mode after the transition

OLD_STATE enum
: Power mode before the transition

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Power mode after the transition

OLD_STATE enum
: Power mode before the transition

REASON string
: Reason for the transition being denied

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Operating mode after the transition

OLD_STATE enum
: Operating mode before the transition

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int
: Ticks count at point of transition.

NEW enum
: New run state.

OLD enum
: Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int
: The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool
: Use EL2 translation regime.

NS bool
: Is Non-Secure.

REG_WIDTH unsigned int
: The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum
: Signal that changed

STATE bool
: Signal asserted state

START_COMPILE

Compilation started. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VADDR unsigned int
: Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...)

OPTIMAL_ALIGN_SELECTOR unsigned int
: Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes)

VADDR unsigned int
: The virtual address of the access

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

LOCAL_QUANTUM unsigned int
: The local quantum of this CPU.

LOCAL_TIME unsigned int
: The local time of this CPU.

SYNC_REASON enum
: Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int
: Immediate value of the system call instruction.

TYPE enum
: System call type.

VADDR unsigned int
: Instruction that caused the system call.

SYSREG_READ

Trace reads from system registers. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REG_NAME enum
: Register number

VALUE unsigned int
: The value read.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

SYSREG_WRITE

Trace write to system registers. Fields:

REG_ACCESS enum
: Register access status

REG_NAME enum
: Register number

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

VALUE unsigned int
: Value written to the register.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...)

NUMBER_OF_BEATS unsigned int
: Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS)

VADDR unsigned int
: The virtual address of the access

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ISET enum
: Origin instructions set

IS_COND bool
: Indicates if this is a conditional waypoint.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PC unsigned int
: Origin address (or 0 if unavailable)

TAKEN bool
: Indicates if this waypoint was taken.

TARGET unsigned int
: Destination address

TARGET_ISET enum
: Destination instructions set

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int
: Ticks count.

REASON enum
: Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool
: This WFE was ignored because the event register was set.

INST_COUNT unsigned int
: Ticks count when ignoring WFE.

TRAPPED bool
: This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool
: This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int
: Ticks count when ignoring WFI.

REASON enum
: specifies reason why WFI trace was ignored

TRAPPED bool
: This WFI was trapped.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int
: Ticks count when WFI wakeup occurred.

REASON enum
: Reason for wakeup.

XPSR

Changes to the xPSR register. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

OLD_VALUE unsigned int
: The old xPSR value

UNKNOWN unsigned int
: Bits within the register that have unknown value.

VALUE unsigned int
: The new xPSR value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.47 ARM_SC300 - trace

This section describes the trace sources.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int
: Fault status

PADDR unsigned int
: Physical Address (or 0 if unavailable)

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool
: Memory access failed

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

LOAD_VALUE unsigned int
: Loaded values

NSDESC unsigned int
: The security state of the access.

OPERAND_VALUE unsigned int
: Operation's operand

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int
: The virtual address of the access.

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

COMPARE_VALUE unsigned int
: Compare value for CAS

NSDESC unsigned int
: The security state of the access.

OPERAND_VALUE unsigned int
: Operation's operand

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OPERATION enum
: Operation type

PADDR unsigned int
: The physical address of the access.

PRIV bool
: Is this a privileged access?

ArchMsg.Error.exit_code

Fields:

EXITCODE signed int
: Exit code to be returned

KIND string
: Component kind that invoked the exit code trace

REASON string
: Reason why the exit code trace was invoked (optional)

ArchMsg.Warning.TarmacReconstructor

Unexpected event happened during Tarmac reconstruction. Fields:

REASON string
: Reason

ArchMsg.Warning.dap_csw_bad_size

A write to CM3DAP CSW has an invalid size field. Fields:

DATA unsigned int
: bits[2:0] are size

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. Fields:

PC unsigned int
: Address of instruction causing the branch

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. Fields:

CPSR unsigned int
: Processor state

PC unsigned int
: Address of instruction causing the exception

TYPE enum
: Type of exception

ArchMsg.Warning.secure_vector_fetch_from_nonsecure

Secure vector table is being fetched from Non-secure memory .

ArchMsg.Warning.sg_in_it_block

Arm recommends that software does not place SG (security gate instruction) inside an IT instruction block.

ArchMsg.warning_unpred_system_register_access

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

IS_WRITE unsigned int
: Write Not Read

OFFSET unsigned int
: Register Offset

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
: Origin address (or 0 if unavailable)

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

IS_COND bool
: Indicates if this is a conditional branch.

IS_LINK bool
: Indicates if this is a branch with link.

PC unsigned int
: The address of the branch instruction.

TARGET_ISET enum
: The instructions set after the branch.

TARGET_PC unsigned int
: The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branche return fail, perhaps to a register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum
: The condition of the conditional instruction.

CORE_NUM unsigned int
: Core number in a multi processor.

PC unsigned int
: The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int
: Inclusive end addres for by VA or PA requests

NS bool
: Non-secure world for PA

START unsigned int
: Start address for by VA or PA requests

TYPE enum
: Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int
: Address of next instruction after this basic block

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int
: Address of first instruction in basic block

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string
: Disassembly of the instruction.

ISET enum
: The instruction set of this instruction.

ITSTATE unsigned int
: The ITSTATE current for the instruction.

OPCODE unsigned int
: The opcode of the instruction.

PC unsigned int
: The address of the instruction.

SIZE unsigned int
: The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

NS bool
: Secure or nonsecure banked register is accessed.

UNDEF bool
: The register accessed is undefined.

VALUE unsigned int
: The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool
: Architectural Context Synchronization Event

SYSREG_SYNC bool
: System register synchronization event

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool
: Core BE8 Big-Endian state

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum
: The architecture profile of the core.

CLUSTER_ID unsigned int
: The cluster ID of this processor.

CORE_NUM unsigned int
: The number of this core in an MP processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DETAILED_CORE_FEATURES enum
: Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field

FPU_VERSION enum
: The VFP version implemented by the core.

MEM_ARCH enum
: The memory architecture of the core.

MIDR_EL1 unsigned int
: MIDR_EL1 value

NUM_CORES unsigned int
: The number of cores in this MP processor.

QUANTUM_SIZE unsigned int
: The default quantum size of the core.

SECURITY_FEATURES bool
: Does the core have security features?

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

TRANS bool
: Is this a translated access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VADDR unsigned int
: The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ID unsigned int
: The register number, 0 to 14.

OLD_VALUE unsigned int
: The old value overwritten.

PHYS_ID enum
: The physical register accessed.

VALUE unsigned int
: The new value written to the register.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum
: The type of instruction performing the access.

ACQREL enum
: Is this an acquire/release

ATTR unsigned int
: Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

ATTR2 unsigned int
: Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

DATA unsigned int
: The data read or written.

ELEMENT_SIZE unsigned int
: Width of each element.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

LOCK enum
: Normal, exclusive or locked access.

NSDESC unsigned int
: The physical address non-secure bit.

NSDESC2 unsigned int
: The second page physical address non-secure bit.

PADDR unsigned int
: The physical (translated) address.

PADDR2 unsigned int
: If different from PADDR, the physical address of the second page of the access.

RESPONSE enum
: 0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsuccessful

SIZE unsigned int
: Width of the access in bytes. Only required if DATA is not traced.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

TRANS bool
: Is this a translated access.

VADDR unsigned int
: The virtual address of the access.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of memory in bytes.

TAG unsigned int
: The value of the tag being set.

VADDR unsigned int
: Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int
: Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

NSDESC unsigned int
: The security state of the access.

PADDR unsigned int
: The physical address of the access.

RESPONSE enum
: 0=Aborted, 1=OK

SIZE unsigned int
: The size of zero'd memory in bytes.

VADDR unsigned int
: Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum
: Description of event

VALUE unsigned int
: data value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DWT_MATCH

DWT comparator matches. Fields:

NUM unsigned int
: DWT comparator number

TYPE enum
: DWT comparator configuration

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int
: Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int
: Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int
: Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int
: Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int
: Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

EXCEPTION

Exceptions which are taken. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ISET enum
: The instruction set of the processor when the exception occurred.

LR unsigned int
: The value assigned to the link register.

PC unsigned int
: The location where the exception occurred.

TARGET_ISET enum
: The instruction set of the exception handler code.

TARGET_PC unsigned int
: The address the exception branches to.

VECTOR enum
: The exception vector.

EXCEPTION_END

Every exception completed.

EXCEPTION_ENTRY

Event marking the entry of an exception. All pushes of register to the stack will follow this event. Fields:

PC unsigned int
: The location where the exception occurred.

VECTOR enum
: The exception that occurred.

EXCEPTION_RAISE

Every exception raised.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EXCEPTION_RETURN

Marks the end of an exception, but on an M core does not indicate a program flow change (branch). In most situations it will be followed by an indirect branch. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The core's instruction counter, starting at 1 for the first instruction.

ISET enum
: The instructions set of the branch instruction.

PC unsigned int
: The address of the branch instruction.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

EXCEPTION_VECTOR_FETCH

I-side vector fetch for M-class exception. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

DATA unsigned int
: Result of fetch if OK

RESPONSE enum
: 0=Aborted, 1=OK

VADDR unsigned int
: Where the vector is fetched from (including VTOR)

FP_STATE

Floating point state. Fields:

FPSR unsigned int
: FPSR register value.

MASK unsigned int
: The mask indicating updated cumulative bits.

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int
: The 16-bit immediate value encoded in HLT instruction.

INFO_EXCEPTION_REASON

Provide information of real cause of exception. Fields:

FaultCause enum
: Which bit of which V7M/V8M-mainline FSR/HFSR would have been set.

PC unsigned int
: The location where the exception occurred.

PHASE enum
: What we are doing with the exception.

REASONS enum
: Why we are doing it.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VECTOR enum
The exception that occurred.

INFO_STACKING

Provide information of real cause of exception. Fields:

PHASE enum
Are we starting or ending a sequence of stack writes.
REASONS enum
Why we are doing it.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int
Core number in a multi processor.
CURRENT_TIME unsigned int
The core's current time, as simulated time plus local time.
DEBUG_STATE bool
The instruction is executed in debug state.
DISASS string
Disassembly of instruction.
INST_COUNT unsigned int
The core's instruction counter, starting at 1 for the first instruction.
ISET enum
The current instruction set.
ITSTATE unsigned int
The current ITSTATE.
LOCAL_TIME unsigned int
The core's local time, relative to the current quantum.
MODE enum
The mode the core is in.
NSDESC unsigned int
The physical address non-secure bit.
NSDESC2 unsigned int
The second page physical address non-secure bit.
OPCODE unsigned int
The opcode of the instruction.
PADDR unsigned int
The physical address of the instruction.
PADDR2 unsigned int
If different from PADDR, the physical address of the second page of the instruction.
PC unsigned int
The address of the instruction.
SIZE unsigned int
The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

ISET enum
The current instruction set.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

INST_STRADDLE

Instruction straddles boundary. Fields:

ISET enum
: The current instruction set.

MODE enum
: The mode the core is in.

NS enum
: The current Secure State.

PC unsigned int
: The address of the conditional instruction.

ISB

ISB instruction occurred.

ITM

Instrumentation Trace Macrocell. Fields:

ITM_PACKET_TYPE enum
: ITM and DWT packets type.

PACKET_HEADER unsigned int
: ITM Packet Header.

PACKET_PAYLOAD unsigned int
: ITM Packet Payload.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string
: Register to add into the list

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int
: Local Monitor Address

State enum
: State of the monitor (Open/Exclusive)

LOCKUP_CYCLE

This event is triggered if the core enters or stays in the lock-up state. Fields:

CAUSE enum
: What causes the lockup?.

LOCKUP_ENTRY

This event is triggered if the core enters the lock-up state. Fields:

PC unsigned int
: The PC when the lockup state is entered.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LOCKUP_EXIT

This event is triggered if the core leaves the lock-up state.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

MODE enum
: The new mode.

OLD_MODE enum
: The old mode.

MPU_TRANS

Address translation information. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

EXEC_PERM enum
: Execution Permission

INNERCACHE_RA bool
: Is the inner cache allocate on read

INNERCACHE_TYPE enum
: Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool
: Is the inner cache allocate on write

MEMTYPE enum
: Memory type.

OUTERCACHE_RA bool
: Is the outer cache allocate on read

OUTERCACHE_TYPE enum
: Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool
: Is the outer cache allocate on write

PADDR unsigned int
: Address of the access.

PAGESIZE unsigned int
: Page size as log2(size).

READ_PERM enum
: Read Permission

REG_NUM signed int
: MPU region-number 0-15 (else 0xFF=none, 0xBB/0xDD=background/default)

SH enum
: Shareability

SIDE enum
: Inst / Data.

WRITE_PERM enum
: Write Permission

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

INST_COUNT unsigned int
: The instruction count of this CPU.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PC unsigned int
: The address of the next instruction to be executed on this CPU.

PPB_READ_ACCESS

Trace reads from the core to memory mapped registers in the PPB (private peripheral bus) address range. Fields:

ACCESS_SIZE unsigned int
: Logarithm of the access size: 0=byte, 1=halfword, 2=word, 3=doubleword, ...

BURST_LEN unsigned int
: The number of data transfers (beats) in this burst.

DATA unsigned int
: The data transferred.

INNER_ATTRIBUTES unsigned int
: The inner attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

INST bool
: Is an instruction fetch.

LOCK enum
: Normal / Locked / Exclusive.

MASTER_ID unsigned int
: The AXI master ID.

NS bool
: Is a nonsecure access.

OUTER_ATTRIBUTES unsigned int
: The outer attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

PADDR unsigned int
: Physical address of access.

PRIV bool
: Is privileged access.

RESPONSE enum
: Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int
: Core specific additional signals.

PPB_WRITE_ACCESS

Trace writes from the core to memory mapped registers in the PPB (private peripheral bus) address range. Fields:

ACCESS_SIZE unsigned int
: Logarithm of the access size: 0=byte, 1=halfword, 2=word, 3=doubleword, ...

BURST_LEN unsigned int
: The number of data transfers (beats) in this burst.

DATA unsigned int
: The data transferred.

INNER_ATTRIBUTES unsigned int
: The inner attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

INST bool
: Is an instruction fetch.

LOCK enum
: Normal / Locked / Exclusive.

MASTER_ID unsigned int
: The AXI master ID.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NS bool
: Is a nonsecure access.

OUTER_ATTRIBUTES unsigned int
: The outer attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

PADDR unsigned int
: Physical address of access.

PRIV bool
: Is privileged access.

RESPONSE enum
: Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int
: Core specific additional signals.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int
: Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int
: Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int
: The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int
: The core's local time, relative to the current quantum.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Operating mode after the transition

OLD_STATE enum
: Operating mode before the transition

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NEW_STATE enum
: Operating mode after the transition

OLD_STATE enum
: Operating mode before the transition

REASON string
: Reason for the transition being denied

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Power mode after the transition

OLD_STATE enum
: Power mode before the transition

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Power mode after the transition

OLD_STATE enum
: Power mode before the transition

REASON string
: Reason for the transition being denied

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int
: Integer representation of DEVPACTIVE[] signals

NEW_STATE enum
: Operating mode after the transition

OLD_STATE enum
: Operating mode before the transition

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int
: Ticks count at point of transition.

NEW enum
: New run state.

OLD enum
: Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int
: The program counter after the semihosting call.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool
: Use EL2 translation regime.

NS bool
: Is Non-Secure.

REG_WIDTH unsigned int
: The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum
: Signal that changed

STATE bool
: Signal asserted state

START_COMPILE

Compilation started. Fields:

VADDR unsigned int
: Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int
: Final address.

ADDR_START unsigned int
: Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...)

OPTIMAL_ALIGN_SELECTOR unsigned int
: Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes)

VADDR unsigned int
: The virtual address of the access

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

INST_COUNT unsigned int
: The instruction count of this CPU.

LOCAL_QUANTUM unsigned int
: The local quantum of this CPU.

LOCAL_TIME unsigned int
: The local time of this CPU.

SYNC_REASON enum
: Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int
: Immediate value of the system call instruction.

TYPE enum
: System call type.

VADDR unsigned int
: Instruction that caused the system call.

SYSREG_READ

Trace reads from system registers. Fields:

REG_NAME enum
: Register number

VALUE unsigned int
: The value read.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

REG enum
: Register number.

UNKNOWN unsigned int
: Bits of the register which became unknown.

VALUE unsigned int
: Value written to the register.

SYSREG_WRITE

Trace write to system registers. Fields:

REG_ACCESS enum
: Register access status

REG_NAME enum
: Register number

UPDATED_VALUE unsigned int
: Updated value of the register now it has been written.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VALUE unsigned int
: Value written to the register.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int
: Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...)

NUMBER_OF_BEATS unsigned int
: Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS)

VADDR unsigned int
: The virtual address of the access

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

ISET enum
: Origin instructions set

IS_COND bool
: Indicates if this is a conditional waypoint.

PC unsigned int
: Origin address (or 0 if unavailable)

TAKEN bool
: Indicates if this waypoint was taken.

TARGET unsigned int
: Destination address

TARGET_ISET enum
: Destination instructions set

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int
: Ticks count.

REASON enum
: Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool
: This WFE was ignored because the event register was set.

INST_COUNT unsigned int
: Ticks count when ignoring WFE.

TRAPPED bool
: This WFE was trapped.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int
: Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool
: This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int
: Ticks count when ignoring WFI.

REASON enum
: specifies reason why WFI trace was ignored

TRAPPED bool
: This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int
: Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int
: Ticks count when WFI wakeup occurred.

REASON enum
: Reason for wakeup.

XPSR

Changes to the xPSR register. Fields:

CORE_NUM unsigned int
: Core number in a multi processor.

OLD_VALUE unsigned int
: The old xPSR value

UNKNOWN unsigned int
: Bits within the register that have unknown value.

VALUE unsigned int
: The new xPSR value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.48 ARMv8Cluster - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message `string`
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.49 AsyncCacheFlushUnit - trace

This section describes the trace sources.

STATE_CHANGE

Change in state of the AsyncCacheFlushUnit state machine. Fields:

STATE enum
: New state

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.50 Base_PowerController - trace

This section describes the trace sources.

PWRC_register_read

A register read occurred. Fields:

data unsigned int
: The data returned if not an error

error bool
: An error is being returned

ns bool
: The security state of the access

offset enum
: The offset of the register access

PWRC_register_write

A register write occurred. Fields:

data unsigned int
: The data written if not an error

error bool
: An error is being returned

ns bool
: The security state of the access

offset enum
: The offset of the register access

PWRC_signal_input

signal inputs. Fields:

index unsigned int
: index into port array

signal enum
: input signal

value bool
: whether signal is asserted or not

PWRC_signal_output

signal outputs. Fields:

index unsigned int
: index into port array

signal enum
: output signal

value bool
: whether signal is asserted or not

PWRC_sys_status_update

SYS_STATUS register is updated. Fields:

affinity unsigned int
: affinity level identifier of the core which is changing

data unsigned int
: new value of SYS_STATUS

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

index `unsigned int`
pin index to which this core is wired

4.51 CCI400 - trace

This section describes the trace sources.

CCI_REGISTER_READ

A valid read from the register file. (Access violations are not traced.). Fields:

Offset unsigned int
: Offset into the register block

Value unsigned int
: Value read

CCI_REGISTER_WRITE

A valid write to the register file. (Access violations are not traced). Fields:

Offset unsigned int
: Offset into the register block

Value unsigned int
: Value written

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

read_for_0_came_from_snoop

A read from master 0 was satisfied by a snoop from an upstream port. Fields:

Bus address unsigned int
: The start bus address of the read transaction

Is non secure bool
: Is the transaction for the NS world?

read_for_1_came_from_snoop

A read from master 1 was satisfied by a snoop from an upstream port. Fields:

Bus address unsigned int
: The start bus address of the read transaction

Is non secure bool
: Is the transaction for the NS world?

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

read_for_2_came_from_snoop

A read from master 2 was satisfied by a snoop from an upstream port. Fields:

Bus address unsigned int
: The start bus address of the read transaction

Is non secure bool
: Is the transaction for the NS world?

read_for_3_came_from_snoop

A read from master 3 was satisfied by a snoop from an upstream port. Fields:

Bus address unsigned int
: The start bus address of the read transaction

Is non secure bool
: Is the transaction for the NS world?

read_for_4_came_from_snoop

A read from master 4 was satisfied by a snoop from an upstream port. Fields:

Bus address unsigned int
: The start bus address of the read transaction

Is non secure bool
: Is the transaction for the NS world?

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.52 CCI500 - trace

This section describes the trace sources.

ArchMsg.Error.reset_state_of_upstream_is_in_reset_but_trying_to_enable_snoops_and or_dvm

The upstream system is known to be in reset but we are trying to enable snoops/DVM to the port. In a real system, this could deadlock as snoop transactions could get routed to the port unless there were absolutely no shared transactions in flight or made. In any event, it is highly unlikely that the programmer intended this. Fields:

is_dvm_enable bool
: Is DVM enable (rather than snoop enable).

upstream_port_index unsigned int
: The upstream port index of the reset signal.

ArchMsg.Error.sw_reset

An error occurred in managing the reset of upstream systems whose entrance and exit of the coherency domain is managed by software. Fields:

why string
: Why the problem occurred.

ArchMsg.Warning.acchannelensx_enables_an_upstream_port_with_no_snoop_channel

ACCHANNELENSx should tell us which upstream ports have a connected snoop and DVM channels. The model has detected that an enabled port does not have a snoop/DVM channel. This will be silently ignored in the model, but might have deadlocked the hardware. Fields:

acchannelensx unsigned int
: The value of ACCHANNELENSx that is being used.

upstream_port_index unsigned int
: Upstream port index of offending port

ArchMsg.Warning.odd_programming_trying_to_enable_upstream_port

DESCRIPTION: The software tried to enable %{which} messages on port %{upstream_port_index} that is not capable of receiving these messages, for example by being disallowed by ACCHANNELENS% {upstream_port_index} or entirely disconnected. Fields:

acchannelensx unsigned int
: The ACCHANNELENSx bitmap of upstream ports.

bitmap_of_connected_upstream_ports unsigned int
: This is the bitmap of upstream ports that are actually connected.

bitmap_of_dvm_upstream_ports unsigned int
: The bitmap of DVM-capable upstream ports.

bitmap_of_full_ace_upstream_ports unsigned int
: The bitmap of snoop-capable upstream ports.

upstream_port_index unsigned int
: The upstream port index of the port

which enum
: Which type of enable we were trying to enable

ArchMsg.Warning.reset_state_of_upstream_port_driven_after_first_transaction_seen

All signals should be driven at simulation reset so that both sides of the connection agree on the value of the wire. This trace source means that the driver of the signal did not do this. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

upstream_port_index unsigned int
: The upstream port index of the reset signal.

value bool
: The value driven.

ArchMsg.Warning.reset_state_of_upstream_system_changed_whilst_a_snoop_change_is_pending

If snoop change request is pending, and the upstream system is reset during that process then the system could deadlock if there is any possibility of a shared transaction being in flight at the time. The upstream port might have an outstanding snoop request when it is reset and the interconnect would wait indefinitely for the response. Fields:

upstream_port_index unsigned int
: The upstream port index of the reset signal.

value bool
: The value driven.

why enum
: Why this message is emitted.

ArchMsg.Warning.shared_transaction_received_from_upstream_port_where_acchannelensx_is_disabled

ACCHANNELENSx tells the interconnect which upstream ports do not have connected snoop channels. This warns when a shared transaction is received from an upstream ACE port that doesn't have its snoop channel enabled by ACCHANNELENSx and there are other ports. This may be OK if the upstream system does not accept Snoop/DVM and so is purely an ACE-Lite system, or the upstream systems are truly separate shareability domains. However, this might also mean that you have completely forgotten to program the interconnect or use the parameter force_on_from_start. This will only be warned _once_ between resets of the interconnect. Fields:

upstream_port_index unsigned int
: Upstream port index of offending port

allowed_register_access

An allowed register access to the register file. Fields:

data unsigned int
: The data read/written. If this is a read, it is only valid if result is ok.

is_debug bool
: Is the transaction a debug transaction?

is_read bool
: Is the transaction a read transaction?

ns bool
: The transaction is non-secure

register enum
: The register of the transaction

change_dvm_disabled_ports

This reports a bitmap of which ports are disabled to receive DVM messages. Fields:

new_bitmap unsigned int
: The new bitmap of disabled ports

new_bitmap_list unsigned int
: A list of port numbers that were disabled.

old_bitmap unsigned int
: The old bitmap of disabled ports

old_bitmap_list unsigned int
: A list of port numbers that were disabled.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

change_upstream_disabled_ports

This reports a bitmap of which upstream ports of the cache are _disabled_ and so we won't sends snoop requests to them. Fields:

new_bitmap unsigned int
: The bitmap of the first 32 upstream ports that are disabled.

new_bitmap_list unsigned int
: A list of port numbers that were disabled.

old_bitmap unsigned int
: The bitmap of the first 32 upstream ports that are disabled.

old_bitmap_list unsigned int
: A list of port numbers that were disabled.

configuration_pins

One of the configuration pins changed. In the RTL these are sampled at reset, but in the model, we sample it at first transaction. If it occurs after this point then it is traced but the field 'ignored' will be true and the value reported will be what it wanted to change to rather than the value it actually is. Fields:

ignored bool
: The value was ignored because it occurred after seeing a transaction.

value unsigned int
: The value it wants to change to.

which enum
: Which configuration pin changed.

debug_enables

The signals/parameters that cause whether events are counted or not. Fields:

dbgen bool
: DBGEN value

niden bool
: NIDEN value

non_secure_traceable bool
: Non-secure events are traceable

secure_traceable bool
: Secure events are traceable

spiden bool
: SPIDEN value

spniden bool
: SPNIDEN value

errirq

This is the error interrupt signal that is generated when there are unacknowledged imprecise errors. Fields:

value bool
: The value it is driven to.

evntcntoverflow

The event counter overflow interrupt lines. Fields:

counter_id unsigned int
: The ID of the counter that this relates to.

value bool
: The value of the interrupt line

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

force_on_from_start

A commentary on what force_on_from_start is doing. Fields:

acchannelen_dvm unsigned int
: The bitmap of which upstream ports are capable of receiving DVM messages. If the appropriate bit is clear in this register then we won't enable it.

acchannelen_snoop unsigned int
: The bitmap of which upstream ports are capable of receiving snoop messages. If the appropriate bit is clear in this register then we won't enable it.

enable bool
: Whether we are trying to enable the upstream port or not.

reset_state_of_upstream_system enum
: What the interconnect knows about the reset state of the upstream system.

upstream_port_index unsigned int
: The upstream port index.

why enum
: Why the value changed

ignored_register_access

The register access is ignored for some reason. Fields:

address enum
: The address.

is_debug bool
: Is the access a debug access?

is_read bool
: Is the access a read?

ns bool
: The security state of the transaction.

why enum
: Why the access was ignored.

imprecise_error_received

An imprecise error was received for the specified transaction. Fields:

address unsigned int
: Address of transaction

downstream_port_index unsigned int
: The downstream port index that the transaction went out.

ns bool
: Is the transaction non-secure

pmu_overflow

The performance monitor counter overflowed. Fields:

counter_id unsigned int
: The ID of the counter that this relates to.

event_counting unsigned int
: The event that the counter is counting.

new_value bool
: The new value of the overflowed flag.

old_value bool
: The old value of the overflowed flag.

pmu_programmed

A programmed change to the performance monitor unit counter. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

counter_id unsigned int
: The ID of the counter that this relates to.

current_count unsigned int
: The current value of the counter

enabled bool
: Is the counter enabled?

event_counting unsigned int
: The event that the counter is counting.

why enum
: why

register_access

Read/Write of the register file. Fields:

address unsigned int
: The address of the transaction

data unsigned int
: The data read/written. If this is a read, it is only valid if result is ok.

is_debug bool
: Is the transaction a debug transaction?

is_read bool
: Is the transaction a read transaction?

ns bool
: Is the transaction non-secure?

number_of_beats unsigned int
: The number of beats in the transaction

result enum
: The result of the transaction

width_in_bytes unsigned int
: Width of the transaction in bytes.

reset_state_of_upstream_port

The pins reset_state_of_upstream_port[N] are intended to be use as checks by the interconnect that the programmer has disabled snoops and DVMs to upstream ports whose systems are in reset. If you connect these ports to a signal that indicates if the upstream port is in reset then the interconnect can perform this check. This trace source is the trace of those reset state changes. Fields:

upstream_port_index unsigned int
: The upstream port index of the reset signal.

value bool
: The value driven.

upstream_port_with_an_unsynced_snoop_change_pending

When a change to whether to send snoop requests or DVM messages to a port is setup then it takes a finite period of time to take effect and the SW should poll for completion. This tells you when an upstream port has a snoop change pending on it that hasn't been polled for completion. Fields:

comment enum
: Comment

pending bool
: Whether the change is pending or not

upstream_port_index unsigned int
: Upstream port index

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.53 CCI550 - trace

This section describes the trace sources.

ArchMsg.Error.reset_state_of_upstream_is_in_reset_but_trying_to_enable_snoops_and or_dvm

The upstream system is known to be in reset but we are trying to enable snoops/DVM to the port. In a real system, this could deadlock as snoop transactions could get routed to the port unless there were absolutely no shared transactions in flight or made. In any event, it is highly unlikely that the programmer intended this. Fields:

is_dvm_enable bool
: Is DVM enable (rather than snoop enable).

upstream_port_index unsigned int
: The upstream port index of the reset signal.

ArchMsg.Error.sw_reset

An error occurred in managing the reset of upstream systems whose entrance and exit of the coherency domain is managed by software. Fields:

why string
: Why the problem occurred.

ArchMsg.Warning.acchannelensx_enables_an_upstream_port_with_no_snoop_channel

ACCHANNELENSx should tell us which upstream ports have a connected snoop and DVM channels. The model has detected that an enabled port does not have a snoop/DVM channel. This will be silently ignored in the model, but might have deadlocked the hardware. Fields:

acchannelensx unsigned int
: The value of ACCHANNELENSx that is being used.

upstream_port_index unsigned int
: Upstream port index of offending port

ArchMsg.Warning.odd_programming_trying_to_enable_upstream_port

DESCRIPTION: The software tried to enable %{which} messages on port %{upstream_port_index} that is not capable of receiving these messages, for example by being disallowed by ACCHANNELENS% {upstream_port_index} or entirely disconnected. Fields:

acchannelensx unsigned int
: The ACCHANNELENSx bitmap of upstream ports.

bitmap_of_connected_upstream_ports unsigned int
: This is the bitmap of upstream ports that are actually connected.

bitmap_of_dvm_upstream_ports unsigned int
: The bitmap of DVM-capable upstream ports.

bitmap_of_full_ace_upstream_ports unsigned int
: The bitmap of snoop-capable upstream ports.

upstream_port_index unsigned int
: The upstream port index of the port

which enum
: Which type of enable we were trying to enable

ArchMsg.Warning.reset_state_of_upstream_port_driven_after_first_transaction_seen

All signals should be driven at simulation reset so that both sides of the connection agree on the value of the wire. This trace source means that the driver of the signal did not do this. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

upstream_port_index unsigned int
: The upstream port index of the reset signal.

value bool
: The value driven.

ArchMsg.Warning.reset_state_of_upstream_system_changed_whilst_a_snoop_change_is_pending

If snoop change request is pending, and the upstream system is reset during that process then the system could deadlock if there is any possibility of a shared transaction being in flight at the time. The upstream port might have an outstanding snoop request when it is reset and the interconnect would wait indefinitely for the response. Fields:

upstream_port_index unsigned int
: The upstream port index of the reset signal.

value bool
: The value driven.

why enum
: Why this message is emitted.

ArchMsg.Warning.shared_transaction_received_from_upstream_port_where_acchannelensx_is_disabled

ACCHANNELENSx tells the interconnect which upstream ports do not have connected snoop channels. This warns when a shared transaction is received from an upstream ACE port that doesn't have its snoop channel enabled by ACCHANNELENSx and there are other ports. This may be OK if the upstream system does not accept Snoop/DVM and so is purely an ACE-Lite system, or the upstream systems are truly separate shareability domains. However, this might also mean that you have completely forgotten to program the interconnect or use the parameter force_on_from_start. This will only be warned _once_ between resets of the interconnect. Fields:

upstream_port_index unsigned int
: Upstream port index of offending port

allowed_register_access

An allowed register access to the register file. Fields:

data unsigned int
: The data read/written. If this is a read, it is only valid if result is ok.

is_debug bool
: Is the transaction a debug transaction?

is_read bool
: Is the transaction a read transaction?

ns bool
: The transaction is non-secure

register enum
: The register of the transaction

change_dvm_disabled_ports

This reports a bitmap of which ports are disabled to receive DVM messages. Fields:

new_bitmap unsigned int
: The new bitmap of disabled ports

new_bitmap_list unsigned int
: A list of port numbers that were disabled.

old_bitmap unsigned int
: The old bitmap of disabled ports

old_bitmap_list unsigned int
: A list of port numbers that were disabled.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

change_upstream_disabled_ports

This reports a bitmap of which upstream ports of the cache are _disabled_ and so we won't sends snoop requests to them. Fields:

new_bitmap unsigned int
: The bitmap of the first 32 upstream ports that are disabled.

new_bitmap_list unsigned int
: A list of port numbers that were disabled.

old_bitmap unsigned int
: The bitmap of the first 32 upstream ports that are disabled.

old_bitmap_list unsigned int
: A list of port numbers that were disabled.

configuration_pins

One of the configuration pins changed. In the RTL these are sampled at reset, but in the model, we sample it at first transaction. If it occurs after this point then it is traced but the field 'ignored' will be true and the value reported will be what it wanted to change to rather than the value it actually is. Fields:

ignored bool
: The value was ignored because it occurred after seeing a transaction.

value unsigned int
: The value it wants to change to.

which enum
: Which configuration pin changed.

debug_enables

The signals/parameters that cause whether events are counted or not. Fields:

dbgen bool
: DBGEN value

niden bool
: NIDEN value

non_secure_traceable bool
: Non-secure events are traceable

secure_traceable bool
: Secure events are traceable

spiden bool
: SPIDEN value

spniden bool
: SPNIDEN value

errirq

This is the error interrupt signal that is generated when there are unacknowledged imprecise errors. Fields:

value bool
: The value it is driven to.

evntcntoverflow

The event counter overflow interrupt lines. Fields:

counter_id unsigned int
: The ID of the counter that this relates to.

value bool
: The value of the interrupt line

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

force_on_from_start

A commentary on what force_on_from_start is doing. Fields:

acchannelen_dvm unsigned int
: The bitmap of which upstream ports are capable of receiving DVM messages. If the appropriate bit is clear in this register then we won't enable it.

acchannelen_snoop unsigned int
: The bitmap of which upstream ports are capable of receiving snoop messages. If the appropriate bit is clear in this register then we won't enable it.

enable bool
: Whether we are trying to enable the upstream port or not.

reset_state_of_upstream_system enum
: What the interconnect knows about the reset state of the upstream system.

upstream_port_index unsigned int
: The upstream port index.

why enum
: Why the value changed

ignored_register_access

The register access is ignored for some reason. Fields:

address enum
: The address.

is_debug bool
: Is the access a debug access?

is_read bool
: Is the access a read?

ns bool
: The security state of the transaction.

why enum
: Why the access was ignored.

imprecise_error_received

An imprecise error was received for the specified transaction. Fields:

address unsigned int
: Address of transaction

downstream_port_index unsigned int
: The downstream port index that the transaction went out.

ns bool
: Is the transaction non-secure

pmu_overflow

The performance monitor counter overflowed. Fields:

counter_id unsigned int
: The ID of the counter that this relates to.

event_counting unsigned int
: The event that the counter is counting.

new_value bool
: The new value of the overflowed flag.

old_value bool
: The old value of the overflowed flag.

pmu_programmed

A programmed change to the performance monitor unit counter. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

counter_id unsigned int
: The ID of the counter that this relates to.

current_count unsigned int
: The current value of the counter

enabled bool
: Is the counter enabled?

event_counting unsigned int
: The event that the counter is counting.

why enum
: why

register_access

Read/Write of the register file. Fields:

address unsigned int
: The address of the transaction

data unsigned int
: The data read/written. If this is a read, it is only valid if result is ok.

is_debug bool
: Is the transaction a debug transaction?

is_read bool
: Is the transaction a read transaction?

ns bool
: Is the transaction non-secure?

number_of_beats unsigned int
: The number of beats in the transaction

result enum
: The result of the transaction

width_in_bytes unsigned int
: Width of the transaction in bytes.

reset_state_of_upstream_port

The pins reset_state_of_upstream_port[N] are intended to be use as checks by the interconnect that the programmer has disabled snoops and DVMs to upstream ports whose systems are in reset. If you connect these ports to a signal that indicates if the upstream port is in reset then the interconnect can perform this check. This trace source is the trace of those reset state changes. Fields:

upstream_port_index unsigned int
: The upstream port index of the reset signal.

value bool
: The value driven.

upstream_port_with_an_unsynced_snoop_change_pending

When a change to whether to send snoop requests or DVM messages to a port is setup then it takes a finite period of time to take effect and the SW should poll for completion. This tells you when an upstream port has a snoop change pending on it that hasn't been polled for completion. Fields:

comment enum
: Comment

pending bool
: Whether the change is pending or not

upstream_port_index unsigned int
: Upstream port index

4.54 CCNCache - trace

This section describes the trace sources.

ALLOC_LINEFILL

The system allocated a complete line fill into the RAMs. This happens when the cache has to read the data for a line fill from potentially upstream or downstream. Fields:

ENTRY_INDEX `unsigned int`
: The entry index the line has been loaded into.

MASTER_ID `unsigned int`
: The master ID for the associated transaction.

MEMORY_ATTRIBUTES `unsigned int`
: The memory attributes used for the allocation. bits[3:0] are the inner ACACHE, bits[7:4] are the outer ACACHE, bits[9:8] are ADOMAIN, bits[12:10] are APROT, the rest are undocumented.

NS_ADDR `unsigned int`
: The security world and address of the first byte of the line, the MSB encodes the NS bit.

ALLOC_WRITE

The system allocated a complete line write into the RAMs. This happens when the cache receives a complete cache line write. It need not read from anywhere. Fields:

ENTRY_INDEX `unsigned int`
: The entry index the line has been written into.

MEMORY_ATTRIBUTES `unsigned int`
: The memory attributes used for the allocation. bits[3:0] are the inner ACACHE, bits[7:4] are the outer ACACHE, bits[9:8] are ADOMAIN, bits[12:10] are APROT, the rest are undocumented.

NS_ADDR `unsigned int`
: The security world and address of the first byte of the line, the MSB encodes the NS bit.

ATOMIC_SLAVE_ACCESS

Information on the atomic operation at slave side. Fields:

ACCESS_RESULT `enum`
: Result of atomic access

COMPARE_VALUE `unsigned int`
: Value to be compared with memory by CAS

LOAD_VALUE `unsigned int`
: Value to be loaded from memory as a result of atomic operation

MASTER `unsigned int`
: ID of master which initiated the transaction

NS `bool`
: Transaction is Non-Secure

OPERAND_VALUE `unsigned int`
: Incoming operand value provided by core

OPERATION `enum`
: Type of atomic operation

PADDR `unsigned int`
: Physical address

STORE_VALUE `unsigned int`
: Value to be stored to memory as a result of atomic operation

ArchMsg.Error.cached_attributes_mismatch

Attributes differ between page and line in cache from same page. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LINEATTR unsigned int
: Attributes of the cache allocated lines

LINES unsigned int
: Number of cache lines already allocated

NS_ADDR unsigned int
: The security world and address of the first byte of the page, the MSB encodes the NS bit.

TXATTR unsigned int
: Attributes of the transaction

ArchMsg.Error.cached_attributes_mismatch#lineinfo

Information about allocated lines in page. Fields:

PADDR unsigned int
: address of this cache line

TAG unsigned int
: tag data of this cache line

ArchMsg.Warning.ns_s_dirty_hit

Cache hit at S and NS versions of the same physical address. Fields:

INDEX0 unsigned int
: The cache line index of the affected cache line

INDEX1 unsigned int
: The cache line index of the other regime cache line

PADDR unsigned int
: The address of the affected cache line

TAG0 unsigned int
: The tag data of the affected cache line

TAG1 unsigned int
: The tag data of the other regime cache line

CACHE_ACCESS

Number of cache lookups.

CACHE_MISS

cache access cache miss.

CACHE_READ_HIT

Read access cache hit. Note that this trace source causes a large slowdown in the simulation. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

CACHE_READ_MISS

Read access cache miss and cache miss latency. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LATENCY unsigned int
: Cache miss latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

CACHE_SNOOP BROADCAST

cache snoop accesses.

CACHE_WRITE_HIT

Write access cache hit. Note that this trace source causes a large slowdown in the simulation. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

CACHE_WRITE_MISS

Write access cache miss and cache miss latency. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache miss latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

ENTRY_BECOMES_INVALID

An entry is now invalid. The cause could be any reason. Fields:

ENTRY_INDEX unsigned int
: The entry index that has become invalid.

ENTRY_SET_DIRTY

Entry change, clean/dirty. Fields:

ENTRY_INDEX unsigned int
: The entry index that has become clean or dirty.

STATUS unsigned int
: True if the line was made dirty

ERROR_MIXED_ATTRIBUTES_LINE

Mismatched line and transaction attributes. Fields:

ENTRY_INDEX unsigned int
: The entry index that has collided.

NS_ADDR unsigned int
: The security world and address of the first byte of the line, the MSB encodes the NS bit.

ERROR_MIXED_ATTRIBUTES_PAGE

Attributes differ between page and lines in cache from the same page. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NS_ADDR unsigned int
: The security world and address of the first byte of the page, the MSB encodes the NS bit.

change_dvm_disabled_ports

This reports a bitmap of which ports are disabled to receive DVM messages. Fields:

new_bitmap unsigned int
: The new bitmap of disabled ports

new_bitmap_list unsigned int
: A list of port numbers that were disabled.

old_bitmap unsigned int
: The old bitmap of disabled ports

old_bitmap_list unsigned int
: A list of port numbers that were disabled.

change_upstream_disabled_ports

This reports a bitmap of which upstream ports of the cache are _disabled_ and so we won't sends snoop requests to them. Fields:

new_bitmap unsigned int
: The bitmap of the first 32 upstream ports that are disabled.

new_bitmap_list unsigned int
: A list of port numbers that were disabled.

old_bitmap unsigned int
: The bitmap of the first 32 upstream ports that are disabled.

old_bitmap_list unsigned int
: A list of port numbers that were disabled.

entry_after_far_atomic

A cache line has had a far atomic applied to it. Fields:

atomic_operation enum
: The operation that operated on this line.

be bool
: The far atomic's big-endian flag.

data unsigned int
: The data in the cache line.

entry_begin_address unsigned int
: The start address of the entry.

entry_index unsigned int
: The entry index in the cache.

incoming_data unsigned int
: The incoming data from the far atomic. For CAS operations then this is compare-value and then the replacement-value

master_id unsigned int
: The master ID for the associated transaction

ns enum
: The security state of the line

prior_data unsigned int
: The data that will be returned as the 'prior' data of the far atomic.

trans_begin_address unsigned int
: The start address of the transaction.

entry_after_read

A cache line has been read. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ace_operation enum
: The ACE operation that operated on this line.

data unsigned int
: The data in the cache line.

dirty bool
: Is the line ACE-dirty.

entry_begin_address unsigned int
: The start address of the entry.

entry_index unsigned int
: The entry index in the cache.

ns enum
: The security state of the line

snoop bool
: This transaction is a snoop transaction

trans_begin_address unsigned int
: The start address of the transaction.

unique bool
: Is the line ACE-unique.

entry_after_write

A cache line has been written. Fields:

ace_operation enum
: The ACE operation that operated on this line.

data unsigned int
: The data in the cache line.

entry_begin_address unsigned int
: The start address of the entry.

entry_index unsigned int
: The entry index in the cache.

ns enum
: The security state of the line

trans_begin_address unsigned int
: The start address of the transaction.

4.55 CCNRegisterSet - trace

This section describes the trace sources.

ArchMsg.Warning.CCNRegister.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
: Offset of address within the CCN module.

ArchMsg.Warning.CCNRegister.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the CCN module.

REG_NAME string
: Name of the register being read.

ArchMsg.Warning.CCNRegister.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the CCN module.

REG_NAME string
: Name of the register being written.

VALUE unsigned int
: Value written.

ArchMsg.Warning.CCNRegister.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
: Offset of address within the CCN module.

VALUE unsigned int
: Value written.

CCNRegister.MemoryMapped_Read

Trace read from a CCN memory-mapped register. Fields:

NS bool
: Access is non-secure.

OFFSET unsigned int
: Offset of address within the CCN module.

REG_NAME string
: Name of the register being read.

VALUE unsigned int
: Value returned.

CCNRegister.MemoryMapped_Write

Trace write to a CCN memory-mapped register. Fields:

NS bool
: Access is non-secure.

OFFSET unsigned int
: Offset of address within the CCN module.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REG_NAME `string`
: Name of the register being written.

UPDATED_VALUE `unsigned int`
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE `unsigned int`
: Value written.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.56 CMN600 - trace

This section describes the trace sources.

ArchMsg.Warning.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
: Offset of address within the CMN600.

ArchMsg.Warning.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the CMN600.

REG_NAME string
: Name of the register being read.

ArchMsg.Warning.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the CMN600.

REG_NAME string
: Name of the register being written.

VALUE unsigned int
: Value written.

ArchMsg.Warning.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
: Offset of address within the CMN600.

VALUE unsigned int
: Value written.

CMN600_Cache_Routing

Fields:

ADDR unsigned int
: Address of memory location being accessed.

CMN600_Downstream_Routing

Fields:

ADDR unsigned int
: Address of memory location being accessed.

PORT unsigned int
: Downstream port number to which access is routed.

TYPE string
: Downstream port type to which access is routed.

CMN600_Invalid_OCM_Region

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CACHE_REGION_END unsigned int
: End Address of memory location that belongs to the Cache.

CACHE_REGION_START unsigned int
: Start Address of memory location that belongs to the Cache.

OCM_REGION_END unsigned int
: End Address of OCM region.

OCM_REGION_START unsigned int
: Start Address of OCM region.

CMN600_OCM_Routing

Fields:

ADDR unsigned int
: Address of memory location being accessed.

OFFSET unsigned int
: OFFSET in OCM memory location to which access is routed.

HNFSAM_Memory_Map

Fields:

HNF_INDEX unsigned int
: Index of HNF.

MMAP string
: memory map of cmn600 hnfsam.

MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

NS bool
: Access is non-secure.

OFFSET unsigned int
: Offset of address within the CMN600.

REG_NAME string
: Name of the register being read.

VALUE unsigned int
: Value returned.

MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

NS bool
: Access is non-secure.

OFFSET unsigned int
: Offset of address within the CMN600.

REG_NAME string
: Name of the register being written.

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written.

OCM_Regions

Fields:

REGIONS string
: memory regions allocated to OCM

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RNSAM_Memory_Map

Fields:

MMAP string
: memory map of cmn600 rnsam.

RNSAM_Target_HNF

Fields:

ADDRESS unsigned int
: Transaction Address.

HNF_NUM unsigned int
: HNF Node Index to which the transaction is routed.

Warning.HNF_part_of_multiple_system_cache_group

Fields:

NODE_INDEX unsigned int
: HNF Node index which is part of multiple system cache group.

Warning.Hashing_enabled_for_cache_group

Fields:

HNF_INDEX unsigned int
: HNF Node index which is part of system cache group.

Warning.RNSAM_Not_Unique

Fields:

INDEX unsigned int
: Index of RN component. Index starts with RNFs and then the RNIs.

Warning.RNSAM_target_id already used

Fields:

NODEID unsigned int
: Node Id specified in target register.

NODE_TYPE enum
: Node type of node id specified in non_hash_tgt register.

Warning.RNSAM_target_id not matching target type

Fields:

NODEID unsigned int
: Node Id specified in non_hash_tgt register.

NODE_TYPE enum
: Node type of node id specified in non_hash_tgt register.

TARGET_TYPE enum
: Target Type specified in non_hash_region register.

Warning.event_smp_mode

Event not propagated SMP not enabled.

Warning.rnsam_and_cxrasam_mismatch

RNSAM and CXRASAM address regions don't match. You may need to review its configuration.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Warning.scg_hnf_count not valid

Fields:

SCG_HNF_COUNT unsigned int
: Number of HNF configured for the group.

SCG_REGION_NUM unsigned int
: System Cache Group region number.

event_propagation_downstream

Fields:

STATE unsigned int
: State being transmitted.

event_propagation_downstream_routing

Fields:

LINK unsigned int
: Target link.

PORT unsigned int
: Activated port.

STATE unsigned int
: State being transmitted.

event_propagation_upstream

Fields:

STATE unsigned int
: State being transmitted.

trace_add_cxra_memory_region

Fields:

END unsigned int
: End address of the memory region.

HAID unsigned int
: Memory region target HAID

START unsigned int
: Start address of the memory region.

trace_add_memory_region

Fields:

END unsigned int
: End address of the memory region.

START unsigned int
: Start address of the memory region.

TYPE enum
: Node type.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.57 CMN600CML - trace

This section describes the trace sources.

event_propagation_hub_routing

Fields:

CLIENT unsigned int
: Event initiator.

STATE enum
: State being transmitted.

trace_add_port_address_map

Fields:

CLIENT unsigned int
: Client port

END unsigned int
: End address of the memory region.

START unsigned int
: Start address of the memory region.

TARGET unsigned int
: Target port

trace_address_decode

Fields:

ADDRESS unsigned int
: Target Address

CLIENT unsigned int
: Client port

TARGET unsigned int
: Target port

Non-Confidential

4.58 CMN600Cache - trace

This section describes the trace sources.

ALLOC_LINEFILL

The system allocated a complete line fill into the RAMs. This happens when the cache has to read the data for a line fill from potentially upstream or downstream. Fields:

ENTRY_INDEX `unsigned int`
: The entry index the line has been loaded into.

MASTER_ID `unsigned int`
: The master ID for the associated transaction.

MEMORY_ATTRIBUTES `unsigned int`
: The memory attributes used for the allocation. bits[3:0] are the inner ACACHE, bits[7:4] are the outer ACACHE, bits[9:8] are ADOMAIN, bits[12:10] are APROT, the rest are undocumented.

NS_ADDR `unsigned int`
: The security world and address of the first byte of the line, the MSB encodes the NS bit.

ALLOC_WRITE

The system allocated a complete line write into the RAMs. This happens when the cache receives a complete cache line write. It need not read from anywhere. Fields:

ENTRY_INDEX `unsigned int`
: The entry index the line has been written into.

MEMORY_ATTRIBUTES `unsigned int`
: The memory attributes used for the allocation. bits[3:0] are the inner ACACHE, bits[7:4] are the outer ACACHE, bits[9:8] are ADOMAIN, bits[12:10] are APROT, the rest are undocumented.

NS_ADDR `unsigned int`
: The security world and address of the first byte of the line, the MSB encodes the NS bit.

ATOMIC_SLAVE_ACCESS

Information on the atomic operation at slave side. Fields:

ACCESS_RESULT `enum`
: Result of atomic access

COMPARE_VALUE `unsigned int`
: Value to be compared with memory by CAS

LOAD_VALUE `unsigned int`
: Value to be loaded from memory as a result of atomic operation

MASTER `unsigned int`
: ID of master which initiated the transaction

NS `bool`
: Transaction is Non-Secure

OPERAND_VALUE `unsigned int`
: Incoming operand value provided by core

OPERATION `enum`
: Type of atomic operation

PADDR `unsigned int`
: Physical address

STORE_VALUE `unsigned int`
: Value to be stored to memory as a result of atomic operation

ArchMsg.Error.cached_attributes_mismatch

Attributes differ between page and line in cache from same page. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LINEATTR unsigned int
: Attributes of the cache allocated lines

LINES unsigned int
: Number of cache lines already allocated

NS_ADDR unsigned int
: The security world and address of the first byte of the page, the MSB encodes the NS bit.

TXATTR unsigned int
: Attributes of the transaction

ArchMsg.Error.cached_attributes_mismatch#lineinfo

Information about allocated lines in page. Fields:

PADDR unsigned int
: address of this cache line

TAG unsigned int
: tag data of this cache line

ArchMsg.Warning.ns_s_dirty_hit

Cache hit at S and NS versions of the same physical address. Fields:

INDEX0 unsigned int
: The cache line index of the affected cache line

INDEX1 unsigned int
: The cache line index of the other regime cache line

PADDR unsigned int
: The address of the affected cache line

TAG0 unsigned int
: The tag data of the affected cache line

TAG1 unsigned int
: The tag data of the other regime cache line

CACHE_READ_HIT

Read access cache hit. Note that this trace source causes a large slowdown in the simulation. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

CACHE_READ_MISS

Read access cache miss and cache miss latency. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache miss latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CACHE_WRITE_HIT

Write access cache hit. Note that this trace source causes a large slowdown in the simulation. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

CACHE_WRITE_MISS

Write access cache miss and cache miss latency. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache miss latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

CMN600_REMAP_ABORT_TRACE

remap() returns abort port. Fields:

ABORT_REASON string
: Reason for routing to ABORT port in CMN600Interconnect cache

ENTRY_BECOMES_INVALID

An entry is now invalid. The cause could be any reason. Fields:

ENTRY_INDEX unsigned int
: The entry index that has become invalid.

ENTRY_SET_DIRTY

Entry change, clean/dirty. Fields:

ENTRY_INDEX unsigned int
: The entry index that has become clean or dirty.

STATUS unsigned int
: True if the line was made dirty

ERROR_MIXED_ATTRIBUTES_LINE

Mismatched line and transaction attributes. Fields:

ENTRY_INDEX unsigned int
: The entry index that has collided.

NS_ADDR unsigned int
: The security world and address of the first byte of the line, the MSB encodes the NS bit.

ERROR_MIXED_ATTRIBUTES_PAGE

Attributes differ between page and lines in cache from the same page. Fields:

NS_ADDR unsigned int
: The security world and address of the first byte of the page, the MSB encodes the NS bit.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

change_dvm_disabled_ports

This reports a bitmap of which ports are disabled to receive DVM messages. Fields:

new_bitmap unsigned int
: The new bitmap of disabled ports

new_bitmap_list unsigned int
: A list of port numbers that were disabled.

old_bitmap unsigned int
: The old bitmap of disabled ports

old_bitmap_list unsigned int
: A list of port numbers that were disabled.

change_upstream_disabled_ports

This reports a bitmap of which upstream ports of the cache are _disabled_ and so we won't sends snoop requests to them. Fields:

new_bitmap unsigned int
: The bitmap of the first 32 upstream ports that are disabled.

new_bitmap_list unsigned int
: A list of port numbers that were disabled.

old_bitmap unsigned int
: The bitmap of the first 32 upstream ports that are disabled.

old_bitmap_list unsigned int
: A list of port numbers that were disabled.

entry_after_far_atomic

A cache line has had a far atomic applied to it. Fields:

atomic_operation enum
: The operation that operated on this line.

be bool
: The far atomic's big-endian flag.

data unsigned int
: The data in the cache line.

entry_begin_address unsigned int
: The start address of the entry.

entry_index unsigned int
: The entry index in the cache.

incoming_data unsigned int
: The incoming data from the far atomic. For CAS operations then this is compare-value and then the replacement-value

master_id unsigned int
: The master ID for the associated transaction

ns enum
: The security state of the line

prior_data unsigned int
: The data that will be returned as the 'prior' data of the far atomic.

trans_begin_address unsigned int
: The start address of the transaction.

entry_after_read

A cache line has been read. Fields:

ace_operation enum
: The ACE operation that operated on this line.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

data unsigned int
: The data in the cache line.

dirty bool
: Is the line ACE-dirty.

entry_begin_address unsigned int
: The start address of the entry.

entry_index unsigned int
: The entry index in the cache.

ns enum
: The security state of the line

snoop bool
: This transaction is a snoop transaction

trans_begin_address unsigned int
: The start address of the transaction.

unique bool
: Is the line ACE-unique.

entry_after_write

A cache line has been written. Fields:

ace_operation enum
: The ACE operation that operated on this line.

data unsigned int
: The data in the cache line.

entry_begin_address unsigned int
: The start address of the entry.

entry_index unsigned int
: The entry index in the cache.

ns enum
: The security state of the line

trans_begin_address unsigned int
: The start address of the transaction.

4.59 CMN650 - trace

This section describes the trace sources.

ArchMsg.Warning.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
: Offset of address within the CMN600.

ArchMsg.Warning.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the CMN600.

REG_NAME string
: Name of the register being read.

ArchMsg.Warning.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the CMN600.

REG_NAME string
: Name of the register being written.

VALUE unsigned int
: Value written.

ArchMsg.Warning.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
: Offset of address within the CMN600.

VALUE unsigned int
: Value written.

CMN600_Cache_Routing

Fields:

ADDR unsigned int
: Address of memory location being accessed.

CMN600_Downstream_Routing

Fields:

ADDR unsigned int
: Address of memory location being accessed.

PORT unsigned int
: Downstream port number to which access is routed.

TYPE string
: Downstream port type to which access is routed.

CMN600_Invalid_OCM_Region

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CACHE_REGION_END unsigned int
: End Address of memory location that belongs to the Cache.

CACHE_REGION_START unsigned int
: Start Address of memory location that belongs to the Cache.

OCM_REGION_END unsigned int
: End Address of OCM region.

OCM_REGION_START unsigned int
: Start Address of OCM region.

CMN600_OCM_Routing

Fields:

ADDR unsigned int
: Address of memory location being accessed.

OFFSET unsigned int
: OFFSET in OCM memory location to which access is routed.

HNFSAM_Memory_Map

Fields:

HNF_INDEX unsigned int
: Index of HNF.

MMAP string
: memory map of cmn600 hnfsam.

MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

NS bool
: Access is non-secure.

OFFSET unsigned int
: Offset of address within the CMN600.

REG_NAME string
: Name of the register being read.

VALUE unsigned int
: Value returned.

MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

NS bool
: Access is non-secure.

OFFSET unsigned int
: Offset of address within the CMN600.

REG_NAME string
: Name of the register being written.

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written.

OCM_Regions

Fields:

REGIONS string
: memory regions allocated to OCM

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RNSAM_Memory_Map

Fields:

MMAP string
: memory map of cmn600 rnsam.

RNSAM_Target_HNF

Fields:

ADDRESS unsigned int
: Transaction Address.

HNF_NUM unsigned int
: HNF Node Index to which the transaction is routed.

Warning.HNF_part_of_multiple_system_cache_group

Fields:

NODE_INDEX unsigned int
: HNF Node index which is part of multiple system cache group.

Warning.Hashing_enabled_for_cache_group

Fields:

HNF_INDEX unsigned int
: HNF Node index which is part of system cache group.

Warning.RNSAM_Not_Unique

Fields:

INDEX unsigned int
: Index of RN component. Index starts with RNFs and then the RNIs.

Warning.RNSAM_target_id already used

Fields:

NODEID unsigned int
: Node Id specified in target register.

NODE_TYPE enum
: Node type of node id specified in non_hash_tgt register.

Warning.RNSAM_target_id not matching target type

Fields:

NODEID unsigned int
: Node Id specified in non_hash_tgt register.

NODE_TYPE enum
: Node type of node id specified in non_hash_tgt register.

TARGET_TYPE enum
: Target Type specified in non_hash_region register.

Warning.event_smp_mode

Event not propagated SMP not enabled.

Warning.rnsam_and_cxrasam_mismatch

RNSAM and CXRASAM address regions don't match. You may need to review its configuration.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Warning.scg_hnf_count not valid

Fields:

SCG_HNF_COUNT unsigned int
: Number of HNF configured for the group.

SCG_REGION_NUM unsigned int
: System Cache Group region number.

event_propagation_downstream

Fields:

STATE unsigned int
: State being transmitted.

event_propagation_downstream_routing

Fields:

LINK unsigned int
: Target link.

PORT unsigned int
: Activated port.

STATE unsigned int
: State being transmitted.

event_propagation_upstream

Fields:

STATE unsigned int
: State being transmitted.

trace_add_cxra_memory_region

Fields:

END unsigned int
: End address of the memory region.

HAID unsigned int
: Memory region target HAID

START unsigned int
: Start address of the memory region.

trace_add_memory_region

Fields:

END unsigned int
: End address of the memory region.

START unsigned int
: Start address of the memory region.

TYPE enum
: Node type.

Non-Confidential

4.60 ClockDivider - trace

This section describes the trace sources.

frequency

Notify when changes of frequency occur. Fields:

current_time_in_simulator_ticks unsigned int
: The current time in simulator ticks (and not clock ticks).

input_frequency_Hz unsigned int
: The input frequency for this clock source (truncated to an integer).

known_invalid_frequency bool
: The input frequency was known to be invalid and so the output frequency is too. Not all frequency sources will provide information on the validity of the frequency it advertises.

output_frequency_Hz unsigned int
: The output frequency of this clock source (truncated to an integer).

rate

Notify when the rate of a ClockDivider has been changed. Fields:

current_time_in_simulator_ticks unsigned int
: The current time in simulator ticks (and not clock ticks).

div unsigned int
: Frequency Divider

mul unsigned int
: Frequency Multiplier

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.61 D71 - trace

This section describes the trace sources.

ArchMsg.Error.IgnoredRead

Register read in reserved area. Fields:

OFFSET unsigned int
: Access offset

ArchMsg.Error.IgnoredWrite

Register write in reserved area. Fields:

DATA unsigned int
: The data written to the address

OFFSET unsigned int
: Access offset

ArchMsg.Error.ReadFromWriteOnlyRegister

Register read of write only register. Fields:

NAME string
: Register name

OFFSET unsigned int
: Access offset

ArchMsg.Error.ReadInReset

Register read during reset. Fields:

OFFSET unsigned int
: Register access offset

ArchMsg.Error.WriteInReset

Register write during reset. Fields:

OFFSET unsigned int
: Register access offset

VALUE unsigned int
: Value written.

ArchMsg.Error.WriteToReadOnlyRegister

Register write of read only register. Fields:

DATA unsigned int
: The data written to the address

NAME string
: Register name

OFFSET unsigned int
: Access offset

ArchMsg.Info.DOU_0.BackendDisabled

Backend disabled.

ArchMsg.Info.DOU_0.CmdModeNoCval

No next frame validated in command mode.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Info.DOU_0.UnsuccessfulDisplayLock

Unable to access visualisation component.

ArchMsg.Info.DOU_1.BackendDisabled

Backend disabled.

ArchMsg.Info.DOU_1.CmdModeNoCval

No next frame validated in command mode.

ArchMsg.Info.DOU_1.UnsuccessfulDisplayLock

Unable to access visualisation component.

ArchMsg.Info.GCU.ModeChange

GCU mode changed. Fields:

NEW_MODE enum
: New mode

OLD_MODE enum
: Old mode

ArchMsg.Info.LPU_0.WriteBack.NullBufferInWriteback

Received NULL buffer from INPUT_ID. Writing a solid grey color (0x808080). Fields:

INPUT_ID unsigned int
: Input block ID configured in LW_INPUT_ID0

ArchMsg.Info.LPU_1.WriteBack.NullBufferInWriteback

Received NULL buffer from INPUT_ID. Writing a solid grey color (0x808080). Fields:

INPUT_ID unsigned int
: Input block ID configured in LW_INPUT_ID0

ArchMsg.Info.RegisterRead

Register read. Fields:

OFFSET unsigned int
: Register access offset

REG_NAME string
: Name of the register being read.

VALUE unsigned int
: Value returned.

ArchMsg.Info.RegisterWrite

Register write. Fields:

OFFSET unsigned int
: Register access offset

REG_NAME string
: Name of the register being written.

VALUE unsigned int
: Value written.

ArchMsg.Info.SharedBlock.InvalidInvGammaLUTType

Invalid Inverse Gamma LUT type (ITSEL) received. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ITSEL unsigned int
: LUT Type configured in ITSEL field.

ArchMsg.Info.SharedBlock.traceFwdLUTTypeInvalid

Invalid Gamma LUT type (FTSEL) received. Fields:

FTSEL unsigned int
: LUT Type configured in FTSEL field.

ArchMsg.Warning.ADU.CVALReceivedWhileActive

FAFBC DMA Unit received CVAL event while being active. This is illegal.

ArchMsg.Warning.CU_0.InvalidSplitScenario

Invalid configuration for a Split scenario. Fields:

LSD bool
: Layer Split disabled in both scalers

LSE bool
: Layer Split enabled in both scalers

MG bool
: Merger enabled

SP bool
: Splitter enabled

ArchMsg.Warning.CU_0.Merger.InvalidInputBlockToMerger

Invalid configuration of MG_INPUT_ID. Will write a solid BLUE color while merging. Fields:

INDEX unsigned int
: Input number

INPUT_ID unsigned int
: Input block ID configured in MG_INPUT_ID

ArchMsg.Warning.CU_0.Scaler_0.DisabledScalerFetchRequest

Data fetch request received while scaler disabled. Will return a solid RED color if/when getLayer() is called.

ArchMsg.Warning.CU_0.Scaler_0.InvalidInputBlockToScaler

Invalid configuration of SC_INPUT_ID0. Writing a solid RED color. Fields:

INPUT_ID unsigned int
: Input block ID configured in SC_INPUT_ID0

ArchMsg.Warning.CU_0.Scaler_0.WrongBufferSizeToScaler

Buffer received in Scaler does not match the expected input size. Fields:

EXPCTD_H unsigned int
: Expected height

EXPCTD_W unsigned int
: Expected width

RCVD_H unsigned int
: Received height

RCVD_W unsigned int
: Received width

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.CU_0.Scaler_1.DisabledScalerFetchRequest

Data fetch request received while scaler disabled. Will return a solid RED color if/when getLayer() is called.

ArchMsg.Warning.CU_0.Scaler_1.InvalidInputBlockToScaler

Invalid configuration of SC_INPUT_ID0. Writing a solid RED color. Fields:

INPUT_ID unsigned int
: Input block ID configured in SC_INPUT_ID0

ArchMsg.Warning.CU_0.Scaler_1.WrongBufferSizeToScaler

Buffer received in Scaler does not match the expected input size. Fields:

EXPCTD_H unsigned int
: Expected height

EXPCTD_W unsigned int
: Expected width

RCVD_H unsigned int
: Received height

RCVD_W unsigned int
: Received width

ArchMsg.Warning.CU_0.Splitter.InvalidInputBlockToSplitter

Invalid configuration of SP_INPUT_ID0. Will write a solid GREEN color while splitting. Fields:

INPUT_ID unsigned int
: Input block ID configured in SP_INPUT_ID0

ArchMsg.Warning.CU_1.InvalidSplitScenario

Invalid configuration for a Split scenario. Fields:

LSD bool
: Layer Split disabled in both scalers

LSE bool
: Layer Split enabled in both scalers

MG bool
: Merger enabled

SP bool
: Splitter enabled

ArchMsg.Warning.CU_1.Merger.InvalidInputBlockToMerger

Invalid configuration of MG_INPUT_ID. Will write a solid BLUE color while merging. Fields:

INDEX unsigned int
: Input number

INPUT_ID unsigned int
: Input block ID configured in MG_INPUT_ID

ArchMsg.Warning.CU_1.Scaler_0.DisabledScalerFetchRequest

Data fetch request received while scaler disabled. Will return a solid RED color if/when getLayer() is called.

ArchMsg.Warning.CU_1.Scaler_0.InvalidInputBlockToScaler

Invalid configuration of SC_INPUT_ID0. Writing a solid RED color. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

INPUT_ID unsigned int
: Input block ID configured in SC_INPUT_ID0

ArchMsg.Warning.CU_1.Scaler_0.WrongBufferSizeToScaler

Buffer received in Scaler does not match the expected input size. Fields:

EXPCTD_H unsigned int
: Expected height

EXPCTD_W unsigned int
: Expected width

RCVD_H unsigned int
: Received height

RCVD_W unsigned int
: Received width

ArchMsg.Warning.CU_1.Scaler_1.DisabledScalerFetchRequest

Data fetch request received while scaler disabled. Will return a solid RED color if/when getLayer() is called.

ArchMsg.Warning.CU_1.Scaler_1.InvalidInputBlockToScaler

Invalid configuration of SC_INPUT_ID0. Writing a solid RED color. Fields:

INPUT_ID unsigned int
: Input block ID configured in SC_INPUT_ID0

ArchMsg.Warning.CU_1.Scaler_1.WrongBufferSizeToScaler

Buffer received in Scaler does not match the expected input size. Fields:

EXPCTD_H unsigned int
: Expected height

EXPCTD_W unsigned int
: Expected width

RCVD_H unsigned int
: Received height

RCVD_W unsigned int
: Received width

ArchMsg.Warning.CU_1.Splitter.InvalidInputBlockToSplitter

Invalid configuration of SP_INPUT_ID0. Will write a solid GREEN color while splitting. Fields:

INPUT_ID unsigned int
: Input block ID configured in SP_INPUT_ID0

ArchMsg.Warning.DOU_0.IPS.SBSWithDLDisabled

Invalid configuration of Side-by-side processing. Dual-link-display disabled but Side-by-side enabled. Disabling Side-by-side processing.

ArchMsg.Warning.DOU_0.NullBufferToDisplay

Unable to create output data, displaying background colour.

ArchMsg.Warning.DOU_0.WrongVisualisationBuffer

Incorrect buffer returned by Visualisation, skipping frame output.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.DOU_1.IPS.SBSWithDLDisabled

Invalid configuration of Side-by-side processing. Dual-link-display disabled but Side-by-side enabled. Disabling Side-by-side processing.

ArchMsg.Warning.DOU_1.NullBufferToDisplay

Unable to create output data, displaying background colour.

ArchMsg.Warning.DOU_1.WrongVisualisationBuffer

Incorrect buffer returned by Visualisation, skipping frame output.

ArchMsg.Warning.GCU.ConfigValidInWrongMode

GCU received CVAL while in wrong mode (No display active). Fields:

MODE enum
: GCU mode when CVAL was received

ArchMsg.Warning.GCU.InvalidModeChangeRequest

GCU received invalid mode change request. Fields:

CUR_MODE enum
: Current mode

REQ_MODE enum
: Requested mode

ArchMsg.Warning.LPU_0.Layer_0.DisabledLayerFetchRequest

Data fetch request received while layer disabled. Will return a solid GOLD color if/when getLayer() is called.

ArchMsg.Warning.LPU_0.Layer_0.SimpleLayerYUVConfig

This is a SimpleLayer configured with YUV format. A solid GOLD color will be returned.

ArchMsg.Warning.LPU_0.Layer_0.TBUEnabledButDisonnected

TBU not connected but enabled in Layer. Passing the request to AXI port.

ArchMsg.Warning.LPU_0.Layer_0.UnsupportedInputFormat

Format is not supported for layer input. Fields:

FORMAT unsigned int
: Pixel Format

ArchMsg.Warning.LPU_0.Layer_1.DisabledLayerFetchRequest

Data fetch request received while layer disabled. Will return a solid GOLD color if/when getLayer() is called.

ArchMsg.Warning.LPU_0.Layer_1.SimpleLayerYUVConfig

This is a SimpleLayer configured with YUV format. A solid GOLD color will be returned.

ArchMsg.Warning.LPU_0.Layer_1.TBUEnabledButDisonnected

TBU not connected but enabled in Layer. Passing the request to AXI port.

ArchMsg.Warning.LPU_0.Layer_1.UnsupportedInputFormat

Format is not supported for layer input. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

FORMAT unsigned int
Pixel Format

ArchMsg.Warning.LPU_0.Layer_2.DisabledLayerFetchRequest

Data fetch request received while layer disabled. Will return a solid GOLD color if/when getLayer() is called.

ArchMsg.Warning.LPU_0.Layer_2.SimpleLayerYUVConfig

This is a SimpleLayer configured with YUV format. A solid GOLD color will be returned.

ArchMsg.Warning.LPU_0.Layer_2.TBUEnabledButDisonnected

TBU not connected but enabled in Layer. Passing the request to AXI port.

ArchMsg.Warning.LPU_0.Layer_2.UnsupportedInputFormat

Format is not supported for layer input. Fields:

FORMAT unsigned int
Pixel Format

ArchMsg.Warning.LPU_0.Layer_3.DisabledLayerFetchRequest

Data fetch request received while layer disabled. Will return a solid GOLD color if/when getLayer() is called.

ArchMsg.Warning.LPU_0.Layer_3.SimpleLayerYUVConfig

This is a SimpleLayer configured with YUV format. A solid GOLD color will be returned.

ArchMsg.Warning.LPU_0.Layer_3.TBUEnabledButDisonnected

TBU not connected but enabled in Layer. Passing the request to AXI port.

ArchMsg.Warning.LPU_0.Layer_3.UnsupportedInputFormat

Format is not supported for layer input. Fields:

FORMAT unsigned int
Pixel Format

ArchMsg.Warning.LPU_0.WriteBack.InvalidInputBlockToWriteback

Invalid configuration of LW_INPUT_ID0. Writing a solid grey color (0x404040). Fields:

INPUT_ID unsigned int
Input block ID configured in LW_INPUT_ID0

ArchMsg.Warning.LPU_0.WriteBack.TBUEnabledButDisonnected

TBU not connected but enabled in Writeback Layer. Passing the request to AXI port.

ArchMsg.Warning.LPU_0.WriteBack.UnsupportedWritebackFormat

Format not supported for writeback. Fields:

FORMAT unsigned int
Pixel Format

ArchMsg.Warning.LPU_1.Layer_0.DisabledLayerFetchRequest

Data fetch request received while layer disabled. Will return a solid GOLD color if/when getLayer() is called.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.LPU_1.Layer_0.SimpleLayerYUVConfig

This is a SimpleLayer configured with YUV format. A solid GOLD color will be returned.

ArchMsg.Warning.LPU_1.Layer_0.TBUEnabledButDisonnected

TBU not connected but enabled in Layer. Passing the request to AXI port.

ArchMsg.Warning.LPU_1.Layer_0.UnsupportedInputFormat

Format is not supported for layer input. Fields:

FORMAT `unsigned int`
: Pixel Format

ArchMsg.Warning.LPU_1.Layer_1.DisabledLayerFetchRequest

Data fetch request received while layer disabled. Will return a solid GOLD color if/when getLayer() is called.

ArchMsg.Warning.LPU_1.Layer_1.SimpleLayerYUVConfig

This is a SimpleLayer configured with YUV format. A solid GOLD color will be returned.

ArchMsg.Warning.LPU_1.Layer_1.TBUEnabledButDisonnected

TBU not connected but enabled in Layer. Passing the request to AXI port.

ArchMsg.Warning.LPU_1.Layer_1.UnsupportedInputFormat

Format is not supported for layer input. Fields:

FORMAT `unsigned int`
: Pixel Format

ArchMsg.Warning.LPU_1.Layer_2.DisabledLayerFetchRequest

Data fetch request received while layer disabled. Will return a solid GOLD color if/when getLayer() is called.

ArchMsg.Warning.LPU_1.Layer_2.SimpleLayerYUVConfig

This is a SimpleLayer configured with YUV format. A solid GOLD color will be returned.

ArchMsg.Warning.LPU_1.Layer_2.TBUEnabledButDisonnected

TBU not connected but enabled in Layer. Passing the request to AXI port.

ArchMsg.Warning.LPU_1.Layer_2.UnsupportedInputFormat

Format is not supported for layer input. Fields:

FORMAT `unsigned int`
: Pixel Format

ArchMsg.Warning.LPU_1.Layer_3.DisabledLayerFetchRequest

Data fetch request received while layer disabled. Will return a solid GOLD color if/when getLayer() is called.

ArchMsg.Warning.LPU_1.Layer_3.SimpleLayerYUVConfig

This is a SimpleLayer configured with YUV format. A solid GOLD color will be returned.

ArchMsg.Warning.LPU_1.Layer_3.TBUEnabledButDisonnected

TBU not connected but enabled in Layer. Passing the request to AXI port.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.LPU_1.Layer_3.UnsupportedInputFormat

Format is not supported for layer input. Fields:

FORMAT unsigned int
: Pixel Format

ArchMsg.Warning.LPU_1.WriteBack.InvalidInputBlockToWriteback

Invalid configuration of LW_INPUT_ID0. Writing a solid grey color (0x404040). Fields:

INPUT_ID unsigned int
: Input block ID configured in LW_INPUT_ID0

ArchMsg.Warning.LPU_1.WriteBack.TBUEnabledButDisonnected

TBU not connected but enabled in Writeback Layer. Passing the request to AXI port.

ArchMsg.Warning.LPU_1.WriteBack.UnsupportedWritebackFormat

Format not supported for writeback. Fields:

FORMAT unsigned int
: Pixel Format

4.62 DMC-500 - trace

This section describes the trace sources.

DMC_AccessInResetState

DMC Register access in reset state.

DMC_AccessToUnimplementedRegister

Accessed an unimplemented register. Fields:

ADDR unsigned int
: Address of the accessed register.

READ bool
: Transaction type is read or write.

DMC_BlockingTransactions

Blocking transaction detected. Fields:

ADDR unsigned int
: Address for the transaction.

MASTER_ID unsigned int
: Which master initiated the transaction.

NS bool
: Whether the transaction is secure or non-secure.

READ bool
: Transaction type is read or write.

DMC_CheckPermissions

Permission check performed. Fields:

ADDR unsigned int
: Transaction address.

MASTER_ID unsigned int
: Which master initiated the transaction.

NS bool
: Whether the transaction is secure or non-secure.

OUTSIDE_DEFAULT bool
: Whether the access failed due to outside default region.

READ bool
: Transaction type is read or write.

SUCCESS bool
: Whether transaction succeeded or failed.

TZ_FAIL bool
: Whether the access failed due to invalid permissions.

DMC_ReadToWriteOnlyRegister

Read to a write only register. Fields:

ADDR unsigned int
: Address of the accessed register.

DMC_RegRead

Register read. Fields:

REG_NAME string
: The name of the register read.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REG_OFFSET unsigned int
: The address of the register read.

VALUE unsigned int
: Read Value from the register.

DMC_RegWrite

Register written. Fields:

REG_NAME string
: The name of the register updated.

REG_OFFSET unsigned int
: The address of the register updated.

UPDATED_VALUE unsigned int
: New Value in the register.

VALUE unsigned int
: Old Value in the register.

DMC_RestrictedAccessToRegister

Register access restricted and not allowed in current DMC state. Fields:

DMC_STATE unsigned int
: Architectural state of the DMC.

READ bool
: Access type is read or write.

REG_NAME string
: The name of the register updated.

REG_OFFSET unsigned int
: The address of the register accessed.

REG_RESTRICTIONS unsigned int
: Access restrictions mask of the register.

DMC_WriteToReadOnlyRegister

Write to a read only register. Fields:

ADDR unsigned int
: Address of the accessed register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.63 DMC-520 - trace

This section describes the trace sources.

DMC520_ArchStateUpdate

Attempt to change architectural state due to command. Fields:

CMD enum
: Command received to process.

CURRENT_STATE enum
: State before the command processed.

NEW_STATE enum
: Final state after command processed.

SUCCESS bool
: Whether succeeded or failed.

DMC_AccessInResetState

DMC Register access in reset state.

DMC_AccessToUnimplementedRegister

Accessed an unimplemented register. Fields:

ADDR unsigned int
: Address of the accessed register.

READ bool
: Transaction type is read or write.

DMC_BlockingTransactions

Blocking transaction detected. Fields:

ADDR unsigned int
: Address for the transaction.

MASTER_ID unsigned int
: Which master initiated the transaction.

NS bool
: Whether the transaction is secure or non-secure.

READ bool
: Transaction type is read or write.

DMC_CheckPermissions

Permission check performed. Fields:

ADDR unsigned int
: Transaction address.

MASTER_ID unsigned int
: Which master initiated the transaction.

NS bool
: Whether the transaction is secure or non-secure.

OUTSIDE_DEFAULT bool
: Whether the access failed due to outside default region.

READ bool
: Transaction type is read or write.

SUCCESS bool
: Whether transaction succeeded or failed.

TZ_FAIL bool
: Whether the access failed due to invalid permissions.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DMC_ReadToWriteOnlyRegister

Read to a write only register. Fields:

ADDR unsigned int
: Address of the accessed register.

DMC_RegRead

Register read. Fields:

REG_NAME string
: The name of the register read.

REG_OFFSET unsigned int
: The address of the register read.

VALUE unsigned int
: Read Value from the register.

DMC_RegWrite

Register written. Fields:

REG_NAME string
: The name of the register updated.

REG_OFFSET unsigned int
: The address of the register updated.

UPDATED_VALUE unsigned int
: New Value in the register.

VALUE unsigned int
: Old Value in the register.

DMC_RestrictedAccessToRegister

Register access restricted and not allowed in current DMC state. Fields:

DMC_STATE unsigned int
: Architectural state of the DMC.

READ bool
: Access type is read or write.

REG_NAME string
: The name of the register updated.

REG_OFFSET unsigned int
: The address of the register accessed.

REG_RESTRICTIONS unsigned int
: Access restrictions mask of the register.

DMC_WriteToReadOnlyRegister

Write to a read only register. Fields:

ADDR unsigned int
: Address of the accessed register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.64 DMC-620 - trace

This section describes the trace sources.

DMC620_ArchStateUpdate

Attempt to change architectural state due to command. Fields:

CMD enum
: Command received to process.

CURRENT_STATE enum
: State before the command processed.

NEW_STATE enum
: Final state after command processed.

SUCCESS bool
: Whether succeeded or failed.

DMC620_DetectedRASError

DMC620 RAS error detected. Fields:

RAS_ERROR enum
: Type of detected RAS error.

DMC620_Interrupt

DMC620 interrupt raised. Fields:

INTERRUPT_RAISED enum
: Type of the raised interrupt.

DMC_AccessInResetState

DMC Register access in reset state.

DMC_AccessToUnimplementedRegister

Accessed an unimplemented register. Fields:

ADDR unsigned int
: Address of the accessed register.

READ bool
: Transaction type is read or write.

DMC_BlockingTransactions

Blocking transaction detected. Fields:

ADDR unsigned int
: Address for the transaction.

MASTER_ID unsigned int
: Which master initiated the transaction.

NS bool
: Whether the transaction is secure or non-secure.

READ bool
: Transaction type is read or write.

DMC_CheckPermissions

Permission check performed. Fields:

ADDR unsigned int
: Transaction address.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MASTER_ID unsigned int
: Which master initiated the transaction.

NS bool
: Whether the transaction is secure or non-secure.

OUTSIDE_DEFAULT bool
: Whether the access failed due to outside default region.

READ bool
: Transaction type is read or write.

SUCCESS bool
: Whether transaction succeeded or failed.

TZ_FAIL bool
: Whether the access failed due to invalid permissions.

DMC_ReadToWriteOnlyRegister

Read to a write only register. Fields:

ADDR unsigned int
: Address of the accessed register.

DMC_RegRead

Register read. Fields:

REG_NAME string
: The name of the register read.

REG_OFFSET unsigned int
: The address of the register read.

VALUE unsigned int
: Read Value from the register.

DMC_RegWrite

Register written. Fields:

REG_NAME string
: The name of the register updated.

REG_OFFSET unsigned int
: The address of the register updated.

UPDATED_VALUE unsigned int
: New Value in the register.

VALUE unsigned int
: Old Value in the register.

DMC_RestrictedAccessToRegister

Register access restricted and not allowed in current DMC state. Fields:

DMC_STATE unsigned int
: Architectural state of the DMC.

READ bool
: Access type is read or write.

REG_NAME string
: The name of the register updated.

REG_OFFSET unsigned int
: The address of the register accessed.

REG_RESTRICTIONS unsigned int
: Access restrictions mask of the register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DMC_WriteToReadOnlyRegister

Write to a read only register. Fields:

ADDR `unsigned int`
: Address of the accessed register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.65 DP500 - trace

This section describes the trace sources.

ArchMsg.Error.MultipleScalingRequests

Multiple scaling requests in the same frame. Fields:

STAGE string
: The current processing stage.

ArchMsg.Error.MultipleWriteRequests

Multiple write requests in the same frame. Fields:

STAGE string
: The current processing stage.

ArchMsg.Info.IgnoredRead

Register read in reserved area. Fields:

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.IgnoredWrite

Register write in reserved area. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.Initialised

Initialised.

ArchMsg.Info.Processing

Processing layer. Fields:

STAGE string
: The current processing stage

ArchMsg.Info.ReadFromWriteOnlyRegister

Register read of write only register. Fields:

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.ReadInReset

Register read during reset. Fields:

NSECURE bool
: True when the access is not a secure access

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OFFSET unsigned int
: Access offset

ArchMsg.Info.RegisterRead

Register read. Fields:

DATA unsigned int
: The data returned by the component

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Register access offset

ArchMsg.Info.RegisterWrite

Register write. Fields:

DATA unsigned int
: The data written to the register

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Register access offset

ArchMsg.Info.Resetting

Resetting.

ArchMsg.Info.TimerFired

Timer has fired.

ArchMsg.Info.WriteInReset

Register write during reset. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.WriteToReadOnlyRegister

Register write of read only register. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Warn.DisplayLockFailed

Couldn't acquire display lock.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.66 DP550 - trace

This section describes the trace sources.

ArchMsg.Error.IgnoredRead

Register read in reserved area. Fields:

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Error.IgnoredWrite

Register write in reserved area. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Error.ReadFromWriteOnlyRegister

Register read of write only register. Fields:

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Error.ReadInReset

Register read during reset. Fields:

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Error.UnsecureReadToSecureRegister

Non secure register read of secure register. Fields:

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Error.UnsecureWriteoSecureRegister

Non secure register write of secure register. Fields:

DATA unsigned int
: The data written to the address

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Error.WriteInReset

Register write during reset. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Error.WriteToReadOnlyRegister

Register write of read only register. Fields:

DATA unsigned int
: The data written to the address

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.Initialised

Initialised.

ArchMsg.Info.Processing

Processing layer. Fields:

STAGE string
: The current processing stage

ArchMsg.Info.RegisterRead

Register read. Fields:

DATA unsigned int
: The data returned by the component

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Register access offset

ArchMsg.Info.RegisterWrite

Register write. Fields:

DATA unsigned int
: The data written to the register

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NAME `string`
: Register name

NSECURE `bool`
: True when the access is not a secure access

OFFSET `unsigned int`
: Register access offset

ArchMsg.Info.Resetting

Resetting.

ArchMsg.Info.TimerFired

Timer has fired.

ArchMsg.Warn.DisplayLockFailed

Couldn't acquire display lock.

ArchMsg.Warning.FrameDropped

Frame tried to compose before the previous one finished. It will be dropped.

ArchMsg.Warning.clockTooHigh

The pixel clock is very high, it may affect model performance. Fields:

RATE `unsigned int`
: Refresh rate

4.68 DSU - trace

This section describes the trace sources.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE `unsigned int`
: Integer representation of DEVPACTIVE[] signals

NEW_STATE `enum`
: Operating mode after the transition

OLD_STATE `enum`
: Operating mode before the transition

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE `unsigned int`
: Integer representation of DEVPACTIVE[] signals

NEW_STATE `enum`
: Power mode after the transition

OLD_STATE `enum`
: Power mode before the transition

4.69 DualClusterSystemConfigurationBlock - trace

This section describes the trace sources.

sw_trace_event

This is a trace event generate under SW control. Fields:

cluster_and_cpu_id unsigned int
: The top byte represents the cluster id, the bottom byte the cpu id.

data0 unsigned int
: SW defined data field 0.

data1 unsigned int
: SW defined data field 1.

data2 unsigned int
: SW defined data field 2.

message string
: A message from the SW.

sequence_id unsigned int
: This is a unique id per emitted trace event.

sw_trace_event2

This is a trace event generate under SW control. Fields:

cluster_and_cpu_id unsigned int
: The top byte represents the cluster id, the bottom byte the cpu id.

data0 unsigned int
: SW defined data field 0.

data1 unsigned int
: SW defined data field 1.

data2 unsigned int
: SW defined data field 2.

message string
: A message from the SW.

sequence_id unsigned int
: This is a unique id per emitted trace event.

sw_trace_event3

This is a trace event generate under SW control. Fields:

cluster_and_cpu_id unsigned int
: The top byte represents the cluster id, the bottom byte the cpu id.

data0 unsigned int
: SW defined data field 0.

data1 unsigned int
: SW defined data field 1.

data2 unsigned int
: SW defined data field 2.

message string
: A message from the SW.

sequence_id unsigned int
: This is a unique id per emitted trace event.

sw_trace_event4

This is a trace event generate under SW control. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cluster_and_cpu_id unsigned int
: The top byte represents the cluster id, the bottom byte the cpu id.

data0 unsigned int
: SW defined data field 0.

data1 unsigned int
: SW defined data field 1.

data2 unsigned int
: SW defined data field 2.

message string
: A message from the SW.

sequence_id unsigned int
: This is a unique id per emitted trace event.

4.70 GIC_400 - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

debug_out

Debug trace from the VGIC model, this contains implementation detail that is unlikely to be generally useful. Fields:

message string
: The message from the VGIC

sequence_id unsigned int
: Each successive message is labeled with an increasing number

gic_log_errors_out

Errors from the VGIC model. Fields:

message string
: The message from the VGIC

sequence_id unsigned int
: Each successive message is labeled with an increasing number

gic_log_fatal_out

Fatal error from the VGIC model. Fields:

message string
: The message from the VGIC

gic_log_warnings_out

Warnings from the VGIC model. Fields:

message string
: The message from the VGIC

sequence_id unsigned int
: Each successive message is labeled with an increasing number

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

vgic_cfgsdisable

The VGIC CFGSDISABLE pin has changed its state, this (un)locks down some configuration registers. Fields:

state bool
: The state of the signal

vgic_distributor_register_access

Distributor interface accesses on the VGIC. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_fiq_out

The FIQ output signal to the core. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_hypervisor_register_access

Hypervisor interface register accesses. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_irq_out

The IRQ output signal to the core. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

vgic_legacy_fiq_in

The legacy FIQ input signal into the VGIC. Fields:

cpu_id unsigned int
: The CPU id. There is one legacy IRQ/FIQ per core.

state bool
: The state of the signal

vgic_legacy_irq_in

The legacy IRQ input signal into the VGIC. Fields:

cpu_id unsigned int
: The CPU id. There is one legacy IRQ/FIQ per core.

state bool
: The state of the signal

vgic_physical_register_access

Physical interface accesses on the VGIC. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_reset

The reset pin on the VGIC has been changed. Fields:

state bool
: The state of the SPI signal

vgic_spi

Shared Peripheral Interrupt signal changed. Fields:

id unsigned int
: The interrupt id this will generate. SPIs start at ID 32 and so you will only see ids of >= 32

state bool
: The state of the SPI signal

vgic_vfiq_out

The VFIQ output signal to the core. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_virq_out

The VIRQ output signal to the core. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_virtual_machine_register_access

Virtual machine interface register accesses. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_virtual_maintenance_interrupt

The VGIC is signaling that it needs software help from the hypervisor to maintain theVGIC interfaces. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_wakeup_fiq

The wakeup FIQ signal. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_wakeup_irq

The wakeup IRQ signal. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

Non-Confidential

4.71 GICv2 - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

debug_out

Debug trace from the VGIC model, this contains implementation detail that is unlikely to be generally useful. Fields:

message string
: The message from the VGIC

sequence_id unsigned int
: Each successive message is labeled with an increasing number

gic_log_errors_out

Errors from the VGIC model. Fields:

message string
: The message from the VGIC

sequence_id unsigned int
: Each successive message is labeled with an increasing number

gic_log_fatal_out

Fatal error from the VGIC model. Fields:

message string
: The message from the VGIC

gic_log_warnings_out

Warnings from the VGIC model. Fields:

message string
: The message from the VGIC

sequence_id unsigned int
: Each successive message is labeled with an increasing number

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

vgic_cfgsdisable

The VGIC CFGSDISABLE pin has changed its state, this (un)locks down some configuration registers. Fields:

state bool
: The state of the signal

vgic_distributor_register_access

Distributor interface accesses on the VGIC. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_fiq_out

The FIQ output signal to the core. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_hypervisor_register_access

Hypervisor interface register accesses. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_irq_out

The IRQ output signal to the core. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

vgic_legacy_fiq_in

The legacy FIQ input signal into the VGIC. Fields:

cpu_id unsigned int
: The CPU id. There is one legacy IRQ/FIQ per core.

state bool
: The state of the signal

vgic_legacy_irq_in

The legacy IRQ input signal into the VGIC. Fields:

cpu_id unsigned int
: The CPU id. There is one legacy IRQ/FIQ per core.

state bool
: The state of the signal

vgic_physical_register_access

Physical interface accesses on the VGIC. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_reset

The reset pin on the VGIC has been changed. Fields:

state bool
: The state of the SPI signal

vgic_spi

Shared Peripheral Interrupt signal changed. Fields:

id unsigned int
: The interrupt id this will generate. SPIs start at ID 32 and so you will only see ids of >= 32

state bool
: The state of the SPI signal

vgic_vfiq_out

The VFIQ output signal to the core. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_virq_out

The VIRQ output signal to the core. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_virtual_machine_register_access

Virtual machine interface register accesses. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_virtual_maintenance_interrupt

The VGIC is signaling that it needs software help from the hypervisor to maintain theVGIC interfaces. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_wakeup_fiq

The wakeup FIQ signal. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_wakeup_irq

The wakeup IRQ signal. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

4.72 GICv3CPUInterface - trace

This section describes the trace sources.

ArchMsg.Error.GICv3_UnknownDownstreamWrite

Distributor sent a DownstreamWrite packet with unsupported format. Acknowledging and ignoring. This is a PROTOCOL ERROR, the architecture allows system behaviour to become UNPREDICATBLE from this point onwards.

ArchMsg.Warning.GICv3.Invalidv4Inv3onlyModePacket

GICv4 packet received by GICv3-only interface. Fields:

PACKET string
: The name of the invalid packet

ArchMsg.Warning.GICv3_AttemptedToDeactivateLPI

Attempt to deactivate an LPI. Fields:

INTERRUPT_ID unsigned int
: Interrupt ID that the write attempted to end.

VIRTUAL bool
: Access was to virtual interface.

ArchMsg.Warning.GICv3_AttemptedToDeactivateNonExistentInterrupt

Attempt to deactive a non-existent interrupt. Fields:

CPUID unsigned int
: CPU ID specified in end request.

INTERRUPT_ID unsigned int
: Interrupt ID that the write attempted to end.

NS bool
: Access was non-secure.

ArchMsg.Warning.GICv3_AttemptedToDeactivateSpuriousInterrupt

Attempt to deactivate a spurious interrupt. Fields:

CPUID unsigned int
: CPU ID (probably 0, but included for completeness).

GICC_REGISTER bool
: Access was to GICC register (rather than ICC register).

NS bool
: Access was non-secure.

SPURIOUS_INTERRUPT_ID unsigned int
: Interrupt ID that the write attempted to end.

VIRTUAL bool
: Access was to virtual interface.

ArchMsg.Warning.GICv3_AttemptedToEndNonExistentInterrupt

A write has attempted to end a non-existent interrupt. Fields:

CPUID unsigned int
: CPU ID specified in end request.

INTERRUPT_ID unsigned int
: Interrupt ID that the write attempted to end.

NS bool
: Access was non-secure.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VIRTUAL bool
Access was to virtual interface.

ArchMsg.Warning.GICv3_AttemptedToEndSpuriousInterrupt

A write has attempted to end a spurious interrupt. Fields:

CPUID unsigned int
CPU ID (probably 0, but included for completeness).
NS bool
Access was non-secure.
SPURIOUS_INTERRUPT_ID unsigned int
Interrupt ID that the write attempted to end.
VIRTUAL bool
Whether the access was virtual.

ArchMsg.Warning.GICv3_AttemptedToWriteDIRRegisterWhenEOImodeNotSet

Unexpected write to DIR register when EOImode not set. Fields:

CPUID unsigned int
CPU ID (probably 0, but included for completeness).
GICC_REGISTER bool
Access was to GICC register (rather than ICC register).
INTERRUPT_ID unsigned int
Interrupt ID that the write attempted to deactivate.
NS bool
Access was non-secure.
VIRTUAL bool
Access was to virtual interface.

ArchMsg.Warning.GICv3_CFGSDISABLE_unsupported

CFGSDISABLE signal has been set but doing so has no effect.

ArchMsg.Warning.GICv3_CPUInterface.GICC.MemoryMapped_ReadIgnored

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_CPUInterface.GICC.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_CPUInterface.GICC.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module
REG_NAME string
Name of the register being read

ArchMsg.Warning.GICv3_CPUInterface.GICC.MemoryMapped_WriteIgnored

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.GICv3_CPUInterface.GICC.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

VALUE unsigned int
: Value written

ArchMsg.Warning.GICv3_CPUInterface.GICC.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

VALUE unsigned int
: Value written

ArchMsg.Warning.GICv3_CPUInterface.GICH.MemoryMapped_ReadIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_CPUInterface.GICH.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_CPUInterface.GICH.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

ArchMsg.Warning.GICv3_CPUInterface.GICH.MemoryMapped_WriteIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_CPUInterface.GICH.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

VALUE unsigned int
: Value written

ArchMsg.Warning.GICv3_CPUInterface.GICH.MemoryMapped_WriteReserved

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OFFSET unsigned int
: Offset of address within the GICv3 module

VALUE unsigned int
: Value written

ArchMsg.Warning.GICv3_CPUInterface.GICV.MemoryMapped_ReadIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_CPUInterface.GICV.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_CPUInterface.GICV.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

ArchMsg.Warning.GICv3_CPUInterface.GICV.MemoryMapped_WriteIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_CPUInterface.GICV.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

VALUE unsigned int
: Value written

ArchMsg.Warning.GICv3_CPUInterface.GICV.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

VALUE unsigned int
: Value written

ArchMsg.Warning.GICv3_DeactivateInterruptNotSent

Write to EOI/DIR register could not trigger a deactivate. Fields:

ACCESS_NS bool
: Access was non-secure.

CPUID unsigned int
: CPU ID specified in end request.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GROUP_1 bool
: Interrupt is a group-1 interrupt.

INTERRUPT_ID unsigned int
: Interrupt ID that the write is ending.

INTERRUPT_NS bool
: Interrupt is a non-secure interrupt.

ArchMsg.Warning.GICv3_EndInterruptIDMismatch

Interrupt ID mismatch. Fields:

END_INTERRUPT_ID unsigned int
: Interrupt ID that the write is ending.

NS bool
: Access was non-secure.

SPECIFED_INTERRUPT_ID unsigned int
: Interrupt ID that was specified by the register write.

ArchMsg.Warning.GICv3_EndInterruptNotHighestPriority

An interrupt which is not the highest-priority one has been ended. Fields:

CPUID unsigned int
: CPU ID specified in end request.

INTERRUPT_ID unsigned int
: Interrupt ID that the write is ending.

LATEST_CPUID unsigned int
: CPU ID for the interrupt that was last acknowledged.

LATEST_INTERRUPT_ID unsigned int
: Interrupt ID of the interrupt that was last acknowledged.

NS bool
: Access was non-secure.

ArchMsg.Warning.GICv3_EndVirtualInterruptNotAllowed

Invalid attempt to end a virtual interrupt. Fields:

ACTIVE bool
: Matched list register (and virtual interrupt) is active.

GROUP_1 bool
: Matched list register is for a group-1 interrupt.

INTERRUPT_ID unsigned int
: Interrupt ID that the write is ending.

PRIORITY unsigned int
: Priority of the virtual interrupt.

ArchMsg.Warning.GICv3_EndVirtualInterruptNotHighestPriority

Attempt to end a virtual interrupt that is not the highest priority one. Fields:

CPUID unsigned int
: CPU ID specified in end request.

GROUP_1 bool
: Interrupt is a group-1 interrupt.

HIGHEST_PRIORITY unsigned int
: Priority of highest priority active interrupt.

INTERRUPT_ID unsigned int
: Interrupt ID that the write is ending.

INTERRUPT_PRIORITY unsigned int
: Priority level of this interrupt.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PRIORITY unsigned int
: Priority of the virtual interrupt.

ArchMsg.Warning.GICv3_ICC_InterruptIDExceedsSupportedSize

InterruptID raw value too large. Fields:

MASKEDVALUE unsigned int
: The interrupt ID which was understood

REG string
: The name of the register written with the value

VALUE unsigned int
: The written value

ArchMsg.Warning.GICv3_ICH_LR_UnpredictableHWInterruptID

ICH_LR programmed to be associated with an UNPREDICTABLE hw interrupt. Fields:

INTERRUPT_ID unsigned int
: The hardware interrupt ID set in the LR register.

IS_GICH_REG bool
: The register being programmed is GICH_LRn (rather than ICH_LRn).

LR_NUM unsigned int
: The GICH_LRn register written.

LR_VALUE unsigned int
: The value now written to the LR register.

ArchMsg.Warning.GICv3_InvalidRegAccessForLPI

Invalid register access for LPI. Fields:

REG string
: The name of the register written with the value

VALUE unsigned int
: LPI interrupt id

ArchMsg.Warning.GICv3_ReceiveClearDoesntMatchPending

Distributor attempted to clear an interrupt which isn't the pending one. Fields:

CLEAR_INTERRUPT_ID unsigned int
: Interrupt ID that the distributor is attempting to clear.

PENDING_INTERRUPT_ID unsigned int
: Interrupt ID that is pending.

ArchMsg.Warning.GICv3_ReceiveClearWhenNoInterruptPending

Attempt to clear an interrupt when no interrupt is pending. Fields:

INTERRUPT_ID unsigned int
: Interrupt ID that the distributor is attempting to clear.

ArchMsg.Warning.GICv3_ReceivedInvalidCommandFromAbove

Fields:

ACTUAL_LENGTH unsigned int
: Actual length of the data in bytes including the header.

DATA unsigned int
: The data received (including header).

EXPECTED_LENGTH unsigned int
: The length in bytes including header that was expected to be received dependent on command type and potentially the data type in the case of a data write.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

TYPE unsigned int
The command type.

ArchMsg.Warning.GICv3_SGI_RSS_unsupported_upredictable

RSS field non zero in SGI generation when the IRI does not advertise support!.

ArchMsg.Warning.GICv3_UnexpectedAck

Unexpected command received from distributor. Fields:

COMMAND enum
The command type received.

ArchMsg.Warning.GICv3_WriteIgnoredConfiguration

A register write has been ignored. Fields:

REG_NAME string
Name of register being read or written.
VALUE unsigned int
Value attempting to be written.

GICv3_CFGSDISABLE

Fields:

STATE bool
The new state of the signal.

GICv3_CPUInterface.GICC.MemoryMapped_Read

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
Affinity level 0 (for banked registers)
A1 unsigned int
Affinity level 1 (for banked registers)
A2 unsigned int
Affinity level 2 (for banked registers)
A3 unsigned int
Affinity level 3 (for banked registers)
BANKED bool
Whether the access is to a banked register
NS bool
Access is non-secure
OFFSET unsigned int
Offset of address within the GICv3 module
REG_NAME string
Name of the register being read
VALUE unsigned int
Value returned

GICv3_CPUInterface.GICC.MemoryMapped_Read64

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
Affinity level 0 (for banked registers)
A1 unsigned int
Affinity level 1 (for banked registers)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

GICv3_CPUInterface.GICC.MemoryMapped_Write

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_CPUInterface.GICC.MemoryMapped_Write64

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_CPUInterface.GICC.MemoryMapped_WritePort

Trace write to a GICv3 memory-mapped register acting as imp def port. Fields:

FIRST_BYTE_IN_BURST unsigned int
: First byte written in the burst

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

GICv3_CPUInterface.GICH.MemoryMapped_Read

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

GICv3_CPUInterface.GICH.MemoryMapped_Read64

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

GICv3_CPUInterface.GICH.MemoryMapped_Write

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_CPUInterface.GICH.MemoryMapped_Write64

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_CPUInterface.GICH.MemoryMapped_WritePort

Trace write to a GICv3 memory-mapped register acting as imp def port. Fields:

FIRST_BYTE_IN_BURST unsigned int
: First byte written in the burst

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

GICv3_CPUInterface.GICV.MemoryMapped_Read

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

GICv3_CPUInterface.GICV.MemoryMapped_Read64

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_CPUInterface.GICV.MemoryMapped_Write

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_CPUInterface.GICV.MemoryMapped_Write64

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_CPUInterface.GICV.MemoryMapped_WritePort

Trace write to a GICv3 memory-mapped register acting as imp def port. Fields:

FIRST_BYTE_IN_BURST unsigned int
: First byte written in the burst

NS bool
: Access is non-secure

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

GICv3_CPUInterface_Comms_Receive

GICv3 internal communications packet that has been received and is traveling towards the CPU. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

GICv3_CPUInterface_Comms_Send

GICv3 internal communications packet that is being sent towards the top-level. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

GICv3_CreateInterruptAPRWrite

An active interrupt has been created by a write to APR. Fields:

GROUP_1 bool
: Whether the interrupt is created as group 1.

NS_REG bool
: Whether the access was through GICC_NSAPR.

PRIORITY unsigned int
: Priority of the interrupt being created.

GICv3_DeactivateInterrupt

Trace writes to EOI/DIR registers that deactivate an interrupt. Fields:

ACCESS_NS bool
: Access was non-secure.

CPUID unsigned int
: CPU ID specified in end request.

GROUP_1 bool
: Interrupt is a group-1 interrupt.

INTERRUPT_ID unsigned int
: Interrupt ID that the write is ending.

INTERRUPT_NS bool
: Interrupt is a non-secure interrupt.

GICv3_EndInterrupt

Trace writes to GICC_EOIR or GICC_AEOIR that end an interrupt. Fields:

CPUID unsigned int
: CPU ID specified in end request.

DEACTIVATE bool
: Interrupt is deactivated (rather than requiring a separate DIR request); will never be true for LPIs.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GROUP_1 bool
: Interrupt is a group-1 interrupt.

INTERRUPT_ID unsigned int
: Interrupt ID that the write is ending.

NS bool
: Access was non-secure.

GICv3_EndInterruptAPRWrite

An interrupt has been deactivated because of a write to the priority register. Fields:

INTERRUPT_ID unsigned int
: Interrupt ID that the write is ending.

NS_REG bool
: Whether the access was through GICC_NSAPR.

PRIORITY unsigned int
: Priority of the interrupt being deactivated.

GICv3_ICH_MISR_Changed

Change of ICH_MISR register. Fields:

VALUE unsigned int
: The new value for ICH_MISR.

GICv3_IRQBypassSignalIn

An interrupt bypass signal has changed state. Fields:

IS_FIQ bool
: Whether the signal in question is the FIQ signal (rather than the IRQ).

VALUE bool
: New value for the signal (i.e. whether it is set).

GICv3_IRQLegacySignalOut

An output legacy interrupt signal has changed state. Fields:

IS_FIQ bool
: Whether the signal in question is the FIQ signal (rather than the IRQ).

VALUE bool
: New value for the signal (i.e. whether it is set).

GICv3_IRQSignalOut

An interrupt signal has changed state. Fields:

IS_FIQ bool
: Whether the signal in question is the FIQ signal (rather than the IRQ).

VALUE bool
: New value for the signal (i.e. whether it is set).

VIRTUAL bool
: Whether we're changing the virtual signal.

GICv3_InterfaceQuiesced

Event fires when the CPU interface is quiesced (Quiesce Acknowledge command sent to distributor).

GICv3_MaintenanceInterruptChanged

Change of state of maintenance interrupt. Fields:

STATE bool
: Whether the maintenance interrupt was set or cleared.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_RegUpdated32

Fields:

REG_NAME `string`
: The name of the register being updated.

VALUE `unsigned int`
: The updated value.

GICv3_RegUpdated64

Fields:

REG_NAME `string`
: The name of the register being updated.

VALUE `unsigned int`
: The updated value.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.73 GICv3CPUInterfaceDecoder - trace

This section describes the trace sources.

GICV3_DECODER_DECODE

Trace accesses through the GICv3 decoder (not including pass-through). Fields:

ADDR `unsigned int`
: Address of the access.

ADDR_OUTPUT_OFFSET `unsigned int`
: The output offset for this transaction.

FORCE_SECURE `bool`
: Whether this transaction is using the input port that forces transaction attributes to secure.

OUTPUT_PORT_NAME `string`
: The name of the output port that we're using

READnWRITE `bool`
: Whether this transaction is a read (rather than a write).

GICV3_DECODER_PASSTHRU

Trace accesses through the GICv3 decoder that are being passed straight-through. Fields:

ADDR `unsigned int`
: Address of the access.

READnWRITE `bool`
: Whether this transaction is a read (rather than a write).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.74 GICv3CommsLogger - trace

This section describes the trace sources.

ACTIVATE

The CPU interface sends an Activate command when acknowledging an interrupt. Fields:

DIRECTION enum
: Direction of the command.

INTID unsigned int
: Interrupt number

V enum
: The Activate corresponds to a Set or VSet command.

ACTIVATE_ACKNOWLEDGE

The Redistributor sends an Activate Acknowledge response to confirm receipt of an Activate command. Fields:

DIRECTION enum
: Direction of the command.

V enum
: The Activate Acknowledge corresponds to a Set or VSet command.

CLEAR

The Clear command clears the specified pending interrupt. Fields:

DIRECTION enum
: Direction of the command.

INTID unsigned int
: Interrupt number

CLEAR_ACKNOWLEDGE

Clear Acknowledge response to acknowledge the receipt of a Clear or VClear command. Fields:

DIRECTION enum
: Direction of the command.

V enum
: The Clear Acknowlegde corresponds to a Clear or VClear command.

DEACTIVATE

The Deactivate command deactivates an interrupt, provided the initiating Exception level and Security state can access the interrupt group to which the INTID belongs. Fields:

DIRECTION enum
: Direction of the command.

GROUP0 bool
: 1=Group 0 interrupts can be modified

GROUP1_NS bool
: 1=Non-secure group 1 interrupts can be modified

GROUP1_S bool
: 1=Secure group 1 interrupts can be modified

INTID unsigned int
: Interrupt number

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DEACTIVATE_ACKNOWLEDGE

The Redistributor sends a Deactivate Acknowledge response to confirm receipt of a Deactivate command. Fields:

DIRECTION enum
: Direction of the command.

DOWNSTREAM_CONTROL_ACKNOWLEDGE

Downstream Control Acknowledge response to confirm receipt of a Downstream Control command. Fields:

DIRECTION enum
: Direction of the command.

PL enum
: Size of pINTID

VL enum
: Size of vINTID

DOWNSTREAM_CONTROL_IMP_DEF

Implementation defined command send to CPU interface. Fields:

DIRECTION enum
: Direction of the command.

DOWNSTREAM_CONTROL_SETTINGS

Communicates settings to CPU interface. Fields:

DIRECTION enum
: Direction of the command.

DS bool
: Disable Security. Indicates the value of GICD_CTLR.DS

PL enum
: Size of pINTID

VL enum
: Size of vINTID

GENERATE_SGI

The CPU interface sends a Generate SGI command to the Redistributor to generate an SGI. Fields:

A1 unsigned int
: Affinity level 1 values used for generating the set of target PEs

A2 unsigned int
: Affinity level 2 values used for generating the set of target PEs

A3 unsigned int
: Affinity level 3 values used for generating the set of target PEs

A3V bool
: Command includes an A3 field

DIRECTION enum
: Direction of the command.

IRM bool
: Interrupt Routing Mode used

NS bool
: 0=command originates from a Secure Execution state. 1=command originates from a Non-secure Execution state

SGInum unsigned int
: The INTID of the SGI to be generated

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SGT enum
: Register access that caused the Generate SGI comman

Target_List unsigned int
: The group of target PEs defined by the routing mode

GENERATE_SGI_ACKNOWLEDGE

The Redistributor sends a Generate SGI Acknowledge response to confirm that is has received a Generate SGIcommand from the CPU interface. Fields:

DIRECTION enum
: Direction of the command.

QUIESCE

The Redistributor sends a Quiesce command to request that the CPU interface enters the quiescent state. Fields:

DIRECTION enum
: Direction of the command.

QUIESCE_ACKNOWLEDGE

Quiesce Acknowledge response to confirm receipt of a Quiesce command, and to confirm that it is quiescent. Fields:

DIRECTION enum
: Direction of the command.

RELEASE

The CPU interface logic sends a Release response when it cannot handle a particular interrupt. Fields:

DIRECTION enum
: Direction of the command.

INTID unsigned int
: Interrupt number

V enum
: The Release corresponds to a Set or VSet command.

SET

The Set command sets the highest priority pending interrupt for a PE. Fields:

DIRECTION enum
: Direction of the command.

GROUP bool
: The interrupt group, as indicated by the corresponding GICD_IGROUPR<n>.Group status bit.

INTID unsigned int
: Interrupt number

MOD bool
: The value of the GICD_IGRPMODR<n>.Group status bit for the interrupt

PRIORITY unsigned int
: The actual priority of the interrupt, that is, the Secure, unshifted view

UPSTREAM_CONTROL_ACKNOWLEDGE

The Redistributor sends an Upstream Control Acknowledge response to confirm receipt of an Upstream Control command. Fields:

DIRECTION enum
: Direction of the command.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

UPSTREAM_CONTROL_PHYSICAL_ENABLE

Communicates physical CPU interface enable to the Redistributor. Fields:

DIRECTION enum
: Direction of the command.

GROUP0 bool
: The value of ICC_IGRPEN0_EL1.Enable

GROUP1_NS bool
: The value of the Non-secure copy of ICC_IGRPEN1_EL1.Enable

GROUP1_S bool
: The value of the Secure copy of ICC_IGRPEN1_EL1.Enable

UPSTREAM_CONTROL_PHYSICAL_PRIORITY

Communicates Priority Mask to the Redistributor. Fields:

DIRECTION enum
: Direction of the command.

PMR unsigned int
: The value of PMR

UPSTREAM_CONTROL_VIRTUAL_ENABLE

Communicates virtual CPU interface enable to the Redistributor. Fields:

DIRECTION enum
: Direction of the command.

GROUP0 bool
: The value of ICH_VMCR_EL2.VENG0

GROUP1 bool
: The value of ICH_VMCR_EL2.VENG1

VCLEAR

The VClear command resets the highest priority pending virtual interrupt. Fields:

DIRECTION enum
: Direction of the command.

VINTID unsigned int
: Interrupt number

VSET

The VSet command sets the highest priority pending interrupt for a PE. Fields:

DIRECTION enum
: Direction of the command.

GROUP bool
: The interrupt group

PRIORITY unsigned int
: The actual priority of the interrupt, that is, the Secure, unshifted view

VINTID unsigned int
: Interrupt number

Non-Confidential

4.75 GICv3CommsPVBus - trace

This section describes the trace sources.

ArchMsg.Warning.GICv3CommsPVBus_PacketTooBig

Fields:

DATA_0 unsigned int
: First byte of the packet (normally data type).

INDEX unsigned int
: Index of GICv3Comms connection that the message should have been sent to (based on AXI master ID).

LENGTH unsigned int
: Number bytes in data packet.

ArchMsg.Warning.GICv3CommsPVBus_UnknownDestination

Fields:

DATA unsigned int
: The message data.

DATA_0 unsigned int
: First byte of the packet (normally data type).

INDEX unsigned int
: Index of GICv3Comms connection that the message should have been sent to (based on AXI master ID).

LENGTH unsigned int
: Number bytes in data packet.

GICv3CommsPVBus_FailedMessage

Processed message from connected GICv3Comms port and sent out, but PVBus transaction failed.
Fields:

DATA unsigned int
: The message data.

INDEX unsigned int
: Index of GICv3Comms connection that message came in on.

LENGTH unsigned int
: Message length in bytes.

GICv3CommsPVBus_ProcessedMessage

Processed message from connected GICv3Comms port. Fields:

DATA unsigned int
: The message data.

INDEX unsigned int
: Index of GICv3Comms connection that message came in on.

LENGTH unsigned int
: Message length in bytes.

GICv3CommsPVBus_ReceiveAXIMasterID

Fields:

INDEX unsigned int
: Index of GICv3Comms connection that message came in on.

MASTER_ID unsigned int
: Master ID value recieved.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3CommsPVBus_SentViaGICv3Comms

Packet received via PVBus and sent via GICv3 Comms to connected distributor/CPU. Fields:

DATA `unsigned int`
: The message data.

INDEX `unsigned int`
: Index of GICv3Comms connection that the message should have been sent to (based on AXI master ID).

LENGTH `unsigned int`
: Number bytes in data packet.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.76 GICv3Distributor - trace

This section describes the trace sources.

ArchMsg.Info.GICv3_DroppedInternalPacket

Fields:

INTERFACE unsigned int
: Index of the interface

ArchMsg.Warning.GICv3_CFGSDISABLE_unsupported

CFGSDISABLE signal has been set but doing so has no effect.

ArchMsg.Warning.GICv3_Distributor.MemoryMapped_ReadIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Distributor.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Distributor.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

ArchMsg.Warning.GICv3_Distributor.MemoryMapped_WriteIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Distributor.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

VALUE unsigned int
: Value written

ArchMsg.Warning.GICv3_Distributor.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

VALUE unsigned int
: Value written

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.GICv3_DroppedInternalPacket

Fields:

INTERFACE unsigned int
: Index of the interface

ArchMsg.Warning.GICv3_MemoryMapped_AccessInIncorrectAREState

Fields:

ARE_NS bool
: Value of GICD_CTLR.ARE_NS.

ARE_S bool
: Value of GICD_CTLR.ARE_S.

NS bool
: Access is non-secure.

READnWRITE bool
: Access is a read (rather than a write).

REG_NAME string
: Name of the register being accessed

ArchMsg.Warning.GICv3_MemoryMapped_ChangeUnimplementedSPI

Write attempted to change the configuration for an unimplemented SPI.

ArchMsg.Warning.GICv3_MemoryMapped_IRouteR_RoutingModeWrittenWhenRazWi

Fields:

REG_NAME string
: Name of the register being accessed.

ArchMsg.Warning.GICv3_MemoryMapped_IgnoredPendingChange

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID specified in the register access.

IS_PENDING bool
: The current pending state of the interrupt (and what the access attempted to set it to).

REG_NAME string
: Name of the register being accessed.

ArchMsg.Warning.GICv3_MemoryMapped_NSAccessToSecureInterruptIgnored

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID specified in the register access.

REG_NAME string
: Name of the register being accessed.

ArchMsg.Warning.GICv3_MemoryMapped_NSWriteToSecureInterrupt

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID specified in the register access.

READnWRITE bool
: Access is a read (rather than a write).

REG_NAME string
: Name of the register being accessed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.GICv3_MemoryMapped_SGIRWrittenUsingReservedValue

Fields:

REG_NAME string
: Name of the register being written.

VALUE unsigned int
: Value being written to the register.

ArchMsg.Warning.GICv3_MemoryMapped_SGISendToZeroTargets

Fields:

REG_NAME string
: Name of the register being written.

VALUE unsigned int
: Value being written to the register.

ArchMsg.Warning.GICv3_MemoryMapped_SGIWrongGroup

Fields:

CPU_NS bool
: The destination CPU is configured to accept non-secure SGIs.

REG_NAME string
: Name of the register being written.

SGI_ID unsigned int
: Interrupt ID for the SGI which is attempting to be sent.

SOURCE_NO unsigned int
: GICv2 processor number for the source CPU.

TARGET_NO unsigned int
: GICv2 processor number for the destination CPU.

VALUE unsigned int
: Value being written to the register.

ArchMsg.Warning.GICv3_MemoryMapped_SPISpecifiedOutOfRange

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID specified in the register access.

READnWRITE bool
: The access in question is a read rather than a write

REG_NAME string
: Name of the register being accessed.

ArchMsg.Warning.GICv3_MemoryMapped_SecureSPIRegWrittenWhenSecurityDisabled

Fields:

INTERRUPT_ID unsigned int
: The SPI attempting to be set/cleared.

REG_NAME string
: Name of the register being accessed.

ArchMsg.Warning.GICv3_ReceivedInvalidCommandFromBelow

Fields:

ACTUAL_LENGTH unsigned int
: Actual length of the data in bytes including the header.

DATA unsigned int
: The data received (including header).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EXPECTED_LENGTH unsigned int
: The length in bytes including header that was expected to be received dependent on command type and potentially the data type in the case of a data write.

REDISTRIBUTOR_INDEX unsigned int
: Index for the downstream port that this command was received on.

TYPE unsigned int
: The command type.

ArchMsg.Warning.GICv3_SGIDiscardedDueToInvalidTarget

Fields:

A1 unsigned int
: Affinity level 1.

A2 unsigned int
: Affinity level 2.

A3 unsigned int
: Affinity level 3.

INTERRUPT_ID unsigned int
: The ID of the SGI.

TARGET_LIST unsigned int
: Bit vector of targets.

ArchMsg.Warning.GICv3_SPI_OUT_OF_RANGE_ONLINE

Fields:

END_SPI_ID unsigned int
: End of SPI ID assigned to this distributor for multichip operation.

SPI_PIN unsigned int
: The interrupt ID for the SPI from wire.

START_SPI_ID unsigned int
: Beginning of SPI ID assigned to this distributor for multichip operation.

GICv3_CFGSDISABLE

Fields:

STATE bool
: The new state of the signal.

GICv3_Distributor.MemoryMapped_Read

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VALUE unsigned int
Value returned

GICv3_Distributor.MemoryMapped_Read64

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
Affinity level 0 (for banked registers)
A1 unsigned int
Affinity level 1 (for banked registers)
A2 unsigned int
Affinity level 2 (for banked registers)
A3 unsigned int
Affinity level 3 (for banked registers)
BANKED bool
Whether the access is to a banked register
NS bool
Access is non-secure
OFFSET unsigned int
Offset of address within the GICv3 module
REG_NAME string
Name of the register being read
VALUE unsigned int
Value returned

GICv3_Distributor.MemoryMapped_Write

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
Affinity level 0 (for banked registers)
A1 unsigned int
Affinity level 1 (for banked registers)
A2 unsigned int
Affinity level 2 (for banked registers)
A3 unsigned int
Affinity level 3 (for banked registers)
BANKED bool
Whether the access is to a banked register
NS bool
Access is non-secure
OFFSET unsigned int
Offset of address within the GICv3 module
REG_NAME string
Name of the register being written
UPDATED_VALUE unsigned int
New value read back from the register; for write-only registers this will be equal to VALUE.
VALUE unsigned int
Value written

GICv3_Distributor.MemoryMapped_Write64

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
Affinity level 0 (for banked registers)
A1 unsigned int
Affinity level 1 (for banked registers)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_Distributor.MemoryMapped_WritePort

Trace write to a GICv3 memory-mapped register acting as imp def port. Fields:

FIRST_BYTE_IN_BURST unsigned int
: First byte written in the burst

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

GICv3_Distributor_Comms_Receive

GICv3 internal communications packet that has been received and is traveling towards the top-level. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

INDEX unsigned int
: Index for the redistributor at the lower level from which this packet is being sent. Not applicable for sends from CPU interface to RD0.

GICv3_Distributor_Comms_Send

GICv3 internal communications packet that is being sent towards the CPU. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

INDEX unsigned int
: Index for the redistributor at the lower level from which this packet is being sent. Not applicable for sends from CPU interface to RD0.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_InterruptSetPendingButGroupNotEnabled

Fields:

GROUP1 bool
: Whether the interrupt is group 1.

INTERRUPT_ID unsigned int
: The interrupt ID that was set pending.

NS bool
: Whether the interrupt is non-secure.

GICv3_InterruptSetPendingButNoDestinations

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID that was set pending.

GICv3_InterruptSetReservedGroup

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID that was set pending.

GICv3_Multichip_PROPBASEUpdateFromRd

Fields:

PROC_NUM unsigned int
: ID of this redistributor which consists of chip id and core id

PROPBASE unsigned int
: The value of PROPBASE written at the Redistributor.

GICv3_RegUpdated32

Fields:

REG_NAME string
: The name of the register being updated.

VALUE unsigned int
: The updated value.

GICv3_RegUpdated64

Fields:

REG_NAME string
: The name of the register being updated.

VALUE unsigned int
: The updated value.

GICv3_SPISignalChanged

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID for the SPI.

STATE bool
: The new state of the signal.

GICv3_TraceWakeRequest

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

INTERFACE `unsigned int`
: Index of the interface

SETnCLEAR `bool`
: Whether the signal is set(true) or cleared (false)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.77 GICv3IRI - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.78 GICv3InterruptTranslationService - trace

This section describes the trace sources.

ArchMsg.Error.GICv3_GITS_BASER_NotProvisionedAtEnable

Fields:

BASER_INDEX unsigned int
: Index of the BASER register that should have been provisioned.

BASER_TYPE enum
: The type of the BASER register that needs to have been provisioned.

ArchMsg.Warning.GICv3_CBASERUnpredAddress

Fields:

VALUE unsigned int
: Value attempting to be written.

ArchMsg.Warning.GICv3_CFGSDISABLE_unsupported

CFGSDISABLE signal has been set but doing so has no effect.

ArchMsg.Warning.GICv3_CWRITER_Write

Fields:

OFFSET unsigned int
: Offset written to CWRITE register.

ArchMsg.Warning.GICv3_CommandInvalidEncoding

Fields:

ADDRESS unsigned int
: Address that the command was read from.

DATA unsigned int
: Data for the command.

ArchMsg.Warning.GICv3_CommandReadError

Fields:

ADDRESS unsigned int
: Address that the command was attepted to be read from.

ArchMsg.Warning.GICv3_DISCARDInvalidDevice

Fields:

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Interrupt ID that should be discarded.

ArchMsg.Warning.GICv3_DISCARDInvalidID

Fields:

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Interrupt ID that should be discarded.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ITT_ADDRESS unsigned int
The ITT address found in the device table.

ArchMsg.Warning.GICv3_GITS_BASER_AddressAlignementError

Fields:

BASER_INDEX unsigned int
Index of the BASER register that should have been provisioned.
BASE_ADDRESS unsigned int
The base address for the table
PAGE_SIZE_KB unsigned int
The size of a page in kB

ArchMsg.Warning.GICv3_GITS_BASER_CollectionTableLargerThanSupportedCollectionSpan

Fields:

BASER_INDEX unsigned int
Index of the BASER register that should have been provisioned.
BASER_TYPE enum
The type of the BASER register that needs to have been provisioned.
COLECTION_COUNT_IN_MEM unsigned int
The number of collections suported by this ITS
COLLECTION_ENTRY_SIZE unsigned int
The size in bytes of a collection entry
MAX_NEEDED_PAGE_COUNT unsigned int
The number of pages needed to hold all memory based supported collections
PROVISIONED_PAGE_COUNT unsigned int
The number of provisioned pages

ArchMsg.Warning.GICv3_GITS_BASER_InsufficientMemory

Fields:

BASER_INDEX unsigned int
Index of the BASER register that should have been provisioned.
BASER_TYPE enum
The type of the BASER register that needs to have been provisioned.
ID unsigned int
ID being used to store information.
NAME string
Command or register name that caused device to be used.

ArchMsg.Warning.GICv3_GITS_BASER_InvalidIndirectEntry

Fields:

BASER_INDEX unsigned int
Index of the BASER register that should have been provisioned.
BASER_TYPE enum
The type of the BASER register that needs to have been provisioned.
ID unsigned int
ID being used to store information.
NAME string
Command or register name that caused device to be used.

ArchMsg.Warning.GICv3_GITS_BASER_NotProvisioned

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

BASER_INDEX unsigned int
: Index of the BASER register that should have been provisioned.

BASER_TYPE enum
: The type of the BASER register that needs to have been provisioned.

NAME string
: Command or register name that caused device to be used.

ArchMsg.Warning.GICv3_GITS_CTLR_UnpredWrite

Fields:

ENABLE bool
: Value of the current GITS_CTLR.Enable

ITSNUM unsigned int
: Current value ot GITS_CTLR.ITSNumber

QUIESCENT bool
: Value of the current GITS_CTLR.Quiescent

VALUE unsigned int
: Value being written to the register, after masking

ArchMsg.Warning.GICv3_INVALLInvalid

Fields:

COLLECTION_ID unsigned int
: Collection ID to be invalidated.

ArchMsg.Warning.GICv3_INVInvalidCollection

Fields:

COLLECTION_ID unsigned int
: Collection ID that cannot be found.

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Interrupt ID that should be invalidated.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

ArchMsg.Warning.GICv3_INVInvalidDevice

Fields:

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Interrupt ID that should be inved.

ArchMsg.Warning.GICv3_INVInvalidID

Fields:

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Interrupt ID that should be invalidated.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

Non-Confidential

ArchMsg.Warning.GICv3_ITS.MemoryMapped_ReadIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_ITS.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_ITS.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

ArchMsg.Warning.GICv3_ITS.MemoryMapped_WriteIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_ITS.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

VALUE unsigned int
: Value written

ArchMsg.Warning.GICv3_ITS.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

VALUE unsigned int
: Value written

ArchMsg.Warning.GICv3_ITS_TranslateDeviceOutOfRangeIgnored

Fields:

DEVICE_ID unsigned int
: Device ID to be mapped.

DEVICE_ID_BITS unsigned int
: Device ID bits supported

ArchMsg.Warning.GICv3_ITS_TranslateEventOutOfRangeIgnored

Fields:

DEVICE_ID unsigned int
: ID of the device trigerring the event

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EVENT_ID unsigned int
: Event ID to be mapped

EVENT_ID_BITS unsigned int
: Event ID bits supported

ArchMsg.Warning.GICv3_ITS_TranslateRequestIgnored

Fields:

DEVICE_ID unsigned int
: Device ID to be mapped.

EVENT_ID unsigned int
: Event ID to be mapped

SYNDROME enum
: Error Syndrome

ArchMsg.Warning.GICv3_InvalidDeviceMap

Fields:

CMD_NAME string
: The name of ITS Command that triggered the translation.

DEVICE_ID unsigned int
: Non-mapped device ID specified in the command.

ID unsigned int
: Incoming interrupt ID specified in the command.

ArchMsg.Warning.GICv3_InvalidTargetAddress

Fields:

COMMAND_NAME string
: Name of the command being executed.

PROCESSOR_NUM unsigned int
: Processor number specified in the command.

ArchMsg.Warning.GICv3_InvalidVCPU

Fields:

CMD_NAME string
: The name of ITS Command that requested the map.

VCPU unsigned int
: Virtual CPU specified in the command.

ArchMsg.Warning.GICv3_LPIUnmappedCollection

Fields:

COLLECTION_ID unsigned int
: Collection ID that the interrupt maps to.

DEVICE_ID unsigned int
: Device ID for the interrupt.

ID unsigned int
: Incoming interrupt ID specified.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

SET bool
: Whether the interrupt is set (rather than cleared).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.GICv3_LPIUnmappedDevice

Fields:

DEVICE_ID unsigned int
: Device ID for the interrupt.

ID unsigned int
: Incoming interrupt ID specified.

SET bool
: Whether the interrupt is set (rather than cleared).

ArchMsg.Warning.GICv3_LPIUnmappedID

Fields:

DEVICE_ID unsigned int
: Device ID for the interrupt.

ID unsigned int
: Incoming interrupt ID specified.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

SET bool
: Whether the interrupt is set (rather than cleared).

ArchMsg.Warning.GICv3_MAPCUnmapInvalid

Fields:

COLLECTION_ID unsigned int
: Collection ID requested to be unmapped.

ArchMsg.Warning.GICv3_MAPCUnmapInvalidTarget

MAPC command request unmapping with non-zero target value.

ArchMsg.Warning.GICv3_MAPDUnmapInvalid

Fields:

DEVICE_ID unsigned int
: Device ID attempting to be unmapped.

ArchMsg.Warning.GICv3_MAPDUnmapInvalidSize

MAPD command request unmapping with non-zero Size value.

ArchMsg.Warning.GICv3_MAPIInvalid

Fields:

COLLECTION_ID unsigned int
: Collection ID specified in the map request.

DEVICE_ID unsigned int
: Non-mapped device ID specified in the map request.

ID unsigned int
: Incoming interrupt ID specified in the map request.

PHYSICAL_ID unsigned int
: Outgoing interrupt ID specified in the map request.

ArchMsg.Warning.GICv3_MOVIInvalidCollection

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Input interrupt ID that should be moved.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

NEW_COLLECTION_ID unsigned int
: Collection ID that was requested.

NEW_INVALID bool
: It is the new collection ID that is invalid (rather than the old collection ID).

OLD_COLLECTION_ID unsigned int
: Collection ID that this interrupt used to be associated with.

ArchMsg.Warning.GICv3_MOVIInvalidDevice

Fields:

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Input interrupt ID that should be moved.

NEW_COLLECTION_ID unsigned int
: Collection ID that was requested.

ArchMsg.Warning.GICv3_MOVIInvalidID

Fields:

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Input interrupt ID that should be moved.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

NEW_COLLECTION_ID unsigned int
: Collection ID that was requested.

ArchMsg.Warning.GICv3_RangeErrorCollection

Fields:

COLLECTION_ID unsigned int
: Collection ID specified.

NAME string
: Command or register name.

ArchMsg.Warning.GICv3_RangeErrorDeviceID

Fields:

DEVICE_ID unsigned int
: Device ID specified.

NAME string
: Command or register name.

ArchMsg.Warning.GICv3_RangeErrorIDBits

Fields:

ID_BITS unsigned int
: Number of ID bits specified.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NAME string
: Command or register name.

ArchMsg.Warning.GICv3_RangeErrorIncomingID

Fields:

COLLECTION_ID unsigned int
: Collection ID specified.

ID_BITS unsigned int
: Maximum number of ID bits allowed for this access.

NAME string
: Command or register name.

ArchMsg.Warning.GICv3_WriteIgnoredConfiguration

Fields:

REG_NAME string
: Name of register being read or written.

VALUE unsigned int
: Value attempting to be written.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

GICv3_CFGSDISABLE

Fields:

STATE bool
: The new state of the signal.

GICv3_CommandComplete

Fields:

COMMAND_TYPE enum
: Type of the command being executed.

ERROR enum
: The error type if the command was not successful.

SUCCESS bool
: Whether the command succeeded.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_CommandDecode

Fields:

COMMAND_NAME string
: Name of the decoded command.

DATA_0 unsigned int
: First 64-bit word from the command.

DATA_1 unsigned int
: Second 64-bit word from the command.

DATA_2 unsigned int
: Third 64-bit word from the command.

DATA_3 unsigned int
: Forth 64-bit word from the command.

OFFSET unsigned int
: Offset from GITS_CBASER that the command was read from.

VALID bool
: Whether the command was valid.

GICv3_CommandStart_CLEAR

Fields:

DEVICE unsigned int
: The Device ID specified in the command.

ID unsigned int
: The incoming ID of interrupts to move to a new collection.

GICv3_CommandStart_DISCARD

Fields:

DEVICE unsigned int
: The Device ID specified in the command.

ID unsigned int
: The incoming ID of interrupts to discard.

GICv3_CommandStart_INT

Fields:

DEVICE unsigned int
: The Device ID specified in the command.

ID unsigned int
: The incoming ID of interrupts to move to a new collection.

GICv3_CommandStart_INV

Fields:

DEVICE unsigned int
: The Device ID specified in the command.

ID unsigned int
: The incoming ID of interrupts to invalidate caches for.

GICv3_CommandStart_INVALL

Fields:

COLLECTION unsigned int
: The collection for which all interrupt caches should be invalidated.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_CommandStart_MAPC

Fields:

COLLECTION unsigned int
: The ID of the collection being mapped.

TARGET unsigned int
: The processor number or redistributor base address for the redistributor to synchronise.

VALID bool
: Whether to create a new device mapping (true) or to discard an old one (false).

GICv3_CommandStart_MAPD

Fields:

DEVICE unsigned int
: The Device ID specified in the command.

ITT_ADDRESS unsigned int
: The interrupt translation table address specified in the command.

SIZE unsigned int
: Number of interrupt ID bits supported by this device, minus one.

VALID bool
: Whether to create a new device mapping (true) or to discard an old one (false).

GICv3_CommandStart_MAPI

Fields:

COLLECTION unsigned int
: The ID of the collection to map the interrupts to.

DEVICE unsigned int
: The Device ID specified in the command.

ID unsigned int
: The incoming ID of interrupts to map (and the same ID that will be passed to software).

GICv3_CommandStart_MAPVI

Fields:

COLLECTION unsigned int
: The ID of the collection to map the interrupts to.

DEVICE unsigned int
: The Device ID specified in the command.

ID unsigned int
: The incoming ID of interrupts to map.

PHYSICAL_ID unsigned int
: The ID presented to software for these interrupts.

GICv3_CommandStart_MOVALL

Fields:

SOURCE unsigned int
: The processor number or redistributor base address for the source redistributor.

TARGET unsigned int
: The processor number or redistributor base address for the target redistributor.

GICv3_CommandStart_MOVI

Fields:

COLLECTION unsigned int
: The ID of the new collection to move the interrupt to.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DEVICE unsigned int
: The Device ID specified in the command.

ID unsigned int
: The incoming ID of interrupts to move to a new collection.

GICv3_CommandStart_SYNC

Fields:

TARGET unsigned int
: The processor number or redistributor base address for the redistributor to synchronise.

GICv3_CommandStart_VINVALL

Fields:

VCPU unsigned int
: The VCPU id for which all interrupt caches should be invalidated.

GICv3_CommandStart_VMAPI

Fields:

DEVICE unsigned int
: The Device ID specified in the command.

ID unsigned int
: The incoming ID of interrupt to map.

PHYSICAL_ID unsigned int
: The doorbell ID to be presented to guest

VCPU unsigned int
: The VCPU ID specified in the command.

GICv3_CommandStart_VMAPP

Fields:

SIZE unsigned int
: Number of interrupt ID bits supported by this device, minus one.

TARGET_ADDRESS unsigned int
: The Redistributor address specified in the command.

VALID bool
: Whether to create a new device mapping (true) or to discard an old one (false).

VCPU unsigned int
: The VCPU ID specified in the command.

VPT_ADDRESS unsigned int
: The Virtual Pending Table address specified in the command.

GICv3_CommandStart_VMAPVI

Fields:

DEVICE unsigned int
: The Device ID specified in the command.

ID unsigned int
: The incoming ID of interrupt to map.

PHYSICAL_ID unsigned int
: The doorbell ID to be presented to guest

VCPU unsigned int
: The VCPU ID specified in the command.

VIRTUAL_ID unsigned int
: The Virtual ID to be presented to guest.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_CommandStart_VMOVI

Fields:

DEVICE unsigned int
: The Device ID specified in the command.

ID unsigned int
: The incoming ID of interrupt to map.

PHYSICAL_ID unsigned int
: The doorbell ID to be presented to guest

VCPU unsigned int
: The VCPU ID specified in the command.

GICv3_CommandStart_VMOVP

Fields:

ITS_LIST unsigned int
: The ITS numbers participating in the synchronizatio operation.

SEQUENCE_NUM unsigned int
: The identifier of synchronizatio point in the command.

TARGET_ADDRESS unsigned int
: The Redistributor address specified in the command.

VCPU unsigned int
: The VCPU ID specified in the command.

GICv3_CommandStart_VSYNC

Fields:

VCPU unsigned int
: The VCPU id for which commands must be synchronized.

GICv3_DISCARD

Fields:

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Interrupt ID that should be discarded.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

GICv3_INV

Fields:

COLLECTION_ID unsigned int
: Collection ID for this interrupt.

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Input interrupt ID that should be invalidated.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

PHYSICAL_ID unsigned int
: Interrupt ID that will be specified to the redistributor.

REDISTRIBUTOR_BASE unsigned int
: Base address for the redistributor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_INVALL

Fields:

COLLECTION_ID unsigned int
: Collection ID to be invalidated.

REDISTRIBUTOR_BASE unsigned int
: Base address for the redistributor.

GICv3_ITS.MemoryMapped_Read

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

GICv3_ITS.MemoryMapped_Read64

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

GICv3_ITS.MemoryMapped_Write

Trace write to a GICv3 memory-mapped register. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_ITS.MemoryMapped_Write64

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_ITS.MemoryMapped_WritePort

Trace write to a GICv3 memory-mapped register acting as imp def port. Fields:

FIRST_BYTE_IN_BURST unsigned int
: First byte written in the burst

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_ITS_TranslationStart

Fields:

DEVICE_ID unsigned int
: Device ID to be mapped.

EVENT_ID unsigned int
: Event ID to be mapped

START bool
: Translation Started

GICv3_ITS_TranslationStatus

Fields:

DEVICE_ID unsigned int
: Device ID to be mapped.

EVENT_ID unsigned int
: Event ID to be mapped

SUCCESS bool
: Translation Success

GICv3_LPISent

Fields:

COLLECTION_ID unsigned int
: Collection ID that the interrupt maps to.

DEVICE_ID unsigned int
: Device ID for the interrupt.

ID unsigned int
: Incoming interrupt ID specified.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

PHYSICAL_ID unsigned int
: Outgoing interrupt ID found in the map.

REDISTRIBUTOR_BASE unsigned int
: Base address for redistristributor (may be an internal address for monolithic implementations).

SET bool
: Whether the interrupt is set (rather than cleared).

GICv3_MAPCMap

Fields:

ADDRESS unsigned int
: Redistributor base address.

COLLECTION_ID unsigned int
: Collection ID to be mapped.

GICv3_MAPCMapMonolithic

Fields:

ADDRESS unsigned int
: Redistributor base address.

COLLECTION_ID unsigned int
: Collection ID to be mapped.

PROC_NUM unsigned int
: Processor number for redistributor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_MAPCUnmap

Fields:

COLLECTION_ID unsigned int
: Collection ID being unmapped.

GICv3_MAPDMap

Fields:

DEVICE_ID unsigned int
: Device ID to be mapped.

INTERRUPT_BITS unsigned int
: Number of interrupt ID bits supported by the device.

ITT_ADDRESS unsigned int
: Base address for memory to store Interrupt Translation Table.

GICv3_MAPDUnmap

Fields:

DEVICE_ID unsigned int
: Device ID to be unmapped.

GICv3_MAPI

Fields:

COLLECTION_ID unsigned int
: Collection ID specified in the map request.

DEVICE_ID unsigned int
: Device ID specified in the map request.

ID unsigned int
: Incoming interrupt ID specified in the map request.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

PHYSICAL_ID unsigned int
: Outgoing interrupt ID specified in the map request.

GICv3_MOVALL

Fields:

NEW_REDISTRIBUTOR_BASE unsigned int
: Base address (or processor number for monolithic implementation) for destination redistristributor.

OLD_REDISTRIBUTOR_BASE unsigned int
: Base address (or processor number for monolithic implementation) for source redistristributor.

GICv3_MOVI

Fields:

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Input interrupt ID that was moved.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

MOVE_REQUIRED bool
: Whether a move between redistributors was required.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NEW_COLLECTION_ID unsigned int
: Collection ID that this interrupt is now associated with.

OLD_COLLECTION_ID unsigned int
: Collection ID that this interrupt used to be associated with.

PHYSICAL_ID unsigned int
: Interrupt ID that will be specified to the redistributor.

GICv3_MultiChip_Forwarding_LPI_CMD_ACK_to_Dist

Fields:

THIS_CHIP_ID unsigned int
: Chip

GICv3_MultiChip_Forwarding_LPI_CMD_REQ_to_Dist

Fields:

CMD_TYPE unsigned int
: The command type

DST_CHIP unsigned int
: Destination chip for the command

DST_CORE unsigned int
: Destination core for the command

LPI_ID unsigned int
: LPI interrupt ID being operated on by the command

SRC_CHIP unsigned int
: Source chip for the command

SRC_CORE unsigned int
: Source core for the command

THIS_CHIP_ID unsigned int
: Chip ID

GICv3_MultiChip_SETLPI_BY_MOVI

Fields:

DST_TGT unsigned int
: Destination chip and core for MOVI

LPI unsigned int
: LPI to be moved

SRC_TGT unsigned int
: Source chip and core for MOVI

THIS_CHIP_ID unsigned int
: Chip

GICv3_MultiChip_VMOVP_Received

Fields:

DST_TGT unsigned int
: Destination chip and core for VMOVP

SRC_TGT unsigned int
: Source chip and core for VMOVP

THIS_CHIP_ID unsigned int
: Chip

vPEID unsigned int
: ID of the vPE to be moved

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_RegUpdated32

Fields:

REG_NAME string
: The name of the register being updated.

VALUE unsigned int
: The updated value.

GICv3_RegUpdated64

Fields:

REG_NAME string
: The name of the register being updated.

VALUE unsigned int
: The updated value.

GICv3_TableWalk_Collection

Fields:

ID unsigned int
: The ID of the collection being looked up.

TARGET unsigned int
: The target address (or processor number) specified for this collection.

GICv3_TableWalk_CollectionInvalid

Fields:

ID unsigned int
: The ID of the collection being looked up.

GICv3_TableWalk_Device

Fields:

DEVICE_ID unsigned int
: The device ID being looked up.

INTERRUPT_BITS unsigned int
: The number of interrupt bits specified in the device table.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

GICv3_TableWalk_DeviceInvalid

Fields:

DEVICE_ID unsigned int
: The device ID being looked up.

GICv3_TableWalk_ITT

Fields:

COLLECTION_ID unsigned int
: The collection ID used for routing this interrupt to the appropriate CPU.

ID unsigned int
: The input indentifier used for the translation process.

ITT_ADDRESS unsigned int
: The base address specified in the previous MAPD command for this table.

PHYSICAL_ID unsigned int
: The physical interrupt ID presented to software.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_TableWalk_ITTInvalid

Fields:

ID unsigned int
: The input indentifier used for the translation process.

ITT_ADDRESS unsigned int
: The base address specified in the MAPD command that is being used.

GICv3_TableWalk_ITT_VLPI

Fields:

ID unsigned int
: The input indentifier used for the translation process.

ITT_ADDRESS unsigned int
: The base address specified in the previous MAPD command for this table.

PHYSICAL_ID unsigned int
: The physical interrupt ID presented to software.

VCPU unsigned int
: The VCPU ID used for routing this interrupt to the appropriate CPU.

GICv3_TableWalk_VCPU

Fields:

TARGET unsigned int
: The Redistributor address specified in VCPU table.

VCPU unsigned int
: The VCPU being looked up.

VINTERRUPT_BITS unsigned int
: The number of virtual interrupt bits specified in the VCPU table.

VPT_ADDRESS unsigned int
: The Virtual Pending Table address assigned to VCPU.

GICv3_TableWalk_VCPUInvalid

Fields:

VCPU unsigned int
: The Virtual CPU ID being looked up.

GICv3_TableWalk_VPTAddrInvalid

Fields:

VPTAddr unsigned int
: The Virtual Pending Table address supposedly corresponding to a VCPU, being looked up.

GICv3_VMAPI

Fields:

DEVICE_ID unsigned int
: Device ID specified in the map request.

ID unsigned int
: Incoming interrupt ID specified in the map request.

ITT_ADDRESS unsigned int
: The ITT address found in the device table.

PHYSICAL_ID unsigned int
: Outgoing Physical interrupt ID specified in the map request.

VCPU unsigned int
: Virtual CPU specified in the map request.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VIRTUAL_ID unsigned int
: Outgoing Virtual interrupt ID specified in the map request.

GICv3_VMAPP_Map

Fields:

TARGET_ADDRESS unsigned int
: The Redistributor address assigned to VCPU.

VCPU unsigned int
: VCPU ID to be mapped.

VPT_ADDRESS unsigned int
: The Virtual Pending Table address assigned to VCPU.

GICv3_VMAPP_Unmap

Fields:

VCPU unsigned int
: Virtual CPU being unmapped.

GICv3_VMOVI

Fields:

DEVICE_ID unsigned int
: Device ID for interrupt source.

ID unsigned int
: Input interrupt ID that was moved.

MOVE_REQUIRED bool
: Whether a move between redistributors was required.

NEW_VCPU unsigned int
: Collection ID that this interrupt is now associated with.

OLD_VCPU unsigned int
: Collection ID that this interrupt used to be associated with.

PHYSICAL_ID unsigned int
: DoorBell Interrupt ID that will be specified to the redistributor.

VIRTUAL_ID unsigned int
: Interrupt ID that will be specified to the redistributor.

GICv4_ITS_VMOVPSynchronization

Fields:

ITSNUM unsigned int
: Current value of GITS_CTLR.ITSNumber.

REDISTRIBUTOR_BASE unsigned int
: The base address of the new redistributor that the VCPU should be mapped to.

SENDINGnRECEIVED bool
: Whether the ITS is sending or has received a VMOVP to/from the router unit.

VCPU unsigned int
: The VCPU to be remapped.

GICv4_ITS_VMOVPSynchronizationAck

Fields:

ITSNUM unsigned int
: Current value of GITS_CTLR.ITSNumber.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv4_ITS_VMOVPSynchronizationDone

Fields:

ITSNUM unsigned int
: Current value of GITS_CTLR.ITSNumber.

GICv4_ITS_VMOVPSynchronizationStarted

Fields:

ITSNUM unsigned int
: Current value of GITS_CTLR.ITSNumber.

RDBase unsigned int
: The base address of the new redistributor that the VCPU should be mapped to.

VCPU unsigned int
: The VCPU to be remapped.

4.79 GICv3ProtocolChecker - trace

This section describes the trace sources.

GICv3ProtocolChecker.protocol_violation

Fields:

MESSAGE `string`
Protocol Violation Message

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.80 GICv3Redistributor - trace

This section describes the trace sources.

ArchMsg.Error.GICv3IgnorePPILegacyPendingNoSource

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID of the PPI

ArchMsg.Error.GICv3_UnexpectedClearAcknowledge

Received a ClearAcknowlege command but not expecting one.

ArchMsg.Error.GICv3_UnknownTypeUpstreamWrite

Upstream write of unknown type received. Acknowledging and ignoring.This is a PROTOCOL ERROR, the architecture allows system behaviour to become UNPREDICATBLE from this point onwards.

ArchMsg.Error.LPIConfigReadError

Fields:

ADDRESS unsigned int
: Address used for the access

INTERRUPT_ID unsigned int
: The interrupt ID for the LPI

ArchMsg.Error.LPIDeviceWriteError

Fields:

ADDRESS unsigned int
: Address used for the access

ArchMsg.Error.LPIPendingAccessError

Fields:

ADDRESS unsigned int
: Address used for the access

READnWRITE bool
: Whether this is a read or a write

ArchMsg.Info.GICv3_DroppedInternalPacket

Fields:

INTERFACE unsigned int
: Index of the interface

ArchMsg.Info.GICv3_LPI_CachedProperty_Discard

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID for the LPI

ArchMsg.Info.GICv3_LPI_CachedProperty_Update

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID for the LPI

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PRIORITY unsigned int
The priority for the Cached interrupt (unshifted value)

ArchMsg.Warning.GICv3-PITS.DeactivateIgnored

Fields:

INTERRUPT_ID unsigned int
The interrupt ID in the EOI message

ArchMsg.Warning.GICv3-PITS.TrackActive-NotFound

Fields:

INTERRUPT_ID unsigned int
The interrupt ID in the Activate message

ArchMsg.Warning.GICv3.GICR_CTLR_EnableLPI_negedge_ignored

Update to GICR_CTLR has EnableLPI as 0, but EnableLPI has been set to 1 in the past, and this bit only goes one way.

ArchMsg.Warning.GICv3.GenerateSGI_A3VnotSupported

GenerateSGI packet received form CPU with A3V set, the Redistributor does not support A3, it will be acknowledged but is ignored.

ArchMsg.Warning.GICv3.GenerateSGI_IRMwithA3VorAff

GenerateSGI packet received form CPU with IRM=1 but A3V or one of the Ax fields is not zero, this packet should not exist but will be handled as if A0=A1=A2=A3=0.

ArchMsg.Warning.GICv3.GenerateSGI_Ignored

GenerateSGI packet received form CPU but ARE_S and ARE_NS are 0 and distributor is configured to ignore such packets.

ArchMsg.Warning.GICv3.PENDBASERUpdateIgnored

Update to PENDBASER when GICR_CTLR.EnableLPI=1 and GICR_WAKER.Quiescent=0 is ignored.

ArchMsg.Warning.GICv3.PROPBASERUpdateIgnored

Update to PROPBASER when GICR_CTLR.EnableLPI=1 and GICR_WAKER.Quiescent=0 is ignored.

ArchMsg.Warning.GICv3.PROPBASERUpdateReadOnly

Update to PROPBASER when register is read only -- Has been ignored and probably won't perform as you would expect.

ArchMsg.Warning.GICv3IgnorePPINotImplemented

Fields:

INTERRUPT_ID unsigned int
The interrupt ID of the PPI

ArchMsg.Warning.GICv3_A3NonZeroNotSupported

Fields:

A3 unsigned int
Affinity level 3 value.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.GICv3_CFGSDISABLE_unsupported

CFGSDISABLE signal has been set but doing so has no effect.

ArchMsg.Warning.GICv3_DroppedInternalPacket

Fields:

INTERFACE unsigned int
: Index of the interface

ArchMsg.Warning.GICv3_GICR_WAKER.PROCESSOR_SLEEP clear ignored

GICR_WAKER.PROCESSOR_SLEEP clear ignored as SLEEP is true.

ArchMsg.Warning.GICv3_GICR_WAKER.SLEEP set ignored

GICR_WAKER.SLEEP set ignored as PROCESSOR_SLEEP is not true.

ArchMsg.Warning.GICv3_IgnoredActivate

Received Activate packet with unusable payload (8196>ID>1023 and 9:4 != 0).

ArchMsg.Warning.GICv3_IgnoredActivateARE

Received Activate packet with unusual payload (8196>ID>1023) and 9:4 == 0 but ARE forbids the packet to be considered.

ArchMsg.Warning.GICv3_IgnoredDeactivate

Received Deactivate packet with unusable payload (8196>ID>1023 and 9:4 != 0).

ArchMsg.Warning.GICv3_IgnoredDeactivateARE

Received Deactivate packet with unusual payload (8196>ID>1023) and 9:4 == 0 but ARE forbids the packet to be considered.

ArchMsg.Warning.GICv3_IgnoredDeactivateSpurious

Received Deactivate packet with a special ID (1020-1023) or an out of range ID.

ArchMsg.Warning.GICv3_LPIDroppedOutOfRange

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID for the LPI

REG_NAME string
: Name of the register being written

ArchMsg.Warning.GICv3_LPI_CachedProperty_CacheMismatch

Fields:

CACHED_CFG unsigned int
: Configuration the cache returned

INTERRUPT_ID unsigned int
: The interrupt ID for the LPI

MEMORY_CFG unsigned int
: Configuration present in memory for the LPI

ArchMsg.Warning.GICv3_LPIsDisabled

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

READnWRITE bool
: Whether the access was a read.

REG_NAME string
: Name of the register being accessed.

ArchMsg.Warning.GICv3_MemoryMapped_AccessInIncorrectAREState

Fields:

ARE_NS bool
: Value of GICD_CTLR.ARE_NS.

ARE_S bool
: Value of GICD_CTLR.ARE_S.

NS bool
: Access is non-secure.

READnWRITE bool
: Access is a read (rather than a write).

REG_NAME string
: Name of the register being accessed

ArchMsg.Warning.GICv3_MemoryMapped_IgnoredPendingChange

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID specified in the register access.

IS_PENDING bool
: The current pending state of the interrupt (and what the access attempted to set it to).

REG_NAME string
: Name of the register being accessed.

ArchMsg.Warning.GICv3_MemoryMapped_NSAccessToSecureInterruptIgnored

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID specified in the register access.

REG_NAME string
: Name of the register being accessed.

ArchMsg.Warning.GICv3_MemoryMapped_WriteIgnored

Fields:

REG_FIELD_NAME string
: Name of register and optionally field being written.

VALUE unsigned int
: Value attempting to be written.

ArchMsg.Warning.GICv3_ReceivedInvalidCommandFromAbove

Fields:

ACTUAL_LENGTH unsigned int
: Actual length of the data in bytes including the header.

DATA unsigned int
: The data received (including header).

EXPECTED_LENGTH unsigned int
: The length in bytes including header that was expected to be received dependent on command type and potentially the data type in the case of a data write.

TYPE unsigned int
: The command type.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.GICv3_ReceivedInvalidCommandFromBelow

Fields:

ACTUAL_LENGTH unsigned int
: Actual length of the data in bytes including the header.

DATA unsigned int
: The data received (including header).

EXPECTED_LENGTH unsigned int
: The length in bytes including header that was expected to be received dependent on command type and potentially the data type in the case of a data write.

REDISTRIBUTOR_INDEX unsigned int
: Index for the downstream port that this command was received on.

TYPE unsigned int
: The command type.

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_ReadIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_WriteIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

VALUE unsigned int
: Value written

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VALUE unsigned int
Value written

ArchMsg.Warning.GICv3_Redistributor_Internal.MemoryMapped_ReadIgnored

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Redistributor_Internal.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Redistributor_Internal.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module
REG_NAME string
Name of the register being read

ArchMsg.Warning.GICv3_Redistributor_Internal.MemoryMapped_WriteIgnored

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Redistributor_Internal.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module
REG_NAME string
Name of the register being written
VALUE unsigned int
Value written

ArchMsg.Warning.GICv3_Redistributor_Internal.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module
VALUE unsigned int
Value written

ArchMsg.Warning.GICv3_ReleasedNotSent

Fields:

INTERRUPT_ID unsigned int
The interrupt ID of the interrupt considered

ArchMsg.Warning.GICv3_SGIDiscardedDueToInvalidTarget

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A1 unsigned int
: Affinity level 1.

A2 unsigned int
: Affinity level 2.

A3 unsigned int
: Affinity level 3.

INTERRUPT_ID unsigned int
: The ID of the SGI.

RANGE_SELECTOR unsigned int
: Value of the RS field used for generating the SGI if applicable, SBZ otherwise

TARGET_LIST unsigned int
: Bit vector of targets.

ArchMsg.Warning.GICv3_SGIRSNotSupported

IRI received Generate SGI packet from CPU with RSV=1 and RS non-zeroand the IRI does not support this feature. RS treated as 0.

ArchMsg.Warning.GICv3_SGI_Dropped

Fields:

ENABLED bool
: Whether the SGI is enable in the destination CPU.

INTERRUPT_G1 bool
: Whether the SGI is configured as group 1 in this redistributor.

INTERRUPT_ID unsigned int
: The interrupt ID of the SPI

INTERRUPT_NS bool
: Whether the SGI is configured as non-secure in this redistributor.

LEGACY bool
: IS the SGI a legacy type interrupt

NS bool
: Original register access was non-secure.

NSACR unsigned int
: The value of the NSACR field for the SGI

SGT enum
: The SGT field in the incoming GenerateSGI packet (corresponds to the ICC register that was written).

ArchMsg.Warning.GICv3_SGI_GICD_SGIR_BRoadcast_Dropped

Fields:

ENABLED bool
: Whether the SGI is enable in the destination CPU.

INTERRUPT_G1 bool
: Whether the SGI is configured as group 1 in this redistributor.

INTERRUPT_ID unsigned int
: The interrupt ID of the SPI

INTERRUPT_NS bool
: Whether the SGI is configured as non-secure in this redistributor.

NS bool
: Original register access was non-secure.

NSACR unsigned int
: The value of the NSACR field for the SGI

ArchMsg.Warning.GICv3_SPIDropped

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A0 unsigned int
: Affinity level 0 address

A1 unsigned int
: Affinity level 1 address

A2 unsigned int
: Affinity level 2 address

A3 unsigned int
: Affinity level 3 address

INTERRUPT_ID unsigned int
: The interrupt ID for the LPI

ArchMsg.Warning.GICv3_VLPIDroppedOutOfRange

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID for the LPI

REG_NAME string
: Name of the register being written

VPT unsigned int
: The address of the virtual pending table

ArchMsg.Warning.GICv3_VLPIsDisabled

Fields:

READnWRITE bool
: Whether the access was a read.

REG_NAME string
: Name of the register being accessed.

ArchMsg.Warning.GICv3_WakerequestIgnored

Wakerequest was asserted but the component is not asleep.

ArchMsg.Warning.GICv3_access_asleep_rd

Fields:

REG_NAME string
: Name of the register being accessed.

ArchMsg.Warning.GICv3_command_received_processorsleep

Command received from CPU when ProcessorSleep and ChildrenAsleep.

GICv3-PITS.TrackActive

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID of the interrupt considered

PRIORITY unsigned int
: The interrupt Priority of the interrupt considered

GICv3-PITS.TrackPending

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID of the interrupt considered

PRIORITY unsigned int
: The interrupt Priority of the interrupt considered

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3-PITS.TrackSent

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID of the interrupt considered

PRIORITY unsigned int
: The interrupt Priority of the interrupt considered

GICv3_CFGSDISABLE

Fields:

STATE bool
: The new state of the signal.

GICv3_ClearDropped

Fields:

A0 unsigned int
: Affinity level 0 address

A1 unsigned int
: Affinity level 1 address

A2 unsigned int
: Affinity level 2 address

A3 unsigned int
: Affinity level 3 address

INTERRUPT_ID unsigned int
: The interrupt ID for the LPI

GICv3_InterruptSetPendingButGroupNotEnabled

Fields:

GROUP1 bool
: Whether the interrupt is group 1.

INTERRUPT_ID unsigned int
: The interrupt ID that was set pending.

NS bool
: Whether the interrupt is non-secure.

GICv3_InterruptSetReservedGroup

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID that was set pending.

GICv3_PPISignalChanged

Fields:

INTERRUPT_ID unsigned int
: The interrupt ID for the PPI.

STATE bool
: The new state of the signal.

GICv3_Redistributor.MemoryMapped_Read

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

GICv3_Redistributor.MemoryMapped_Read64

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

GICv3_Redistributor.MemoryMapped_Write

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_Redistributor.MemoryMapped_Write64

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_Redistributor.MemoryMapped_WritePort

Trace write to a GICv3 memory-mapped register acting as imp def port. Fields:

FIRST_BYTE_IN_BURST unsigned int
: First byte written in the burst

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

GICv3_Redistributor_Comms_ReceiveAbove

GICv3 internal communications packet that has been received and is traveling towards the CPU. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

GICv3_Redistributor_Comms_ReceiveBelow

GICv3 internal communications packet that has been received and is traveling towards the top-level. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

INDEX unsigned int
: Index for the redistributor at the lower level from which this packet is being sent. Not applicable for sends from CPU interface to RD0.

GICv3_Redistributor_Comms_SendAbove

GICv3 internal communications packet that is being sent towards the top-level. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

GICv3_Redistributor_Comms_SendBelow

GICv3 internal communications packet that is being sent towards the CPU. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

INDEX unsigned int
: Index for the redistributor at the lower level from which this packet is being sent. Not applicable for sends from CPU interface to RD0.

GICv3_Redistributor_Internal.MemoryMapped_Read

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_Redistributor_Internal.MemoryMapped_Read64

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

GICv3_Redistributor_Internal.MemoryMapped_Write

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_Redistributor_Internal.MemoryMapped_Write64

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

UPDATED_VALUE unsigned int
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int
: Value written

GICv3_Redistributor_Internal.MemoryMapped_WritePort

Trace write to a GICv3 memory-mapped register acting as imp def port. Fields:

FIRST_BYTE_IN_BURST unsigned int
: First byte written in the burst

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

GICv3_RegUpdated32

Fields:

REG_NAME string
: The name of the register being updated.

VALUE unsigned int
: The updated value.

GICv3_RegUpdated64

Fields:

REG_NAME string
: The name of the register being updated.

VALUE unsigned int
: The updated value.

GICv3_TraceWakeRequest

Fields:

INTERFACE unsigned int
: Index of the interface

SETnCLEAR bool
: Whether the signal is set(true) or cleared (false)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.81 GICv3RedistributorInternal - trace

This section describes the trace sources.

ArchMsg.Info.GICv3_DroppedInternalPacket

Fields:

INTERFACE unsigned int
: Index of the interface

ArchMsg.Warning.GICv3_CFGSDISABLE_unsupported

CFGSDISABLE signal has been set but doing so has no effect.

ArchMsg.Warning.GICv3_DroppedInternalPacket

Fields:

INTERFACE unsigned int
: Index of the interface

ArchMsg.Warning.GICv3_ReceivedInvalidCommandFromAbove

Fields:

ACTUAL_LENGTH unsigned int
: Actual length of the data in bytes including the header.

DATA unsigned int
: The data received (including header).

EXPECTED_LENGTH unsigned int
: The length in bytes including header that was expected to be received dependent on command type and potentially the data type in the case of a data write.

TYPE unsigned int
: The command type.

ArchMsg.Warning.GICv3_ReceivedInvalidCommandFromBelow

Fields:

ACTUAL_LENGTH unsigned int
: Actual length of the data in bytes including the header.

DATA unsigned int
: The data received (including header).

EXPECTED_LENGTH unsigned int
: The length in bytes including header that was expected to be received dependent on command type and potentially the data type in the case of a data write.

REDISTRIBUTOR_INDEX unsigned int
: Index for the downstream port that this command was received on.

TYPE unsigned int
: The command type.

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_ReadIgnored

Fields:

OFFSET unsigned int
: Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_ReadReserved

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OFFSET unsigned int
Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module
REG_NAME string
Name of the register being read

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_WriteIgnored

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module
REG_NAME string
Name of the register being written
VALUE unsigned int
Value written

ArchMsg.Warning.GICv3_Redistributor.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
Offset of address within the GICv3 module
VALUE unsigned int
Value written

ArchMsg.Warning.GICv3_SPIDropped

Fields:

A0 unsigned int
Affinity level 0 address
A1 unsigned int
Affinity level 1 address
A2 unsigned int
Affinity level 2 address
A3 unsigned int
Affinity level 3 address
INTERRUPT_ID unsigned int
The interrupt ID for the LPI

ArchMsg.Warning.GICv3_WakerequestIgnored

Wakerequest was asserted but the component is not asleep.

GICv3_CFGSDISABLE

Fields:

STATE bool
The new state of the signal.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3_ClearDropped

Fields:

A0 unsigned int
: Affinity level 0 address

A1 unsigned int
: Affinity level 1 address

A2 unsigned int
: Affinity level 2 address

A3 unsigned int
: Affinity level 3 address

INTERRUPT_ID unsigned int
: The interrupt ID for the LPI

GICv3_Redistributor.MemoryMapped_Read

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

VALUE unsigned int
: Value returned

GICv3_Redistributor.MemoryMapped_Read64

Trace read from a GICv3 memory-mapped register. Fields:

A0 unsigned int
: Affinity level 0 (for banked registers)

A1 unsigned int
: Affinity level 1 (for banked registers)

A2 unsigned int
: Affinity level 2 (for banked registers)

A3 unsigned int
: Affinity level 3 (for banked registers)

BANKED bool
: Whether the access is to a banked register

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being read

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VALUE unsigned int
Value returned

GICv3_Redistributor.MemoryMapped_Write

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
Affinity level 0 (for banked registers)
A1 unsigned int
Affinity level 1 (for banked registers)
A2 unsigned int
Affinity level 2 (for banked registers)
A3 unsigned int
Affinity level 3 (for banked registers)
BANKED bool
Whether the access is to a banked register
NS bool
Access is non-secure
OFFSET unsigned int
Offset of address within the GICv3 module
REG_NAME string
Name of the register being written
UPDATED_VALUE unsigned int
New value read back from the register; for write-only registers this will be equal to VALUE.
VALUE unsigned int
Value written

GICv3_Redistributor.MemoryMapped_Write64

Trace write to a GICv3 memory-mapped register. Fields:

A0 unsigned int
Affinity level 0 (for banked registers)
A1 unsigned int
Affinity level 1 (for banked registers)
A2 unsigned int
Affinity level 2 (for banked registers)
A3 unsigned int
Affinity level 3 (for banked registers)
BANKED bool
Whether the access is to a banked register
NS bool
Access is non-secure
OFFSET unsigned int
Offset of address within the GICv3 module
REG_NAME string
Name of the register being written
UPDATED_VALUE unsigned int
New value read back from the register; for write-only registers this will be equal to VALUE.
VALUE unsigned int
Value written

GICv3_Redistributor.MemoryMapped_WritePort

Trace write to a GICv3 memory-mapped register acting as imp def port. Fields:

FIRST_BYTE_IN_BURST unsigned int
First byte written in the burst

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NS bool
: Access is non-secure

OFFSET unsigned int
: Offset of address within the GICv3 module

REG_NAME string
: Name of the register being written

GICv3_Redistributor_Comms_ReceiveAbove

GICv3 internal communications packet that has been received and is traveling towards the CPU. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

GICv3_Redistributor_Comms_ReceiveBelow

GICv3 internal communications packet that has been received and is traveling towards the top-level. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

INDEX unsigned int
: Index for the redistributor at the lower level from which this packet is being sent. Not applicable for sends from CPU interface to RD0.

GICv3_Redistributor_Comms_SendAbove

GICv3 internal communications packet that is being sent towards the top-level. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

GICv3_Redistributor_Comms_SendBelow

GICv3 internal communications packet that is being sent towards the CPU. Fields:

COMMAND enum
: The command type for this packet

DATA unsigned int
: The data (including header) contained within this packet

DATA_LENGTH unsigned int
: Number of bytes in the data (including header)

INDEX unsigned int
: Index for the redistributor at the lower level from which this packet is being sent. Not applicable for sends from CPU interface to RD0.

GICv3_RegUpdated32

Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REG_NAME `string`
: The name of the register being updated.

VALUE `unsigned int`
: The updated value.

GICv3_RegUpdated64

Fields:

REG_NAME `string`
: The name of the register being updated.

VALUE `unsigned int`
: The updated value.

GICv3_TraceWakeRequest

Fields:

INTERFACE `unsigned int`
: Index of the interface

SETnCLEAR `bool`
: Whether the signal is set(true) or cleared (false)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.82 MMU_400_BASE - trace

This section describes the trace sources.

aarch64_AddressSizeFault_base_address_out_of_range

An AArch64 context got an AddressSizeFault as the base address of the TTBR used is out of range. Fields:

CPAMax unsigned int
: Configured PAMax.

PAMax unsigned int
: Actual PAMax.

context_bank unsigned int
: context_bank.

stage unsigned int
: Stage.

aarch64_AddressSizeFault_in_final_block_address_trace

An AArch64 context got an AddressSizeFault in the final block descriptor. Fields:

CPAMax unsigned int
: Configured PAMax.

PAMax unsigned int
: Actual PAMax.

context_bank unsigned int
: context_bank.

output_address unsigned int
: Output address from stage.

stage unsigned int
: Stage.

aarch64_AddressSizeFault_in_table_descriptor

An AArch64 context got an AddressSizeFault as a descriptor encoded a page and the table base address described was out of range. Fields:

CPAMax unsigned int
: Configured PAMax.

PAMax unsigned int
: Actual PAMax.

context_bank unsigned int
: context_bank.

ipa_address unsigned int
: IPA of descriptor.

ns bool
: Descriptor address is non-secure.

pa_address unsigned int
: PA of descriptor.

stage unsigned int
: Stage.

aarch64_TranslationFault_as_block_too_large

The AArch64 block described by a descriptor is too large. Fields:

context_bank unsigned int
: context_bank.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

level unsigned int
: level.

stage unsigned int
: stage.

aarch64_TranslationFault_input_address_out_of_range

An AArch64 context received an address which was outside of the programmed TxSZ. Fields:

context_bank unsigned int
: context_bank.

input_address unsigned int
: Input address to stage.

ns bool
: Security state of context bank.

stage unsigned int
: Stage.

aarch64_TranslationFault_st2_starting_level_and_tsize_inconsistent

An AArch64 context got a TranslationFault as the specified starting level and TxSZ field are inconsistent. Fields:

context_bank unsigned int
: context_bank.

stage unsigned int
: Stage.

add_ns_context_fault

A context fault occurred and this is the record it wishes to generate. Fields:

SMMU_CBFRSYNRAn unsigned int
: SMMU_CBFRSYNRAn value that it wishes to write.

SMMU_CBn_FAR unsigned int
: SMMU_CBn_FAR value that it wishes to write.

SMMU_CBn_FSR unsigned int
: SMMU_CBn_FSR value that it wishes to write.

SMMU_CBn_FSYNR0 unsigned int
: SMMU_CBn_FSYNR0 value that it wishes to write.

SMMU_CBn_FSYNR1 unsigned int
: SMMU_CBn_FSYNR1 value that it wishes to write.

SMMU_CBn_IPAFAR unsigned int
: (SMMUv2 only) SMMU_CBn_IPAFAR value that it wishes to write. The value is UNKNOWN if this is a stage 1 context.

context_bank unsigned int
: Context bank.

going_to_be_lost bool
: This fault record is going to be lost as there is already an unhandled fault record.

add_ns_global_fault

Attempt to raise a Non-Secure global fault. Fields:

SMMU_GFAR unsigned int
: The fault address that we are attempting to record.

SMMU_GFSR unsigned int
: The bits that we are attempting to set in the SMMU_GFSR.

SMMU_GFSYNR0 unsigned int
: The syndrome we are attempting to record.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SMMU_GFSYNR1 unsigned int
: The syndrome we are attempting to record.

going_to_be_lost bool
: This fault record is going to be lost as there is already an unhandled fault record.

add_s_context_fault

A context fault occurred and this is the record it wishes to generate. Fields:

SMMU_CBFRSYNRAn unsigned int
: SMMU_CBFRSYNRAn value that it wishes to write.

SMMU_CBn_FAR unsigned int
: SMMU_CBn_FAR value that it wishes to write.

SMMU_CBn_FSR unsigned int
: SMMU_CBn_FSR value that it wishes to write.

SMMU_CBn_FSYNR0 unsigned int
: SMMU_CBn_FSYNR0 value that it wishes to write.

SMMU_CBn_FSYNR1 unsigned int
: SMMU_CBn_FSYNR1 value that it wishes to write.

SMMU_CBn_IPAFAR unsigned int
: (SMMUv2) SMMU_CBn_IPAFAR value that it wishes to read. This becomes UNKNOWN as this is a secure bank.

context_bank unsigned int
: Context bank.

going_to_be_lost bool
: This fault record is going to be lost as there is already an unhandled fault record.

add_s_global_fault

Attempt to raise a Secure global fault. Fields:

SMMU_SGFAR unsigned int
: The fault address that we are attempting to record.

SMMU_SGFSR unsigned int
: The bits that we are attempting to set in the SMMU_SGFSR.

SMMU_SGFSYNR0 unsigned int
: The syndrome we are attempting to record.

SMMU_SGFSYNR1 unsigned int
: The syndrome we are attempting to record.

going_to_be_lost bool
: This fault record is going to be lost as there is already an unhandled fault record.

ats_cb_atsr_read

A context bank Address Translation Status Register read occurred (Writes are reported through ats_cb_operation_doesnt_exist_trace). Fields:

ACTIVE bool
: The ACTIVE bit returned.

context_id unsigned int
: Context bank ID.

is_debug bool
: The access was a debug access.

ats_cb_operation_doesnt_exist

An attempt was made to use a Context Bank Address Translation Operation that didn't exist for some reason. Fields:

context_id unsigned int
: Context bank ID.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

desc string
: Description of why it doesn't exist.

ats_cb_operation_queued

A new Context Bank Address Translation Operation was queued. Fields:

VA unsigned int
: Virtual Address.

ats_is_privileged bool
: The ATS operation is asking for a 'privileged' access.

ats_is_read bool
: The ATS operation is asking for a 'read' access.

context_id unsigned int
: Context bank ID.

is_debug bool
: Is for a debug request.

ats_cb_operation_received_while_ats_in_progress

Another Context Bank Address Translation operation was received whilst one was currently in progress. This is UNPREDICTABLE. Fields:

context_id unsigned int
: Context bank ID.

desc string
: Description of new ATS operation.

ats_global_atsr_read

A Global Address Translation Status Register read occurred (Writes are reported through ats_cb_operation_doesnt_exist_trace). Fields:

ACTIVE bool
: The ACTIVE bit returned.

is_debug bool
: The access was a debug access.

which enum
: Which global ATSR register?

ats_global_operation_doesnt_exist

An attempt was made to use a Context Bank Address Translation Operation that didn't exist for some reason. Fields:

desc string
: Description of why it doesn't exist.

is_non_secure enum
: Is the operation non-secure.

ats_global_operation_queued

A new Context Bank Address Translation Operation was queued. Fields:

VA unsigned int
: Virtual Address.

ats_is_privileged bool
: The ATS operation is asking for a 'privileged' access.

ats_is_read bool
: The ATS operation is asking for a 'read' access.

context_id unsigned int
: Context bank ID.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

is_debug bool
: Is for a debug request.

is_non_secure enum
: Is the operation non-secure.

is_s12 bool
: Is a stage 1 and stage 2 translation.

ats_global_operation_received_while_ats_in_progress

Another Global Address Translation operation was received whilst one was currently in progress. This is UNPREDICTABLE. Fields:

context_id unsigned int
: Context bank ID of new operation.

desc string
: Description of new ATS operation.

is_non_secure enum
: Is the operation non-secure.

ats_op_started

A queued address translation operation has started. Fields:

VA unsigned int
: Input virtual address.

context_bank unsigned int
: Context bank if which == 'context_bank'.

is_debug bool
: The operation is a debug ATS command.

is_privileged bool
: Is a privileged operation.

is_read bool
: Is a read operation.

is_s12 bool
: Is for a stage 1 and 2 translation.

which enum
: Which group of operations?

cfg_cttw

The cfg_cttw signal level that indicates that the SoC support coherent page walks. Fields:

value bool
: The signal level.

cfg_flt_irpt

Configuration Fault Interrupt. Fields:

asserted bool
: The signal is asserted.

is_non_secure bool
: cfg_flt_irpt_ns or cfg_flt_irpt_s.

changed_PAGESIZE

The PAGESIZE has been told to change. Fields:

is_64KiB bool
: The PAGESIZE is 64 KiB.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

changing_security_state_of_context_bank

The specified bank has changed its security state. Fields:

context_bank unsigned int
: Context bank number.

now_is_non_secure bool
: The context bank is now non-secure.

prev_is_non_secure bool
: Prior to this change in the SMMU_SCR1.NSNUMCBO then the bank was non-secure.

cmo_permission_fault

A Cache Maintenance Operation (CMO) generated a permission fault. Fields:

abort_returned_to_device bool
: An abort is returned to the device.

cmo enum
: Cache Maintenance Operation.

context_id unsigned int
: Context ID that receives the fault.

input_address unsigned int
: The address of the CMO.

cmo_permission_model_being_applied

The cache maintenance operation permission model is being applied. Fields:

aarch64 bool
: Is the initial context bank aarch64?

fault_action enum
: Whether there is a fault or not.

incoming_cmo_operation enum
: The CMO operation.

instruction bool
: Is the CMO instruction?

outgoing_cmo_operation enum
: The CMO operation.

privileged bool
: Is the CMO privileged?

stage1_perms enum
: The permissions at stage 1.

stage2_perms enum
: The permissions at stage 1.

comb_irpt

Combined interrupt signal. This is the OR of all of the non-secure interrupt signals. Fields:

asserted bool
: The signal is asserted.

is_non_secure bool
: Is the comb_irpt_ns signal or the comb_irpt_s signal.

configuration_access_fault_unimplemented_stream_mapping_register_group

This occurs when a configuration transaction attempts to access a stream mapping register group that doesn't exist and if the implementation treats this as a Configuration Access Fault. Fields:

address unsigned int
: Address that was used.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

group_number unsigned int
: Group number if it were to exist/be accessible.

is_non_secure bool
: Is the configuration access non-secure?

is_read bool
: Is the configuration access a read?

context_bank_commentary

These messages are verbose commentary about what the context bank is doing. Fields:

output string
: The stream output.

context_bank_mmu_off_stage1

This is the transformation applied by the stage 1 SMMU_CBn_SCTLR. Fields:

SMMU_CBn_SCTLR unsigned int
: Value of the SMMU_CBn_SCTLR used.

context_id unsigned int
: Context bank id the transaction has been mapped to.

trans_id unsigned int
: Transaction ID.

context_bank_mmu_off_stage2

This is the transformation applied by the stage 2 SMMU_CBn_SCTLR. Fields:

SMMU_CBn_SCTLR unsigned int
: Value of the SMMU_CBn_SCTLR used.

context_id unsigned int
: Context bank id the transaction has been mapped to.

trans_id unsigned int
: Transaction ID.

ctx_irpt_ns

Context Interrupt, this can only ever be non-secure. Fields:

asserted bool
: The signal is asserted.

debug

This is the textual output of the debug messages of the SMMU model, this need not necessarily make much sense to the user, but is useful for sending to the model writers when reporting bugs. Fields:

output string
: The stream output.

denied_access_due_to_imp_def_reason

The register access was denied because of some IMPLEMENTATION DEFINED reason due to the transaction attributes. Fields:

address unsigned int
: Address of register access.

desc string
: Description of register.

denied_access_due_to_smmu_scr1_gasrae

The register access was denied because SMMU_SCR1.GASRAE has locked down the register. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

address unsigned int
: Address of register access.

dvm_tlbinvalidate_complete

The DVM TLB Invalidate message completed.

dvm_tlbinvalidate_received

A DVM message for a TLB Invalidate has been received. Fields:

address unsigned int
: The VA or IPA to use if match_address.

asid unsigned int
: The ASID to match if match_asid.

by_ipa bool
: The operation is for an IPA operation if match_address.

ignored enum
: The DVM message was ignored.

last_level bool
: The operation is for last level if supported.

match_address bool
: Match the address field.

match_asid bool
: Match the asid field.

match_vmid bool
: Match the vmid field.

prot enum
: The protection level for which this TLB Invalidate will operate on.

security_world enum
: The security world that this will apply to.

stage1_only bool
: The operation is for stage 1 only if supported.

vmid unsigned int
: The VMID to match if match_vmid.

end_stall_transaction

Indicates a transaction unstalling. Fields:

context_id unsigned int
: The context id that we are stalling against.

trans_id unsigned int
: Transaction id of replaying transaction.

unstall_state enum
: Describes why we unstalled. If we are head of line then we are either replay/terminate, otherwise we will be not be.

error

These messages are about activity occurring on the SMMU that is considered an error. Fields:

output string
: The stream output.

error_contiguous_bit_is_bad

The contiguous bit is inconsistent with the descriptor. Fields:

B_mask unsigned int
: The mask of the address that is zapped if we were to use the contiguous bit.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

aarch64_contig_bit_too_high bool
: AArch64 claims that the contig bit can't be set for this particular set of start levels and input address size.

input_address unsigned int
: The input address that will be combined with the output address.

ln2_size_in_bytes_of_region_if_contiguous unsigned int
: The number of address bits that form the 'offset' within the contiguous region.

out_of_range_of_input bool
: The range mapped by a contiguous bit being on is larger than the input range for this stage.

output_address unsigned int
: The output address as contained in the descriptor.

output_address_if_contig_bit_uses_input_address unsigned int
: Output address if contig bit was fully taken (maximally sized region) and those bits came from the input address.

output_address_inconsistent bool
: The output address in the descriptor is inconsistent with its position in the table.

stage_and_level unsigned int
: Top 8 bits are the stage, bottom 8 bits are level.

error_invalid_smmu_cbar

A SMMU_CBAR has been encountered for a secure stream that is not of the Stage 1 with Stage 2 bypass form. Fields:

SMMU_CBARn unsigned int
: The corresponding SMMU_CBARn for the context.

action enum
: Action taken.

context_id unsigned int
: Context ID.

trans_id unsigned int
: Transaction id.

error_tlb_entries_overlap

A TLB entry was attempted to be inserted into the TLB and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

end_address_of_new_entry unsigned int
: End address of new entry.

end_address_of_old_entry unsigned int
: End address of old entry.

index_of_new_entry unsigned int
: Index of new entry.

index_of_old_entry unsigned int
: Index of old entry.

start_address_of_new_entry unsigned int
: Start address of new entry.

start_address_of_old_entry unsigned int
: Start address of old entry.

extended_attributes_for_stage

This gives the attributes that a particular stage gives prior to being applied to the incoming attributes. Fields:

inner enum
: Inner cacheability.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns bool
: NS/S security state.

outer enum
: Outer cacheability.

racfg enum
: RACFG from descriptor (if exists).

shareability enum
: Shareability.

stage unsigned int
: Stage that this record is for.

trans_id unsigned int
: Transaction ID this is for.

wacfg enum
: WACFG from descriptor (if exists).

glbl_flt_irpt

Global Fault Interrupt. Fields:

asserted bool
: The signal is asserted.

is_non_secure bool
: glbl_flt_irpt_ns or glbl_flt_irpt_s.

imp_def_non_SMMU_CBn_RESUME_register_access_transaction_forces_replay

There is an IMP DEF option to replay stalled transactions in affected banks. This records that the implementation has made use of this option. Fields:

context_id unsigned int
: Context ID of affected bank.

why enum
: Why did this replay occur?

implementation_postprocess

This describes the non-architectural transformation that the implementation makes. Fields:

end_adomain enum
: End adomain value.

end_inner_acache enum
: End inner acache value.

end_outer_acache enum
: End outer acache value.

is_read bool
: Is a read transaction.

start_adomain enum
: Start adomain value.

start_inner_acache enum
: Start inner acache value.

start_outer_acache enum
: Start outer acache value.

info

These are information messages about what is happening in the SMMU. Fields:

output string
: The stream output.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

invalid_address_range

An input or output address range check failed. Input address range checks are reported as TranslationFault, output ones as AddressSizeFault. Fields:

context_bank unsigned int
: Context bank.

offending_address unsigned int
: The address that failed the address check.

why enum
: The reason why the address was invalid.

ld_access_fault

An Access Fault occurred. Fields:

context_bank unsigned int
: Context bank.

input_address unsigned int
: The input address used for this descriptor.

is_non_secure bool
: Is the input address non-secure?

level unsigned int
: Level of walk.

stage unsigned int
: Stage of walk.

ld_descriptor_fetch_failed

Long Descriptor AArch32 or AArch64, level 'n' descriptor fetch failed. Fields:

context_bank unsigned int
: Context bank.

ipa_address unsigned int
: IPA of the descriptor address.

is_non_secure bool
: Is the page walk and input addresses non-secure?

level unsigned int
: Level of walk.

pa_address unsigned int
: PA of the descriptor address.

stage unsigned int
: Stage of walk.

ld_descriptor_invalid

Long Descriptor AArch32 or AArch64 encodes an invalid entry. Fields:

context_bank unsigned int
: Context bank.

ipa_address unsigned int
: IPA of the descriptor address.

level unsigned int
: Level of walk.

pa_address unsigned int
: PA of the descriptor address.

ssd_ns bool
: Is the transaction classified as non-secure.

stage unsigned int
: Stage of walk.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ld_hyp_mode_address_out_of_range

A hypervisor input address is out of range of T0SZ. Fields:

context_bank unsigned int
: The context bank.

input_address unsigned int
: The VA input address used for this descriptor.

is_non_secure bool
: Is this for the Non-secure side?

ld_ipa_out_of_range

A stage 2 context bank was given an address that didn't match T0SZ. Fields:

context_bank unsigned int
: The context bank.

input_address_ipa unsigned int
: The IPA input address used for this descriptor.

is_non_secure bool
: Is this for the Non-secure side?

ld_ipa_out_of_range_for_st1ptw_st2_mmu_off

(SMMUv2) The stage 2 context (nested with MMU off or bypass) for a stage 1 translation had an address that was out of the allowed range. Fields:

context_bank unsigned int
: The context bank.

input_address_ipa unsigned int
: The IPA input address used for this descriptor.

is_non_secure bool
: Is this for the Non-secure side?

ld_last_level_descriptor_does_not_encode_a_page

Long Descriptor, last level descriptor must encode a page but didn't. Fields:

context_bank unsigned int
: Context bank.

ipa_address unsigned int
: IPA of the descriptor address.

level unsigned int
: Level of walk.

pa_address unsigned int
: PA of the descriptor address.

ssd_ns bool
: Is the transaction classified as non-secure?

stage unsigned int
: Stage of walk.

ld_misprogramming_fault_trace

A misprogramming occurred that the implementation faulted. Fields:

context_bank unsigned int
: Context bank.

input_address unsigned int
: Input address.

stage unsigned int
: Stage.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

why enum
: Why the fault occurred.

ld_st2_produced_any_device_memory_for_st1ptw

A stage 2 translation process for a stage 1 page walk address produce a any-device memory type. Fields:

context_bank unsigned int
: Context bank.

input_address unsigned int
: The input address used for this descriptor.

level unsigned int
: Level of walk.

ld_st2_s1ptw_has_no_access_rights

A stage 2 translation process for a stage 1 page walk address produce a permission fault. Fields:

context_bank unsigned int
: Context bank.

input_address unsigned int
: The input address used for this descriptor.

level unsigned int
: Level of walk.

ld_stage1_non_hyp_no_ttbr_match

A stage 1 non-hyp entry failed to match TTBR0 or TTBR1. Fields:

context_bank unsigned int
: The context bank.

input_address unsigned int
: The input address used.

is_non_secure bool
: Is this for the Non-secure side?

ld_walk_process_is_disabled

A L1 or L2 short descriptor access flag has disabled access for this (super-)section/page. Fields:

context_bank unsigned int
: The context bank.

input_address unsigned int
: The input address used.

is_non_secure bool
: Is this for the Non-secure side?

stage unsigned int
: Which change this corresponds to.

ttbr_id unsigned int
: Which TTBR we are using (is 0 for a stage 2).

non_PTW_external_fault_recorded

A non Page Table Walk access was recorded when a translated transaction went downstream, but the downstream system aborted it. This is recorded as an asynchronous fault. In the model, we can provide more information about the faulting transaction. Fields:

downstream_address unsigned int
: The downstream address.

downstream_ns enum
: The downstream NS state. This is not the SSD.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

is_read enum
: Is the transaction a read?

result_reported_upstream enum
: The result that is reported upstream.

sGFSYNR0 unsigned int
: The value of sGFSYNR0 that will attempt to be recorded (all 1s mean it will not be updated).

sGFSYNR1 unsigned int
: The value of sGFSYNR1 that will attempt to be recorded (all 1s mean it will not be updated).

smmu_scr1_gefro bool
: The value of SMMU_SCR1.GEFRO.

smmu_xcr0_gfre bool
: The appropriate SMMU_sCR0.GFRE bit. If this is 0 then it squash the downstream abort.

ssd_ns enum
: SSD.

upstream_address unsigned int
: The upstream address.

upstream_ns enum
: The upstream NS state. This is not the SSD.

post_s2crn_attributes

The attributes after the SMMU_S2CRn transformation has been applied. Fields:

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

inner_transient bool
: Is the transaction marked with the transient hint?

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

outer_transient bool
: Is the transaction marked with the transient hint?

trans_id unsigned int
: Transaction id.

v8_dev_gathering bool
: Is the transaction marked with the V8 Device Gathering property?

v8_dev_reordering bool
: Is the transaction marked with the V8 Device Reordering property?

ptw_read

Page Table Walk (read). This is the physical access that the SMMU is making. Fields:

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

auser unsigned int
: The AUSER fields.

data unsigned int
: The data read in little-endian format.

hyp bool
: Current mode is hyp.

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

input_address unsigned int
: Input address this lookup is for.

ns bool
: This is for SSD Non-secure.

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int
: Physical address.

result enum
: The PTW result.

st2_st1_context_banks unsigned int
: The stage 1 and 2 context bank that this walk is for (if there is one, otherwise 0xFF). Stage 1 is the lowest byte, stage 2 the highest.

stage_and_level unsigned int
: Stage and level that this walk is for. Top byte is stage, bottom is level.

trans_id unsigned int
: Transaction id.

ptw_read_st1_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

level unsigned int
: The page table level this walk is for.

ns bool
: This is for SSD Non-secure.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

ptw_read_st1_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool
: Access Flag.

AP21 enum
: The access permissions.

AttrIndx210 unsigned int
: The attribute index into the MAIR0/1.

NS bool
: The encoding is for non-secure if this is a secure fetch.

PXN bool
: Privileged eXecute Never.

SH10 enum
: The shareability.

XN bool
: eXecute Never.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

contiguous bool
: Contiguous hint.

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

level unsigned int
: The page table level this walk is for.

mair unsigned int
: The MAIRn encoding attribute.

nG bool
: not Global.

ns bool
: The agent is Non-Secure.

output_address unsigned int
: Output address.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

APTable enum
: Remove permissions independently of subsequent descriptors.

NSTable bool
: The next level table descriptor is forced to non-secure.

PXNTable bool
: Force PXN independently of subsequent descriptors.

TableAddress unsigned int
: Address of the next table.

XNTable bool
: Force XN independently of subsequent descriptors.

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

level unsigned int
: The page table level this walk is for.

ns bool
: This is for SSD Non-secure.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ptw_read_st1_v7s_fault_descriptor

Page Table Walk (read). The descriptor encodes a fault descriptor. Fields:

level unsigned int
: The level of the page table.

trans_id unsigned int
: Transaction id.

ptw_read_st1_v7s_large_page_descriptor

Page Table Walk (read). The descriptor encodes a large page descriptor. Fields:

AP210 unsigned int
: AP[2:0].

S bool
: Shareable.

TEX210CB unsigned int
: {TEX[2:0],C,B}.

XN bool
: eXecute Never.

large_page_base_address unsigned int
: Base address of the large page.

nG bool
: not Global.

trans_id unsigned int
: Transaction id.

ptw_read_st1_v7s_page_table_descriptor

Page Table Walk (read). The descriptor encodes a page table descriptor pointing to an L2 table. Fields:

NS bool
: Encodes a non-secure entry.

PXN bool
: Privileged eXecute Never.

domain unsigned int
: Domain.

l2_table_address unsigned int
: L2 page table address.

trans_id unsigned int
: Transaction id.

ptw_read_st1_v7s_section_descriptor

Page Table Walk (read). The descriptor encodes a section descriptor. Fields:

AP210 unsigned int
: AP[2:0].

NS bool
: Encodes a non-secure entry.

PXN bool
: Privileged eXecute Never.

S bool
: Shareable.

TEX210CB unsigned int
: {TEX[2:0],C,B}.

XN bool
: eXecute Never.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

domain unsigned int
: Domain.

nG bool
: not Global.

section_base_address unsigned int
: Base address of section.

trans_id unsigned int
: Transaction id.

ptw_read_st1_v7s_small_page_descriptor

Page Table Walk (read). The descriptor encodes a small page descriptor. Fields:

AP210 unsigned int
: AP[2:0].

S bool
: Shareable.

TEX210CB unsigned int
: {TEX[2:0],C,B}.

XN bool
: eXecute Never.

nG bool
: not Global.

small_page_base_address unsigned int
: Base address of the small page.

trans_id unsigned int
: Transaction id.

ptw_read_st1_v7s_super_section_descriptor

Page Table Walk (read). The descriptor encodes a section descriptor. Fields:

AP210 unsigned int
: AP[2:0].

NS bool
: Encodes a non-secure entry.

PXN bool
: Privileged eXecute Never.

S bool
: Shareable.

TEX210CB unsigned int
: {TEX[2:0],C,B}.

XN bool
: eXecute Never.

nG bool
: not Global.

super_section_base_address unsigned int
: Base address of the super section.

trans_id unsigned int
: Transaction id.

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

level unsigned int
: The page table level this walk is for.

ns bool
: This is for SSD Non-secure.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool
: Access Flag.

HAP21 enum
: The access permissions.

MemAttr3_0 enum
: The memory attributes.

RACFG enum
: The extra SMMU RACFG field.

SH10 enum
: The shareability.

WACFG enum
: The extra SMMU WACFG field.

XN bool
: eXecute Never.

contiguous bool
: Contiguous hint.

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

level unsigned int
: The page table level this walk is for.

ns bool
: This is for SSD Non-secure.

output_address unsigned int
: Output address.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

APTable enum
: Remove permissions independently of subsequent descriptors.

NSTable bool
: The next level table descriptor is forced to non-secure.

PXNTable bool
: Force PXN independently of subsequent descriptors.

TableAddress unsigned int
: Address of the next table.

XNTable bool
: Force XN independently of subsequent descriptors.

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

level unsigned int
: The page table level this walk is for.

ns bool
: This is for SSD Non-secure.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

raw_want_to_change_context_interrupt

This represents a context's bank intent to want to change an interrupt pin. However, this doesn't take into account the accessibility of the bank, nor if other banks are driving the pin. Fields:

accessible bool
: Is the interrupt ID accessible to this context bank?

asserted bool
: Is this context bank attempting to assert the interrupt?

context_bank unsigned int
: Context bank attempting to change the interrupt pin.

interrupt_id unsigned int
: The interrupt ID it is attempting to change.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string
: The text description of the register value read

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string
: The text description of the register value written

register_read

Read of the register file. Fields:

address unsigned int
: The address of the register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

context_id unsigned int
: Context id bank (or 0xFF if not a context bank)

ln2_width enum
: The log2 width of the access

ns enum
: The security state of the transaction addressing the register

register_trans_id unsigned int
: Register transaction ID (if top bit set then a debug transaction)

result enum
: The result of the access

value unsigned int
: The byte-stream of all the data (little-endian)

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string
: The text description of the register value

register_read_string

A text representation of the read of a register. Fields:

out string
: The text description of the register value read

register_write

Write to the register file. Fields:

address unsigned int
: The address of the register.

context_id unsigned int
: Context id bank (or 0xFF if not a context bank)

ln2_width enum
: The log2 width of the access

ns enum
: The security state of the transaction addressing the register

register_trans_id unsigned int
: Register transaction ID (if top bit set then a debug transaction)

result enum
: The result of the access

value unsigned int
: The byte-stream of all the data (little-endian)

register_write_reserved

A text representation of an access to a register address that is reserved. Fields:

in string
: The text description of the register value

register_write_string

A text representation of the write of a register. Fields:

in string
: The text description of the register value written

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

reset_sequence

Marks the beginning and end of the reset sequence. Fields:

starting bool
: True if starting the reset sequence, false when finished.

signal_reset

The reset signal level. Fields:

value bool
: The signal level.

smmu_faulting_transaction

This is a trace of transaction that are not expected to fault. This does not include those transaction that are faulting by stage 2 or where the access flag or permission model is not allowing the transaction. Fields:

context_id unsigned int
: The context id of the transaction used, if we failed to immediately hit in the TLB.

input_address unsigned int
: The input address of the transaction group.

mapped_attributes unsigned int
: The mapped attributes of the transaction.

original_attributes unsigned int
: The original unmapped attributes of the transaction.

output_address unsigned int
: The output address of the transaction group.

ssd_index unsigned int
: The Security State Determination Index if applicable.

ssd_ns enum
: The Security State Determination of the transaction.

state enum
: The state of the transaction.

stream_id unsigned int
: The stream id of the transaction

tbu unsigned int
: Translation Buffer Unit number.

tlb_entry_index_st1 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 1 translation.

tlb_entry_index_st2 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 2 translation.

trans_id unsigned int
: Transaction id.

type_of_transaction enum
: The type of transaction.

smmu_final_transaction

This is a trace of the SMMU transaction after it has been fully remapped. Fields:

context_id unsigned int
: The context id of the transaction used, if we failed to immediately hit in the TLB.

input_address unsigned int
: The input address of the transaction group.

mapped_attributes unsigned int
: The mapped attributes of the transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

original_attributes unsigned int
: The original unmapped attributes of the transaction.

output_address unsigned int
: The output address of the transaction group.

ssd_index unsigned int
: The Security State Determination Index if applicable.

ssd_ns enum
: The Security State Determination of the transaction.

state enum
: The state of the transaction.

stream_id unsigned int
: The stream id of the transaction

tbu unsigned int
: Translation Buffer Unit number.

tlb_entry_index_st1 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 1 translation.

tlb_entry_index_st2 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 2 translation.

trans_id unsigned int
: Transaction id.

type_of_transaction enum
: The type of transaction.

smmu_initial_transaction

This is the initial transaction group request to remap. This represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. Fields:

input_address unsigned int
: The input address of the transaction group.

kind_addressed enum
: The kind of transaction this represents if it is an addressed transaction

original_attributes unsigned int
: The original unmapped attributes of the transaction.

ssd_index unsigned int
: The Security State Determination Index if applicable.

ssd_ns enum
: The Security State Determination of the transaction.

stream_id unsigned int
: The stream id of the transaction.

tbu unsigned int
: Translation Buffer Unit number.

trans_id unsigned int
: Transaction id.

type_of_transaction enum
: The type of transaction.

smmu_iprt_xgirpt

This trace source records the state of the SMMU_gIrpt/SMMU_NSgIrpt pins. Fields:

asserted bool
: The interrupt is now asserted.

is_non_secure bool
: Identifies the pin as SMMU_NSgIrpt.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

smmu_irpt_combined_context_interrupt_pin

This trace source records when there is at least one context bank in the specific world with an interrupt pin raised. Fields:

asserted bool
: The interrupt is now asserted.

ns bool
: Non-secure

smmu_irpt_context_interrupt_pin

This trace source records when a context bank interrupt pin changes state. Fields:

asserted bool
: The interrupt is now asserted.

interrupt_pin unsigned int
: Interrupt pin number.

smmu_irpt_context_interrupt_pin_drivers

This trace source records when a context bank tries to assert an interrupt. Multiple banks can drive the same pin and so long as one is driving it then it is asserted. Fields:

context_bank unsigned int
: The context bank number changing its request for the pin

interrupt_pin unsigned int
: Interrupt pin number.

new_count_asserting_pin unsigned int
: The number of banks asserting the pin

this_context_asserting bool
: The request that this context is making -- if this is true then the context bank is asserting a request

smmu_irpt_xgcfgirpt

This trace source records the state of the SMMU_gCfgIrpt/SMMU_NSgCfgIrpt pins. Fields:

asserted bool
: The interrupt is now asserted.

is_non_secure bool
: Identifies the pin as SMMU_NSgCfgIrpt.

smmu_st1_st2fault_transaction

This is a trace of transactions that map to stage 1 with stage 2 faulting. Fields:

context_id unsigned int
: The context id of the transaction used, if we failed to immediately hit in the TLB.

input_address unsigned int
: The input address of the transaction group.

mapped_attributes unsigned int
: The mapped attributes of the transaction.

original_attributes unsigned int
: The original unmapped attributes of the transaction.

output_address unsigned int
: The output address of the transaction group.

ssd_index unsigned int
: The Security State Determination Index if applicable.

ssd_ns enum
: The Security State Determination of the transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

state enum
: The state of the transaction.

stream_id unsigned int
: The stream id of the transaction

tbu unsigned int
: Translation Buffer Unit number.

tlb_entry_index_st1 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 1 translation.

tlb_entry_index_st2 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 2 translation.

trans_id unsigned int
: Transaction id.

type_of_transaction enum
: The type of transaction.

smrg_matched

Stream Match Register Group matched. Fields:

desc string
: A textual description of the register group

n unsigned int
: The SMRG that we matched against.

trans_id unsigned int
: The transaction id that we are matching against.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

auser unsigned int
: The AUSER fields.

hyp bool
: Current mode is hyp.

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int
: Input address this lookup is for.

ns bool
: This is for SSD Non-secure.

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int
: Physical address.

st2_st1_context_banks unsigned int
: The stage 1 and 2 context bank that this walk is for (if there is one, otherwise 0xFF). Stage 1 is the lowest byte, stage 2 the highest.

stage_and_level unsigned int
: Stage and level that this walk is for. Top byte is stage, bottom is level.

trans_id unsigned int
: Transaction id.

start_stall_transaction

Indicating that a transaction is stalled. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

context_id unsigned int
: The context id that we are stalling against.

head_of_line bool
: The transaction is the head-of-line to stall -- it is the one that will pick up the value of SMMU_CBn_RESUME.

reason_for_stall enum
: The state of the transaction as to why it stalled.

trans_id unsigned int
: Transaction id of replaying transaction.

tlb_commentary

A commentary from the TLB about what is going on. Fields:

output string
: The stream output.

tlb_entry_allocated

A TLB entry has been allocated. Fields:

index unsigned int
: Index of TLB entry.

input_end_incl_address unsigned int
: The end inclusive address of the input range that this matches.

input_start_address unsigned int
: The start address of the input range that this matches.

output_end_incl_address unsigned int
: The end inclusive address of the output range.

output_start_address unsigned int
: The start address of the output range.

tlb_entry_invalidated

A TLB entry has been invalidated for some reason. Fields:

index unsigned int
: Index of TLB entry.

reason enum
: The reason why it was invalidated.

tlb_invalidate_command_executed

A TLB Invalidate command was executed. Fields:

address unsigned int
: Address if appropriate.

asid unsigned int
: ASID if appropriate.

command enum
: Command queued

context_bank unsigned int
: Context bank number if queue_type is 'context_bank'.

last_level bool
: Last level if appropriate.

ns bool
: Security world if appropriate.

queue_type enum
: Queue added to

seq_id unsigned int
: Sequence id for this TLB invalidate.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

vmid unsigned int
VMID if appropriate.

tlb_invalidate_command_queued

A TLB Invalidate command was queued (but not synced). Fields:

address unsigned int
Address if appropriate.
asid unsigned int
ASID if appropriate.
command enum
Command queued
context_bank unsigned int
Context bank number if queue_type is 'context_bank'.
last_level bool
Last level if appropriate.
ns bool
Security world if appropriate.
queue_type enum
Queue added to
seq_id unsigned int
Sequence id for this TLB invalidate.
vmid unsigned int
VMID if appropriate.

tlb_sync

A TLB Sync command was issued. Fields:

context_bank unsigned int
Context bank number if queue_type is 'context_bank'.
ns bool
Security world
queue_type enum
Queues that will be synced

unpred_nested_st2_bank_is_not_marked_as_st2

The Stage 1 context bank is marked as Stage 1 + Stage 2 by SMMU_CBARn.TYPE; however, the Stage 2 context bank marked by SMMU_CBARn.CBNDX is not marked in it's SMMU_CBARm.TYPE as a Stage 2 context. Fields:

st1_context_bank_id unsigned int
The context bank id of the stage 1 bank.
st2_context_bank_id unsigned int
The context bank id of the stage 2 bank.

unpred_ptw_replay_asked_for_different_data

A PTW was in progress and was restarted (for some reason), but this time it asked for different data than last time. This means that the register file changed during the walk process and so the result of the translation for this transaction is unpredictable as to whether it would have seen the first or second walk data. Fields:

first_address unsigned int
The address of the first walk transaction that it performed.
first_ns bool
The NS state of the first walk transaction that it performed.
second_address unsigned int
The address that it is now walking for.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

second_ns bool
: The NS state that it is now walking for.

trans_id unsigned int
: Transaction ID that was affected.

v7sd_access_fault

A L1 or L2 short descriptor access flag has disabled access for this (super-)section/page. Fields:

context_bank unsigned int
: Context bank.

input_address unsigned int
: The input address used for this descriptor.

is_non_secure bool
: Is this for the Non-secure side?

level unsigned int
: Level of walk.

v7sd_descriptor_faults

V7 Short Descriptor, level 'n' descriptor is marked as faulting. Fields:

context_bank unsigned int
: Context bank.

input_address unsigned int
: The input address used for this descriptor.

is_non_secure bool
: Is this for the Non-secure side?

level unsigned int
: Level of walk.

v7sd_descriptor_fetch_failed

V7 Short Descriptor, level 'n' descriptor fetch failed. Fields:

context_bank unsigned int
: Context bank.

ipa_address unsigned int
: IPA of the descriptor address.

is_non_secure bool
: Is the page walk and input addresses non-secure?

level unsigned int
: Level of walk.

pa_address unsigned int
: PA of the descriptor address.

v7sd_walk_process_is_disabled

V7 Short Descriptor, walk process is disabled so producing a fault. Fields:

context_bank unsigned int
: Context bank.

warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the SMMU. Fields:

output string
: The stream output.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

warning_failed_to_clear_fsr_before_resuming

The programming model expects for the user to clear the fault in the FSR before calling SMMU_CBn_RESUME to unstall a transaction. Fields:

context_id `unsigned int`
: Context ID of the FSR.

fault_flags_of_fsr `unsigned int`
: Value of the fault bits of the FSR (excludes SS and the Format field).

warning_multiple_match_transaction

A transaction was encountered that multiple matched the stream id registers. Fields:

action `enum`
: Action taken.

trans_id `unsigned int`
: Transaction id.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc `string`
: The textual description of what happened.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.83 MMU_500_BASE - trace

This section describes the trace sources.

SMMU_SACR_change_PAGESIZE

The PAGESIZE of the device was changed by a write to the SMMU_SACR register. Fields:

is_64KiB bool
: The PAGESIZE is 64KiB.

aarch64_AddressSizeFault_base_address_out_of_range

An AArch64 context got an AddressSizeFault as the base address of the TTBR used is out of range. Fields:

CPAMax unsigned int
: Configured PAMax.

PAMax unsigned int
: Actual PAMax.

context_bank unsigned int
: context_bank.

stage unsigned int
: Stage.

aarch64_AddressSizeFault_in_final_block_address_trace

An AArch64 context got an AddressSizeFault in the final block descriptor. Fields:

CPAMax unsigned int
: Configured PAMax.

PAMax unsigned int
: Actual PAMax.

context_bank unsigned int
: context_bank.

output_address unsigned int
: Output address from stage.

stage unsigned int
: Stage.

aarch64_AddressSizeFault_in_table_descriptor

An AArch64 context got an AddressSizeFault as a descriptor encoded a page and the table base address described was out of range. Fields:

CPAMax unsigned int
: Configured PAMax.

PAMax unsigned int
: Actual PAMax.

context_bank unsigned int
: context_bank.

ipa_address unsigned int
: IPA of descriptor.

ns bool
: Descriptor address is non-secure.

pa_address unsigned int
: PA of descriptor.

stage unsigned int
: Stage.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

aarch64_TranslationFault_as_block_too_large

The AArch64 block described by a descriptor is too large. Fields:

context_bank unsigned int
: context_bank.

level unsigned int
: level.

stage unsigned int
: stage.

aarch64_TranslationFault_input_address_out_of_range

An AArch64 context received an address which was outside of the programmed TxSZ. Fields:

context_bank unsigned int
: context_bank.

input_address unsigned int
: Input address to stage.

ns bool
: Security state of context bank.

stage unsigned int
: Stage.

aarch64_TranslationFault_st2_starting_level_and_tsize_inconsistent

An AArch64 context got a TranslationFault as the specified starting level and TxSZ field are inconsistent. Fields:

context_bank unsigned int
: context_bank.

stage unsigned int
: Stage.

add_ns_context_fault

A context fault occurred and this is the record it wishes to generate. Fields:

SMMU_CBFRSYNRAn unsigned int
: SMMU_CBFRSYNRAn value that it wishes to write.

SMMU_CBn_FAR unsigned int
: SMMU_CBn_FAR value that it wishes to write.

SMMU_CBn_FSR unsigned int
: SMMU_CBn_FSR value that it wishes to write.

SMMU_CBn_FSYNR0 unsigned int
: SMMU_CBn_FSYNR0 value that it wishes to write.

SMMU_CBn_FSYNR1 unsigned int
: SMMU_CBn_FSYNR1 value that it wishes to write.

SMMU_CBn_IPAFAR unsigned int
: (SMMUv2 only) SMMU_CBn_IPAFAR value that it wishes to write. The value is UNKNOWN if this is a stage 1 context.

context_bank unsigned int
: Context bank.

going_to_be_lost bool
: This fault record is going to be lost as there is already an unhandled fault record.

add_ns_global_fault

Attempt to raise a Non-Secure global fault. Fields:

SMMU_GFAR unsigned int
: The fault address that we are attempting to record.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SMMU_GFSR unsigned int
: The bits that we are attempting to set in the SMMU_GFSR.

SMMU_GFSYNR0 unsigned int
: The syndrome we are attempting to record.

SMMU_GFSYNR1 unsigned int
: The syndrome we are attempting to record.

going_to_be_lost bool
: This fault record is going to be lost as there is already an unhandled fault record.

add_s_context_fault

A context fault occurred and this is the record it wishes to generate. Fields:

SMMU_CBFRSYNRAn unsigned int
: SMMU_CBFRSYNRAn value that it wishes to write.

SMMU_CBn_FAR unsigned int
: SMMU_CBn_FAR value that it wishes to write.

SMMU_CBn_FSR unsigned int
: SMMU_CBn_FSR value that it wishes to write.

SMMU_CBn_FSYNR0 unsigned int
: SMMU_CBn_FSYNR0 value that it wishes to write.

SMMU_CBn_FSYNR1 unsigned int
: SMMU_CBn_FSYNR1 value that it wishes to write.

SMMU_CBn_IPAFAR unsigned int
: (SMMUv2) SMMU_CBn_IPAFAR value that it wishes to read. This becomes UNKNOWN as this is a secure bank.

context_bank unsigned int
: Context bank.

going_to_be_lost bool
: This fault record is going to be lost as there is already an unhandled fault record.

add_s_global_fault

Attempt to raise a Secure global fault. Fields:

SMMU_SGFAR unsigned int
: The fault address that we are attempting to record.

SMMU_SGFSR unsigned int
: The bits that we are attempting to set in the SMMU_SGFSR.

SMMU_SGFSYNR0 unsigned int
: The syndrome we are attempting to record.

SMMU_SGFSYNR1 unsigned int
: The syndrome we are attempting to record.

going_to_be_lost bool
: This fault record is going to be lost as there is already an unhandled fault record.

ats_cb_atsr_read

A context bank Address Translation Status Register read occurred (Writes are reported through ats_cb_operation_doesnt_exist_trace). Fields:

ACTIVE bool
: The ACTIVE bit returned.

context_id unsigned int
: Context bank ID.

is_debug bool
: The access was a debug access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ats_cb_operation_doesnt_exist

An attempt was made to use a Context Bank Address Translation Operation that didn't exist for some reason. Fields:

context_id unsigned int
: Context bank ID.

desc string
: Description of why it doesn't exist.

ats_cb_operation_queued

A new Context Bank Address Translation Operation was queued. Fields:

VA unsigned int
: Virtual Address.

ats_is_privileged bool
: The ATS operation is asking for a 'privileged' access.

ats_is_read bool
: The ATS operation is asking for a 'read' access.

context_id unsigned int
: Context bank ID.

is_debug bool
: Is for a debug request.

ats_cb_operation_received_while_ats_in_progress

Another Context Bank Address Translation operation was received whilst one was currently in progress. This is UNPREDICTABLE. Fields:

context_id unsigned int
: Context bank ID.

desc string
: Description of new ATS operation.

ats_global_atsr_read

A Global Address Translation Status Register read occurred (Writes are reported through ats_cb_operation_doesnt_exist_trace). Fields:

ACTIVE bool
: The ACTIVE bit returned.

is_debug bool
: The access was a debug access.

which enum
: Which global ATSR register?

ats_global_operation_doesnt_exist

An attempt was made to use a Context Bank Address Translation Operation that didn't exist for some reason. Fields:

desc string
: Description of why it doesn't exist.

is_non_secure enum
: Is the operation non-secure.

ats_global_operation_queued

A new Context Bank Address Translation Operation was queued. Fields:

VA unsigned int
: Virtual Address.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ats_is_privileged bool
: The ATS operation is asking for a 'privileged' access.

ats_is_read bool
: The ATS operation is asking for a 'read' access.

context_id unsigned int
: Context bank ID.

is_debug bool
: Is for a debug request.

is_non_secure enum
: Is the operation non-secure.

is_s12 bool
: Is a stage 1 and stage 2 translation.

ats_global_operation_received_while_ats_in_progress

Another Global Address Translation operation was received whilst one was currently in progress. This is UNPREDICTABLE. Fields:

context_id unsigned int
: Context bank ID of new operation.

desc string
: Description of new ATS operation.

is_non_secure enum
: Is the operation non-secure.

ats_op_started

A queued address translation operation has started. Fields:

VA unsigned int
: Input virtual address.

context_bank unsigned int
: Context bank if which == 'context_bank'.

is_debug bool
: The operation is a debug ATS command.

is_privileged bool
: Is a privileged operation.

is_read bool
: Is a read operation.

is_s12 bool
: Is for a stage 1 and 2 translation.

which enum
: Which group of operations?

cfg_cttw

The cfg_cttw signal level that indicates that the SoC support coherent page walks. Fields:

value bool
: The signal level.

changed_PAGESIZE

The PAGESIZE has been told to change. Fields:

is_64KiB bool
: The PAGESIZE is 64 KiB.

changing_security_state_of_context_bank

The specified bank has changed its security state. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

context_bank unsigned int
: Context bank number.

now_is_non_secure bool
: The context bank is now non-secure.

prev_is_non_secure bool
: Prior to this change in the SMMU_SCR1.NSNUMCBO then the bank was non-secure.

cmo_permission_fault

A Cache Maintenance Operation (CMO) generated a permission fault. Fields:

abort_returned_to_device bool
: An abort is returned to the device.

cmo enum
: Cache Maintenance Operation.

context_id unsigned int
: Context ID that receives the fault.

input_address unsigned int
: The address of the CMO.

cmo_permission_model_being_applied

The cache maintenance operation permission model is being applied. Fields:

aarch64 bool
: Is the initial context bank aarch64?

fault_action enum
: Whether there is a fault or not.

incoming_cmo_operation enum
: The CMO operation.

instruction bool
: Is the CMO instruction?

outgoing_cmo_operation enum
: The CMO operation.

privileged bool
: Is the CMO privileged?

stage1_perms enum
: The permissions at stage 1.

stage2_perms enum
: The permissions at stage 1.

comb_irpt

Combined interrupt signal. This is the OR of all of the non-secure interrupt signals. Fields:

asserted bool
: The signal is asserted.

is_non_secure bool
: Is the comb_irpt_ns signal or the comb_irpt_s signal.

configuration_access_fault_unimplemented_stream_mapping_register_group

This occurs when a configuration transaction attempts to access a stream mapping register group that doesn't exist and if the implementation treats this as a Configuration Access Fault. Fields:

address unsigned int
: Address that was used.

group_number unsigned int
: Group number if it were to exist/be accessible.

is_non_secure bool
: Is the configuration access non-secure?

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

is_read bool
: Is the configuration access a read?

context_bank_commentary

These messages are verbose commentary about what the context bank is doing. Fields:

output string
: The stream output.

context_bank_mmu_off_stage1

This is the transformation applied by the stage 1 SMMU_CBn_SCTLR. Fields:

SMMU_CBn_SCTLR unsigned int
: Value of the SMMU_CBn_SCTLR used.

context_id unsigned int
: Context bank id the transaction has been mapped to.

trans_id unsigned int
: Transaction ID.

context_bank_mmu_off_stage2

This is the transformation applied by the stage 2 SMMU_CBn_SCTLR. Fields:

SMMU_CBn_SCTLR unsigned int
: Value of the SMMU_CBn_SCTLR used.

context_id unsigned int
: Context bank id the transaction has been mapped to.

trans_id unsigned int
: Transaction ID.

ctx_irpt

Context Interrupt. Fields:

asserted bool
: The signal is asserted.

context_id unsigned int
: The context id of the interrupt.

debug

This is the textual output of the debug messages of the SMMU model, this need not necessarily make much sense to the user, but is useful for sending to the model writers when reporting bugs. Fields:

output string
: The stream output.

denied_access_due_to_imp_def_reason

The register access was denied because of some IMPLEMENTATION DEFINED reason due to the transaction attributes. Fields:

address unsigned int
: Address of register access.

desc string
: Description of register.

denied_access_due_to_smmu_scr1_gasrae

The register access was denied because SMMU_SCR1.GASRAE has locked down the register. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

address unsigned int
: Address of register access.

dvm_tlbinvalidate_complete

The DVM TLB Invalidate message completed.

dvm_tlbinvalidate_received

A DVM message for a TLB Invalidate has been received. Fields:

address unsigned int
: The VA or IPA to use if match_address.

asid unsigned int
: The ASID to match if match_asid.

by_ipa bool
: The operation is for an IPA operation if match_address.

ignored enum
: The DVM message was ignored.

last_level bool
: The operation is for last level if supported.

match_address bool
: Match the address field.

match_asid bool
: Match the asid field.

match_vmid bool
: Match the vmid field.

prot enum
: The protection level for which this TLB Invalidate will operate on.

security_world enum
: The security world that this will apply to.

stage1_only bool
: The operation is for stage 1 only if supported.

vmid unsigned int
: The VMID to match if match_vmid.

end_stall_transaction

Indicates a transaction unstalling. Fields:

context_id unsigned int
: The context id that we are stalling against.

trans_id unsigned int
: Transaction id of replaying transaction.

unstall_state enum
: Describes why we unstalled. If we are head of line then we are either replay/terminate, otherwise we will be not be.

error

These messages are about activity occurring on the SMMU that is considered an error. Fields:

output string
: The stream output.

error_contiguous_bit_is_bad

The contiguous bit is inconsistent with the descriptor. Fields:

B_mask unsigned int
: The mask of the address that is zapped if we were to use the contiguous bit.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

aarch64_contig_bit_too_high bool
: AArch64 claims that the contig bit can't be set for this particular set of start levels and input address size.

input_address unsigned int
: The input address that will be combined with the output address.

ln2_size_in_bytes_of_region_if_contiguous unsigned int
: The number of address bits that form the 'offset' within the contiguous region.

out_of_range_of_input bool
: The range mapped by a contiguous bit being on is larger than the input range for this stage.

output_address unsigned int
: The output address as contained in the descriptor.

output_address_if_contig_bit_uses_input_address unsigned int
: Output address if contig bit was fully taken (maximally sized region) and those bits came from the input address.

output_address_inconsistent bool
: The output address in the descriptor is inconsistent with its position in the table.

stage_and_level unsigned int
: Top 8 bits are the stage, bottom 8 bits are level.

error_invalid_smmu_cbar

A SMMU_CBAR has been encountered for a secure stream that is not of the Stage 1 with Stage 2 bypass form. Fields:

SMMU_CBARn unsigned int
: The corresponding SMMU_CBARn for the context.

action enum
: Action taken.

context_id unsigned int
: Context ID.

trans_id unsigned int
: Transaction id.

error_tlb_entries_overlap

A TLB entry was attempted to be inserted into the TLB and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

end_address_of_new_entry unsigned int
: End address of new entry.

end_address_of_old_entry unsigned int
: End address of old entry.

index_of_new_entry unsigned int
: Index of new entry.

index_of_old_entry unsigned int
: Index of old entry.

start_address_of_new_entry unsigned int
: Start address of new entry.

start_address_of_old_entry unsigned int
: Start address of old entry.

extended_attributes_for_stage

This gives the attributes that a particular stage gives prior to being applied to the incoming attributes. Fields:

inner enum
: Inner cacheability.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns bool
: NS/S security state.

outer enum
: Outer cacheability.

racfg enum
: RACFG from descriptor (if exists).

shareability enum
: Shareability.

stage unsigned int
: Stage that this record is for.

trans_id unsigned int
: Transaction ID this is for.

wacfg enum
: WACFG from descriptor (if exists).

glbl_flt_irpt

Global Fault Interrupt. Fields:

asserted bool
: The signal is asserted.

is_non_secure bool
: glbl_flt_irpt_ns or glbl_flt_irpt_s.

imp_def_non_SMMU_CBn_RESUME_register_access_transaction_forces_replay

There is an IMP DEF option to replay stalled transactions in affected banks. This records that the implementation has made use of this option. Fields:

context_id unsigned int
: Context ID of affected bank.

why enum
: Why did this replay occur?

implementation_postprocess

This describes the non-architectural transformation that the implementation makes. Fields:

end_adomain enum
: End adomain value.

end_inner_acache enum
: End inner acache value.

end_outer_acache enum
: End outer acache value.

is_read bool
: Is a read transaction.

start_adomain enum
: Start adomain value.

start_inner_acache enum
: Start inner acache value.

start_outer_acache enum
: Start outer acache value.

info

These are information messages about what is happening in the SMMU. Fields:

output string
: The stream output.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

invalid_address_range

An input or output address range check failed. Input address range checks are reported as TranslationFault, output ones as AddressSizeFault. Fields:

context_bank unsigned int
: Context bank.

offending_address unsigned int
: The address that failed the address check.

why enum
: The reason why the address was invalid.

ld_access_fault

An Access Fault occurred. Fields:

context_bank unsigned int
: Context bank.

input_address unsigned int
: The input address used for this descriptor.

is_non_secure bool
: Is the input address non-secure?

level unsigned int
: Level of walk.

stage unsigned int
: Stage of walk.

ld_descriptor_fetch_failed

Long Descriptor AArch32 or AArch64, level 'n' descriptor fetch failed. Fields:

context_bank unsigned int
: Context bank.

ipa_address unsigned int
: IPA of the descriptor address.

is_non_secure bool
: Is the page walk and input addresses non-secure?

level unsigned int
: Level of walk.

pa_address unsigned int
: PA of the descriptor address.

stage unsigned int
: Stage of walk.

ld_descriptor_invalid

Long Descriptor AArch32 or AArch64 encodes an invalid entry. Fields:

context_bank unsigned int
: Context bank.

ipa_address unsigned int
: IPA of the descriptor address.

level unsigned int
: Level of walk.

pa_address unsigned int
: PA of the descriptor address.

ssd_ns bool
: Is the transaction classified as non-secure.

stage unsigned int
: Stage of walk.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ld_hyp_mode_address_out_of_range

A hypervisor input address is out of range of T0SZ. Fields:

context_bank unsigned int
: The context bank.

input_address unsigned int
: The VA input address used for this descriptor.

is_non_secure bool
: Is this for the Non-secure side?

ld_ipa_out_of_range

A stage 2 context bank was given an address that didn't match T0SZ. Fields:

context_bank unsigned int
: The context bank.

input_address_ipa unsigned int
: The IPA input address used for this descriptor.

is_non_secure bool
: Is this for the Non-secure side?

ld_ipa_out_of_range_for_st1ptw_st2_mmu_off

(SMMUv2) The stage 2 context (nested with MMU off or bypass) for a stage 1 translation had an address that was out of the allowed range. Fields:

context_bank unsigned int
: The context bank.

input_address_ipa unsigned int
: The IPA input address used for this descriptor.

is_non_secure bool
: Is this for the Non-secure side?

ld_last_level_descriptor_does_not_encode_a_page

Long Descriptor, last level descriptor must encode a page but didn't. Fields:

context_bank unsigned int
: Context bank.

ipa_address unsigned int
: IPA of the descriptor address.

level unsigned int
: Level of walk.

pa_address unsigned int
: PA of the descriptor address.

ssd_ns bool
: Is the transaction classified as non-secure?

stage unsigned int
: Stage of walk.

ld_misprogramming_fault_trace

A misprogramming occurred that the implementation faulted. Fields:

context_bank unsigned int
: Context bank.

input_address unsigned int
: Input address.

stage unsigned int
: Stage.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

why enum
: Why the fault occurred.

ld_st2_produced_any_device_memory_for_st1ptw

A stage 2 translation process for a stage 1 page walk address produce a any-device memory type. Fields:

context_bank unsigned int
: Context bank.

input_address unsigned int
: The input address used for this descriptor.

level unsigned int
: Level of walk.

ld_st2_s1ptw_has_no_access_rights

A stage 2 translation process for a stage 1 page walk address produce a permission fault. Fields:

context_bank unsigned int
: Context bank.

input_address unsigned int
: The input address used for this descriptor.

level unsigned int
: Level of walk.

ld_stage1_non_hyp_no_ttbr_match

A stage 1 non-hyp entry failed to match TTBR0 or TTBR1. Fields:

context_bank unsigned int
: The context bank.

input_address unsigned int
: The input address used.

is_non_secure bool
: Is this for the Non-secure side?

ld_walk_process_is_disabled

A L1 or L2 short descriptor access flag has disabled access for this (super-)section/page. Fields:

context_bank unsigned int
: The context bank.

input_address unsigned int
: The input address used.

is_non_secure bool
: Is this for the Non-secure side?

stage unsigned int
: Which change this corresponds to.

ttbr_id unsigned int
: Which TTBR we are using (is 0 for a stage 2).

non_PTW_external_fault_recorded

A non Page Table Walk access was recorded when a translated transaction went downstream, but the downstream system aborted it. This is recorded as an asynchronous fault. In the model, we can provide more information about the faulting transaction. Fields:

downstream_address unsigned int
: The downstream address.

downstream_ns enum
: The downstream NS state. This is not the SSD.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

is_read enum
: Is the transaction a read?

result_reported_upstream enum
: The result that is reported upstream.

sGFSYNR0 unsigned int
: The value of sGFSYNR0 that will attempt to be recorded (all 1s mean it will not be updated).

sGFSYNR1 unsigned int
: The value of sGFSYNR1 that will attempt to be recorded (all 1s mean it will not be updated).

smmu_scr1_gefro bool
: The value of SMMU_SCR1.GEFRO.

smmu_xcr0_gfre bool
: The appropriate SMMU_sCR0.GFRE bit. If this is 0 then it squash the downstream abort.

ssd_ns enum
: SSD.

upstream_address unsigned int
: The upstream address.

upstream_ns enum
: The upstream NS state. This is not the SSD.

post_s2crn_attributes

The attributes after the SMMU_S2CRn transformation has been applied. Fields:

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

inner_transient bool
: Is the transaction marked with the transient hint?

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

outer_transient bool
: Is the transaction marked with the transient hint?

trans_id unsigned int
: Transaction id.

v8_dev_gathering bool
: Is the transaction marked with the V8 Device Gathering property?

v8_dev_reordering bool
: Is the transaction marked with the V8 Device Reordering property?

ptw_read

Page Table Walk (read). This is the physical access that the SMMU is making. Fields:

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

auser unsigned int
: The AUSER fields.

data unsigned int
: The data read in little-endian format.

hyp bool
: Current mode is hyp.

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

input_address unsigned int
: Input address this lookup is for.

ns bool
: This is for SSD Non-secure.

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int
: Physical address.

result enum
: The PTW result.

st2_st1_context_banks unsigned int
: The stage 1 and 2 context bank that this walk is for (if there is one, otherwise 0xFF). Stage 1 is the lowest byte, stage 2 the highest.

stage_and_level unsigned int
: Stage and level that this walk is for. Top byte is stage, bottom is level.

trans_id unsigned int
: Transaction id.

ptw_read_st1_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

level unsigned int
: The page table level this walk is for.

ns bool
: This is for SSD Non-secure.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

ptw_read_st1_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool
: Access Flag.

AP21 enum
: The access permissions.

AttrIndx210 unsigned int
: The attribute index into the MAIR0/1.

NS bool
: The encoding is for non-secure if this is a secure fetch.

PXN bool
: Privileged eXecute Never.

SH10 enum
: The shareability.

XN bool
: eXecute Never.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

contiguous bool
: Contiguous hint.

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

level unsigned int
: The page table level this walk is for.

mair unsigned int
: The MAIRn encoding attribute.

nG bool
: not Global.

ns bool
: The agent is Non-Secure.

output_address unsigned int
: Output address.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

APTable enum
: Remove permissions independently of subsequent descriptors.

NSTable bool
: The next level table descriptor is forced to non-secure.

PXNTable bool
: Force PXN independently of subsequent descriptors.

TableAddress unsigned int
: Address of the next table.

XNTable bool
: Force XN independently of subsequent descriptors.

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

level unsigned int
: The page table level this walk is for.

ns bool
: This is for SSD Non-secure.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ptw_read_st1_v7s_fault_descriptor

Page Table Walk (read). The descriptor encodes a fault descriptor. Fields:

level unsigned int
: The level of the page table.

trans_id unsigned int
: Transaction id.

ptw_read_st1_v7s_large_page_descriptor

Page Table Walk (read). The descriptor encodes a large page descriptor. Fields:

AP210 unsigned int
: AP[2:0].

S bool
: Shareable.

TEX210CB unsigned int
: {TEX[2:0],C,B}.

XN bool
: eXecute Never.

large_page_base_address unsigned int
: Base address of the large page.

nG bool
: not Global.

trans_id unsigned int
: Transaction id.

ptw_read_st1_v7s_page_table_descriptor

Page Table Walk (read). The descriptor encodes a page table descriptor pointing to an L2 table. Fields:

NS bool
: Encodes a non-secure entry.

PXN bool
: Privileged eXecute Never.

domain unsigned int
: Domain.

l2_table_address unsigned int
: L2 page table address.

trans_id unsigned int
: Transaction id.

ptw_read_st1_v7s_section_descriptor

Page Table Walk (read). The descriptor encodes a section descriptor. Fields:

AP210 unsigned int
: AP[2:0].

NS bool
: Encodes a non-secure entry.

PXN bool
: Privileged eXecute Never.

S bool
: Shareable.

TEX210CB unsigned int
: {TEX[2:0],C,B}.

XN bool
: eXecute Never.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

domain unsigned int
: Domain.

nG bool
: not Global.

section_base_address unsigned int
: Base address of section.

trans_id unsigned int
: Transaction id.

ptw_read_st1_v7s_small_page_descriptor

Page Table Walk (read). The descriptor encodes a small page descriptor. Fields:

AP210 unsigned int
: AP[2:0].

S bool
: Shareable.

TEX210CB unsigned int
: {TEX[2:0],C,B}.

XN bool
: eXecute Never.

nG bool
: not Global.

small_page_base_address unsigned int
: Base address of the small page.

trans_id unsigned int
: Transaction id.

ptw_read_st1_v7s_super_section_descriptor

Page Table Walk (read). The descriptor encodes a section descriptor. Fields:

AP210 unsigned int
: AP[2:0].

NS bool
: Encodes a non-secure entry.

PXN bool
: Privileged eXecute Never.

S bool
: Shareable.

TEX210CB unsigned int
: {TEX[2:0],C,B}.

XN bool
: eXecute Never.

nG bool
: not Global.

super_section_base_address unsigned int
: Base address of the super section.

trans_id unsigned int
: Transaction id.

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

level unsigned int
: The page table level this walk is for.

ns bool
: This is for SSD Non-secure.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool
: Access Flag.

HAP21 enum
: The access permissions.

MemAttr3_0 enum
: The memory attributes.

RACFG enum
: The extra SMMU RACFG field.

SH10 enum
: The shareability.

WACFG enum
: The extra SMMU WACFG field.

XN bool
: eXecute Never.

contiguous bool
: Contiguous hint.

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

level unsigned int
: The page table level this walk is for.

ns bool
: This is for SSD Non-secure.

output_address unsigned int
: Output address.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

APTable enum
: Remove permissions independently of subsequent descriptors.

NSTable bool
: The next level table descriptor is forced to non-secure.

PXNTable bool
: Force PXN independently of subsequent descriptors.

TableAddress unsigned int
: Address of the next table.

XNTable bool
: Force XN independently of subsequent descriptors.

hyp bool
: Current mode is hyp.

input_address unsigned int
: Input address this lookup is for.

level unsigned int
: The page table level this walk is for.

ns bool
: This is for SSD Non-secure.

pa_address unsigned int
: Physical address.

st1_context_bank unsigned int
: The stage 1 context bank that this walk is for (if there is one, otherwise 0xFF).

st2_context_bank unsigned int
: The stage 2 context bank that this walk is for (if there is one, otherwise 0xFF).

trans_id unsigned int
: Transaction id.

raw_want_to_change_context_interrupt

This represents a context's bank intent to want to change an interrupt pin. However, this doesn't take into account the accessibility of the bank, nor if other banks are driving the pin. Fields:

accessible bool
: Is the interrupt ID accessible to this context bank?

asserted bool
: Is this context bank attempting to assert the interrupt?

context_bank unsigned int
: Context bank attempting to change the interrupt pin.

interrupt_id unsigned int
: The interrupt ID it is attempting to change.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string
: The text description of the register value read

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string
: The text description of the register value written

register_read

Read of the register file. Fields:

address unsigned int
: The address of the register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

context_id unsigned int
: Context id bank (or 0xFF if not a context bank)

ln2_width enum
: The log2 width of the access

ns enum
: The security state of the transaction addressing the register

register_trans_id unsigned int
: Register transaction ID (if top bit set then a debug transaction)

result enum
: The result of the access

value unsigned int
: The byte-stream of all the data (little-endian)

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string
: The text description of the register value

register_read_string

A text representation of the read of a register. Fields:

out string
: The text description of the register value read

register_write

Write to the register file. Fields:

address unsigned int
: The address of the register.

context_id unsigned int
: Context id bank (or 0xFF if not a context bank)

ln2_width enum
: The log2 width of the access

ns enum
: The security state of the transaction addressing the register

register_trans_id unsigned int
: Register transaction ID (if top bit set then a debug transaction)

result enum
: The result of the access

value unsigned int
: The byte-stream of all the data (little-endian)

register_write_reserved

A text representation of an access to a register address that is reserved. Fields:

in string
: The text description of the register value

register_write_string

A text representation of the write of a register. Fields:

in string
: The text description of the register value written

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

rejected_register_transaction

The transaction is rejected because it didn't have the right characteristics. Fields:

address unsigned int
: Address of transaction.

is_fixed bool
: Is a FIXED AMBA burst.

is_read bool
: Is a read.

number_of_beats unsigned int
: Number of beats in transaction.

width_in_bytes unsigned int
: Width of transaction in bytes.

reset

The reset signal level. Fields:

value bool
: The signal level.

reset_sequence

Marks the beginning and end of the reset sequence. Fields:

starting bool
: True if starting the reset sequence, false when finished.

smmu_faulting_transaction

This is a trace of transaction that are not expected to fault. This does not include those transaction that are faulting by stage 2 or where the access flag or permission model is not allowing the transaction. Fields:

context_id unsigned int
: The context id of the transaction used, if we failed to immediately hit in the TLB.

input_address unsigned int
: The input address of the transaction group.

mapped_attributes unsigned int
: The mapped attributes of the transaction.

original_attributes unsigned int
: The original unmapped attributes of the transaction.

output_address unsigned int
: The output address of the transaction group.

ssd_index unsigned int
: The Security State Determination Index if applicable.

ssd_ns enum
: The Security State Determination of the transaction.

state enum
: The state of the transaction.

stream_id unsigned int
: The stream id of the transaction

tbu unsigned int
: Translation Buffer Unit number.

tlb_entry_index_st1 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 1 translation.

tlb_entry_index_st2 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 2 translation.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

trans_id unsigned int
: Transaction id.

type_of_transaction enum
: The type of transaction.

smmu_final_transaction

This is a trace of the SMMU transaction after it has been fully remapped. Fields:

context_id unsigned int
: The context id of the transaction used, if we failed to immediately hit in the TLB.

input_address unsigned int
: The input address of the transaction group.

mapped_attributes unsigned int
: The mapped attributes of the transaction.

original_attributes unsigned int
: The original unmapped attributes of the transaction.

output_address unsigned int
: The output address of the transaction group.

ssd_index unsigned int
: The Security State Determination Index if applicable.

ssd_ns enum
: The Security State Determination of the transaction.

state enum
: The state of the transaction.

stream_id unsigned int
: The stream id of the transaction

tbu unsigned int
: Translation Buffer Unit number.

tlb_entry_index_st1 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 1 translation.

tlb_entry_index_st2 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 2 translation.

trans_id unsigned int
: Transaction id.

type_of_transaction enum
: The type of transaction.

smmu_initial_transaction

This is the initial transaction group request to remap. This represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. Fields:

input_address unsigned int
: The input address of the transaction group.

kind_addressed enum
: The kind of transaction this represents if it is an addressed transaction

original_attributes unsigned int
: The original unmapped attributes of the transaction.

ssd_index unsigned int
: The Security State Determination Index if applicable.

ssd_ns enum
: The Security State Determination of the transaction.

stream_id unsigned int
: The stream id of the transaction.

tbu unsigned int
: Translation Buffer Unit number.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

trans_id unsigned int
: Transaction id.

type_of_transaction enum
: The type of transaction.

smmu_iprt_xgirpt

This trace source records the state of the SMMU_gIrpt/SMMU_NSgIrpt pins. Fields:

asserted bool
: The interrupt is now asserted.

is_non_secure bool
: Identifies the pin as SMMU_NSgIrpt.

smmu_irpt_combined_context_interrupt_pin

This trace source records when there is at least one context bank in the specific world with an interrupt pin raised. Fields:

asserted bool
: The interrupt is now asserted.

ns bool
: Non-secure

smmu_irpt_context_interrupt_pin

This trace source records when a context bank interrupt pin changes state. Fields:

asserted bool
: The interrupt is now asserted.

interrupt_pin unsigned int
: Interrupt pin number.

smmu_irpt_context_interrupt_pin_drivers

This trace source records when a context bank tries to assert an interrupt. Multiple banks can drive the same pin and so long as one is driving it then it is asserted. Fields:

context_bank unsigned int
: The context bank number changing its request for the pin

interrupt_pin unsigned int
: Interrupt pin number.

new_count_asserting_pin unsigned int
: The number of banks asserting the pin

this_context_asserting bool
: The request that this context is making -- if this is true then the context bank is asserting a request

smmu_irpt_xgcfgirpt

This trace source records the state of the SMMU_gCfgIrpt/SMMU_NSgCfgIrpt pins. Fields:

asserted bool
: The interrupt is now asserted.

is_non_secure bool
: Identifies the pin as SMMU_NSgCfgIrpt.

smmu_st1_st2fault_transaction

This is a trace of transactions that map to stage 1 with stage 2 faulting. Fields:

context_id unsigned int
: The context id of the transaction used, if we failed to immediately hit in the TLB.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

input_address unsigned int
: The input address of the transaction group.

mapped_attributes unsigned int
: The mapped attributes of the transaction.

original_attributes unsigned int
: The original unmapped attributes of the transaction.

output_address unsigned int
: The output address of the transaction group.

ssd_index unsigned int
: The Security State Determination Index if applicable.

ssd_ns enum
: The Security State Determination of the transaction.

state enum
: The state of the transaction.

stream_id unsigned int
: The stream id of the transaction

tbu unsigned int
: Translation Buffer Unit number.

tlb_entry_index_st1 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 1 translation.

tlb_entry_index_st2 unsigned int
: If this was mapped by a TLB entry index then this is the one used for the stage 2 translation.

trans_id unsigned int
: Transaction id.

type_of_transaction enum
: The type of transaction.

smrg_matched

Stream Match Register Group matched. Fields:

desc string
: A textual description of the register group

n unsigned int
: The SMRG that we matched against.

trans_id unsigned int
: The transaction id that we are matching against.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

auser unsigned int
: The AUSER fields.

hyp bool
: Current mode is hyp.

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int
: Input address this lookup is for.

ns bool
: This is for SSD Non-secure.

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

pa_address unsigned int
: Physical address.

st2_st1_context_banks unsigned int
: The stage 1 and 2 context bank that this walk is for (if there is one, otherwise 0xFF). Stage 1 is the lowest byte, stage 2 the highest.

stage_and_level unsigned int
: Stage and level that this walk is for. Top byte is stage, bottom is level.

trans_id unsigned int
: Transaction id.

start_stall_transaction

Indicating that a transaction is stalled. Fields:

context_id unsigned int
: The context id that we are stalling against.

head_of_line bool
: The transaction is the head-of-line to stall -- it is the one that will pick up the value of SMMU_CBn_RESUME.

reason_for_stall enum
: The state of the transaction as to why it stalled.

trans_id unsigned int
: Transaction id of replaying transaction.

tlb_commentary

A commentary from the TLB about what is going on. Fields:

output string
: The stream output.

tlb_entry_allocated

A TLB entry has been allocated. Fields:

index unsigned int
: Index of TLB entry.

input_end_incl_address unsigned int
: The end inclusive address of the input range that this matches.

input_start_address unsigned int
: The start address of the input range that this matches.

output_end_incl_address unsigned int
: The end inclusive address of the output range.

output_start_address unsigned int
: The start address of the output range.

tlb_entry_invalidated

A TLB entry has been invalidated for some reason. Fields:

index unsigned int
: Index of TLB entry.

reason enum
: The reason why it was invalidated.

tlb_invalidate_command_executed

A TLB Invalidate command was executed. Fields:

address unsigned int
: Address if appropriate.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

asid unsigned int
: ASID if appropriate.

command enum
: Command queued

context_bank unsigned int
: Context bank number if queue_type is 'context_bank'.

last_level bool
: Last level if appropriate.

ns bool
: Security world if appropriate.

queue_type enum
: Queue added to

seq_id unsigned int
: Sequence id for this TLB invalidate.

vmid unsigned int
: VMID if appropriate.

tlb_invalidate_command_queued

A TLB Invalidate command was queued (but not synced). Fields:

address unsigned int
: Address if appropriate.

asid unsigned int
: ASID if appropriate.

command enum
: Command queued

context_bank unsigned int
: Context bank number if queue_type is 'context_bank'.

last_level bool
: Last level if appropriate.

ns bool
: Security world if appropriate.

queue_type enum
: Queue added to

seq_id unsigned int
: Sequence id for this TLB invalidate.

vmid unsigned int
: VMID if appropriate.

tlb_sync

A TLB Sync command was issued. Fields:

context_bank unsigned int
: Context bank number if queue_type is 'context_bank'.

ns bool
: Security world

queue_type enum
: Queues that will be synced

unpred_nested_st2_bank_is_not_marked_as_st2

The Stage 1 context bank is marked as Stage 1 + Stage 2 by SMMU_CBARn.TYPE; however, the Stage 2 context bank marked by SMMU_CBARn.CBNDX is not marked in it's SMMU_CBARm.TYPE as a Stage 2 context. Fields:

st1_context_bank_id unsigned int
: The context bank id of the stage 1 bank.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

st2_context_bank_id unsigned int
The context bank id of the stage 2 bank.

unpred_ptw_replay_asked_for_different_data

A PTW was in progress and was restarted (for some reason), but this time it asked for different data than last time. This means that the register file changed during the walk process and so the result of the translation for this transaction is unpredictable as to whether it would have seen the first or second walk data. Fields:

first_address unsigned int
The address of the first walk transaction that it performed.
first_ns bool
The NS state of the first walk transaction that it performed.
second_address unsigned int
The address that it is now walking for.
second_ns bool
The NS state that it is now walking for.
trans_id unsigned int
Transaction ID that was affected.

v7sd_access_fault

A L1 or L2 short descriptor access flag has disabled access for this (super-)section/page. Fields:

context_bank unsigned int
Context bank.
input_address unsigned int
The input address used for this descriptor.
is_non_secure bool
Is this for the Non-secure side?
level unsigned int
Level of walk.

v7sd_descriptor_faults

V7 Short Descriptor, level 'n' descriptor is marked as faulting. Fields:

context_bank unsigned int
Context bank.
input_address unsigned int
The input address used for this descriptor.
is_non_secure bool
Is this for the Non-secure side?
level unsigned int
Level of walk.

v7sd_descriptor_fetch_failed

V7 Short Descriptor, level 'n' descriptor fetch failed. Fields:

context_bank unsigned int
Context bank.
ipa_address unsigned int
IPA of the descriptor address.
is_non_secure bool
Is the page walk and input addresses non-secure?
level unsigned int
Level of walk.
pa_address unsigned int
PA of the descriptor address.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

v7sd_walk_process_is_disabled

V7 Short Descriptor, walk process is disabled so producing a fault. Fields:

context_bank unsigned int
: Context bank.

warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the SMMU. Fields:

output string
: The stream output.

warning_failed_to_clear_fsr_before_resuming

The programming model expects for the user to clear the fault in the FSR before calling SMMU_CBn_RESUME to unstall a transaction. Fields:

context_id unsigned int
: Context ID of the FSR.

fault_flags_of_fsr unsigned int
: Value of the fault bits of the FSR (excludes SS and the Format field).

warning_multiple_match_transaction

A transaction was encountered that multiple matched the stream id registers. Fields:

action enum
: Action taken.

trans_id unsigned int
: Transaction id.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc string
: The textual description of what happened.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.84 MMU_600 - trace

This section describes the trace sources.

ArchMsg.Error.error

These messages are about activity occurring on the SMMU that is considered an error. Messages will only come out here if parameter all_error_messages_through_trace is true. Fields:

output string
: The stream output

ArchMsg.Error.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int
: The address of the descriptor fetch.

desc_inner enum
: Inner cacheability of descriptor

desc_outer enum
: Outer cacheability of descriptor

desc_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

desc_sh enum
: Shareability of descriptor

ssd_ns bool
: Is the Security State Determination of the transaction non-secure.

stage unsigned int
: The stage at which we had a problem.

streamid unsigned int
: The StreamID of the transaction

substreamid unsigned int
: The SubstreamID of the transaction (or ~0u if no substreamid)

trans_id unsigned int
: Transaction id.

ArchMsg.Error.ns_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int
: Command ID of the command in error.

cons unsigned int
: CONS of the command.

what string
: What is wrong.

ArchMsg.Error.priq_streamid_truncated

The SMMU received a PCIe PRI request with a StreamID) that was larger than that which the SMMU has been configured for. The StreamID that appears in the PRIQ entry will be truncated. Fields:

actual_streamid unsigned int
: The actual StreamID that this request has.

sidsize unsigned int
: The bit width of the SMMU for StreamIDs, as indicated by SMMU_IDR1.SIDSIZE.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

trans_id unsigned int
The transaction ID that identifies this request.
trunc_streamid unsigned int
The truncated StreamID that will appear in the PRIQ entry.

ArchMsg.Error.priq_substreamid_truncated

The SMMU received a PCIe PRI request with a PASID prefix (SubstreamID) that was larger than that which the SMMU has been configured for. The SubstreamID that appears in the PRIQ entry will be truncated. Fields:

actual_substreamid unsigned int
The actual SubstreamID that this request has.
ssidsize unsigned int
The bit width of the SMMU for SubstreamIDs, as indicated by SMMU_IDR1.SSIDSIZE.
trans_id unsigned int
The transaction ID that identifies this request.
trunc_substreamid unsigned int
The truncated SubstreamID that will appear in the PRIQ entry.

ArchMsg.Error.s_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int
Command ID of the command in error.
cons unsigned int
CONS of the command.
what string
What is wrong.

ArchMsg.Error.tlb_entries_overlap

A TLB entry was attempted to be inserted into the TLB and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

do_f_tlb_conflict bool
Chosen to perform an F_TLB_CONFLICT.
end_address_of_new_entry unsigned int
End address of new entry.
end_address_of_old_entry unsigned int
End address of old entry.
index_of_new_entry unsigned int
Index of new entry.
index_of_old_entry unsigned int
Index of old entry.
start_address_of_new_entry unsigned int
Start address of new entry.
start_address_of_old_entry unsigned int
Start address of old entry.
why enum
Why it is an error for these two entries to overlap.

ArchMsg.Error.tlb_entry_not_invalidated_due_to_ril

An entry in the cache was not invalidated even though in the right address range because of the RIL fields of the command the entry do not match. Fields:

cmd_num unsigned int
The NUM field of the RIL part of the command.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_ril_tg enum
: The RIL_TG field of the RIL part of the command.

cmd_ril_ttl unsigned int
: The TTL field of the RIL part of the command, zero means any level.

cmd_scale unsigned int
: The SCALE field of the RIL part of the command.

entry_id unsigned int
: The entry id that is being invalidated.

tlb_entry string
: The TLB entry.

ArchMsg.Error.vatos_sel_vmid_out_of_range

The SMMU_(S_)VATOS_SEL.VMID field was programmed with a VMID that was too wide for this implementation (SMMU_IDR0.VMID16 == 0). Fields:

ssd_ns bool
: The security state of the VATOS interface

vmid unsigned int
: The VMID programmed.

ArchMsg.Info.info

These are information messages about what is happening in the SMMU. Fields:

output string
: The stream output

ArchMsg.Warning.CMD_RESUME_no_transaction_resumed

A CMD_RESUME was issued that matched no transaction. Fields:

stag unsigned int
: STAG in the CMD_RESUME.

streamid unsigned int
: StreamID in the CMD_RESUME.

streamid_ns bool
: The StreamID was for the non-secure world.

ArchMsg.Warning.atc_inv_strange

Something was odd about the CMD_ATC_INV. Fields:

cmd_id unsigned int
: Command id

why string
: Why the CMD_ATC_INV was strange

ArchMsg.Warning.bad_conf_reset_of_SMMU_GBPA_ABORT

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.bad_conf_reset_of_SMMU_S_GBPA_ABORT

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_httu

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_sec_override

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_sup_btm

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_sup_cohacc

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_sup_sev

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

value bool
The value of the signal.

ArchMsg.Warning.bad_tbu0_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
The default value of the signal we have been assuming.
value bool
The value of the signal.

ArchMsg.Warning.bad_tcu_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
The default value of the signal we have been assuming.
value bool
The value of the signal.

ArchMsg.Warning.contig_bit_gives_too_large_region_for_TxSZ

If the contig bit was used then the size of the contig region would be larger than that indicated by TxSZ. Fields:

desc_kind enum
Descriptor kind
el enum
Exception level
input_address unsigned int
Input address
log2_contig_region_size unsigned int
Log2(contig region size in bytes)
output_address unsigned int
Output address
stage_and_level unsigned int
The stage in bits [7:4] and the level in [3:0].
vmid unsigned int
VMID if appropriate

ArchMsg.Warning.contig_bit_has_inconsistent_input_and_output_address

If the contig bit was used then the some bits of the output address held in the descriptor and the input address must match. Fields:

desc_kind enum
Descriptor kind
el enum
Exception level
input_address unsigned int
Input address
log2_contig_region_size unsigned int
Log2(contig region size in bytes)
match_mask unsigned int
Bits that must match.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

output_address unsigned int
: Output address

stage_and_level unsigned int
: The stage in bits [7:4] and the level in [3:0].

vmid unsigned int
: VMID if appropriate

ArchMsg.Warning.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int
: The address of the descriptor fetch.

desc_inner enum
: Inner cacheability of descriptor

desc_outer enum
: Outer cacheability of descriptor

desc_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

desc_sh enum
: Shareability of descriptor

ssd_ns bool
: Is the Security State Determination of the transaction non-secure.

stage unsigned int
: The stage at which we had a problem.

streamid unsigned int
: The StreamID of the transaction

substreamid unsigned int
: The SubstreamID of the transaction (or ~0u if no substreamid)

trans_id unsigned int
: Transaction id.

ArchMsg.Warning.msi_address_truncated

An MSI was generated, but the address was silently truncated due to the limited downstream address bus width. Fields:

pmcg_index_and_counter unsigned int
: If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int
: If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

truncated_address unsigned int
: The truncated address.

untruncated_address unsigned int
: The untruncated address.

which enum
: Which MSI this is

ArchMsg.Warning.msi_lost

An MSI was attempted to be sent, but the implementation doesn't support it. Fields:

id unsigned int
: ID of this interrupt transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

kind enum
What kind of interrupt.

ArchMsg.Warning.pmcg_non_secure_world

A commentary on potential mis-programming of the PMCG when transitioning the PMCG from the secure world to the non-secure. Fields:

commentary string
The commentary.

ArchMsg.Warning.pmcg_programming_violates_security

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between non-secure and secure worlds. This is under the assumption that a non-secure asynchronous agent could be writing to the PMCG. Fields:

commentary string
The commentary.

ArchMsg.Warning.priq_auto_response_failed_to_find_STE

The PRIQ was going to generate an auto-response, but failed to find an STE and so is returning a Failure message to the EndPoint which should disable the PRI interface of the EndPoint. Fields:

trans_id unsigned int
The ID of the PPR that is being lost.
why enum
Why the PPR is being lost.

ArchMsg.Warning.priq_overflow_bad_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG but an overflow condition did not exist. Fields:

new_ovackflg bool
The new value of the SMMU_PRIQ_CONS.OVACKFLG.

ArchMsg.Warning.priq_smmuen_forces_effective_priqen_low

If SMMUEN == 0, then the effective value of PRIQEN is 0. This warning is triggered when PRIQEN == 1 && SMMUEN == 0; which may not be what was intended. The PRIQ cannot be active if SMMUEN == 0.

ArchMsg.Warning.sev_lost

A SEV was lost because it isn't supported according to SMMU_IDR0.SEV. Fields:

why enum
Why the SEV was generated.

ArchMsg.Warning.smmu_pcie_rc_is_in_reset_ignoring_atc_invalidate

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that mapped to a PCIe Root Complex that is in reset. The message will be discarded and act as though completed successfully. Fields:

port_index unsigned int
The port index (node index) that is in reset but we would have sent it to.
streamid unsigned int
The StreamID that failed to map.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.smmu_pcie_rc_not_found_for_streamid

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that did not map to a PCIe Root Complex. This might be that the SW used an incorrect StreamID or it might be that the model has not been connected correctly. ATC Invalidate messages complete as though successful and PRI Requests are ignored. Fields:

streamid unsigned int
: The StreamID that failed to map.

ArchMsg.Warning.smmu_pmusnapshot

Something strange happened on the pmusnapshot_req/pmusnapshot_ack inteface. Fields:

pin_index unsigned int
: If the PMCG index corresponds to an array of signals, this is the index in the array, or 0 otherwise.

pmcg_index enum
: The PMCG index.

warning string
: The warning message.

ArchMsg.Warning.warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the SMMU. Fields:

output string
: The stream output

EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

PRIQ_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

PRIQ_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

PRIQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

SMMU_CR0ACK_SMMUEN_hazarded_by_priq

The SMMU_CR0ACK.SMMUEN cannot acknowledge the change to SMMUEN because there are outstanding PRIQ writes.

SMMU_CR0ACK_SMMUEN_update

The acknowledge to SMMU_CR0.SMMUEN was performed. Fields:

new_value bool
: The new value of the register.

SMMU_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_CR0.SMMUEN completed. Fields:

last bool
: This is the last set completing.

old_value bool
: The old value of the set completing.

SMMU_CR0_SMMUEN_write

A write to SMMU_CR0.SMMUEN occurred. Fields:

new_value bool
: The new value of the register.

old_value bool
: The old value of the register.

SMMU_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_GBPA completed. Fields:

last bool
: This is the last set completing.

old_value unsigned int
: The old value of the set completing.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SMMU_GBPA_update

The Update flag to SMMU_GBPA was lowered. Fields:

new_value unsigned int
: The new value of the register.

SMMU_GBPA_write

A write to SMMU_GBPA occurred. Fields:

new_value unsigned int
: The new value of the register.

old_value unsigned int
: The old value of the register.

SMMU_S_CR0ACK_SMMUEN_update

The acknowledge to SMMU_S_CR0.SMMUEN was performed. Fields:

new_value bool
: The new value of the register.

SMMU_S_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_S_CR0.SMMUEN completed. Fields:

last bool
: This is the last set completing.

old_value bool
: The old value of the set completing.

SMMU_S_CR0_SMMUEN_write

A write to SMMU_S_CR0.SMMUEN occurred. Fields:

new_value bool
: The new value of the register.

old_value bool
: The old value of the register.

SMMU_S_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_S_GBPA completed. Fields:

last bool
: This is the last set completing.

old_value unsigned int
: The old value of the set completing.

SMMU_S_GBPA_update

The Update flag to SMMU_S_GBPA was lowered. Fields:

new_value unsigned int
: The new value of the register.

SMMU_S_GBPA_write

A write to SMMU_S_GBPA occurred. Fields:

new_value unsigned int
: The new value of the register.

old_value unsigned int
: The old value of the register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

S_EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

S_EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

S_EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

S_GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

tr bool
: transient attribute

wa bool
: write-allocate attributes.

S_GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

S_GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

TLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

TLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

atc_inv_nop

The CMD_ATC_INV command is ignored as a NOP. This may be emitted multiple times if the CMD_ATC_INV is being ignored for multiple reasons. Fields:

address unsigned int
: Untranslated Address to invalidate.

cmd_id unsigned int
: Command id, if top-bit is set then was issued from the Non-secure CMDQ.

cons unsigned int
: CONS of the command.

global bool
: Global flag.

log2_size_in_bytes unsigned int
: Log 2 of the size in bytes of the region to invalidate.

streamid unsigned int
: StreamID in the invalidate command.

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

why enum
: Why was NOPped

atos_complete_fault

The ATOS operation completed with a fault. Fields:

effective_st1translate bool
: Because of the settings and/or the ATOS type then the effective st1translate can be different.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

fault_faddr unsigned int
: The fault FADDR.

fault_faultcode enum
: The fault code.

fault_reason enum
: The fault reason.

ssd_ns bool
: This is a non-secure ATOS operation.

st1translate bool
: The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool
: The translation suffered a stage 2 translation.

state enum
: The final transaction state of the ATOS operation.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_complete_fault_inv_req

The ATOS operation completed, faulted and generated an INV_REQ response. Fields:

ssd_ns bool
: This is a non-secure ATOS operation.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

why enum
: Why the ATOS operation generated an INV_REQ

atos_complete_success

The ATOS operation completed successfully. Fields:

base_addr unsigned int
: The actual base address of region.

effective_st1translate bool
: Because of the settings and/or the ATOS type then the effective st1translate can be different.

par_addr unsigned int
: The PAR.ADDR field.

par_mair unsigned int
: The memory attributes encoded as a MAIR

par_ns bool
: The PAR.NS field, for an SSD-ns request then this will always be 0.

par_sh enum
: Shareability

par_size bool
: The PAR.Size field.

size_in_bytes unsigned int
: The actual size in bytes of the region.

ssd_ns bool
: This is a non-secure ATOS operation.

st1translate bool
: The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool
: The translation suffered a stage 2 translation.

state enum
: The final transaction state of the ATOS operation.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

atos_run_set

The SMMU_s_GATOS_CTRL.RUN field was set to start the ATOS operation. Fields:

ssd_ns bool
: This is a non-secure ATOS operation.

vatos bool
: This is a VATOS operation

atos_starting

The ATOS operation is starting. Fields:

addr unsigned int
: The input address to the ATOS operation.

httui bool
: Inhibit HTTU update.

ind bool
: Instruction Data.

pnu bool
: Privileged not User.

rnw bool
: Read not Write.

ssd_ns bool
: This is a non-secure ATOS operation.

ssec bool
: If this is a secure ATOS operation then this is if it is secure or not.

streamid unsigned int
: The StreamID requested.

substreamid unsigned int
: The SubstreamID requested, or ~0u if no SubstreamID.

type enum
: The requested ATOS type.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

cd_cc.CD_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

cd_cc.CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

cd_entry_allocated

An CD entry has been allocated. Fields:

cd string
: A textual description of the CD.

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

ns enum
: For the non-secure world

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

streamid unsigned int
: The StreamID of the entry this will match.

substreamid unsigned int
: The SubstreamID of the entry this will match. This may be zero for transactions without a SubstreamID.

conf_reset_of_SMMU_GBPA_ABORT

The reset value of SMMU_GBPA.ABORT. Fields:

value bool
: The value of the signal.

conf_reset_of_SMMU_S_GBPA_ABORT

The reset value of SMMU_S_GBPA.ABORT. Fields:

value bool
: The value of the signal.

conf_system_supports_httu

The system supports HTTU. Fields:

value bool
: The value of the signal.

dvm_tlbinvalidate_complete

The DVM TLB Invalidate message completed. Fields:

id unsigned int
: The unique id of this DVM message.

ok bool
: The DVM message was OK.

dvm_tlbinvalidate_received

A DVM message for a TLB Invalidate has been received. Fields:

address unsigned int
: The VA or IPA to use if match_address.

asid unsigned int
: The ASID to match if match_asid.

by_ipa bool
: The operation is for an IPA operation if match_address.

id unsigned int
: The unique id of this DVM message.

ignored enum
: The DVM message was ignored

last_level bool
: The operation is for last level if supported.

match_address bool
: Match the address field.

match_asid bool
: Match the asid field.

match_vmid bool
: Match the vmid field.

num unsigned int
: If a range operation, the NUM field. If a single-address operation this is 0.

prot enum
: The protection level for which this TLB Invalidate will operate on.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

security_world enum
: The security world that this will apply to.

smmu_scale unsigned int
: If a range operation, then the SCALE field with the meaning in the SMMU architecture which is different to the PE architecture. If a single-address operation this is 0.

stage1_only bool
: The operation is for stage 1 only if supported.

tg enum
: If a single-address or address-range operation, then the Translation Granule hint. Address-range operations always supply a Translation Granule.

translation_table_level enum
: The leaf level of the translation table.

vmid unsigned int
: The VMID to match if match_vmid.

found_tlb_entry_has_different_aset

Architecturally, a particular ASID either should be ASET0 or ASET1. However, we have managed to find a TLB entry that has a different ASET than that which we were searching for. This indicates a programming error. You should examine all contexts with this particular ASID/VMID and ensure they are consistent. Fields:

aset unsigned int
: The ASET of this entry.

asid unsigned int
: ASID if appropriate.

index unsigned int
: Index of TLB entry.

input_start_address unsigned int
: The start address of the input range that this matches.

scheme enum
: The tagging scheme used

ssd_ns enum
: Security State

vmid unsigned int
: VMID if appropriate.

gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool
: True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int
: GERRORN register value.

interrupt_potentially_sent bool
: An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interupt.

new_gerror unsigned int
: GERROR register value after any invertion.

which enum
: Which bit was attempted to be inverted.

gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

which enum
: Which GERROR was acknowledged.

httu_update_abandoned_update

The HTTU update of a descriptor in memory was potentially possible, but it was behind an update that failed to apply cleanly. Fields:

AF enum
: Whether an AF update should/could occur.

DBM enum
: Whether a DBM update should/could occur.

address unsigned int
: Address of HTTU update.

httu_inner enum
: Inner cacheability of descriptor to update

httu_outer enum
: Outer cacheability of descriptor to update

httu_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

httu_sh enum
: Shareability of descriptor to update

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

original_descriptor unsigned int
: The original descriptor that the model observed.

stage_and_level unsigned int
: The stage (bits[7:4]) and level (bits[3:0]).

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

what enum
: What this descriptor represents

httu_update_end_update

The attempted update of a descriptor in memory has occurred. Fields:

is_big_endian bool
: The descriptor is big-endian in memory.

original_descriptor unsigned int
: The original descriptor value.

result enum
: The result of the attempt to update.

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int
: The new descriptor value that tried to replace the original.

value_that_was_in_memory unsigned int
: The value that the compare-and-swap operation returned as the value that was in memory.

httu_update_not_done

A discretionary HTTU update could occur and the implementation choose not to do it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum
: Whether an AF update should/could occur.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DBM enum
: Whether a DBM update should/could occur.

address unsigned int
: Address of HTTU update.

httu_inner enum
: Inner cacheability of descriptor to update

httu_outer enum
: Outer cacheability of descriptor to update

httu_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

httu_sh enum
: Shareability of descriptor to update

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

original_descriptor unsigned int
: The original descriptor that the model observed.

stage_and_level unsigned int
: The stage (bits[7:4]) and level (bits[3:0]).

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

what enum
: What this descriptor represents

httu_update_start_update

An HTTU update could occur and the implementation chose to try it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum
: Whether an AF update should/could occur.

DBM enum
: Whether a DBM update should/could occur.

address unsigned int
: Address of HTTU update.

httu_inner enum
: Inner cacheability of descriptor to update

httu_outer enum
: Outer cacheability of descriptor to update

httu_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

httu_sh enum
: Shareability of descriptor to update

is_big_endian bool
: The descriptor will be written to memory as big-endian.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

original_descriptor unsigned int
: The original descriptor that the model observed.

stage_and_level unsigned int
: The stage (bits[7:4]) and level (bits[3:0]).

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int
: The new descriptor value that is going to try replace the original.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

what enum
: What this descriptor represents

will_do_AF bool
: What the implementation chose to do for the AF update.

will_do_DBM bool
: What the implementation chose to do for the DBM update.

interrupt_returned

An interrupt/MSI returned from downstream. Fields:

InD_NS_PnU enum
: Instruction/Data, Non-secure/Secure, Privileged/User.

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

id unsigned int
: ID of this interrupt transaction.

inner_cache enum
: The actual attributes of the access.

kind enum
: What kind of interrupt.

mpam_ns bool
: The security state associated with the MPAM PARTID/PMG.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_valid bool
: MSI will attempt to be sent.

ok bool
: Did the access return OK or an abort?

outer_cache enum
: The actual attributes of the access.

pmcg_index_and_counter unsigned int
: If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int
: If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum
: Shareability

interrupt_sent

An interrupt is raised. If it sends an MSI then this is _after_ any device-dependent transform on the architectural attributes and so may differ from what is programmed. Fields:

InD_NS_PnU enum
: Instruction/Data, Non-secure/Secure, Privileged/User.

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

id unsigned int
: ID of this interrupt transaction.

inner_cache enum
: The actual attributes of the access.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

kind enum
: What kind of interrupt.

mpam_ns bool
: The NS state of the MPAM PARTID and MPAM PMG.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_valid bool
: MSI will attempt to be sent.

outer_cache enum
: The actual attributes of the access.

pmcg_index_and_counter unsigned int
: If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int
: If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum
: Shareability

l1cd_cc.L1CD_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

l1cd_cc.L1CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

l1cd_entry_allocated

An L1 CD entry has been allocated. Fields:

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

normalised_substreamid unsigned int
: The first SubstreamID of the range of SubstreamIDs that this L1CD entry will match.

ns enum
: For the non-secure world

pa_l2 unsigned int
: The PA of the L2 CD table. This is L2Ptr << 12.

streamid unsigned int
: The StreamID this CD is for.

valid bool
: Is the entry valid.

l1ste_cc.L1STE_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

l1ste_cc.L1STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

l1ste_entry_allocated

An L1 STE entry has been allocated. Fields:

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

first_streamid_of_range unsigned int
: The first StreamID of the range of StreamIDs that this L1STE entry will match.

ns enum
: For the non-secure world

num_entries_in_l2 unsigned int
: The number of entries in the L2 table. This is 2**(Span-1) or 0 if invalid.

pa_l2 unsigned int
: The PA of the L2 ST table. This is L2Ptr << 6 and aligned to the size of the table.

ns_cmd_sync_completed_irq

Non-secure CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_completed_no_action

Non-secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_completed_sev

Non-secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_completed_with_error

Non-secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

cerror enum
: The error associated with the CMD_SYNC

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns_cmd_sync_issued

Non-secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

hazarded bool
: The CMD_SYNC is currently hazarded from completing.

ns_cmd_sync_issuing

Non-secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_starting_completion_action_irq

Non-secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

msiaddress unsigned int
: The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int
: The MSI data to send.

ns_cmd_sync_starting_completion_action_sev

Non-secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum
: The CERROR to attach.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

ns_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum
: The CERROR to attach.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_id unsigned int
: Command ID of the CMD_SYNC

ns_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum
: The error being exposed, if any.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

enack bool
: The value of ENACK.

forced_error bool
: The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

ns_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int
: Command ID of the command being executed.

cons unsigned int
: CONS of the command.

what string
: What is being executed.

ns_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

disable_fetch bool
: The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int
: The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int
: The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int
: The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int
: The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int
: The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int
: The PROD pointer of the region unfetched (including wrap).

ns_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool
: There is a CERROR that can be recognised.

can_cmd_sync bool
: There is a CMD_SYNC that can be recognised.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

can_fetch bool
: The SMMU can fetch

can_issue bool
: There are fetched commands that are eligible to be issued.

can_update_cons bool
: The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

cmd_sync enum
: Why a CMD_SYNC cannot be issued

cmdqen bool
: CMDQEN, when enabled then the CMDQ can fetch commands

cmdqen_1_to_0_unacknowledged bool
: CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum
: The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool
: The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int
: The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum
: The state of the fetch state machine

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool
: If there are too may issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int
: The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int
: This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum
: The internal issued state machine state

outstanding_fetches_since_reset unsigned int
: The number of outstanding fetches.

ns_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int
: The transaction id that caused the event.

ns_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int
: Transaction id of the auto-retried transaction.

why enum
: Why the transaction retried.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int
: The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int
: The current programmer-visible prod including wrap bit.

ns_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum
: Some more information about the queue state.

cons_incl_wrap unsigned int
: The CONS pointer (including wrap bits).

eventqen bool
: EVENTQEN.

eventqenack bool
: EVENTQENACK.

prod_incl_wrap unsigned int
: The PROD pointer (including wrap bits).

ns_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int
: The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int
: The transaction id that produced the event record that aborted.

ns_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD index of the event if appropriate or ~0u otherwise.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

ns_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

bad bool
: If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int
: This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

ns_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code.

is_prior_set bool
: The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete

trans_id unsigned int
: The transaction id that this corresponds to.

ns_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int
: The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int
: The number of events available to the programmer.

prog_cons unsigned int
: The programmer-visible CONS pointer.

prog_prod unsigned int
: The programmer-visible PROD pointer.

what enum
: What changed?

ns_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

ns_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int
: The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum
: The reason the event was removed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

trans_id unsigned int
The transaction id that caused the event.

ns_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int
Double word 0 of event.
dword1 unsigned int
Double word 1 of event.
dword2 unsigned int
Double word 2 of event.
dword3 unsigned int
Double word 3 of event.
event enum
Event code that was thrown away.
reason enum
The reason the record was lost.
trans_id unsigned int
The transaction id that this corresponds to.

ns_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int
Double word 0 of event.
dword1 unsigned int
Double word 1 of event.
dword2 unsigned int
Double word 2 of event.
dword3 unsigned int
Double word 3 of event.
event enum
Event code that was thrown away.
prod unsigned int
The PROD pointer (without wrap) that this event will be written to.
stall_event bool
Describes an event for a stalled transaction.
trans_id unsigned int
Transaction ID that generated this event.

ns_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool
The write aborted.
dword0 unsigned int
Double word 0 of event.
dword1 unsigned int
Double word 1 of event.
dword2 unsigned int
Double word 2 of event.
dword3 unsigned int
Double word 3 of event.
event enum
Event code that was thrown away.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

pmcg_irq_config

The interrupt configuration of the Performance Monitor Counter Group (PMCG) changed. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: SMMU_PMCG_CTRL.IRQEN.

memattr enum
: Memory type

mpam_ns bool
: The NS state of the MPAM PARTID and MPAM PMG

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_supported bool
: Are MSIs supported for this security world.

ns bool
: Non-secure bus attribute.

number_of_interrupts_in_flight unsigned int
: The number of interrupts that have been committed to be produced or in flight.

pmcg_index unsigned int
: Index of the PMCG

sh enum
: Shareability.

smmu_pmcg_gmpam_Update bool
: The SMMU_PMCG_GMPAM.Update flag. Only when this is zero are writes predictable.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_irqen

A trace of SMMU_PMCG_IRQ_CTRL.IRQEN. Fields:

new_value bool
: The new value of IRQEN.

pmcg_index unsigned int
: Index of the PMCG.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_irqen_ack

A trace of SMMU_PMCG_IRQ_CTRLACK.IRQEN. Fields:

new_value bool
: The new value of IRQEN.

pmcg_index unsigned int
: Index of the PMCG.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

pmcg_merging_interrupts

An interrupt was wanted to be generated, but one was already pending so the two were merged together. Fields:

pmcg_index unsigned int
: Index of the PMCG.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_trigger

A PMCG counter has been triggered. Fields:

counter_index unsigned int
: The index of the counter within the PMCG.

event_id unsigned int
: The event id that has been triggered.

ns_event bool
: The security state associated with the event.

pmcg_index unsigned int
: Index of the PMCG.

streamid unsigned int
: The StreamID associated with the event, if there is one.

pmu_active_counter

Traces what active counters are in a PMCG and what streamids it might filter on. Those counters that trace both secure and non-secure StreamIDs or those that are not filtered by StreamID will appear twice, once for each security world. All active counters for a PMCG are traced one after another. Fields:

begin_streamid unsigned int
: The start StreamID to filter on.

counter_index unsigned int
: The counter index within the PMCG.

end_incl_streamid unsigned int
: The end inclusive StreamID to filter on.

evcnt unsigned int
: The current count.

event_id unsigned int
: The event ID to filter.

ns bool
: Are the StreamIDs non-secure?

pmcg_index unsigned int
: The index of the PMCG that this counter belongs to.

pmu_all_counters_in_pmcg_became_inactive

The PMCG was tracing some events and now is not tracing any. Fields:

pmcg_index unsigned int
: The index of the PMCG.

pmu_capture

For some reason, a capture event occurred. Fields:

pmcg_index unsigned int
: The index of the PMCG that the capture occurred on.

why enum
: Why did the capture occur?

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

pmu_counter_configured_to_use_unsupported_event

An enabled counter was configured to use a unsupported event. Fields:

counter_index unsigned int
: The counter index within the PMCG.

event_id unsigned int
: The unsupported event id.

pmcg_index unsigned int
: The index of the PMCG that this counter belongs to.

pmu_counter_overflowed

A counter in a particular PMCG overflowed. Fields:

already_overflowed bool
: True if the overflow flag was already set.

capture bool
: True if it captured the other counter values.

counter_index unsigned int
: The counter index within the PMCG.

interrupt bool
: True if going to attempt to generate an interrupt.

interrupt_action enum
: The interrupt action that is going to occur

pmcg_index unsigned int
: The index of the PMCG that this counter belongs to.

ssd_ns bool
: The PMCG is controlled by the Non-secure world.

priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int
: The PRG Index of the response.

resp enum
: The response to send.

streamid unsigned int
: The StreamID of the response.

substreamid unsigned int
: The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int
: The ID of the PPR that is being lost.

why enum
: Why the PPR is being lost.

priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool
: The PPR being lost is a Stop Marker.

resp enum
: What, if any, auto-response will be.

trans_id unsigned int
: The ID of the PPR that is being lost.

why enum
: Why the PPR is being lost

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool
: The new value of the SMMU_PRIQ_CONS.OVACKFLG.

priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool
: The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int
: The transaction ID of the PPR that caused the overflow.

priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool
: The Last in the Page Request Group (PRG).

R bool
: Read permission is requested.

W bool
: Read permission is requested.

prgindex unsigned int
: The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

ssd_ns bool
: The SSD of the StreamID. PRIQ should only receive _non-secure_ PRI Requests.

stop_marker bool
: If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int
: The StreamID this request is associated with.

substreamid unsigned int
: The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool
: If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool
: If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int
: The transaction ID that identifies this request.

untranslated_address unsigned int
: The Untranslated Address that this is requesting.

priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int
: The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int
: The transaction ID of the PPR that aborted.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int
: The PROD including the Wrap bit where we wrote..

trans_id unsigned int
: The transaction ID of the PPR.

priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue. Fields:

L bool
: The Last in the Page Request Group (PRG).

R bool
: Read permission is requested.

W bool
: Read permission is requested.

prgindex unsigned int
: The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int
: PROD position including the wrap bit.

stop_marker bool
: If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int
: The StreamID this request is associated with.

substreamid unsigned int
: The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool
: If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool
: If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int
: The transaction ID that identifies this request.

untranslated_address unsigned int
: The Untranslated Address that this is requesting.

priqen_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int
: The value of SMMU_PRIQ.CONS.RD_and_RD_wrap.

number_of_pprs unsigned int
: The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int
: This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int
: The number of writes to the PRIQ that are currently in flight.

ovackflg bool
: The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool
: The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool
: There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool
: The value of SMMU_CR0.PRIQEN. The _effective_ value is 0 if SMMUEN == 0.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

priqenack bool
: The value of SMMU_CR0ACK.PRIQEN.

prod_incl_wrap unsigned int
: The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool
: The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CR0.PRIQEN.

smmuen bool
: The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool
: The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int
: The size of the table in the number of items it can hold.

ptw_read

Page Table Walk (read). This is the result of the physical access that the SMMU is making. Fields:

abort enum
: Non-zero if the access aborted/failed.

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

data unsigned int
: The data fetch if it didn't abort.

desckind enum
: The kind of descriptor

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st1_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum
: The kind of descriptor

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st1_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool
: Access Flag.

AP21 enum
: The access permissions.

AttrIndx210 unsigned int
: The attribute index into the MAIR0/1.

DBM bool
: Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

NS bool
: The encoding is for non-secure if this is a secure fetch.

PXN bool
: Privileged eXecute Never.

SH10 enum
: The shareability.

XN bool
: eXecute Never.

contiguous bool
: Contiguous hint.

desckind enum
: The kind of descriptor

hwu_pbha unsigned int
: Top four bits are appropriate CD.HWU*, bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by CD.HWU0*/CD.HWU1*.

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

nG bool
: not Global.

nT bool
: SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns bool
: Non-Secure

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

output_address unsigned int
: Output address.

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

APTable enum
: Remove permissions independently of subsequent descriptors.

NSTable bool
: The next level table descriptor is forced to non-secure.

PXNTable bool
: Force PXN independently of subsequent descriptors.

TableAddress unsigned int
: Address of the next table.

XNTable bool
: Force XN independently of subsequent descriptors.

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum
: The kind of descriptor

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool
: Access Flag.

DBM bool
: Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

HAP21 enum
: The access permissions.

MemAttr3_0 enum
: The memory attributes.

SH10 enum
: The shareability.

XN enum
: eXecute Never.

contiguous bool
: Contiguous hint.

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

nT bool
: SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns bool
: Non-Secure

output_address unsigned int
: Output address.

pa_address unsigned int
: Physical address.

s2hwu_pbha unsigned int
: Top four bits are STE.S2HWU*, bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by STE.S2HWU*.

ssd_ns enum
: Security state of stream

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

APTable enum
: Remove permissions independently of subsequent descriptors.

PXNTable bool
: Force PXN independently of subsequent descriptors.

TableAddress unsigned int
: Address of the next table.

XNTable bool
: Force XN independently of subsequent descriptors.

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

raw_register_end_read

The raw register read transaction. This is the transaction as directed to the register port. Fields:

id unsigned int
: Id of this transaction.

ok bool
: Was the access OK? The bus response will always be OK, but is the register access reasonable.

read_data unsigned int
: The data read.

raw_register_end_write

The raw register write transaction. This is the transaction as directed to the register port. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

id unsigned int
: Id of this transaction.

ok bool
: Was the access OK? The bus response will always be OK, but is the register access reasonable.

raw_register_start_read

The raw register read transaction. This is the transaction as directed to the register port. Fields:

address unsigned int
: Address of transaction.

id unsigned int
: Id of this transaction. Top bit is set if is a debug transaction.

ns enum
: Is the transaction non-secure?

number_of_beats unsigned int
: Number of beats.

size_of_beat_in_bytes unsigned int
: Size of each beat in bytes.

raw_register_start_write

The raw register write transaction. This is the transaction as directed to the register port. Fields:

address unsigned int
: Address of transaction

id unsigned int
: Id of this transaction. Top bit is set if is a debug transaction.

ns enum
: Is the transaction non-secure?

number_of_beats unsigned int
: Number of beats.

size_of_beat_in_bytes unsigned int
: Size of each beat in bytes.

write_data unsigned int
: The data to write.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string
: The text description of the register value read.

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string
: The text description of the register value written.

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string
: The text description of the register value.

register_read_string

A text representation of the read of a register. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

out string
The text description of the register value read.

register_write_reserved

A text representation of an access to a register address that is reserved or a write.to a RES0 field in a register. Fields:

in string
The text description of the register value.

register_write_string

A text representation of the write of a register. Fields:

in string
The text description of the register value written.

s_cmd_sync_completed_irq

Secure CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int
The ID of the command being issued.
cons_incl_wrap unsigned int
CONS pointer of CMD_SYNC.

s_cmd_sync_completed_no_action

Secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int
The ID of the command being issued.
cons_incl_wrap unsigned int
CONS pointer of CMD_SYNC.

s_cmd_sync_completed_sev

Secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int
The ID of the command being issued.
cons_incl_wrap unsigned int
CONS pointer of CMD_SYNC.

s_cmd_sync_completed_with_error

Secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

cerror enum
The error associated with the CMD_SYNC
cmd_id unsigned int
The ID of the command being issued.
cons_incl_wrap unsigned int
CONS pointer of CMD_SYNC.

s_cmd_sync_issued

Secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int
The ID of the command being issued.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

hazarded bool
: The CMD_SYNC is currently hazarded from completing.

s_cmd_sync_issuing

Secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

s_cmd_sync_starting_completion_action_irq

Secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

msiaddress unsigned int
: The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int
: The MSI data to send.

s_cmd_sync_starting_completion_action_sev

Secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

s_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum
: The CERROR to attach.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

s_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum
: The CERROR to attach.

cmd_id unsigned int
: Command ID of the CMD_SYNC

s_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cerror enum
: The error being exposed, if any.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

enack bool
: The value of ENACK.

forced_error bool
: The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

s_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int
: Command ID of the command being executed.

cons unsigned int
: CONS of the command.

what string
: What is being executed.

s_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

disable_fetch bool
: The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int
: The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int
: The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int
: The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int
: The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int
: The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int
: The PROD pointer of the region unfetched (including wrap).

s_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool
: There is a CERROR that can be recognised.

can_cmd_sync bool
: There is a CMD_SYNC that can be recognised.

can_fetch bool
: The SMMU can fetch

can_issue bool
: There are fetched commands that are eligible to be issued.

can_update_cons bool
: The programmer view of CMDQ_CONS can be moved to say some have been consumed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

cmd_sync enum
: Why a CMD_SYNC cannot be issued

cmdqen bool
: CMDQEN, when enabled then the CMDQ can fetch commands

cmdqen_1_to_0_unacknowledged bool
: CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum
: The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool
: The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int
: The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum
: The state of the fetch state machine

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool
: If there are too may issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int
: The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int
: This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum
: The internal issued state machine state

outstanding_fetches_since_reset unsigned int
: The number of outstanding fetches.

s_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int
: The transaction id that caused the event.

s_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int
: Transaction id of the auto-retried transaction.

why enum
: Why the transaction retried.

s_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int
: The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int
: The current programmer-visible prod including wrap bit.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

s_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum
: Some more information about the queue state.

cons_incl_wrap unsigned int
: The CONS pointer (including wrap bits).

eventqen bool
: EVENTQEN.

eventqenack bool
: EVENTQENACK.

prod_incl_wrap unsigned int
: The PROD pointer (including wrap bits).

s_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/ s_eventq_lost_event_records trace. Fields:

prod unsigned int
: The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int
: The transaction id that produced the event record that aborted.

s_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD index of the event if appropriate or ~0u otherwise.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

s_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool
: If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int
: This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

s_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code.

is_prior_set bool
: The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete

trans_id unsigned int
: The transaction id that this corresponds to.

s_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int
: The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int
: The number of events available to the programmer.

prog_cons unsigned int
: The programmer-visible CONS pointer.

prog_prod unsigned int
: The programmer-visible PROD pointer.

what enum
: What changed?

s_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

s_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int
: The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum
: The reason the event was removed.

trans_id unsigned int
: The transaction id that caused the event.

s_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

s_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

s_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool
: The write aborted.

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

s_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool
: True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int
: GERRORN register value.

interrupt_potentially_sent bool
: An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interupt.

new_gerror unsigned int
: GERROR register value after any invertion.

which enum
: Which bit was attempted to be inverted.

s_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum
: Which GERROR was acknowledged.

sec_override

Controls non-secure accesses to some registers. Fields:

value bool
: The value of the signal.

sev

Send a SEV. Fields:

why enum
: Why the SEV was generated.

smmu_atc_inv

The CMD_ATC_INV command is sent. Fields:

address unsigned int
: Untranslated Address to invalidate.

cmd_id unsigned int
: Command id, if top-bit is set then was issued from the Non-secure CMDQ.

cons unsigned int
: CONS of the command.

global bool
: Global flag.

log2_size_in_bytes unsigned int
: Log 2 of the size in bytes of the region to invalidate.

ns_number_in_flight unsigned int
: Number of ATC invalidates in flight issued from the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

s_number_in_flight unsigned int
: Number of ATC invalidates in flight issued from the Secure CMDQ.

s_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

streamid unsigned int
: StreamID in the invalidate command.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

smmu_atc_inv_completed

The CMD_ATC_INV command completed. Fields:

cmd_id unsigned int
: Command id, if top-bit is set then was issued from the Non-secure CMDQ.

ns_number_in_flight unsigned int
: Number of ATC invalidates in flight now this one has completed, that were issued by the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

response enum
: The response.

s_number_in_flight unsigned int
: Number of ATC invalidates in flight now this one has completed, that were issued by the Secure CMDQ.

s_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

smmu_atc_inv_end

An ATC invalidate request has been started. Fields:

PASID_global bool
: If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int
: The Untranslated Address to use.

log2_size_in_bytes unsigned int
: Log2 of the size of the region in bytes to invalidate.

response enum
: The response to the ATC invalidate

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_atc_inv_start

An ATC invalidate request has been started. Fields:

PASID_global bool
: If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int
: The Untranslated Address to use.

log2_size_in_bytes unsigned int
: Log2 of the size of the region in bytes to invalidate.

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_ats_initial

This is the initial ATS request. Fields:

ia unsigned int
: Input address

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

max_number_of_replies unsigned int
: The maximum number of replies allowed to return

no_write bool
: The NW (no write flag) of the ATS request. If clear then the requester is going to do a write.

pasid_execute_requested bool
: If there is a PASID (substreamid != ~0u) then this represents the requester asking for execution permissions.

pasid_privileged_mode_requested bool
: If there is a PASID (substreamid != ~0u) then this represents the requester asking for the privileged mode's permissions.

ssd_ns bool
: Incoming SSD, only non-secure ATS requests are legal.

streamid unsigned int
: StreamID of the ATS request.

substreamid unsigned int
: SubstreamID (which is identical to the PASID) of the ATS request. If no PASID-prefix is sent then this is ~0u

tbu unsigned int
: Translation Buffer Unit number

smmu_ats_reply_failure

This is an ATS reply indicating failure. Fields:

event enum
: Equivalent event number that would have been generated for an equivalent ordinary transaction.

failure enum
: What is the failure response code?

state enum
: The transaction state of the successfully ATS request.

smmu_ats_reply_success

This is an ATS reply, typically the SMMU will only return a single response, even if the requester indicated it could accept more replies. NOTE that the SMMU responds with 'success' in some cases when a fault is encountered and RW==0. Fields:

N bool
: Non-snooped access. If one then the requester must clear the NoSnoop bit on transactions, unless otherwise enabled in a Function-specific manner.

P bool
: Privileged mode. These permissions related to privileged mode.

RWX enum
: Read/Write/Execute

U bool
: Untranslated access. If one, and RW !=0 then use UntranslatedAccesses for the allowed accesses by RW(X).

inner enum
: The inner cacheability attributes to use for TranslatedAccesses

input_address unsigned int
: Input address of the ATS request

instcfg enum
: The STE.INSTCFG field

outer enum
: The outer cacheability attributes to use for TranslatedAccesses

privcfg enum
: The STE.PRIVCFG field

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

shareability unsigned int
: The shareability to use for TranslatedAccesses

size unsigned int
: The size of the region covered by this translation.

state enum
: The transaction state of the successfully ATS request.

translated_address unsigned int
: If RW!=0 && U != 0, then the Translated Address that a TranslatedAccess can be made with

smmu_final_transaction

This is the transaction group request to remap has completed one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. If it stalls then it will report through this trace source, stall (stag_if_stalling != ~0u) and when resume will issue another smmu_initial_transaction as it undergoes remapping again. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum
: The AxMMUFLOW for this transaction group. stallable -- allow the transaction to be stalled if configured. translated-access -- is a PCIe Translated Access non-stallable -- do not stall transaction even if configured. transfault-flow -- do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum
: The point associated with the CMO, if applicable

input_address unsigned int
: The input address of the transaction group.

input_inner enum
: Inner cacheability for the input attributes.

input_outer enum
: Outer cacheability for the input attributes.

input_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

input_sh enum
: Shareability for the input attributes.

ipa_address unsigned int
: The IPA of the transaction.

kind enum
: The kind of access this transaction group that this represents.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

operation enum
: The kind of operation that this represents.

output_address unsigned int
: The input address of the transaction group.

output_inner enum
: Inner cacheability for the output attributes.

output_outer enum
: Outer cacheability for the output attributes.

output_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

output_sh enum
: Shareability for the output attributes.

output_vmid unsigned int
: The output VMID/GBPA.IMPDEF or ~0u if not valid.

size_of_region_in_bytes unsigned int
: An imp def size of region for which this translation is valid for.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ssd_ns enum
: The security state of the transaction

stag_if_stalling unsigned int
: This is the STAG used by the transaction if it is going to stall. It is ~0u if it is not going to stall.

state enum
: The final transaction state.

streamid unsigned int
: The StreamID of the transction.

substreamid unsigned int
: The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int
: Translation Buffer Unit number.

trans_id unsigned int
: Transaction id. Top bit set if debug transaction.

smmu_initial_transaction

This is the transaction group request to remap is going to start one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. A stalling transaction will report through this trace source when it unstalls. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum
: The AxMMUFLOW for this transaction group. stallable -- allow the transaction to be stalled if configured. translated-access -- is a PCIe Translated Access non-stallable -- do not stall transaction even if configured. transfault-flow -- do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum
: The point associated with the CMO, if applicable

input_address unsigned int
: The input address of the transaction group.

input_inner enum
: Inner cacheability for the input attributes.

input_outer enum
: Outer cacheability for the input attributes.

input_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

input_sh enum
: Shareability for the input attributes.

kind enum
: The kind of access this transaction group that this represents.

operation enum
: The kind of operation that this represents.

ssd_ns enum
: The security state of the transaction

streamid unsigned int
: The StreamID of the transction.

substreamid unsigned int
: The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int
: Translation Buffer Unit number.

trans_id unsigned int
: Transaction id. Top bit set if debug transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

smmu_pmusnapshot_ack

Acknowledge the pmusnapshot_req to indicate the snapshot has occurred. This is part of a four-phase handshake. Fields:

pin_index unsigned int
: The pin index of the signal, or ~0u if not relevant.

pmcg_index enum
: The PMCG index.

value bool
: The value of the signal.

smmu_pmusnapshot_req

Take a snap shot of the PMU values as though SMMU_PMCG_CAPR.CAPTURE had been written. This is part of a four-phase handshake. Fields:

pin_index unsigned int
: The pin index of the signal, or ~0u if not relevant.

pmcg_index enum
: The PMCG index.

value bool
: The value of the signal.

smmu_poison_tw_data

Poison data has been returned to a table walk transaction. Fields:

bitmap_of_poison unsigned int
: The bitmap of which beats of the transaction where poisoned.

is_cas bool
: True if this is a compare-and-swap operation.

ns bool
: Non-secure state of the bus transaction.

number_of_64bit_beats unsigned int
: Number of beats this transaction fetched.

paddress unsigned int
: Physical address of the table walk transaction.

ras_group_id unsigned int
: If non-~0u then is the RAS group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

ras_record_index_in_group unsigned int
: If non-~0u then is the RAS record index in the group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

what enum
: What table walk was being performed.

smmu_pri_resp

The CMD_PRI_RESP command is queued to be sent to the PCIe system. Fields:

cmd_id unsigned int
: Command id

cons unsigned int
: CONS of the command.

prgindex unsigned int
: PRG Index.

response enum
: If has a SubstreamID (PASID) then if it is 'global' or not.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

streamid unsigned int
: StreamID in the invalidate command.

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

smmu_pri_resp_nop

The CMD_PRI_RESP command was NOPped. Fields:

cmd_id unsigned int
: Command id

cons unsigned int
: CONS of the command.

prgindex unsigned int
: PRG Index.

response enum
: If has a SubstreamID (PASID) then if it is 'global' or not.

streamid unsigned int
: StreamID in the invalidate command.

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

why enum
: Why the CMD_PRI_RESP was NOPped.

smmu_priq_resp_fake_return

A PRIQ Response is posted to the PCIe subsystem and so has no acknowledgement that it is received. However, in the model then we artificially know when the the PRIQ Response has been delivered to the PCIe subsystem, even if the ATC has not yet acted on it. Fields:

prgindex unsigned int
: The PRG Index this request corresponds to.

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

what enum
: What happened.

smmu_priq_resp_start

A PRIQ Response has been posted to the PCIe subsystem. As the response is posted then there is no way of knowing when it is received by the EndPoint. Fields:

prgindex unsigned int
: The PRG Index this request corresponds to.

response enum
: If has a SubstreamID (PASID) then if it is 'global' or not.

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_thread_wait_wake

Traces a thread's wait/wake status. Fields:

current_ticks unsigned int
: The current tick count of simulated time.

event enum
: What is happening to this thread.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

thread_index unsigned int
: The ID of this thread.

ticks unsigned int
: If the event relates to a time then this is held in this field. Otherwise, 0.

stall_transaction

A transaction is about to stall. Fields:

stag unsigned int
: STAG.

streamid unsigned int
: StreamID.

streamid_ns bool
: The StreamID was for the non-secure world.

trans_id unsigned int
: Transaction id.

stall_transaction_inhibited_by_STALL_MAX

A transaction is about to stall but the maximum number of transactions have stalled and we can't report this one to the event queue (even if non-full). Fields:

streamid unsigned int
: StreamID.

streamid_ns bool
: The StreamID was for the non-secure world.

trans_id unsigned int
: Transaction id.

stall_transaction_resuming

A stalled transaction is resuming. Fields:

stag unsigned int
: STAG if appropriate, or if was inhibited by STALL_MAX then 0xFAFA.

stallresult enum
: What the transaction resumed to do.

streamid unsigned int
: StreamID.

streamid_ns bool
: The StreamID was for the non-secure world.

trans_id unsigned int
: Transaction id.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

desckind enum
: The kind of descriptor

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns bool
: Non-Secure

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ste_cc.STE_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

ste_cc.STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

ste_entry_allocated

An STE entry has been allocated. Fields:

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

ns enum
: For the non-secure world

ste string
: A textual description of the STE.

streamid unsigned int
: The StreamID of the entry this will match.

sup_btm

The system supports BTM. Fields:

value bool
: The value of the signal.

sup_cohacc

The system supports cohacc. Fields:

value bool
: The value of the signal.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

sup_sev

The system supports SEV. Fields:

value bool
: The value of the signal.

tbu0_reset_in

The reset signal of the TBU0. Fields:

value bool
: The value of the signal.

tcu_reset_in

The reset signal. Fields:

value bool
: The value of the signal.

tlb_entry_allocated

A TLB entry has been allocated. Fields:

aset unsigned int
: The ASET of this entry.

asid unsigned int
: ASID if appropriate.

index unsigned int
: Index of TLB entry.

input_end_incl_address unsigned int
: The end inclusive address of the input range that this matches.

input_start_address unsigned int
: The start address of the input range that this matches.

output_end_incl_address unsigned int
: The end inclusive address of the output range.

output_start_address unsigned int
: The start address of the output range.

scheme enum
: The tagging scheme used

ssd_ns enum
: Security State

tbi bool
: Was the entry formed using Top Byte Ignore (TBI).

vmid unsigned int
: VMID if appropriate.

tlb_info_tlb_entries_overlap

A TLB entry was inserted into the TLB and it overlaps an existing entry. This isn't a problem as it was inserted in such a way that it architecturally works. Fields:

end_address_of_new_entry unsigned int
: End address of new entry.

end_address_of_old_entry unsigned int
: End address of old entry.

how_inserted enum
: How the entry was inserted.

index_of_new_entry unsigned int
: Index of new entry.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

index_of_old_entry unsigned int
: Index of old entry.

start_address_of_new_entry unsigned int
: Start address of new entry.

start_address_of_old_entry unsigned int
: Start address of old entry.

verbose_commentary

This is a verbose commentary on the translation process the SMMU is performing. Fields:

output string
: The stream output.

warning_MSI_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
: The untruncated address of the MSI.

warning_MSI_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
: The untruncated address of the MSI.

warning_MSI_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
: The untruncated address of the MSI.

warning_MSI_S_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
: The untruncated address of the MSI.

warning_MSI_S_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
: The untruncated address of the MSI.

warning_MSI_pmcg_address_out_of_range_of_oas

The MSI Address of the Performance Monitor Counter Group (PMCG) is out of range of the OAS and so will be silently truncated. Fields:

address unsigned int
: The untruncated address of the MSI.

pmcg_index unsigned int
: Index of the PMCG.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

warning_discarding_interrupt_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.EVENTQ_IRQEN.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

warning_discarding_interrupt_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_S_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_S_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.GERROR_IRQEN.

warning_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is UNPREDICTABLE if this will generate an interrupt or not. Fields:

which enum
: Which GERROR was acknowledge when there was no active error.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc string
: The textual description of what happened.

warning_s_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is UNPREDICTABLE if this will generate an interrupt or not. Fields:

which enum
: Which GERROR was acknowledge when there was no active error.

what_going_to_do_with_terminated_event

A terminating transaction has produced an event, this tells you what the model is going to do with the event. Fields:

CD.S bool
: The CD.S field if available.

S2 bool
: The event is related to Stage 2.

STE.S1STALLD bool
: The STE.S1STALLD field if available.

STE.S2S bool
: The STE.S2S field if available.

aborts bool
: The transaction will abort.

axmmuflow enum
: The AxMMUFLOW for this transaction group. stallable -- allow the transaction to be stalled if configured. translated-access -- is a PCIe Translated Access non-stallable -- do not stall transaction even if configured. transfault-flow -- do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

is_tr_fault bool
: Is a Translation Related fault.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

reports bool
: The transaction will attempt to report.

ssd_ns bool
: The transaction is classified as SSD non-secure.

supports_stall_model bool
: The implementation supports the stall model.

trans_id unsigned int
: The transaction id.

why_abort_decision enum
: The reason why the transaction aborted/did not abort.

why_report_decision enum
: The reason why the transaction reported/did not report.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.85 MMU_700 - trace

This section describes the trace sources.

ArchMsg.Error.error

These messages are about activity occurring on the SMMU that is considered an error. Messages will only come out here if parameter all_error_messages_through_trace is true. Fields:

output string
: The stream output

ArchMsg.Error.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int
: The address of the descriptor fetch.

desc_inner enum
: Inner cacheability of descriptor

desc_outer enum
: Outer cacheability of descriptor

desc_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

desc_sh enum
: Shareability of descriptor

ssd_ns bool
: Is the Security State Determination of the transaction non-secure.

stage unsigned int
: The stage at which we had a problem.

streamid unsigned int
: The StreamID of the transaction

substreamid unsigned int
: The SubstreamID of the transaction (or ~0u if no substreamid)

trans_id unsigned int
: Transaction id.

ArchMsg.Error.ns_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int
: Command ID of the command in error.

cons unsigned int
: CONS of the command.

what string
: What is wrong.

ArchMsg.Error.priq_streamid_truncated

The SMMU received a PCIe PRI request with a StreamID) that was larger than that which the SMMU has been configured for. The StreamID that appears in the PRIQ entry will be truncated. Fields:

actual_streamid unsigned int
: The actual StreamID that this request has.

sidsize unsigned int
: The bit width of the SMMU for StreamIDs, as indicated by SMMU_IDR1.SIDSIZE.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

trans_id unsigned int
: The transaction ID that identifies this request.

trunc_streamid unsigned int
: The truncated StreamID that will appear in the PRIQ entry.

ArchMsg.Error.priq_substreamid_truncated

The SMMU received a PCIe PRI request with a PASID prefix (SubstreamID) that was larger than that which the SMMU has been configured for. The SubstreamID that appears in the PRIQ entry will be truncated. Fields:

actual_substreamid unsigned int
: The actual SubstreamID that this request has.

ssidsize unsigned int
: The bit width of the SMMU for SubstreamIDs, as indicated by SMMU_IDR1.SSIDSIZE.

trans_id unsigned int
: The transaction ID that identifies this request.

trunc_substreamid unsigned int
: The truncated SubstreamID that will appear in the PRIQ entry.

ArchMsg.Error.s_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int
: Command ID of the command in error.

cons unsigned int
: CONS of the command.

what string
: What is wrong.

ArchMsg.Error.tlb_entries_overlap

A TLB entry was attempted to be inserted into the TLB and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

do_f_tlb_conflict bool
: Chosen to perform an F_TLB_CONFLICT.

end_address_of_new_entry unsigned int
: End address of new entry.

end_address_of_old_entry unsigned int
: End address of old entry.

index_of_new_entry unsigned int
: Index of new entry.

index_of_old_entry unsigned int
: Index of old entry.

start_address_of_new_entry unsigned int
: Start address of new entry.

start_address_of_old_entry unsigned int
: Start address of old entry.

why enum
: Why it is an error for these two entries to overlap.

ArchMsg.Error.tlb_entry_not_invalidated_due_to_ril

An entry in the cache was not invalidated even though in the right address range because of the RIL fields of the command the entry do not match. Fields:

cmd_num unsigned int
: The NUM field of the RIL part of the command.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_ril_tg enum
: The RIL_TG field of the RIL part of the command.

cmd_ril_ttl unsigned int
: The TTL field of the RIL part of the command, zero means any level.

cmd_scale unsigned int
: The SCALE field of the RIL part of the command.

entry_id unsigned int
: The entry id that is being invalidated.

tlb_entry string
: The TLB entry.

ArchMsg.Error.vatos_sel_vmid_out_of_range

The SMMU_(S_)VATOS_SEL.VMID field was programmed with a VMID that was too wide for this implementation (SMMU_IDR0.VMID16 == 0). Fields:

ssd_ns bool
: The security state of the VATOS interface

vmid unsigned int
: The VMID programmed.

ArchMsg.Info.info

These are information messages about what is happening in the SMMU. Fields:

output string
: The stream output

ArchMsg.Warning.CMD_RESUME_no_transaction_resumed

A CMD_RESUME was issued that matched no transaction. Fields:

stag unsigned int
: STAG in the CMD_RESUME.

streamid unsigned int
: StreamID in the CMD_RESUME.

streamid_ns bool
: The StreamID was for the non-secure world.

ArchMsg.Warning.atc_inv_strange

Something was odd about the CMD_ATC_INV. Fields:

cmd_id unsigned int
: Command id

why string
: Why the CMD_ATC_INV was strange

ArchMsg.Warning.bad_conf_reset_of_SMMU_GBPA_ABORT

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.bad_conf_reset_of_SMMU_S_GBPA_ABORT

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_sec_override

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_sup_btm

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_sup_cohacc

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_sup_httu

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_sup_sev

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

value bool
The value of the signal.

ArchMsg.Warning.bad_tbu0_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
The default value of the signal we have been assuming.
value bool
The value of the signal.

ArchMsg.Warning.bad_tcu_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
The default value of the signal we have been assuming.
value bool
The value of the signal.

ArchMsg.Warning.contig_bit_gives_too_large_region_for_TxSZ

If the contig bit was used then the size of the contig region would be larger than that indicated by TxSZ. Fields:

desc_kind enum
Descriptor kind
el enum
Exception level
input_address unsigned int
Input address
log2_contig_region_size unsigned int
Log2(contig region size in bytes)
output_address unsigned int
Output address
stage_and_level unsigned int
The stage in bits [7:4] and the level in [3:0].
vmid unsigned int
VMID if appropriate

ArchMsg.Warning.contig_bit_has_inconsistent_input_and_output_address

If the contig bit was used then the some bits of the output address held in the descriptor and the input address must match. Fields:

desc_kind enum
Descriptor kind
el enum
Exception level
input_address unsigned int
Input address
log2_contig_region_size unsigned int
Log2(contig region size in bytes)
match_mask unsigned int
Bits that must match.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

output_address unsigned int
: Output address

stage_and_level unsigned int
: The stage in bits [7:4] and the level in [3:0].

vmid unsigned int
: VMID if appropriate

ArchMsg.Warning.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int
: The address of the descriptor fetch.

desc_inner enum
: Inner cacheability of descriptor

desc_outer enum
: Outer cacheability of descriptor

desc_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

desc_sh enum
: Shareability of descriptor

ssd_ns bool
: Is the Security State Determination of the transaction non-secure.

stage unsigned int
: The stage at which we had a problem.

streamid unsigned int
: The StreamID of the transaction

substreamid unsigned int
: The SubstreamID of the transaction (or ~0u if no substreamid)

trans_id unsigned int
: Transaction id.

ArchMsg.Warning.msi_address_truncated

An MSI was generated, but the address was silently truncated due to the limited downstream address bus width. Fields:

pmcg_index_and_counter unsigned int
: If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int
: If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

truncated_address unsigned int
: The truncated address.

untruncated_address unsigned int
: The untruncated address.

which enum
: Which MSI this is

ArchMsg.Warning.msi_lost

An MSI was attempted to be sent, but the implementation doesn't support it. Fields:

id unsigned int
: ID of this interrupt transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

kind enum
: What kind of interrupt.

ArchMsg.Warning.pmcg_non_secure_world

A commentary on potential mis-programming of the PMCG when transitioning the PMCG from the secure world to the non-secure. Fields:

commentary string
: The commentary.

ArchMsg.Warning.pmcg_programming_violates_security

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between non-secure and secure worlds. This is under the assumption that a non-secure asynchronous agent could be writing to the PMCG. Fields:

commentary string
: The commentary.

ArchMsg.Warning.priq_auto_response_failed_to_find_STE

The PRIQ was going to generate an auto-response, but failed to find an STE and so is returning a Failure message to the EndPoint which should disable the PRI interface of the EndPoint. Fields:

trans_id unsigned int
: The ID of the PPR that is being lost.

why enum
: Why the PPR is being lost.

ArchMsg.Warning.priq_overflow_bad_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG but an overflow condition did not exist. Fields:

new_ovackflg bool
: The new value of the SMMU_PRIQ_CONS.OVACKFLG.

ArchMsg.Warning.priq_smmuen_forces_effective_priqen_low

If SMMUEN == 0, then the effective value of PRIQEN is 0. This warning is triggered when PRIQEN == 1 && SMMUEN == 0; which may not be what was intended. The PRIQ cannot be active if SMMUEN == 0.

ArchMsg.Warning.sev_lost

A SEV was lost because it isn't supported according to SMMU_IDR0.SEV. Fields:

why enum
: Why the SEV was generated.

ArchMsg.Warning.smmu_pcie_rc_is_in_reset_ignoring_atc_invalidate

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that mapped to a PCIe Root Complex that is in reset. The message will be discarded and act as though completed successfully. Fields:

port_index unsigned int
: The port index (node index) that is in reset but we would have sent it to.

streamid unsigned int
: The StreamID that failed to map.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.smmu_pcie_rc_not_found_for_streamid

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that did not map to a PCIe Root Complex. This might be that the SW used an incorrect StreamID or it might be that the model has not been connected correctly. ATC Invalidate messages complete as though successful and PRI Requests are ignored. Fields:

streamid unsigned int
: The StreamID that failed to map.

ArchMsg.Warning.smmu_pmusnapshot

Something strange happened on the pmusnapshot_req/pmusnapshot_ack inteface. Fields:

pin_index unsigned int
: If the PMCG index corresponds to an array of signals, this is the index in the array, or 0 otherwise.

pmcg_index enum
: The PMCG index.

warning string
: The warning message.

ArchMsg.Warning.warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the SMMU. Fields:

output string
: The stream output

EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

PRIQ_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

PRIQ_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

PRIQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

SMMU_CR0ACK_SMMUEN_hazarded_by_priq

The SMMU_CR0ACK.SMMUEN cannot acknowledge the change to SMMUEN because there are outstanding PRIQ writes.

SMMU_CR0ACK_SMMUEN_update

The acknowledge to SMMU_CR0.SMMUEN was performed. Fields:

new_value bool
: The new value of the register.

SMMU_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_CR0.SMMUEN completed. Fields:

last bool
: This is the last set completing.

old_value bool
: The old value of the set completing.

SMMU_CR0_SMMUEN_write

A write to SMMU_CR0.SMMUEN occurred. Fields:

new_value bool
: The new value of the register.

old_value bool
: The old value of the register.

SMMU_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_GBPA completed. Fields:

last bool
: This is the last set completing.

old_value unsigned int
: The old value of the set completing.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SMMU_GBPA_update

The Update flag to SMMU_GBPA was lowered. Fields:

new_value unsigned int
: The new value of the register.

SMMU_GBPA_write

A write to SMMU_GBPA occurred. Fields:

new_value unsigned int
: The new value of the register.

old_value unsigned int
: The old value of the register.

SMMU_S_CR0ACK_SMMUEN_update

The acknowledge to SMMU_S_CR0.SMMUEN was performed. Fields:

new_value bool
: The new value of the register.

SMMU_S_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_S_CR0.SMMUEN completed. Fields:

last bool
: This is the last set completing.

old_value bool
: The old value of the set completing.

SMMU_S_CR0_SMMUEN_write

A write to SMMU_S_CR0.SMMUEN occurred. Fields:

new_value bool
: The new value of the register.

old_value bool
: The old value of the register.

SMMU_S_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_S_GBPA completed. Fields:

last bool
: This is the last set completing.

old_value unsigned int
: The old value of the set completing.

SMMU_S_GBPA_update

The Update flag to SMMU_S_GBPA was lowered. Fields:

new_value unsigned int
: The new value of the register.

SMMU_S_GBPA_write

A write to SMMU_S_GBPA occurred. Fields:

new_value unsigned int
: The new value of the register.

old_value unsigned int
: The old value of the register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

S_EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

S_EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

S_EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

S_GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

tr bool
: transient attribute

wa bool
: write-allocate attributes.

S_GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

S_GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

TLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

TLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

atc_inv_nop

The CMD_ATC_INV command is ignored as a NOP. This may be emitted multiple times if the CMD_ATC_INV is being ignored for multiple reasons. Fields:

address unsigned int
: Untranslated Address to invalidate.

cmd_id unsigned int
: Command id, if top-bit is set then was issued from the Non-secure CMDQ.

cons unsigned int
: CONS of the command.

global bool
: Global flag.

log2_size_in_bytes unsigned int
: Log 2 of the size in bytes of the region to invalidate.

streamid unsigned int
: StreamID in the invalidate command.

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

why enum
: Why was NOPped

atos_complete_fault

The ATOS operation completed with a fault. Fields:

effective_st1translate bool
: Because of the settings and/or the ATOS type then the effective st1translate can be different.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

fault_faddr unsigned int
: The fault FADDR.

fault_faultcode enum
: The fault code.

fault_reason enum
: The fault reason.

ssd_ns bool
: This is a non-secure ATOS operation.

st1translate bool
: The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool
: The translation suffered a stage 2 translation.

state enum
: The final transaction state of the ATOS operation.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_complete_fault_inv_req

The ATOS operation completed, faulted and generated an INV_REQ response. Fields:

ssd_ns bool
: This is a non-secure ATOS operation.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

why enum
: Why the ATOS operation generated an INV_REQ

atos_complete_success

The ATOS operation completed successfully. Fields:

base_addr unsigned int
: The actual base address of region.

effective_st1translate bool
: Because of the settings and/or the ATOS type then the effective st1translate can be different.

par_addr unsigned int
: The PAR.ADDR field.

par_mair unsigned int
: The memory attributes encoded as a MAIR

par_ns bool
: The PAR.NS field, for an SSD-ns request then this will always be 0.

par_sh enum
: Shareability

par_size bool
: The PAR.Size field.

size_in_bytes unsigned int
: The actual size in bytes of the region.

ssd_ns bool
: This is a non-secure ATOS operation.

st1translate bool
: The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool
: The translation suffered a stage 2 translation.

state enum
: The final transaction state of the ATOS operation.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

atos_run_set

The SMMU_s_GATOS_CTRL.RUN field was set to start the ATOS operation. Fields:

ssd_ns bool
: This is a non-secure ATOS operation.

vatos bool
: This is a VATOS operation

atos_starting

The ATOS operation is starting. Fields:

addr unsigned int
: The input address to the ATOS operation.

httui bool
: Inhibit HTTU update.

ind bool
: Instruction Data.

pnu bool
: Privileged not User.

rnw bool
: Read not Write.

ssd_ns bool
: This is a non-secure ATOS operation.

ssec bool
: If this is a secure ATOS operation then this is if it is secure or not.

streamid unsigned int
: The StreamID requested.

substreamid unsigned int
: The SubstreamID requested, or ~0u if no SubstreamID.

type enum
: The requested ATOS type.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

cd_cc.CD_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

cd_cc.CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

cd_entry_allocated

An CD entry has been allocated. Fields:

cd string
: A textual description of the CD.

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

ns enum
: For the non-secure world

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

streamid unsigned int
: The StreamID of the entry this will match.

substreamid unsigned int
: The SubstreamID of the entry this will match. This may be zero for transactions without a SubstreamID.

conf_reset_of_SMMU_GBPA_ABORT

The reset value of SMMU_GBPA.ABORT. Fields:

value bool
: The value of the signal.

conf_reset_of_SMMU_S_GBPA_ABORT

The reset value of SMMU_S_GBPA.ABORT. Fields:

value bool
: The value of the signal.

dvm_tlbinvalidate_complete

The DVM TLB Invalidate message completed. Fields:

id unsigned int
: The unique id of this DVM message.

ok bool
: The DVM message was OK.

dvm_tlbinvalidate_received

A DVM message for a TLB Invalidate has been received. Fields:

address unsigned int
: The VA or IPA to use if match_address.

asid unsigned int
: The ASID to match if match_asid.

by_ipa bool
: The operation is for an IPA operation if match_address.

id unsigned int
: The unique id of this DVM message.

ignored enum
: The DVM message was ignored

last_level bool
: The operation is for last level if supported.

match_address bool
: Match the address field.

match_asid bool
: Match the asid field.

match_vmid bool
: Match the vmid field.

num unsigned int
: If a range operation, the NUM field. If a single-address operation this is 0.

prot enum
: The protection level for which this TLB Invalidate will operate on.

security_world enum
: The security world that this will apply to.

smmu_scale unsigned int
: If a range operation, then the SCALE field with the meaning in the SMMU architecture which is different to the PE architecture. If a single-address operation this is 0.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

stage1_only bool
: The operation is for stage 1 only if supported.

tg enum
: If a single-address or address-range operation, then the Translation Granule hint. Address-range operations always supply a Translation Granule.

translation_table_level enum
: The leaf level of the translation table.

vmid unsigned int
: The VMID to match if match_vmid.

found_tlb_entry_has_different_aset

Architecturally, a particular ASID either should be ASET0 or ASET1. However, we have managed to find a TLB entry that has a different ASET than that which we were searching for. This indicates a programming error. You should examine all contexts with this particular ASID/VMID and ensure they are consistent. Fields:

aset unsigned int
: The ASET of this entry.

asid unsigned int
: ASID if appropriate.

index unsigned int
: Index of TLB entry.

input_start_address unsigned int
: The start address of the input range that this matches.

scheme enum
: The tagging scheme used

ssd_ns enum
: Security State

vmid unsigned int
: VMID if appropriate.

gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool
: True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int
: GERRORN register value.

interrupt_potentially_sent bool
: An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interupt.

new_gerror unsigned int
: GERROR register value after any invertion.

which enum
: Which bit was attempted to be inverted.

gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum
: Which GERROR was acknowledged.

httu_update_abandoned_update

The HTTU update of a descriptor in memory was potentially possible, but it was behind an update that failed to apply cleanly. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

AF enum
: Whether an AF update should/could occur.

DBM enum
: Whether a DBM update should/could occur.

address unsigned int
: Address of HTTU update.

httu_inner enum
: Inner cacheability of descriptor to update

httu_outer enum
: Outer cacheability of descriptor to update

httu_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

httu_sh enum
: Shareability of descriptor to update

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

original_descriptor unsigned int
: The original descriptor that the model observed.

stage_and_level unsigned int
: The stage (bits[7:4]) and level (bits[3:0]).

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

what enum
: What this descriptor represents

httu_update_end_update

The attempted update of a descriptor in memory has occurred. Fields:

is_big_endian bool
: The descriptor is big-endian in memory.

original_descriptor unsigned int
: The original descriptor value.

result enum
: The result of the attempt to update.

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int
: The new descriptor value that tried to replace the original.

value_that_was_in_memory unsigned int
: The value that the compare-and-swap operation returned as the value that was in memory.

httu_update_not_done

A discretionary HTTU update could occur and the implementation choose not to do it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum
: Whether an AF update should/could occur.

DBM enum
: Whether a DBM update should/could occur.

address unsigned int
: Address of HTTU update.

httu_inner enum
: Inner cacheability of descriptor to update

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

httu_outer enum
: Outer cacheability of descriptor to update

httu_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

httu_sh enum
: Shareability of descriptor to update

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

original_descriptor unsigned int
: The original descriptor that the model observed.

stage_and_level unsigned int
: The stage (bits[7:4]) and level (bits[3:0]).

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

what enum
: What this descriptor represents

httu_update_start_update

An HTTU update could occur and the implementation chose to try it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum
: Whether an AF update should/could occur.

DBM enum
: Whether a DBM update should/could occur.

address unsigned int
: Address of HTTU update.

httu_inner enum
: Inner cacheability of descriptor to update

httu_outer enum
: Outer cacheability of descriptor to update

httu_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

httu_sh enum
: Shareability of descriptor to update

is_big_endian bool
: The descriptor will be written to memory as big-endian.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

original_descriptor unsigned int
: The original descriptor that the model observed.

stage_and_level unsigned int
: The stage (bits[7:4]) and level (bits[3:0]).

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int
: The new descriptor value that is going to try replace the original.

what enum
: What this descriptor represents

will_do_AF bool
: What the implementation chose to do for the AF update.

will_do_DBM bool
: What the implementation chose to do for the DBM update.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

interrupt_returned

An interrupt/MSI returned from downstream. Fields:

InD_NS_PnU enum
: Instruction/Data, Non-secure/Secure, Privileged/User.

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

id unsigned int
: ID of this interrupt transaction.

inner_cache enum
: The actual attributes of the access.

kind enum
: What kind of interrupt.

mpam_ns bool
: The security state associated with the MPAM PARTID/PMG.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_valid bool
: MSI will attempt to be sent.

ok bool
: Did the access return OK or an abort?

outer_cache enum
: The actual attributes of the access.

pmcg_index_and_counter unsigned int
: If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int
: If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum
: Shareability

interrupt_sent

An interrupt is raised. If it sends an MSI then this is _after_ any device-dependent transform on the architectural attributes and so may differ from what is programmed. Fields:

InD_NS_PnU enum
: Instruction/Data, Non-secure/Secure, Privileged/User.

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

id unsigned int
: ID of this interrupt transaction.

inner_cache enum
: The actual attributes of the access.

kind enum
: What kind of interrupt.

mpam_ns bool
: The NS state of the MPAM PARTID and MPAM PMG.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_valid bool
: MSI will attempt to be sent.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

outer_cache enum
: The actual attributes of the access.

pmcg_index_and_counter unsigned int
: If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int
: If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum
: Shareability

l1cd_cc.L1CD_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

l1cd_cc.L1CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

l1cd_entry_allocated

An L1 CD entry has been allocated. Fields:

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

normalised_substreamid unsigned int
: The first SubstreamID of the range of SubstreamIDs that this L1CD entry will match.

ns enum
: For the non-secure world

pa_l2 unsigned int
: The PA of the L2 CD table. This is L2Ptr << 12.

streamid unsigned int
: The StreamID this CD is for.

valid bool
: Is the entry valid.

l1ste_cc.L1STE_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

l1ste_cc.L1STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

l1ste_entry_allocated

An L1 STE entry has been allocated. Fields:

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

first_streamid_of_range unsigned int
: The first StreamID of the range of StreamIDs that this L1STE entry will match.

ns enum
: For the non-secure world

num_entries_in_l2 unsigned int
: The number of entries in the L2 table. This is 2**(Span-1) or 0 if invalid.

pa_l2 unsigned int
: The PA of the L2 ST table. This is L2Ptr << 6 and aligned to the size of the table.

ns_cmd_sync_completed_irq

Non-secure CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_completed_no_action

Non-secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_completed_sev

Non-secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_completed_with_error

Non-secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

cerror enum
: The error associated with the CMD_SYNC

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_issued

Non-secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

hazarded bool
: The CMD_SYNC is currently hazarded from completing.

ns_cmd_sync_issuing

Non-secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_starting_completion_action_irq

Non-secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

msiaddress unsigned int
: The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int
: The MSI data to send.

ns_cmd_sync_starting_completion_action_sev

Non-secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum
: The CERROR to attach.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

ns_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum
: The CERROR to attach.

cmd_id unsigned int
: Command ID of the CMD_SYNC

ns_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum
: The error being exposed, if any.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

enack bool
: The value of ENACK.

forced_error bool
: The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

ns_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int
: Command ID of the command being executed.

cons unsigned int
: CONS of the command.

what string
: What is being executed.

ns_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

disable_fetch bool
: The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int
: The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int
: The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int
: The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int
: The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int
: The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int
: The PROD pointer of the region unfetched (including wrap).

ns_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool
: There is a CERROR that can be recognised.

can_cmd_sync bool
: There is a CMD_SYNC that can be recognised.

can_fetch bool
: The SMMU can fetch

can_issue bool
: There are fetched commands that are eligible to be issued.

can_update_cons bool
: The programmer view of CMDQ_CONS can be moved to say some have been consumed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

cmd_sync enum
: Why a CMD_SYNC cannot be issued

cmdqen bool
: CMDQEN, when enabled then the CMDQ can fetch commands

cmdqen_1_to_0_unacknowledged bool
: CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum
: The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool
: The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int
: The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum
: The state of the fetch state machine

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool
: If there are too may issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int
: The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int
: This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum
: The internal issued state machine state

outstanding_fetches_since_reset unsigned int
: The number of outstanding fetches.

ns_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int
: The transaction id that caused the event.

ns_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int
: Transaction id of the auto-retried transaction.

why enum
: Why the transaction retried.

ns_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int
: The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int
: The current programmer-visible prod including wrap bit.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum
: Some more information about the queue state.

cons_incl_wrap unsigned int
: The CONS pointer (including wrap bits).

eventqen bool
: EVENTQEN.

eventqenack bool
: EVENTQENACK.

prod_incl_wrap unsigned int
: The PROD pointer (including wrap bits).

ns_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int
: The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int
: The transaction id that produced the event record that aborted.

ns_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD index of the event if appropriate or ~0u otherwise.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

ns_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool
: If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int
: This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code.

is_prior_set bool
: The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete

trans_id unsigned int
: The transaction id that this corresponds to.

ns_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int
: The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int
: The number of events available to the programmer.

prog_cons unsigned int
: The programmer-visible CONS pointer.

prog_prod unsigned int
: The programmer-visible PROD pointer.

what enum
: What changed?

ns_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

ns_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int
: The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum
: The reason the event was removed.

trans_id unsigned int
: The transaction id that caused the event.

ns_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

ns_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

ns_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool
: The write aborted.

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

pmcg_irq_config

The interrupt configuration of the Performance Monitor Counter Group (PMCG) changed. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: SMMU_PMCG_CTRL.IRQEN.

memattr enum
: Memory type

mpam_ns bool
: The NS state of the MPAM PARTID and MPAM PMG

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_supported bool
: Are MSIs supported for this security world.

ns bool
: Non-secure bus attribute.

number_of_interrupts_in_flight unsigned int
: The number of interrupts that have been committed to be produced or in flight.

pmcg_index unsigned int
: Index of the PMCG

sh enum
: Shareability.

smmu_pmcg_gmpam_Update bool
: The SMMU_PMCG_GMPAM.Update flag. Only when this is zero are writes predictable.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_irqen

A trace of SMMU_PMCG_IRQ_CTRL.IRQEN. Fields:

new_value bool
: The new value of IRQEN.

pmcg_index unsigned int
: Index of the PMCG.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_irqen_ack

A trace of SMMU_PMCG_IRQ_CTRLACK.IRQEN. Fields:

new_value bool
: The new value of IRQEN.

pmcg_index unsigned int
: Index of the PMCG.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_merging_interrupts

An interrupt was wanted to be generated, but one was already pending so the two were merged together. Fields:

pmcg_index unsigned int
: Index of the PMCG.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_trigger

A PMCG counter has been triggered. Fields:

counter_index unsigned int
: The index of the counter within the PMCG.

event_id unsigned int
: The event id that has been triggered.

ns_event bool
: The security state associated with the event.

pmcg_index unsigned int
: Index of the PMCG.

streamid unsigned int
: The StreamID associated with the event, if there is one.

pmu_active_counter

Traces what active counters are in a PMCG and what streamids it might filter on. Those counters that trace both secure and non-secure StreamIDs or those that are not filtered by StreamID will appear twice, once for each security world. All active counters for a PMCG are traced one after another. Fields:

begin_streamid unsigned int
: The start StreamID to filter on.

counter_index unsigned int
: The counter index within the PMCG.

end_incl_streamid unsigned int
: The end inclusive StreamID to filter on.

evcnt unsigned int
: The current count.

event_id unsigned int
: The event ID to filter.

ns bool
: Are the StreamIDs non-secure?

pmcg_index unsigned int
: The index of the PMCG that this counter belongs to.

pmu_all_counters_in_pmcg_became_inactive

The PMCG was tracing some events and now is not tracing any. Fields:

pmcg_index unsigned int
: The index of the PMCG.

pmu_capture

For some reason, a capture event occurred. Fields:

pmcg_index unsigned int
: The index of the PMCG that the capture occurred on.

why enum
: Why did the capture occur?

pmu_counter_configured_to_use_unsupported_event

An enabled counter was configured to use a unsupported event. Fields:

counter_index unsigned int
: The counter index within the PMCG.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

event_id unsigned int
: The unsupported event id.

pmcg_index unsigned int
: The index of the PMCG that this counter belongs to.

pmu_counter_overflowed

A counter in a particular PMCG overflowed. Fields:

already_overflowed bool
: True if the overflow flag was already set.

capture bool
: True if it captured the other counter values.

counter_index unsigned int
: The counter index within the PMCG.

interrupt bool
: True if going to attempt to generate an interrupt.

interrupt_action enum
: The interrupt action that is going to occur

pmcg_index unsigned int
: The index of the PMCG that this counter belongs to.

ssd_ns bool
: The PMCG is controlled by the Non-secure world.

priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int
: The PRG Index of the response.

resp enum
: The response to send.

streamid unsigned int
: The StreamID of the response.

substreamid unsigned int
: The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int
: The ID of the PPR that is being lost.

why enum
: Why the PPR is being lost.

priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool
: The PPR being lost is a Stop Marker.

resp enum
: What, if any, auto-response will be.

trans_id unsigned int
: The ID of the PPR that is being lost.

why enum
: Why the PPR is being lost

priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:-
SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool
: The new value of the SMMU_PRIQ_CONS.OVACKFLG.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool
: The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int
: The transaction ID of the PPR that caused the overflow.

priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool
: The Last in the Page Request Group (PRG).

R bool
: Read permission is requested.

W bool
: Read permission is requested.

prgindex unsigned int
: The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

ssd_ns bool
: The SSD of the StreamID. PRIQ should only receive _non-secure_ PRI Requests.

stop_marker bool
: If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int
: The StreamID this request is associated with.

substreamid unsigned int
: The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool
: If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool
: If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int
: The transaction ID that identifies this request.

untranslated_address unsigned int
: The Untranslated Address that this is requesting.

priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int
: The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int
: The transaction ID of the PPR that aborted.

priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int
: The PROD including the Wrap bit where we wrote..

trans_id unsigned int
: The transaction ID of the PPR.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue. Fields:

L bool
: The Last in the Page Request Group (PRG).

R bool
: Read permission is requested.

W bool
: Read permission is requested.

prgindex unsigned int
: The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int
: PROD position including the wrap bit.

stop_marker bool
: If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int
: The StreamID this request is associated with.

substreamid unsigned int
: The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool
: If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool
: If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int
: The transaction ID that identifies this request.

untranslated_address unsigned int
: The Untranslated Address that this is requesting.

priqen_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int
: The value of SMMU_PRIQ.CONS.RD_and_RD_wrap.

number_of_pprs unsigned int
: The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int
: This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int
: The number of writes to the PRIQ that are currently in flight.

ovackflg bool
: The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool
: The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool
: There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool
: The value of SMMU_CR0.PRIQEN. The _effective_ value is 0 if SMMUEN == 0.

priqenack bool
: The value of SMMU_CR0ACK.PRIQEN.

prod_incl_wrap unsigned int
: The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool
: The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CR0.PRIQEN.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

smmuen bool
: The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool
: The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int
: The size of the table in the number of items it can hold.

ptw_read

Page Table Walk (read). This is the result of the physical access that the SMMU is making. Fields:

abort enum
: Non-zero if the access aborted/failed.

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

data unsigned int
: The data fetch if it didn't abort.

desckind enum
: The kind of descriptor

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st1_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st1_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool
: Access Flag.

AP21 enum
: The access permissions.

AttrIndx210 unsigned int
: The attribute index into the MAIR0/1.

DBM bool
: Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

NS bool
: The encoding is for non-secure if this is a secure fetch.

PXN bool
: Privileged eXecute Never.

SH10 enum
: The shareability.

XN bool
: eXecute Never.

contiguous bool
: Contiguous hint.

desckind enum
: The kind of descriptor

hwu_pbha unsigned int
: Top four bits are appropriate CD.HWU*, bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by CD.HWU0*/CD.HWU1*.

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

nG bool
: not Global.

nT bool
: SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns bool
: Non-Secure

output_address unsigned int
: Output address.

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

APTable enum
: Remove permissions independently of subsequent descriptors.

NSTable bool
: The next level table descriptor is forced to non-secure.

PXNTable bool
: Force PXN independently of subsequent descriptors.

TableAddress unsigned int
: Address of the next table.

XNTable bool
: Force XN independently of subsequent descriptors.

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool
: Access Flag.

DBM bool
: Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

HAP21 enum
: The access permissions.

MemAttr3_0 enum
: The memory attributes.

SH10 enum
: The shareability.

XN enum
: eXecute Never.

contiguous bool
: Contiguous hint.

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

nT bool
: SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns bool
: Non-Secure

output_address unsigned int
: Output address.

pa_address unsigned int
: Physical address.

s2hwu_pbha unsigned int
: Top four bits are STE.S2HWU*, bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by STE.S2HWU*.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

APTable enum
: Remove permissions independently of subsequent descriptors.

PXNTable bool
: Force PXN independently of subsequent descriptors.

TableAddress unsigned int
: Address of the next table.

XNTable bool
: Force XN independently of subsequent descriptors.

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

raw_register_end_read

The raw register read transaction. This is the transaction as directed to the register port. Fields:

id unsigned int
: Id of this transaction.

ok bool
: Was the access OK? The bus response will always be OK, but is the register access reasonable.

read_data unsigned int
: The data read.

raw_register_end_write

The raw register write transaction. This is the transaction as directed to the register port. Fields:

id unsigned int
: Id of this transaction.

ok bool
: Was the access OK? The bus response will always be OK, but is the register access reasonable.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

raw_register_start_read

The raw register read transaction. This is the transaction as directed to the register port. Fields:

address unsigned int
: Address of transaction.

id unsigned int
: Id of this transaction. Top bit is set if is a debug transaction.

ns enum
: Is the transaction non-secure?

number_of_beats unsigned int
: Number of beats.

size_of_beat_in_bytes unsigned int
: Size of each beat in bytes.

raw_register_start_write

The raw register write transaction. This is the transaction as directed to the register port. Fields:

address unsigned int
: Address of transaction

id unsigned int
: Id of this transaction. Top bit is set if is a debug transaction.

ns enum
: Is the transaction non-secure?

number_of_beats unsigned int
: Number of beats.

size_of_beat_in_bytes unsigned int
: Size of each beat in bytes.

write_data unsigned int
: The data to write.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string
: The text description of the register value read.

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string
: The text description of the register value written.

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string
: The text description of the register value.

register_read_string

A text representation of the read of a register. Fields:

out string
: The text description of the register value read.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

register_write_reserved

A text representation of an access to a register address that is reserved or a write.to a RES0 field in a register. Fields:

in `string`
: The text description of the register value.

register_write_string

A text representation of the write of a register. Fields:

in `string`
: The text description of the register value written.

s_cmd_sync_completed_irq

Secure CMD_SYNC completed its IRQ action. Fields:

cmd_id `unsigned int`
: The ID of the command being issued.

cons_incl_wrap `unsigned int`
: CONS pointer of CMD_SYNC.

s_cmd_sync_completed_no_action

Secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id `unsigned int`
: The ID of the command being issued.

cons_incl_wrap `unsigned int`
: CONS pointer of CMD_SYNC.

s_cmd_sync_completed_sev

Secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id `unsigned int`
: The ID of the command being issued.

cons_incl_wrap `unsigned int`
: CONS pointer of CMD_SYNC.

s_cmd_sync_completed_with_error

Secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

cerror `enum`
: The error associated with the CMD_SYNC

cmd_id `unsigned int`
: The ID of the command being issued.

cons_incl_wrap `unsigned int`
: CONS pointer of CMD_SYNC.

s_cmd_sync_issued

Secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id `unsigned int`
: The ID of the command being issued.

cons_incl_wrap `unsigned int`
: CONS pointer of CMD_SYNC.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

hazarded bool
: The CMD_SYNC is currently hazarded from completing.

s_cmd_sync_issuing

Secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

s_cmd_sync_starting_completion_action_irq

Secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

msiaddress unsigned int
: The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int
: The MSI data to send.

s_cmd_sync_starting_completion_action_sev

Secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

s_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum
: The CERROR to attach.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

s_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum
: The CERROR to attach.

cmd_id unsigned int
: Command ID of the CMD_SYNC

s_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum
: The error being exposed, if any.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

enack bool
: The value of ENACK.

forced_error bool
: The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

s_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int
: Command ID of the command being executed.

cons unsigned int
: CONS of the command.

what string
: What is being executed.

s_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

disable_fetch bool
: The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int
: The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int
: The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int
: The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int
: The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int
: The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int
: The PROD pointer of the region unfetched (including wrap).

s_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool
: There is a CERROR that can be recognised.

can_cmd_sync bool
: There is a CMD_SYNC that can be recognised.

can_fetch bool
: The SMMU can fetch

can_issue bool
: There are fetched commands that are eligible to be issued.

can_update_cons bool
: The programmer view of CMDQ_CONS can be moved to say some have been consumed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

cmd_sync enum
: Why a CMD_SYNC cannot be issued

cmdqen bool
: CMDQEN, when enabled then the CMDQ can fetch commands

cmdqen_1_to_0_unacknowledged bool
: CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum
: The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool
: The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int
: The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum
: The state of the fetch state machine

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool
: If there are too may issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int
: The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int
: This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum
: The internal issued state machine state

outstanding_fetches_since_reset unsigned int
: The number of outstanding fetches.

s_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int
: The transaction id that caused the event.

s_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int
: Transaction id of the auto-retried transaction.

why enum
: Why the transaction retried.

s_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int
: The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int
: The current programmer-visible prod including wrap bit.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

s_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum
: Some more information about the queue state.

cons_incl_wrap unsigned int
: The CONS pointer (including wrap bits).

eventqen bool
: EVENTQEN.

eventqenack bool
: EVENTQENACK.

prod_incl_wrap unsigned int
: The PROD pointer (including wrap bits).

s_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/ s_eventq_lost_event_records trace. Fields:

prod unsigned int
: The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int
: The transaction id that produced the event record that aborted.

s_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD index of the event if appropriate or ~0u otherwise.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

s_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool
: If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int
: This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

s_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code.

is_prior_set bool
: The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete

trans_id unsigned int
: The transaction id that this corresponds to.

s_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int
: The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int
: The number of events available to the programmer.

prog_cons unsigned int
: The programmer-visible CONS pointer.

prog_prod unsigned int
: The programmer-visible PROD pointer.

what enum
: What changed?

s_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

s_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int
: The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum
: The reason the event was removed.

trans_id unsigned int
: The transaction id that caused the event.

s_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

s_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

s_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool
: The write aborted.

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

s_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool
: True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int
: GERRORN register value.

interrupt_potentially_sent bool
: An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interupt.

new_gerror unsigned int
: GERROR register value after any invertion.

which enum
: Which bit was attempted to be inverted.

s_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum
: Which GERROR was acknowledged.

sec_override

Controls non-secure accesses to some registers. Fields:

value bool
: The value of the signal.

sev

Send a SEV. Fields:

why enum
: Why the SEV was generated.

smmu_atc_inv

The CMD_ATC_INV command is sent. Fields:

address unsigned int
: Untranslated Address to invalidate.

cmd_id unsigned int
: Command id, if top-bit is set then was issued from the Non-secure CMDQ.

cons unsigned int
: CONS of the command.

global bool
: Global flag.

log2_size_in_bytes unsigned int
: Log 2 of the size in bytes of the region to invalidate.

ns_number_in_flight unsigned int
: Number of ATC invalidates in flight issued from the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

s_number_in_flight unsigned int
: Number of ATC invalidates in flight issued from the Secure CMDQ.

s_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

streamid unsigned int
: StreamID in the invalidate command.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

smmu_atc_inv_completed

The CMD_ATC_INV command completed. Fields:

cmd_id unsigned int
: Command id, if top-bit is set then was issued from the Non-secure CMDQ.

ns_number_in_flight unsigned int
: Number of ATC invalidates in flight now this one has completed, that were issued by the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

response enum
: The response.

s_number_in_flight unsigned int
: Number of ATC invalidates in flight now this one has completed, that were issued by the Secure CMDQ.

s_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

smmu_atc_inv_end

An ATC invalidate request has been started. Fields:

PASID_global bool
: If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int
: The Untranslated Address to use.

log2_size_in_bytes unsigned int
: Log2 of the size of the region in bytes to invalidate.

response enum
: The response to the ATC invalidate

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_atc_inv_start

An ATC invalidate request has been started. Fields:

PASID_global bool
: If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int
: The Untranslated Address to use.

log2_size_in_bytes unsigned int
: Log2 of the size of the region in bytes to invalidate.

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_ats_initial

This is the initial ATS request. Fields:

ia unsigned int
: Input address

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

max_number_of_replies unsigned int
: The maximum number of replies allowed to return

no_write bool
: The NW (no write flag) of the ATS request. If clear then the requester is going to do a write.

pasid_execute_requested bool
: If there is a PASID (substreamid != ~0u) then this represents the requester asking for execution permissions.

pasid_privileged_mode_requested bool
: If there is a PASID (substreamid != ~0u) then this represents the requester asking for the privileged mode's permissions.

ssd_ns bool
: Incoming SSD, only non-secure ATS requests are legal.

streamid unsigned int
: StreamID of the ATS request.

substreamid unsigned int
: SubstreamID (which is identical to the PASID) of the ATS request. If no PASID-prefix is sent then this is ~0u

tbu unsigned int
: Translation Buffer Unit number

smmu_ats_reply_failure

This is an ATS reply indicating failure. Fields:

event enum
: Equivalent event number that would have been generated for an equivalent ordinary transaction.

failure enum
: What is the failure response code?

state enum
: The transaction state of the successfully ATS request.

smmu_ats_reply_success

This is an ATS reply, typically the SMMU will only return a single response, even if the requester indicated it could accept more replies. NOTE that the SMMU responds with 'success' in some cases when a fault is encountered and RW==0. Fields:

N bool
: Non-snooped access. If one then the requester must clear the NoSnoop bit on transactions, unless otherwise enabled in a Function-specific manner.

P bool
: Privileged mode. These permissions related to privileged mode.

RWX enum
: Read/Write/Execute

U bool
: Untranslated access. If one, and RW !=0 then use UntranslatedAccesses for the allowed accesses by RW(X).

inner enum
: The inner cacheability attributes to use for TranslatedAccesses

input_address unsigned int
: Input address of the ATS request

instcfg enum
: The STE.INSTCFG field

outer enum
: The outer cacheability attributes to use for TranslatedAccesses

privcfg enum
: The STE.PRIVCFG field

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

shareability unsigned int
: The shareability to use for TranslatedAccesses

size unsigned int
: The size of the region covered by this translation.

state enum
: The transaction state of the successfully ATS request.

translated_address unsigned int
: If RW!=0 && U != 0, then the Translated Address that a TranslatedAccess can be made with

smmu_final_transaction

This is the transaction group request to remap has completed one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. If it stalls then it will report through this trace source, stall (stag_if_stalling != ~0u) and when resume will issue another smmu_initial_transaction as it undergoes remapping again. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum
: The AxMMUFLOW for this transaction group. stallable -- allow the transaction to be stalled if configured. translated-access -- is a PCIe Translated Access non-stallable -- do not stall transaction even if configured. transfault-flow -- do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum
: The point associated with the CMO, if applicable

input_address unsigned int
: The input address of the transaction group.

input_inner enum
: Inner cacheability for the input attributes.

input_outer enum
: Outer cacheability for the input attributes.

input_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

input_sh enum
: Shareability for the input attributes.

ipa_address unsigned int
: The IPA of the transaction.

kind enum
: The kind of access this transaction group that this represents.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

operation enum
: The kind of operation that this represents.

output_address unsigned int
: The input address of the transaction group.

output_inner enum
: Inner cacheability for the output attributes.

output_outer enum
: Outer cacheability for the output attributes.

output_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

output_sh enum
: Shareability for the output attributes.

output_vmid unsigned int
: The output VMID/GBPA.IMPDEF or ~0u if not valid.

size_of_region_in_bytes unsigned int
: An imp def size of region for which this translation is valid for.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ssd_ns enum
: The security state of the transaction

stag_if_stalling unsigned int
: This is the STAG used by the transaction if it is going to stall. It is ~0u if it is not going to stall.

state enum
: The final transaction state.

streamid unsigned int
: The StreamID of the transction.

substreamid unsigned int
: The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int
: Translation Buffer Unit number.

trans_id unsigned int
: Transaction id. Top bit set if debug transaction.

smmu_initial_transaction

This is the transaction group request to remap is going to start one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. A stalling transaction will report through this trace source when it unstalls. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum
: The AxMMUFLOW for this transaction group. stallable -- allow the transaction to be stalled if configured. translated-access -- is a PCIe Translated Access non-stallable -- do not stall transaction even if configured. transfault-flow -- do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum
: The point associated with the CMO, if applicable

input_address unsigned int
: The input address of the transaction group.

input_inner enum
: Inner cacheability for the input attributes.

input_outer enum
: Outer cacheability for the input attributes.

input_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

input_sh enum
: Shareability for the input attributes.

kind enum
: The kind of access this transaction group that this represents.

operation enum
: The kind of operation that this represents.

ssd_ns enum
: The security state of the transaction

streamid unsigned int
: The StreamID of the transction.

substreamid unsigned int
: The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int
: Translation Buffer Unit number.

trans_id unsigned int
: Transaction id. Top bit set if debug transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

smmu_pmusnapshot_ack

Acknowledge the pmusnapshot_req to indicate the snapshot has occurred. This is part of a four-phase handshake. Fields:

pin_index unsigned int
: The pin index of the signal, or ~0u if not relevant.

pmcg_index enum
: The PMCG index.

value bool
: The value of the signal.

smmu_pmusnapshot_req

Take a snap shot of the PMU values as though SMMU_PMCG_CAPR.CAPTURE had been written. This is part of a four-phase handshake. Fields:

pin_index unsigned int
: The pin index of the signal, or ~0u if not relevant.

pmcg_index enum
: The PMCG index.

value bool
: The value of the signal.

smmu_poison_tw_data

Poison data has been returned to a table walk transaction. Fields:

bitmap_of_poison unsigned int
: The bitmap of which beats of the transaction where poisoned.

is_cas bool
: True if this is a compare-and-swap operation.

ns bool
: Non-secure state of the bus transaction.

number_of_64bit_beats unsigned int
: Number of beats this transaction fetched.

paddress unsigned int
: Physical address of the table walk transaction.

ras_group_id unsigned int
: If non-~0u then is the RAS group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

ras_record_index_in_group unsigned int
: If non-~0u then is the RAS record index in the group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

what enum
: What table walk was being performed.

smmu_pri_resp

The CMD_PRI_RESP command is queued to be sent to the PCIe system. Fields:

cmd_id unsigned int
: Command id

cons unsigned int
: CONS of the command.

prgindex unsigned int
: PRG Index.

response enum
: If has a SubstreamID (PASID) then if it is 'global' or not.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

streamid unsigned int
: StreamID in the invalidate command.

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

smmu_pri_resp_nop

The CMD_PRI_RESP command was NOPped. Fields:

cmd_id unsigned int
: Command id

cons unsigned int
: CONS of the command.

prgindex unsigned int
: PRG Index.

response enum
: If has a SubstreamID (PASID) then if it is 'global' or not.

streamid unsigned int
: StreamID in the invalidate command.

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

why enum
: Why the CMD_PRI_RESP was NOPped.

smmu_priq_resp_fake_return

A PRIQ Response is posted to the PCIe subsystem and so has no acknowledgement that it is received. However, in the model then we artificially know when the the PRIQ Response has been delivered to the PCIe subsystem, even if the ATC has not yet acted on it. Fields:

prgindex unsigned int
: The PRG Index this request corresponds to.

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

what enum
: What happened.

smmu_priq_resp_start

A PRIQ Response has been posted to the PCIe subsystem. As the response is posted then there is no way of knowing when it is received by the EndPoint. Fields:

prgindex unsigned int
: The PRG Index this request corresponds to.

response enum
: If has a SubstreamID (PASID) then if it is 'global' or not.

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_thread_wait_wake

Traces a thread's wait/wake status. Fields:

current_ticks unsigned int
: The current tick count of simulated time.

event enum
: What is happening to this thread.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

thread_index unsigned int
: The ID of this thread.

ticks unsigned int
: If the event relates to a time then this is held in this field. Otherwise, 0.

stall_transaction

A transaction is about to stall. Fields:

stag unsigned int
: STAG.

streamid unsigned int
: StreamID.

streamid_ns bool
: The StreamID was for the non-secure world.

trans_id unsigned int
: Transaction id.

stall_transaction_inhibited_by_STALL_MAX

A transaction is about to stall but the maximum number of transactions have stalled and we can't report this one to the event queue (even if non-full). Fields:

streamid unsigned int
: StreamID.

streamid_ns bool
: The StreamID was for the non-secure world.

trans_id unsigned int
: Transaction id.

stall_transaction_resuming

A stalled transaction is resuming. Fields:

stag unsigned int
: STAG if appropriate, or if was inhibited by STALL_MAX then 0xFAFA.

stallresult enum
: What the transaction resumed to do.

streamid unsigned int
: StreamID.

streamid_ns bool
: The StreamID was for the non-secure world.

trans_id unsigned int
: Transaction id.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

desckind enum
: The kind of descriptor

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns bool
: Non-Secure

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ste_cc.STE_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

ste_cc.STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

ste_entry_allocated

An STE entry has been allocated. Fields:

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

ns enum
: For the non-secure world

ste string
: A textual description of the STE.

streamid unsigned int
: The StreamID of the entry this will match.

sup_btm

The system supports BTM. Fields:

value bool
: The value of the signal.

sup_cohacc

The system supports cohacc. Fields:

value bool
: The value of the signal.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

sup_httu

The system supports HTTU. Fields:

value bool
: The value of the signal.

sup_sev

The system supports SEV. Fields:

value bool
: The value of the signal.

tbu0_reset_in

The reset signal of the TBU0. Fields:

value bool
: The value of the signal.

tcu_reset_in

The reset signal. Fields:

value bool
: The value of the signal.

tlb_entry_allocated

A TLB entry has been allocated. Fields:

aset unsigned int
: The ASET of this entry.

asid unsigned int
: ASID if appropriate.

index unsigned int
: Index of TLB entry.

input_end_incl_address unsigned int
: The end inclusive address of the input range that this matches.

input_start_address unsigned int
: The start address of the input range that this matches.

output_end_incl_address unsigned int
: The end inclusive address of the output range.

output_start_address unsigned int
: The start address of the output range.

scheme enum
: The tagging scheme used

ssd_ns enum
: Security State

tbi bool
: Was the entry formed using Top Byte Ignore (TBI).

vmid unsigned int
: VMID if appropriate.

tlb_info_tlb_entries_overlap

A TLB entry was inserted into the TLB and it overlaps an existing entry. This isn't a problem as it was inserted in such a way that it architecturally works. Fields:

end_address_of_new_entry unsigned int
: End address of new entry.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

end_address_of_old_entry unsigned int
End address of old entry.
how_inserted enum
How the entry was inserted.
index_of_new_entry unsigned int
Index of new entry.
index_of_old_entry unsigned int
Index of old entry.
start_address_of_new_entry unsigned int
Start address of new entry.
start_address_of_old_entry unsigned int
Start address of old entry.

verbose_commentary

This is a verbose commentary on the translation process the SMMU is performing. Fields:

output string
The stream output.

warning_MSI_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
The untruncated address of the MSI.

warning_MSI_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
The untruncated address of the MSI.

warning_MSI_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
The untruncated address of the MSI.

warning_MSI_S_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
The untruncated address of the MSI.

warning_MSI_S_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
The untruncated address of the MSI.

warning_MSI_pmcg_address_out_of_range_of_oas

The MSI Address of the Performance Monitor Counter Group (PMCG) is out of range of the OAS and so will be silently truncated. Fields:

address unsigned int
The untruncated address of the MSI.
pmcg_index unsigned int
Index of the PMCG.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

warning_discarding_interrupt_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_S_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_S_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.GERROR_IRQEN.

warning_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is UNPREDICTABLE if this will generate an interrupt or not. Fields:

which enum
: Which GERROR was acknowledge when there was no active error.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc string
: The textual description of what happened.

warning_s_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is UNPREDICTABLE if this will generate an interrupt or not. Fields:

which enum
: Which GERROR was acknowledge when there was no active error.

what_going_to_do_with_terminated_event

A terminating transaction has produced an event, this tells you what the model is going to do with the event. Fields:

CD.S bool
: The CD.S field if available.

S2 bool
: The event is related to Stage 2.

STE.S1STALLD bool
: The STE.S1STALLD field if available.

STE.S2S bool
: The STE.S2S field if available.

aborts bool
: The transaction will abort.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

axmmuflow enum
: The AxMMUFLOW for this transaction group. stallable -- allow the transaction to be stalled if configured. translated-access -- is a PCIe Translated Access non-stallable -- do not stall transaction even if configured. transfault-flow -- do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

is_tr_fault bool
: Is a Translation Related fault.

reports bool
: The transaction will attempt to report.

ssd_ns bool
: The transaction is classified as SSD non-secure.

supports_stall_model bool
: The implementation supports the stall model.

trans_id unsigned int
: The transaction id.

why_abort_decision enum
: The reason why the transaction aborted/did not abort.

why_report_decision enum
: The reason why the transaction reported/did not report.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.86 MSIRewriter - trace

This section describes the trace sources.

ArchMsg.Warning.msi_abort

A rewritten MSI was aborted by downstream. Fields:

data unsigned int
: The data value of the MSI.

device_id unsigned int
: The DeviceID presented to the rewriter.

ns bool
: The transaction is non-secure.

original_address unsigned int
: The original address of the transaction.

rewritten_address unsigned int
: The rewritten address of the transaction.

rewritten_data unsigned int
: The rewritten data.

ArchMsg.Warning.msi_strange

A rewritten MSI was translated, but it is not to 'device' memory and so is somewhat suspicious. Fields:

data unsigned int
: The data value of the MSI.

device_id unsigned int
: The DeviceID presented to the rewriter.

ns bool
: The transaction is non-secure.

original_address unsigned int
: The original address of the transaction.

rewritten_address unsigned int
: The rewritten address of the transaction.

rewritten_data unsigned int
: The rewritten data.

rewritten

A transaction that was attempted to be rewritten from the GITS_TRANSLATER register to GITS_TRANSLATE64R. Fields:

action enum
: What we are doing with this transaction.

data unsigned int
: The data value of the MSI.

device_id unsigned int
: The DeviceID presented to the rewriter.

ns bool
: The transaction is non-secure.

original_address unsigned int
: The original address of the transaction.

rewritten_address unsigned int
: The rewritten address of the transaction.

rewritten_data unsigned int
: The rewritten data.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.87 Mali_G51 - trace

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset. Fields:

ADDR `unsigned int`
: Address of the accessed register.

READ `bool`
: Transaction type is read or write.

INFO_IrqGpuControl

IRQ signal received %{IRQ_ID}(%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_ID `unsigned int`
: The IRQ id.

IRQ_NAME `string`
: The IRQ name

IRQ_STATE `bool`
: The IRQ state

INFO_IrqJobControl

IRQ signal received %{IRQ_ID}(%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_ID `unsigned int`
: The IRQ id.

IRQ_NAME `string`
: The IRQ name

IRQ_STATE `bool`
: The IRQ state

INFO_IrqMmuControl

IRQ signal received %{IRQ_ID}(%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_ID `unsigned int`
: The IRQ id.

IRQ_NAME `string`
: The IRQ name

IRQ_STATE `bool`
: The IRQ state

INFO_ReadRegister

GPU Register Offset: %{REG_OFFSET} Value: %{VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME `string`
: The name of the register read.

REG_OFFSET `unsigned int`
: The address of the register read.

VALUE `unsigned int`
: Read Value from the register.

INFO_Reset

GPU Reset %{STATE:(START|END)}. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

STATE bool
: Reset state is start or end.

INFO_WriteRegister

GPU Register Offset: %{REG_OFFSET} Updated: From value %{VALUE} To value %{UPDATED_VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string
: The name of the register updated.

REG_OFFSET unsigned int
: The address of the register updated.

UPDATED_VALUE unsigned int
: New Value in the register.

VALUE unsigned int
: Old Value in the register.

WARN_AccessToUnimplementedRegister

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int
: Address of the accessed register.

READ bool
: Transaction type is read or write.

WARN_ReadToWriteOnlyRegister

GPU Register Read to address: %{ADDR} FAILED as the register is write-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int
: Address of the accessed register.

REG_NAME string
: The name of the register updated.

WARN_WriteToReadOnlyRegister

GPU Register Write to address: %{ADDR} FAILED as the register is read-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int
: Address of the accessed register.

REG_NAME string
: The name of the register updated.

4.88 Mali_G71 - trace

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset. Fields:

ADDR `unsigned int`
: Address of the accessed register.

READ `bool`
: Transaction type is read or write.

INFO_IrqGpuControl

IRQ signal received %{IRQ_ID}(%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_ID `unsigned int`
: The IRQ id.

IRQ_NAME `string`
: The IRQ name

IRQ_STATE `bool`
: The IRQ state

INFO_IrqJobControl

IRQ signal received %{IRQ_ID}(%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_ID `unsigned int`
: The IRQ id.

IRQ_NAME `string`
: The IRQ name

IRQ_STATE `bool`
: The IRQ state

INFO_IrqMmuControl

IRQ signal received %{IRQ_ID}(%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_ID `unsigned int`
: The IRQ id.

IRQ_NAME `string`
: The IRQ name

IRQ_STATE `bool`
: The IRQ state

INFO_ReadRegister

GPU Register Offset: %{REG_OFFSET} Value: %{VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME `string`
: The name of the register read.

REG_OFFSET `unsigned int`
: The address of the register read.

VALUE `unsigned int`
: Read Value from the register.

INFO_Reset

GPU Reset %{STATE:(START|END)}. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

STATE bool
: Reset state is start or end.

INFO_WriteRegister

GPU Register Offset: %{REG_OFFSET} Updated: From value %{VALUE} To value %{UPDATED_VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string
: The name of the register updated.

REG_OFFSET unsigned int
: The address of the register updated.

UPDATED_VALUE unsigned int
: New Value in the register.

VALUE unsigned int
: Old Value in the register.

WARN_AccessToUnimplementedRegister

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int
: Address of the accessed register.

READ bool
: Transaction type is read or write.

WARN_ReadToWriteOnlyRegister

GPU Register Read to address: %{ADDR} FAILED as the register is write-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int
: Address of the accessed register.

REG_NAME string
: The name of the register updated.

WARN_WriteToReadOnlyRegister

GPU Register Write to address: %{ADDR} FAILED as the register is read-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int
: Address of the accessed register.

REG_NAME string
: The name of the register updated.

4.89 Mali_G72 - trace

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset. Fields:

ADDR `unsigned int`
: Address of the accessed register.

READ `bool`
: Transaction type is read or write.

INFO_IrqGpuControl

IRQ signal received %{IRQ_ID}(%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_ID `unsigned int`
: The IRQ id.

IRQ_NAME `string`
: The IRQ name

IRQ_STATE `bool`
: The IRQ state

INFO_IrqJobControl

IRQ signal received %{IRQ_ID}(%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_ID `unsigned int`
: The IRQ id.

IRQ_NAME `string`
: The IRQ name

IRQ_STATE `bool`
: The IRQ state

INFO_IrqMmuControl

IRQ signal received %{IRQ_ID}(%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_ID `unsigned int`
: The IRQ id.

IRQ_NAME `string`
: The IRQ name

IRQ_STATE `bool`
: The IRQ state

INFO_ReadRegister

GPU Register Offset: %{REG_OFFSET} Value: %{VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME `string`
: The name of the register read.

REG_OFFSET `unsigned int`
: The address of the register read.

VALUE `unsigned int`
: Read Value from the register.

INFO_Reset

GPU Reset %{STATE:(START|END)}. Fields:

4.91 MemoryMappedCounterModule - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

Non-Confidential

4.92 MessageHandlingUnitV2 - trace

This section describes the trace sources.

RECV_ArchMsg.Warning.MemoryMapped_AccessAborted

Fields:

OFFSET unsigned int
: Offset of address within the MHU.

RECV_ArchMsg.Warning.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
: Offset of address within the MHU.

RECV_ArchMsg.Warning.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the MHU.

REG_NAME string
: Name of the register being read.

RECV_ArchMsg.Warning.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
: Offset of address within the MHU.

REG_NAME string
: Name of the register being written.

VALUE unsigned int
: Value written.

RECV_ArchMsg.Warning.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
: Offset of address within the MHU.

VALUE unsigned int
: Value written.

RECV_MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

OFFSET unsigned int
: Offset of address within the MHU.

REG_NAME string
: Name of the register being read.

VALUE unsigned int
: Value returned.

RECV_MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

OFFSET unsigned int
Offset of address within the MHU.
REG_NAME string
Name of the register being written.
UPDATED_VALUE unsigned int
New value read back from the register; for write-only registers this will be equal to VALUE.
VALUE unsigned int
Value written.

SEND_ArchMsg.Warning.MemoryMapped_AccessAborted

Fields:

OFFSET unsigned int
Offset of address within the MHU.

SEND_ArchMsg.Warning.MemoryMapped_ReadReserved

Fields:

OFFSET unsigned int
Offset of address within the MHU.

SEND_ArchMsg.Warning.MemoryMapped_ReadWriteOnlyReg

Fields:

OFFSET unsigned int
Offset of address within the MHU.
REG_NAME string
Name of the register being read.

SEND_ArchMsg.Warning.MemoryMapped_WriteReadOnlyReg

Fields:

OFFSET unsigned int
Offset of address within the MHU.
REG_NAME string
Name of the register being written.
VALUE unsigned int
Value written.

SEND_ArchMsg.Warning.MemoryMapped_WriteReserved

Fields:

OFFSET unsigned int
Offset of address within the MHU.
VALUE unsigned int
Value written.

SEND_MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

OFFSET unsigned int
Offset of address within the MHU.
REG_NAME string
Name of the register being read.
VALUE unsigned int
Value returned.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SEND_MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

OFFSET `unsigned int`
: Offset of address within the MHU.

REG_NAME `string`
: Name of the register being written.

UPDATED_VALUE `unsigned int`
: New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE `unsigned int`
: Value written.

Non-Confidential

4.93 NonVolatileCounter - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.94 PL011_Uart - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

pl011_character_in

A character was received. Fields:

char unsigned int
: The character received.

fifo_overflow bool
: If true, then the character was lost as the fifo was full.

tick unsigned int
: The count of ticks from simulation start that the UART has received.

pl011_character_out

A character was written to the UART to output. Fields:

char unsigned int
: The output character.

fifo_overflow bool
: If true, then the character was lost as the fifo was full.

tick unsigned int
: The count of ticks from simulation start that the UART has received.

pl011_line_buffered_out

The buffered output of character_out. The buffer is flushed when any control character is received. The control characters do not form part of the buffer. The buffer's size is limited to 255 characters and truncation is indicated by an appended '...' . Fields:

buffer string
: The line buffer.

tick unsigned int
: The count of ticks from simulation start that the UART has received at the point at which it receives the control character that flushes the buffer.

Non-Confidential

4.96 PL310_L2CC - trace

This section describes the trace sources.

CACHE_READ_HIT

A line read hit occurred. Fields:

addr `unsigned int`
: Address of transaction

cache_line_index `unsigned int`
: Cache line index.

ns `bool`
: Non-secure.

CACHE_READ_MISS

A line read miss occurred. Fields:

addr `unsigned int`
: Address of transaction

ns `bool`
: Non-secure.

CACHE_WRITE_HIT

A line write hit occurred. Fields:

addr `unsigned int`
: Address of transaction

cache_line_index `unsigned int`
: Cache line index.

ns `bool`
: Non-secure.

CACHE_WRITE_MISS

A line write miss occurred. Fields:

addr `unsigned int`
: Address of transaction

ns `bool`
: Non-secure.

cache_line_eviction

The cache is starting to evict a line to downstream. Fields:

addr `unsigned int`
: Address.

cache_line_index `unsigned int`
: Cache line index

data `unsigned int`
: Data being evicted.

memory_attributes `enum`
: Memory attributes

ns `bool`
: Non-secure.

cache_line_refill

The cache refilled a line from downstream. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

addr unsigned int
: Address.

cache_line_index unsigned int
: Cache line index.

data unsigned int
: Data or empty on error.

memory_attributes enum
: Memory attributes

ns bool
: Non-secure.

cache_line_refill_start

The cache is starting to refill a line from downstream. Fields:

addr unsigned int
: Address.

cache_line_index unsigned int
: Cache line index.

memory_attributes enum
: Memory attributes

ns bool
: Non-secure.

interrupt_status

The raw interrupt status. Fields:

mask_of_new_bit unsigned int
: A mask of which bit was changed.

new_value unsigned int
: New interrupt status value.

register_read

A register read occurred. Fields:

data unsigned int
: Data read

name string
: The register name.

ns bool
: Access is non-secure

offset unsigned int
: Offset of register in file.

ok bool
: True if a valid register.

register_write

A register write occurred. Fields:

data unsigned int
: Data written

name string
: The register name.

ns bool
: Access is non-secure

offset unsigned int
: Offset of register in file.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ok `bool`
True if ok.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.97 PL330_DMAC - trace

This section describes the trace sources.

channel_read

A completed channel read. Fields:

acache `unsigned int`
: The ACACHE value expanded to four bits.

address `unsigned int`
: Address of transaction.

aprot `unsigned int`
: The APROT value.

channel_number `unsigned int`
: Channel making transaction.

data `unsigned int`
: The data.

error `bool`
: The transaction produced an error.

width_in_bytes `unsigned int`
: Width in bytes.

channel_write

A completed channel write. Fields:

acache `unsigned int`
: The ACACHE value expanded to four bits.

address `unsigned int`
: Address of transaction.

aprot `unsigned int`
: The APROT value.

channel_number `unsigned int`
: Channel making transaction.

data `unsigned int`
: The data.

error `bool`
: The transaction produced an error.

width_in_bytes `unsigned int`
: Width in bytes.

exec_channel_instruction

About to execute a channel instruction. Fields:

channel `unsigned int`
: Channel about to execute instruction.

opcode `enum`
: Opcode about to be executed.

exec_manager_instruction

About to execute a manager instruction. Fields:

opcode `enum`
: Opcode about to be executed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

fetch_instruction_byte

A byte was fetched for an instruction, this could include extra arguments fetched for multi-byte instructions. Fields:

address unsigned int
: Address of access.

data unsigned int
: Data returned if OK.

ns bool
: NS state of access.

ok bool
: Was the access OK?

inst_dmaend

DMAEND instruction executed by manager thread.

inst_dmago

DMAGO instruction. Fields:

channel_number unsigned int
: Channel issuing instruction.

cns bool
: The thread in non-secure.

pc unsigned int
: Program counter.

inst_dmago_no_go

DMAGO instruction failed. Fields:

channel_number unsigned int
: Channel issuing instruction.

why enum
: Why failed

inst_dmakill

DMAKILL instruction executed by manager thread.

inst_dmald

DMALD instruction. Fields:

channel_number unsigned int
: Channel issuing instruction.

increment_addr bool
: Whether to increment the address or not.

number_of_beats unsigned int
: Number of beats to transfer.

source_address unsigned int
: Source address.

transfer_size_in_bytes unsigned int
: Transfer size in bytes.

inst_dmalp

DMALP instruction executed by channel, loads 'iterations' into the loop counter. Fields:

channel_number unsigned int
: Channel issuing instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

iterations unsigned int
: The value to load into the loop counter.

loop_counter unsigned int
: Which loop counter.

inst_dmamov

DMAMOV instruction. Fields:

channel_number unsigned int
: Channel issuing instruction.

data unsigned int
: Data moved.

register enum
: Register being moved to.

inst_dmanop

DMANOP instruction executed by channel. Fields:

channel_number unsigned int
: Channel issuing instruction.

inst_dmanop_manager

DMANOP instruction executed by manager.

inst_dmasev

DMASEV instruction. Fields:

channel_number unsigned int
: Channel issuing instruction.

irq_number unsigned int
: IRQ number.

inst_dmasev_manager

DMASEV instruction executed by manager. Fields:

irq_number unsigned int
: IRQ number.

inst_dmast

DMAST instruction. Fields:

channel_number unsigned int
: Channel issuing instruction.

destination_address unsigned int
: Destination address.

increment_addr bool
: Whether to increment the address or not.

number_of_beats unsigned int
: Number of beats to transfer.

transfer_size_in_bytes unsigned int
: Transfer size in bytes.

inst_dmawfe

DMAWFE instruction. Fields:

channel_number unsigned int
: Channel issuing instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

pending_event_found unsigned int
The DMAWFE doesn't wait as event is already signaled.

inst_dmawfe_manager

DMAWFE instruction executed by manager.

inst_instruction_not_implemented

Instruction is not implemented by the model. Fields:

which enum
Which instruction is not modelled.

mgr_evnt_err

Manager thread in the Non-secure state attempted to execute either a DMAWFE to wait for a secure event or DMASEV to create a secure event or secure interrupt. Fields:

irq_number unsigned int
Event-interrupt number.
opcode enum
Opcode of the attempted instruction.

register_read

A register read occurred. Fields:

data unsigned int
The data returned if not an error.
error bool
An error is being returned.
ns bool
The security state of the access.
offset enum
The offset of the register access.

register_write

A register write occurred. Fields:

data unsigned int
The write data set if not an error.
error bool
An error is being returned.
ns bool
The security state of the access.
offset enum
The offset of the register access.

start_channel_read

Start of a channel read. Fields:

acache unsigned int
The ACACHE value expanded to four bits.
address unsigned int
Address of transaction.
aprot unsigned int
The APROT value.
channel_number unsigned int
Channel making transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

width_in_bytes unsigned int
: Width in bytes.

start_channel_write

Start of a channel write. Fields:

acache unsigned int
: The ACACHE value expanded to four bits.

address unsigned int
: Address of transaction.

aprot unsigned int
: The APROT value.

channel_number unsigned int
: Channel making transaction.

width_in_bytes unsigned int
: Width in bytes.

Non-Confidential

4.98 PPUv0 - trace

This section describes the trace sources.

PPU_AccessToUnimplementedRegister

Fields:

ADDR `unsigned int`
: Address of the accessed register.

READ `bool`
: Transaction type is read or write.

PPU_ReadToWriteOnlyRegister

Fields:

ADDR `unsigned int`
: Address of the accessed register.

PPU_RegRead

Fields:

REG_NAME `string`
: The name of the register read.

REG_OFFSET `unsigned int`
: The address of the register read.

VALUE `unsigned int`
: Read Value from the register.

PPU_RegWrite

Fields:

REG_NAME `string`
: The name of the register updated.

REG_OFFSET `unsigned int`
: The address of the register updated.

UPDATED_VALUE `unsigned int`
: New Value in the register.

VALUE `unsigned int`
: Old Value in the register.

PPU_WriteToReadOnlyRegister

Fields:

ADDR `unsigned int`
: Address of the accessed register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.99 PPUv1 - trace

This section describes the trace sources.

PPU_AccessToUnimplementedRegister

Fields:

ADDR unsigned int
: Address of the accessed register.

READ bool
: Transaction type is read or write.

PPU_ReadToWriteOnlyRegister

Fields:

ADDR unsigned int
: Address of the accessed register.

PPU_RegRead

Fields:

REG_NAME string
: The name of the register read.

REG_OFFSET unsigned int
: The address of the register read.

VALUE unsigned int
: Read Value from the register.

PPU_RegWrite

Fields:

REG_NAME string
: The name of the register updated.

REG_OFFSET unsigned int
: The address of the register updated.

UPDATED_VALUE unsigned int
: New Value in the register.

VALUE unsigned int
: Old Value in the register.

PPU_WriteToReadOnlyRegister

Fields:

ADDR unsigned int
: Address of the accessed register.

key_registers_value_when_power_state_change

trace the key register value when power state may change. Fields:

PPU_DISR unsigned int
PPU_IESR unsigned int
PPU_ISR unsigned int
PPU_PWPR unsigned int
PPU_PWSR unsigned int
Source string

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

lock_status

The current PPU OFF lock status is %{STATUS}. Fields:

STATUS enum
: The status of PPU OFF lock

pactive_port_status

Detected PACTIVE port signal change %{PORT_STATUS} with value %{SIG_VALUE:x}. Fields:

PORT_STATUS enum
: The status of PPU PACTIVE port

SIG_VALUE unsigned int
: The value of PACTIVE signal

receive_wakerequest

trace the wakerequest event. Fields:

Wakerequest string
: PPU is receiving Wakerequest

transition_status

The current PPU transition status is %{STATUS}. Fields:

STATUS enum
: The status of PPU transition

wakerequest_failed

The wakerequest failed and PPU_ISR is %{PPU_ISR}, PPU_IESR is %{PPU_IESR}. Fields:

PPU_IESR unsigned int
: The value of PPU_IESR when wakerequest is failed

PPU_ISR unsigned int
: The value of PPU_ISR when wakerequest is failed

Non-Confidential

4.100 PVBus2AMBAPVACE - trace

This section describes the trace sources.

ACE_DVM

ACE dvm trace message. Fields:

MSG `string`
: DVM Message

ACE_SNOOP

ACE snoop trace data. Fields:

ADDR_END_INCL `unsigned int`
: Physical address of access - end inclusive

ADDR_START `unsigned int`
: Physical address of access - start

IS_DATATRANS `bool`
: Is a data transfer?

IS_ERROR `bool`
: Is an error?

IS_PASSDIRTY `bool`
: Is pass dirty?

IS_SHARED `bool`
: Is shared?

IS_WASUNIQUE `bool`
: Was unique?

NS `unsigned int`
: Is a non secure transaction?

Snoop `enum`
: Encodes the ACE operation: 0 ReadNoSnoop, 1 ReadOnce, 2 ReadClean, 3 ReadShared, 4 ReadNotSharedDirty, 5 ReadUnique, 6 CleanShared, 7 CleanInvalid, 8 MakeInvalid, 9 CleanUnique ,10 MakeUnique, 11 WriteNoSnoop, 12 PseudoWriteOnce, 13 WriteUnique, 14 WriteLineUnique, 15 WriteBack, 16 WriteClean, 17 Evict, 18 Default, 19 MemoryBarrier, 20 SynchronisationBarrier, 21 NoOperation, 22 DebugRead, 23 DebugWrite

4.101 PVBusBridge - trace

This section describes the trace sources.

BRIDGE_DMI

DMI information from PVBus to AMBA-PV bridge. Fields:

ADDR `unsigned int`
: Address of the operation

Access `string`
: R = Read, W = Write, r = Prefetch only read, w = Prefetch only write, I = Invalidate

Op `string`
: D = Downstream call, N = New range received, I = Invalidate from downstream, M = invalidate from upstream monitor

R_END `unsigned int`
: Range end

R_PTR `unsigned int`
: Range pointer

R_START `unsigned int`
: Range start

Non-Confidential

4.102 PVBusExclusiveMonitor - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

GLOBAL_MONITOR

Global monitor activity. Fields:

MASTER_ID unsigned int
: Indicates the master associated with this monitor

NS enum
: Secure state of the region monitored

PADDR unsigned int
: Physical address of the region monitored

SIZE unsigned int
: Size of the region monitored

STATE enum
: State of the monitor (Open/Exclusive)

TRIGGER enum
: Reason the monitor changed state

WIDTH unsigned int
: Width in bytes of the access which created the exclusive region

MONITOR_TRANSACTION

Transactions observed by the monitor. Fields:

DATA unsigned int
: The data transfered by the transaction

MASTER_ID unsigned int
: Identifies the master of this transaction

NS enum
: Secure state of the transaction

PADDR unsigned int
: Physical address of the transaction

RESPONSE enum
: The transaction result

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

TYPE `enum`
: Type of transaction

WIDTH `unsigned int`
: Width in bytes of the access

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.103 PVBusGICv3Comms - trace

This section describes the trace sources.

ArchMsg.Warning.GICv3CommsPVBus_PacketTooBig

Fields:

DATA_0 unsigned int
: First byte of the packet (normally data type).

INDEX unsigned int
: Index of GICv3Comms connection that the message should have been sent to (based on AXI master ID).

LENGTH unsigned int
: Number bytes in data packet.

ArchMsg.Warning.GICv3CommsPVBus_UnknownDestination

Fields:

DATA unsigned int
: The message data.

DATA_0 unsigned int
: First byte of the packet (normally data type).

INDEX unsigned int
: Index of GICv3Comms connection that the message should have been sent to (based on AXI master ID).

LENGTH unsigned int
: Number bytes in data packet.

GICv3CommsPVBus_FailedMessage

Processed message from connected GICv3Comms port and sent out, but PVBus transaction failed.
Fields:

DATA unsigned int
: The message data.

INDEX unsigned int
: Index of GICv3Comms connection that message came in on.

LENGTH unsigned int
: Message length in bytes.

GICv3CommsPVBus_ProcessedMessage

Processed message from connected GICv3Comms port. Fields:

DATA unsigned int
: The message data.

INDEX unsigned int
: Index of GICv3Comms connection that message came in on.

LENGTH unsigned int
: Message length in bytes.

GICv3CommsPVBus_ReceiveAXIMasterID

Fields:

INDEX unsigned int
: Index of GICv3Comms connection that message came in on.

MASTER_ID unsigned int
: Master ID value recieved.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3CommsPVBus_SentViaGICv3Comms

Packet received via PVBus and sent via GICv3 Comms to connected distributor/CPU. Fields:

DATA `unsigned int`
: The message data.

INDEX `unsigned int`
: Index of GICv3Comms connection that the message should have been sent to (based on AXI master ID).

LENGTH `unsigned int`
: Number bytes in data packet.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.104 PVBusLogger - trace

This section describes the trace sources.

READ_ACCESS

Trace access at this point in the PVBus hierarchy. Fields:

ACCESS_SIZE unsigned int
: Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...)

ACE enum
: Encodes the ACE operation

ATTR unsigned int
: Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

DATA unsigned int
: The data transferred

EXTENDED_ID unsigned int
: The Extended ID

LATENCY unsigned int
: Time downstream (ticks)

MASTER_ID unsigned int
: The AXI Master ID

NUMBER_OF_BEATS unsigned int
: The number of data transfers (beats) in this burst

PADDR unsigned int
: Physical address of access

RESPONSE enum
: Whether the transaction was successful, or an error occurred

USER_FLAGS unsigned int
: Core specific additional signals

READ_ACCESS_START

Trace access at this point in the PVBus hierarchy. Fields:

ACCESS_SIZE unsigned int
: Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...)

ACE enum
: Encodes the ACE operation

ATTR unsigned int
: Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

DATA unsigned int
: The data transferred

EXTENDED_ID unsigned int
: The Extended ID

MASTER_ID unsigned int
: The AXI Master ID

NUMBER_OF_BEATS unsigned int
: The number of data transfers (beats) in this burst

PADDR unsigned int
: Physical address of access

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

USER_FLAGS unsigned int
: Core specific additional signals

WRITE_ACCESS

Trace access at this point in the PVBus hierarchy. Fields:

ACCESS_SIZE unsigned int
: Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...)

ACE enum
: Encodes the ACE operation

ATTR unsigned int
: Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

DATA unsigned int
: The data transferred

EXTENDED_ID unsigned int
: The Extended ID

LATENCY unsigned int
: Time downstream (ticks)

MASTER_ID unsigned int
: The AXI Master ID

NUMBER_OF_BEATS unsigned int
: The number of data transfers (beats) in this burst

PADDR unsigned int
: Physical address of access

RESPONSE enum
: Whether the transaction was successful, or an error occurred

USER_FLAGS unsigned int
: Core specific additional signals

WRITE_ACCESS_START

Trace access at this point in the PVBus hierarchy. Fields:

ACCESS_SIZE unsigned int
: Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...)

ACE enum
: Encodes the ACE operation

ATTR unsigned int
: Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined

DATA unsigned int
: The data transferred

EXTENDED_ID unsigned int
: The Extended ID

MASTER_ID unsigned int
: The AXI Master ID

NUMBER_OF_BEATS unsigned int
: The number of data transfers (beats) in this burst

PADDR unsigned int
: Physical address of access

USER_FLAGS unsigned int
: Core specific additional signals

4.105 PVBusMapper - trace

This section describes the trace sources.

ArchMsg.Error.BusActiveDuringReset

Transactions recieved at the bus slave port whilst reset was asserted.

ArchMsg.Warning.BusDeadlockDetected

A potential bus deadlock has been detected. Fields:

INTERCONNECT_RESET bool
: Downstream bus interconnect reset

INTERMEDIARY_RESET bool
: Bus mapper intermediary reset

SLAVE_RESET bool
: Downstream bus slave reset

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.106 PVBusMaster - trace

This section describes the trace sources.

ArchMsg.Warning.BusDeadlockDetected

A potential bus deadlock has been detected. Fields:

INTERCONNECT_RESET bool
: Bus interconnect reset

MASTER_RESET bool
: Bus master reset

SLAVE_RESET bool
: Bus slave reset

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.107 PVBusSlave - trace

This section describes the trace sources.

ATOMIC_SLAVE_ACCESS

Information on the atomic operation at slave side. Fields:

ACCESS_RESULT enum
: Result of atomic access

COMPARE_VALUE unsigned int
: Value to be compared with memory by CAS

LOAD_VALUE unsigned int
: Value to be loaded from memory as a result of atomic operation

MASTER unsigned int
: ID of master which initiated the transaction

NS bool
: Transaction is Non-Secure

OPERAND_VALUE unsigned int
: Incoming operand value provided by core

OPERATION unsigned int
: Type of atomic operation

PADDR unsigned int
: Physical address

STORE_VALUE unsigned int
: Value to be stored to memory as a result of atomic operation

ArchMsg.Warning.uninitialized_data_read

Unwritten data read warning for ACCESSMODE_TRACKED_MEMORY. Fields:

MASK unsigned int
: Set bits indicate uninitialized data in bits [63:0]

MASK2 unsigned int
: Set bits indicate uninitialized data in bits [127:64]

PADDR unsigned int
: Physical address

WIDTH unsigned int
: Bit width of access

ArchMsg.Warning.unmonitored_exclusive_access

Exclusive access to address not covered by an exclusive monitor. Fields:

DIRECTION enum
: Access direction (read/write)

NS bool
: Transaction is Non-Secure

PADDR unsigned int
: Physical address

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.108 PVCache - trace

This section describes the trace sources.

ALLOC_LINEFILL

The system allocated a complete line fill into the RAMs. This happens when the cache has to read the data for a line fill from potentially upstream or downstream. Fields:

ENTRY_INDEX `unsigned int`
: The entry index the line has been loaded into.

MASTER_ID `unsigned int`
: The master ID for the associated transaction.

MEMORY_ATTRIBUTES `unsigned int`
: The memory attributes used for the allocation. bits[3:0] are the inner ACACHE, bits[7:4] are the outer ACACHE, bits[9:8] are ADOMAIN, bits[12:10] are APROT, the rest are undocumented.

NS_ADDR `unsigned int`
: The security world and address of the first byte of the line, the MSB encodes the NS bit.

ALLOC_WRITE

The system allocated a complete line write into the RAMs. This happens when the cache receives a complete cache line write. It need not read from anywhere. Fields:

ENTRY_INDEX `unsigned int`
: The entry index the line has been written into.

MEMORY_ATTRIBUTES `unsigned int`
: The memory attributes used for the allocation. bits[3:0] are the inner ACACHE, bits[7:4] are the outer ACACHE, bits[9:8] are ADOMAIN, bits[12:10] are APROT, the rest are undocumented.

NS_ADDR `unsigned int`
: The security world and address of the first byte of the line, the MSB encodes the NS bit.

ATOMIC_SLAVE_ACCESS

Information on the atomic operation at slave side. Fields:

ACCESS_RESULT `enum`
: Result of atomic access

COMPARE_VALUE `unsigned int`
: Value to be compared with memory by CAS

LOAD_VALUE `unsigned int`
: Value to be loaded from memory as a result of atomic operation

MASTER `unsigned int`
: ID of master which initiated the transaction

NS `bool`
: Transaction is Non-Secure

OPERAND_VALUE `unsigned int`
: Incoming operand value provided by core

OPERATION `enum`
: Type of atomic operation

PADDR `unsigned int`
: Physical address

STORE_VALUE `unsigned int`
: Value to be stored to memory as a result of atomic operation

ArchMsg.Error.cached_attributes_mismatch

Attributes differ between page and line in cache from same page. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LINEATTR unsigned int
: Attributes of the cache allocated lines

LINES unsigned int
: Number of cache lines already allocated

NS_ADDR unsigned int
: The security world and address of the first byte of the page, the MSB encodes the NS bit.

TXATTR unsigned int
: Attributes of the transaction

ArchMsg.Error.cached_attributes_mismatch#lineinfo

Information about allocated lines in page. Fields:

PADDR unsigned int
: address of this cache line

TAG unsigned int
: tag data of this cache line

ArchMsg.Warning.ns_s_dirty_hit

Cache hit at S and NS versions of the same physical address. Fields:

INDEX0 unsigned int
: The cache line index of the affected cache line

INDEX1 unsigned int
: The cache line index of the other regime cache line

PADDR unsigned int
: The address of the affected cache line

TAG0 unsigned int
: The tag data of the affected cache line

TAG1 unsigned int
: The tag data of the other regime cache line

CACHE_READ_HIT

Read access cache hit. Note that this trace source causes a large slowdown in the simulation. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

CACHE_READ_MISS

Read access cache miss and cache miss latency. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache miss latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CACHE_WRITE_HIT

Write access cache hit. Note that this trace source causes a large slowdown in the simulation. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

CACHE_WRITE_MISS

Write access cache miss and cache miss latency. Fields:

IS_PRELOAD enum
: Is the access a preload

IS_SHARED enum
: Is the access shared

LATENCY unsigned int
: Cache miss latency in ticks per access

MASTER_ID unsigned int
: Indicates the master associated with this monitor

ENTRY_BECOMES_INVALID

An entry is now invalid. The cause could be any reason. Fields:

ENTRY_INDEX unsigned int
: The entry index that has become invalid.

ENTRY_SET_DIRTY

Entry change, clean/dirty. Fields:

ENTRY_INDEX unsigned int
: The entry index that has become clean or dirty.

STATUS unsigned int
: True if the line was made dirty

ERROR_MIXED_ATTRIBUTES_LINE

Mismatched line and transaction attributes. Fields:

ENTRY_INDEX unsigned int
: The entry index that has collided.

NS_ADDR unsigned int
: The security world and address of the first byte of the line, the MSB encodes the NS bit.

ERROR_MIXED_ATTRIBUTES_PAGE

Attributes differ between page and lines in cache from the same page. Fields:

NS_ADDR unsigned int
: The security world and address of the first byte of the page, the MSB encodes the NS bit.

EVICTION

A line was evicted from the cache. Fields:

ADDRESS unsigned int
: Base address of the victim cache line

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CLEAN bool
: If true the cache retained the cache line after writing the dirty data

ENTRY_INDEX unsigned int
: The entry index of the victim

NON_SECURE bool
: If true the victim was NonSecure

IMPRECISE_ABORT

An operation produced an imprecise abort. Usually this is a WriteBack/WriteClean operation receiving an error response. Fields:

ADDRESS unsigned int
: Address of the transaction that imprecise aborted.

DECERR bool
: True if this is a DECERR response.

DOWNSTREAM_PORT_INDEX unsigned int
: The downstream port index that received the imprecise abort

NS bool
: The NS state of the transaction (true is non-secure)

MAINTENANCE_CLEAN_SET_WAY

A cache maintenance by set-way operation occurred, possibly the 'clean' part of a clean-and-invalidate operation. Fields:

ENTRY_INDEX unsigned int
: The entry index the set-way operation has mapped to.

IS_NON_SECURE bool
: If the invalidate operation is a non-secure (and so only affects non-secure lines), or secure (and so affects both).

STATE enum
: Line transformation incurred

MAINTENANCE_INVALIDATE_ALL

A cache maintenance invalidate-all operation occurred. Fields:

IS_NON_SECURE bool
: If the invalidate operation is a non-secure (and so only affects non-secure lines), or secure (and so affects both).

MAINTENANCE_INV_SET_WAY

A cache maintenance by set-way operation occurred, possibly the 'invalidate' part of a clean-and-invalidate operation. Fields:

ENTRY_INDEX unsigned int
: The entry index the set-way operation has mapped to.

IS_NON_SECURE bool
: If the invalidate operation is a non-secure (and so only affects non-secure lines), or secure (and so affects both).

STATE enum
: Line transformation incurred

change_dvm_disabled_ports

This reports a bitmap of which ports are disabled to receive DVM messages. Fields:

new_bitmap unsigned int
: The new bitmap of disabled ports

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

new_bitmap_list unsigned int
: A list of port numbers that were disabled.

old_bitmap unsigned int
: The old bitmap of disabled ports

old_bitmap_list unsigned int
: A list of port numbers that were disabled.

change_upstream_disabled_ports

This reports a bitmap of which upstream ports of the cache are _disabled_ and so we won't sends snoop requests to them. Fields:

new_bitmap unsigned int
: The bitmap of the first 32 upstream ports that are disabled.

new_bitmap_list unsigned int
: A list of port numbers that were disabled.

old_bitmap unsigned int
: The bitmap of the first 32 upstream ports that are disabled.

old_bitmap_list unsigned int
: A list of port numbers that were disabled.

entry_after_far_atomic

A cache line has had a far atomic applied to it. Fields:

atomic_operation enum
: The operation that operated on this line.

be bool
: The far atomic's big-endian flag.

data unsigned int
: The data in the cache line.

entry_begin_address unsigned int
: The start address of the entry.

entry_index unsigned int
: The entry index in the cache.

incoming_data unsigned int
: The incoming data from the far atomic. For CAS operations then this is compare-value and then the replacement-value

master_id unsigned int
: The master ID for the associated transaction

ns enum
: The security state of the line

prior_data unsigned int
: The data that will be returned as the 'prior' data of the far atomic.

trans_begin_address unsigned int
: The start address of the transaction.

entry_after_read

A cache line has been read. Fields:

ace_operation enum
: The ACE operation that operated on this line.

data unsigned int
: The data in the cache line.

dirty bool
: Is the line ACE-dirty.

entry_begin_address unsigned int
: The start address of the entry.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

entry_index unsigned int
: The entry index in the cache.

ns enum
: The security state of the line

snoop bool
: This transaction is a snoop transaction

trans_begin_address unsigned int
: The start address of the transaction.

unique bool
: Is the line ACE-unique.

entry_after_write

A cache line has been written. Fields:

ace_operation enum
: The ACE operation that operated on this line.

data unsigned int
: The data in the cache line.

entry_begin_address unsigned int
: The start address of the entry.

entry_index unsigned int
: The entry index in the cache.

ns enum
: The security state of the line

trans_begin_address unsigned int
: The start address of the transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.109 PVWriteBuffer - trace

This section describes the trace sources.

ATOMIC_SLAVE_ACCESS

Information on the atomic operation at slave side. Fields:

ACCESS_RESULT enum
: Result of atomic access

COMPARE_VALUE unsigned int
: Value to be compared with memory by CAS

LOAD_VALUE unsigned int
: Value to be loaded from memory as a result of atomic operation

MASTER unsigned int
: ID of master which initiated the transaction

NS bool
: Transaction is Non-Secure

OPERAND_VALUE unsigned int
: Incoming operand value provided by core

OPERATION unsigned int
: Type of atomic operation

PADDR unsigned int
: Physical address

STORE_VALUE unsigned int
: Value to be stored to memory as a result of atomic operation

WRITE_BUFFER_CONTENTS

Contents of a Line in WriteBuffer before/after updating them. Fields:

ADDRESS unsigned int
: Address

BEFORE_UPDATE bool
: Before update

DATA unsigned int
: Data content

LINE_INDEX unsigned int
: Line index

METADATA unsigned int
: MetaData value

NS bool
: Normal(true), Secure(false)

WRITE_BUFFER_HIT

An access hits in WriteBuffer. Fields:

ADDRESS unsigned int
: Address

IS_IMMEDIATELY_SERVED_BY_WB bool
: true: This access is serviced in WriteBuffer? false: Sent downstream

IS_READ bool
: Is Read

NS bool
: Normal(true), Secure(false)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

WRITE_BUFFER_READ_DATA_DOWNSTREAM

Read one line of data from downstream. Fields:

ADDRESS unsigned int
: Address

DATA unsigned int
: Data content

NS bool
: Normal(true), Secure(false)

WRITE_BUFFER_READ_METADATA_DOWNSTREAM

Read one MetaDataElement_t from downstream. Fields:

ADDRESS unsigned int
: Address

METADATA unsigned int
: MetaData read from downstream

NS bool
: Normal(true), Secure(false)

WRITE_BUFFER_WARNING_RESET_WHEN_DIRTY

Reset received whilst dirty lines exist in the write buffer.

WRITE_BUFFER_WARNING_RESET_WHEN_IN_TRANSACTIONAL_STATE

Reset received whilst the write buffer constains TME Transactional state.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.110 RAMDevice - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message `string`
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.111 SMMUv3AEM - trace

This section describes the trace sources.

ArchMsg.Error.error

These messages are about activity occurring on the SMMU that is considered an error. Messages will only come out here if parameter all_error_messages_through_trace is true. Fields:

output string
: The stream output

ArchMsg.Error.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int
: The address of the descriptor fetch.

desc_inner enum
: Inner cacheability of descriptor

desc_outer enum
: Outer cacheability of descriptor

desc_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

desc_sh enum
: Shareability of descriptor

ssd_ns bool
: Is the Security State Determination of the transaction non-secure.

stage unsigned int
: The stage at which we had a problem.

streamid unsigned int
: The StreamID of the transaction

substreamid unsigned int
: The SubstreamID of the transaction (or ~0u if no substreamid)

trans_id unsigned int
: Transaction id.

ArchMsg.Error.ns_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int
: Command ID of the command in error.

cons unsigned int
: CONS of the command.

what string
: What is wrong.

ArchMsg.Error.priq_streamid_truncated

The SMMU received a PCIe PRI request with a StreamID) that was larger than that which the SMMU has been configured for. The StreamID that appears in the PRIQ entry will be truncated. Fields:

actual_streamid unsigned int
: The actual StreamID that this request has.

sidsize unsigned int
: The bit width of the SMMU for StreamIDs, as indicated by SMMU_IDR1.SIDSIZE.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

trans_id unsigned int
: The transaction ID that identifies this request.

trunc_streamid unsigned int
: The truncated StreamID that will appear in the PRIQ entry.

ArchMsg.Error.priq_substreamid_truncated

The SMMU received a PCIe PRI request with a PASID prefix (SubstreamID) that was larger than that which the SMMU has been configured for. The SubstreamID that appears in the PRIQ entry will be truncated. Fields:

actual_substreamid unsigned int
: The actual SubstreamID that this request has.

ssidsize unsigned int
: The bit width of the SMMU for SubstreamIDs, as indicated by SMMU_IDR1.SSIDSIZE.

trans_id unsigned int
: The transaction ID that identifies this request.

trunc_substreamid unsigned int
: The truncated SubstreamID that will appear in the PRIQ entry.

ArchMsg.Error.s_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int
: Command ID of the command in error.

cons unsigned int
: CONS of the command.

what string
: What is wrong.

ArchMsg.Error.tlb_entries_overlap

A TLB entry was attempted to be inserted into the TLB and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

do_f_tlb_conflict bool
: Chosen to perform an F_TLB_CONFLICT.

end_address_of_new_entry unsigned int
: End address of new entry.

end_address_of_old_entry unsigned int
: End address of old entry.

index_of_new_entry unsigned int
: Index of new entry.

index_of_old_entry unsigned int
: Index of old entry.

start_address_of_new_entry unsigned int
: Start address of new entry.

start_address_of_old_entry unsigned int
: Start address of old entry.

why enum
: Why it is an error for these two entries to overlap.

ArchMsg.Error.tlb_entry_not_invalidated_due_to_ril

An entry in the cache was not invalidated even though in the right address range because of the RIL fields of the command the entry do not match. Fields:

cmd_num unsigned int
: The NUM field of the RIL part of the command.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_ril_tg enum
: The RIL_TG field of the RIL part of the command.

cmd_ril_ttl unsigned int
: The TTL field of the RIL part of the command, zero means any level.

cmd_scale unsigned int
: The SCALE field of the RIL part of the command.

entry_id unsigned int
: The entry id that is being invalidated.

tlb_entry string
: The TLB entry.

ArchMsg.Error.vatos_sel_vmid_out_of_range

The SMMU_(S_)VATOS_SEL.VMID field was programmed with a VMID that was too wide for this implementation (SMMU_IDR0.VMID16 == 0). Fields:

ssd_ns bool
: The security state of the VATOS interface

vmid unsigned int
: The VMID programmed.

ArchMsg.Info.info

These are information messages about what is happening in the SMMU. Fields:

output string
: The stream output

ArchMsg.Warning.CMD_RESUME_no_transaction_resumed

A CMD_RESUME was issued that matched no transaction. Fields:

stag unsigned int
: STAG in the CMD_RESUME.

streamid unsigned int
: StreamID in the CMD_RESUME.

streamid_ns bool
: The StreamID was for the non-secure world.

ArchMsg.Warning.atc_inv_strange

Something was odd about the CMD_ATC_INV. Fields:

cmd_id unsigned int
: Command id

why string
: Why the CMD_ATC_INV was strange

ArchMsg.Warning.bad_conf_reset_of_SMMU_GBPA_ABORT

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.bad_conf_reset_of_SMMU_S_GBPA_ABORT

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_btm

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_cohacc

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_httu

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_sev

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

value bool
: The value of the signal.

ArchMsg.Warning.bad_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool
: The default value of the signal we have been assuming.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

value bool
: The value of the signal.

ArchMsg.Warning.contig_bit_gives_too_large_region_for_TxSZ

If the contig bit was used then the size of the contig region would be larger than that indicated by TxSZ. Fields:

desc_kind enum
: Descriptor kind

el enum
: Exception level

input_address unsigned int
: Input address

log2_contig_region_size unsigned int
: Log2(contig region size in bytes)

output_address unsigned int
: Output address

stage_and_level unsigned int
: The stage in bits [7:4] and the level in [3:0].

vmid unsigned int
: VMID if appropriate

ArchMsg.Warning.contig_bit_has_inconsistent_input_and_output_address

If the contig bit was used then the some bits of the output address held in the descriptor and the input address must match. Fields:

desc_kind enum
: Descriptor kind

el enum
: Exception level

input_address unsigned int
: Input address

log2_contig_region_size unsigned int
: Log2(contig region size in bytes)

match_mask unsigned int
: Bits that must match.

output_address unsigned int
: Output address

stage_and_level unsigned int
: The stage in bits [7:4] and the level in [3:0].

vmid unsigned int
: VMID if appropriate

ArchMsg.Warning.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int
: The address of the descriptor fetch.

desc_inner enum
: Inner cacheability of descriptor

desc_outer enum
: Outer cacheability of descriptor

desc_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

desc_sh enum
: Shareability of descriptor

ssd_ns bool
: Is the Security State Determination of the transaction non-secure.

stage unsigned int
: The stage at which we had a problem.

streamid unsigned int
: The StreamID of the transaction

substreamid unsigned int
: The SubstreamID of the transaction (or ~0u if no substreamid)

trans_id unsigned int
: Transaction id.

ArchMsg.Warning.msi_address_truncated

An MSI was generated, but the address was silently truncated due to the limited downstream address bus width. Fields:

pmcg_index_and_counter unsigned int
: If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int
: If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

truncated_address unsigned int
: The truncated address.

untruncated_address unsigned int
: The untruncated address.

which enum
: Which MSI this is

ArchMsg.Warning.msi_lost

An MSI was attempted to be sent, but the implementation doesn't support it. Fields:

id unsigned int
: ID of this interrupt transaction.

kind enum
: What kind of interrupt.

ArchMsg.Warning.pmcg_non_secure_world

A commentary on potential mis-programming of the PMCG when transitioning the PMCG from the secure world to the non-secure. Fields:

commentary string
: The commentary.

ArchMsg.Warning.pmcg_programming_violates_security

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between non-secure and secure worlds. This is under the assumption that a non-secure asynchronous agent could be writing to the PMCG. Fields:

commentary string
: The commentary.

ArchMsg.Warning.priq_auto_response_failed_to_find_STE

The PRIQ was going to generate an auto-response, but failed to find an STE and so is returning a Failure message to the EndPoint which should disable the PRI interface of the EndPoint. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

trans_id unsigned int
: The ID of the PPR that is being lost.

why enum
: Why the PPR is being lost.

ArchMsg.Warning.priq_overflow_bad_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG but an overflow condition did not exist. Fields:

new_ovackflg bool
: The new value of the SMMU_PRIQ_CONS.OVACKFLG.

ArchMsg.Warning.priq_smmuen_forces_effective_priqen_low

If SMMUEN == 0, then the effective value of PRIQEN is 0. This warning is triggered when PRIQEN == 1 && SMMUEN == 0; which may not be what was intended. The PRIQ cannot be active if SMMUEN == 0.

ArchMsg.Warning.sev_lost

A SEV was lost because it isn't supported according to SMMU_IDR0.SEV. Fields:

why enum
: Why the SEV was generated.

ArchMsg.Warning.warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the SMMU. Fields:

output string
: The stream output

EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

EVENTQ_irqen

The IRQEN has been changed. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

new_value bool
The new value of IRQEN.

EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
The new value of IRQEN.

GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int
Address of the MSI.
data unsigned int
Data payload of the MSI.
irqen bool
Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.
memattr enum
Memory type
ns bool
Non-secure bus attribute.
ra bool
read-allocate attribute.
sh enum
Shareability.
smmu_idr0_msi bool
Are MSIs supported for this security world.
tr bool
transient attribute
wa bool
write-allocate attributes.

GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool
The new value of IRQEN.

GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
The new value of IRQEN.

PRIQ_config

Configuration of interrupt updated. Fields:

address unsigned int
Address of the MSI.
data unsigned int
Data payload of the MSI.
irqen bool
Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.
memattr enum
Memory type

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

PRIQ_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

PRIQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

SMMU_CR0ACK_SMMUEN_hazarded_by_priq

The SMMU_CR0ACK.SMMUEN cannot acknowledge the change to SMMUEN because there are outstanding PRIQ writes.

SMMU_CR0ACK_SMMUEN_update

The acknowledge to SMMU_CR0.SMMUEN was performed. Fields:

new_value bool
: The new value of the register.

SMMU_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_CR0.SMMUEN completed. Fields:

last bool
: This is the last set completing.

old_value bool
: The old value of the set completing.

SMMU_CR0_SMMUEN_write

A write to SMMU_CR0.SMMUEN occurred. Fields:

new_value bool
: The new value of the register.

old_value bool
: The old value of the register.

SMMU_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_GBPA completed. Fields:

last bool
: This is the last set completing.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

old_value unsigned int
The old value of the set completing.

SMMU_GBPA_update

The Update flag to SMMU_GBPA was lowered. Fields:

new_value unsigned int
The new value of the register.

SMMU_GBPA_write

A write to SMMU_GBPA occurred. Fields:

new_value unsigned int
The new value of the register.
old_value unsigned int
The old value of the register.

SMMU_S_CR0ACK_SMMUEN_update

The acknowledge to SMMU_S_CR0.SMMUEN was performed. Fields:

new_value bool
The new value of the register.

SMMU_S_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_S_CR0.SMMUEN completed. Fields:

last bool
This is the last set completing.
old_value bool
The old value of the set completing.

SMMU_S_CR0_SMMUEN_write

A write to SMMU_S_CR0.SMMUEN occurred. Fields:

new_value bool
The new value of the register.
old_value bool
The old value of the register.

SMMU_S_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_S_GBPA completed. Fields:

last bool
This is the last set completing.
old_value unsigned int
The old value of the set completing.

SMMU_S_GBPA_update

The Update flag to SMMU_S_GBPA was lowered. Fields:

new_value unsigned int
The new value of the register.

SMMU_S_GBPA_write

A write to SMMU_S_GBPA occurred. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

new_value unsigned int
: The new value of the register.

old_value unsigned int
: The old value of the register.

S_EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

S_EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

S_EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

S_GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
: Memory type

ns bool
: Non-secure bus attribute.

ra bool
: read-allocate attribute.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

sh enum
: Shareability.

smmu_idr0_msi bool
: Are MSIs supported for this security world.

tr bool
: transient attribute

wa bool
: write-allocate attributes.

S_GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool
: The new value of IRQEN.

S_GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool
: The new value of IRQEN.

TLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

TLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

atc_inv_nop

The CMD_ATC_INV command is ignored as a NOP. This may be emitted multiple times if the CMD_ATC_INV is being ignored for multiple reasons. Fields:

address unsigned int
: Untranslated Address to invalidate.

cmd_id unsigned int
: Command id, if top-bit is set then was issued from the Non-secure CMDQ.

cons unsigned int
: CONS of the command.

global bool
: Global flag.

log2_size_in_bytes unsigned int
: Log 2 of the size in bytes of the region to invalidate.

streamid unsigned int
: StreamID in the invalidate command.

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

why enum
: Why was NOPped

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

atos_complete_fault

The ATOS operation completed with a fault. Fields:

effective_st1translate bool
: Because of the settings and/or the ATOS type then the effective st1translate can be different.

fault_faddr unsigned int
: The fault FADDR.

fault_faultcode enum
: The fault code.

fault_reason enum
: The fault reason.

ssd_ns bool
: This is a non-secure ATOS operation.

st1translate bool
: The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool
: The translation suffered a stage 2 translation.

state enum
: The final transaction state of the ATOS operation.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_complete_fault_inv_req

The ATOS operation completed, faulted and generated an INV_REQ response. Fields:

ssd_ns bool
: This is a non-secure ATOS operation.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

why enum
: Why the ATOS operation generated an INV_REQ

atos_complete_success

The ATOS operation completed successfully. Fields:

base_addr unsigned int
: The actual base address of region.

effective_st1translate bool
: Because of the settings and/or the ATOS type then the effective st1translate can be different.

par_addr unsigned int
: The PAR.ADDR field.

par_mair unsigned int
: The memory attributes encoded as a MAIR

par_ns bool
: The PAR.NS field, for an SSD-ns request then this will always be 0.

par_sh enum
: Shareability

par_size bool
: The PAR.Size field.

size_in_bytes unsigned int
: The actual size in bytes of the region.

ssd_ns bool
: This is a non-secure ATOS operation.

st1translate bool
: The StreamID/SubstreamID combination should have been translated by stage 1.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

st2translate bool
: The translation suffered a stage 2 translation.

state enum
: The final transaction state of the ATOS operation.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_run_set

The SMMU_s_GATOS_CTRL.RUN field was set to start the ATOS operation. Fields:

ssd_ns bool
: This is a non-secure ATOS operation.

vatos bool
: This is a VATOS operation

atos_starting

The ATOS operation is starting. Fields:

addr unsigned int
: The input address to the ATOS operation.

httui bool
: Inhibit HTTU update.

ind bool
: Instruction Data.

pnu bool
: Privileged not User.

rnw bool
: Read not Write.

ssd_ns bool
: This is a non-secure ATOS operation.

ssec bool
: If this is a secure ATOS operation then this is if it is secure or not.

streamid unsigned int
: The StreamID requested.

substreamid unsigned int
: The SubstreamID requested, or ~0u if no SubstreamID.

type enum
: The requested ATOS type.

vatos_vmid unsigned int
: The VMID of the VATOS operation, or ~0u if not a VATOS operation.

cd_cc.CD_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

cd_cc.CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cd_entry_allocated

An CD entry has been allocated. Fields:

cd string
: A textual description of the CD.

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

ns enum
: For the non-secure world

streamid unsigned int
: The StreamID of the entry this will match.

substreamid unsigned int
: The SubstreamID of the entry this will match. This may be zero for transactions without a SubstreamID.

conf_reset_of_SMMU_GBPA_ABORT

The reset value of SMMU_GBPA.ABORT. Fields:

value bool
: The value of the signal.

conf_reset_of_SMMU_S_GBPA_ABORT

The reset value of SMMU_S_GBPA.ABORT. Fields:

value bool
: The value of the signal.

conf_system_supports_btm

The system supports BTM. Fields:

value bool
: The value of the signal.

conf_system_supports_cohacc

The system supports cohacc. Fields:

value bool
: The value of the signal.

conf_system_supports_httu

The system supports HTTU. Fields:

value bool
: The value of the signal.

conf_system_supports_sev

The system supports SEV. Fields:

value bool
: The value of the signal.

dvm_tlbinvalidate_complete

The DVM TLB Invalidate message completed. Fields:

id unsigned int
: The unique id of this DVM message.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ok bool
: The DVM message was OK.

dvm_tlbinvalidate_received

A DVM message for a TLB Invalidate has been received. Fields:

address unsigned int
: The VA or IPA to use if match_address.

asid unsigned int
: The ASID to match if match_asid.

by_ipa bool
: The operation is for an IPA operation if match_address.

id unsigned int
: The unique id of this DVM message.

ignored enum
: The DVM message was ignored

last_level bool
: The operation is for last level if supported.

match_address bool
: Match the address field.

match_asid bool
: Match the asid field.

match_vmid bool
: Match the vmid field.

num unsigned int
: If a range operation, the NUM field. If a single-address operation this is 0.

prot enum
: The protection level for which this TLB Invalidate will operate on.

security_world enum
: The security world that this will apply to.

smmu_scale unsigned int
: If a range operation, then the SCALE field with the meaning in the SMMU architecture which is different to the PE architecture. If a single-address operation this is 0.

stage1_only bool
: The operation is for stage 1 only if supported.

tg enum
: If a single-address or address-range operation, then the Translation Granule hint. Address-range operations always supply a Translation Granule.

translation_table_level enum
: The leaf level of the translation table.

vmid unsigned int
: The VMID to match if match_vmid.

found_tlb_entry_has_different_aset

Architecturally, a particular ASID either should be ASET0 or ASET1. However, we have managed to find a TLB entry that has a different ASET than that which we were searching for. This indicates a programming error. You should examine all contexts with this particular ASID/VMID and ensure they are consistent. Fields:

aset unsigned int
: The ASET of this entry.

asid unsigned int
: ASID if appropriate.

index unsigned int
: Index of TLB entry.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

input_start_address unsigned int
: The start address of the input range that this matches.

scheme enum
: The tagging scheme used

ssd_ns enum
: Security State

vmid unsigned int
: VMID if appropriate.

gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool
: True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int
: GERRORN register value.

interrupt_potentially_sent bool
: An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interupt.

new_gerror unsigned int
: GERROR register value after any invertion.

which enum
: Which bit was attempted to be inverted.

gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum
: Which GERROR was acknowledged.

httu_update_abandoned_update

The HTTU update of a descriptor in memory was potentially possible, but it was behind an update that failed to apply cleanly. Fields:

AF enum
: Whether an AF update should/could occur.

DBM enum
: Whether a DBM update should/could occur.

address unsigned int
: Address of HTTU update.

httu_inner enum
: Inner cacheability of descriptor to update

httu_outer enum
: Outer cacheability of descriptor to update

httu_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

httu_sh enum
: Shareability of descriptor to update

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

original_descriptor unsigned int
: The original descriptor that the model observed.

stage_and_level unsigned int
: The stage (bits[7:4]) and level (bits[3:0]).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

what enum
: What this descriptor represents

httu_update_end_update

The attempted update of a descriptor in memory has occurred. Fields:

is_big_endian bool
: The descriptor is big-endian in memory.

original_descriptor unsigned int
: The original descriptor value.

result enum
: The result of the attempt to update.

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int
: The new descriptor value that tried to replace the original.

value_that_was_in_memory unsigned int
: The value that the compare-and-swap operation returned as the value that was in memory.

httu_update_not_done

A discretionary HTTU update could occur and the implementation choose not to do it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum
: Whether an AF update should/could occur.

DBM enum
: Whether a DBM update should/could occur.

address unsigned int
: Address of HTTU update.

httu_inner enum
: Inner cacheability of descriptor to update

httu_outer enum
: Outer cacheability of descriptor to update

httu_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

httu_sh enum
: Shareability of descriptor to update

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

original_descriptor unsigned int
: The original descriptor that the model observed.

stage_and_level unsigned int
: The stage (bits[7:4]) and level (bits[3:0]).

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

what enum
: What this descriptor represents

httu_update_start_update

An HTTU update could occur and the implementation chose to try it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum
: Whether an AF update should/could occur.

DBM enum
: Whether a DBM update should/could occur.

address unsigned int
: Address of HTTU update.

httu_inner enum
: Inner cacheability of descriptor to update

httu_outer enum
: Outer cacheability of descriptor to update

httu_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

httu_sh enum
: Shareability of descriptor to update

is_big_endian bool
: The descriptor will be written to memory as big-endian.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

original_descriptor unsigned int
: The original descriptor that the model observed.

stage_and_level unsigned int
: The stage (bits[7:4]) and level (bits[3:0]).

trans_id unsigned int
: The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int
: The new descriptor value that is going to try replace the original.

what enum
: What this descriptor represents

will_do_AF bool
: What the implementation chose to do for the AF update.

will_do_DBM bool
: What the implementation chose to do for the DBM update.

interrupt_returned

An interrupt/MSI returned from downstream. Fields:

InD_NS_PnU enum
: Instruction/Data, Non-secure/Secure, Privileged/User.

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

id unsigned int
: ID of this interrupt transaction.

inner_cache enum
: The actual attributes of the access.

kind enum
: What kind of interrupt.

mpam_ns bool
: The security state associated with the MPAM PARTID/PMG.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_valid bool
: MSI will attempt to be sent.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ok bool
: Did the access return OK or an abort?

outer_cache enum
: The actual attributes of the access.

pmcg_index_and_counter unsigned int
: If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int
: If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum
: Shareability

interrupt_sent

An interrupt is raised. If it sends an MSI then this is _after_ any device-dependent transform on the architectural attributes and so may differ from what is programmed. Fields:

InD_NS_PnU enum
: Instruction/Data, Non-secure/Secure, Privileged/User.

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

id unsigned int
: ID of this interrupt transaction.

inner_cache enum
: The actual attributes of the access.

kind enum
: What kind of interrupt.

mpam_ns bool
: The NS state of the MPAM PARTID and MPAM PMG.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_valid bool
: MSI will attempt to be sent.

outer_cache enum
: The actual attributes of the access.

pmcg_index_and_counter unsigned int
: If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int
: If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum
: Shareability

l1cd_cc.L1CD_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

l1cd_cc.L1CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

l1cd_entry_allocated

An L1 CD entry has been allocated. Fields:

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

normalised_substreamid unsigned int
: The first SubstreamID of the range of SubstreamIDs that this L1CD entry will match.

ns enum
: For the non-secure world

pa_l2 unsigned int
: The PA of the L2 CD table. This is L2Ptr << 12.

streamid unsigned int
: The StreamID this CD is for.

valid bool
: Is the entry valid.

l1ste_cc.L1STE_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

l1ste_cc.L1STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

l1ste_entry_allocated

An L1 STE entry has been allocated. Fields:

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

first_streamid_of_range unsigned int
: The first StreamID of the range of StreamIDs that this L1STE entry will match.

ns enum
: For the non-secure world

num_entries_in_l2 unsigned int
: The number of entries in the L2 table. This is 2**(Span-1) or 0 if invalid.

pa_l2 unsigned int
: The PA of the L2 ST table. This is L2Ptr << 6 and aligned to the size of the table.

ns_cmd_sync_completed_irq

Non-secure CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns_cmd_sync_completed_no_action

Non-secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_completed_sev

Non-secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_completed_with_error

Non-secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

cerror enum
: The error associated with the CMD_SYNC

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_issued

Non-secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

hazarded bool
: The CMD_SYNC is currently hazarded from completing.

ns_cmd_sync_issuing

Non-secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmd_sync_starting_completion_action_irq

Non-secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

msiaddress unsigned int
: The MSI address to use (or 0 if not sending an MSI).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

msidata unsigned int
: The MSI data to send.

ns_cmd_sync_starting_completion_action_sev

Non-secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

ns_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum
: The CERROR to attach.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

ns_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum
: The CERROR to attach.

cmd_id unsigned int
: Command ID of the CMD_SYNC

ns_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum
: The error being exposed, if any.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

enack bool
: The value of ENACK.

forced_error bool
: The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

ns_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int
: Command ID of the command being executed.

cons unsigned int
: CONS of the command.

what string
: What is being executed.

ns_cmdq_pointers_state

The command queue pointers. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

disable_fetch bool
: The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int
: The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int
: The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int
: The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int
: The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int
: The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int
: The PROD pointer of the region unfetched (including wrap).

ns_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool
: There is a CERROR that can be recognised.

can_cmd_sync bool
: There is a CMD_SYNC that can be recognised.

can_fetch bool
: The SMMU can fetch

can_issue bool
: There are fetched commands that are eligible to be issued.

can_update_cons bool
: The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

cmd_sync enum
: Why a CMD_SYNC cannot be issued

cmdqen bool
: CMDQEN, when enabled then the CMDQ can fetch commands

cmdqen_1_to_0_unacknowledged bool
: CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum
: The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool
: The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int
: The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum
: The state of the fetch state machine

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool
: If there are too may issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int
: The number of commands that have been fetched but not yet issued.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

issue-number_of_unissuable_commands unsigned int
: This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum
: The internal issued state machine state

outstanding_fetches_since_reset unsigned int
: The number of outstanding fetches.

ns_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int
: The transaction id that caused the event.

ns_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int
: Transaction id of the auto-retried transaction.

why enum
: Why the transaction retried.

ns_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int
: The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int
: The current programmer-visible prod including wrap bit.

ns_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum
: Some more information about the queue state.

cons_incl_wrap unsigned int
: The CONS pointer (including wrap bits).

eventqen bool
: EVENTQEN.

eventqenack bool
: EVENTQENACK.

prod_incl_wrap unsigned int
: The PROD pointer (including wrap bits).

ns_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int
: The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int
: The transaction id that produced the event record that aborted.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD index of the event if appropriate or ~0u otherwise.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

ns_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool
: If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int
: This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

ns_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code.

is_prior_set bool
: The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete

trans_id unsigned int
: The transaction id that this corresponds to.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int
: The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int
: The number of events available to the programmer.

prog_cons unsigned int
: The programmer-visible CONS pointer.

prog_prod unsigned int
: The programmer-visible PROD pointer.

what enum
: What changed?

ns_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

ns_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int
: The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum
: The reason the event was removed.

trans_id unsigned int
: The transaction id that caused the event.

ns_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

ns_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

ns_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool
: The write aborted.

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

pmcg_irq_config

The interrupt configuration of the Performance Monitor Counter Group (PMCG) changed. Fields:

address unsigned int
: Address of the MSI.

data unsigned int
: Data payload of the MSI.

irqen bool
: SMMU_PMCG_CTRL.IRQEN.

memattr enum
: Memory type

mpam_ns bool
: The NS state of the MPAM PARTID and MPAM PMG

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_supported bool
: Are MSIs supported for this security world.

ns bool
: Non-secure bus attribute.

number_of_interrupts_in_flight unsigned int
: The number of interrupts that have been committed to be produced or in flight.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

pmcg_index unsigned int
: Index of the PMCG

sh enum
: Shareability.

smmu_pmcg_gmpam_Update bool
: The SMMU_PMCG_GMPAM.Update flag. Only when this is zero are writes predictable.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_irqen

A trace of SMMU_PMCG_IRQ_CTRL.IRQEN. Fields:

new_value bool
: The new value of IRQEN.

pmcg_index unsigned int
: Index of the PMCG.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_irqen_ack

A trace of SMMU_PMCG_IRQ_CTRLACK.IRQEN. Fields:

new_value bool
: The new value of IRQEN.

pmcg_index unsigned int
: Index of the PMCG.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_merging_interrupts

An interrupt was wanted to be generated, but one was already pending so the two were merged together. Fields:

pmcg_index unsigned int
: Index of the PMCG.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

pmcg_trigger

A PMCG counter has been triggered. Fields:

counter_index unsigned int
: The index of the counter within the PMCG.

event_id unsigned int
: The event id that has been triggered.

ns_event bool
: The security state associated with the event.

pmcg_index unsigned int
: Index of the PMCG.

streamid unsigned int
: The StreamID associated with the event, if there is one.

pmu_active_counter

Traces what active counters are in a PMCG and what streamids it might filter on. Those counters that trace both secure and non-secure StreamIDs or those that are not filtered by StreamID will appear twice, once for each security world. All active counters for a PMCG are traced one after another. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

begin_streamid unsigned int
: The start StreamID to filter on.

counter_index unsigned int
: The counter index within the PMCG.

end_incl_streamid unsigned int
: The end inclusive StreamID to filter on.

evcnt unsigned int
: The current count.

event_id unsigned int
: The event ID to filter.

ns bool
: Are the StreamIDs non-secure?

pmcg_index unsigned int
: The index of the PMCG that this counter belongs to.

pmu_all_counters_in_pmcg_became_inactive

The PMCG was tracing some events and now is not tracing any. Fields:

pmcg_index unsigned int
: The index of the PMCG.

pmu_capture

For some reason, a capture event occurred. Fields:

pmcg_index unsigned int
: The index of the PMCG that the capture occurred on.

why enum
: Why did the capture occur?

pmu_counter_configured_to_use_unsupported_event

An enabled counter was configured to use a unsupported event. Fields:

counter_index unsigned int
: The counter index within the PMCG.

event_id unsigned int
: The unsupported event id.

pmcg_index unsigned int
: The index of the PMCG that this counter belongs to.

pmu_counter_overflowed

A counter in a particular PMCG overflowed. Fields:

already_overflowed bool
: True if the overflow flag was already set.

capture bool
: True if it captured the other counter values.

counter_index unsigned int
: The counter index within the PMCG.

interrupt bool
: True if going to attempt to generate an interrupt.

interrupt_action enum
: The interrupt action that is going to occur

pmcg_index unsigned int
: The index of the PMCG that this counter belongs to.

ssd_ns bool
: The PMCG is controlled by the Non-secure world.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int
: The PRG Index of the response.

resp enum
: The response to send.

streamid unsigned int
: The StreamID of the response.

substreamid unsigned int
: The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int
: The ID of the PPR that is being lost.

why enum
: Why the PPR is being lost.

priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool
: The PPR being lost is a Stop Marker.

resp enum
: What, if any, auto-response will be.

trans_id unsigned int
: The ID of the PPR that is being lost.

why enum
: Why the PPR is being lost

priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool
: The new value of the SMMU_PRIQ_CONS.OVACKFLG.

priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool
: The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int
: The transaction ID of the PPR that caused the overflow.

priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool
: The Last in the Page Request Group (PRG).

R bool
: Read permission is requested.

W bool
: Read permission is requested.

prgindex unsigned int
: The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ssd_ns bool
: The SSD of the StreamID. PRIQ should only receive _non-secure_ PRI Requests.

stop_marker bool
: If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int
: The StreamID this request is associated with.

substreamid unsigned int
: The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool
: If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool
: If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int
: The transaction ID that identifies this request.

untranslated_address unsigned int
: The Untranslated Address that this is requesting.

priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int
: The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int
: The transaction ID of the PPR that aborted.

priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int
: The PROD including the Wrap bit where we wrote..

trans_id unsigned int
: The transaction ID of the PPR.

priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue. Fields:

L bool
: The Last in the Page Request Group (PRG).

R bool
: Read permission is requested.

W bool
: Read permission is requested.

prgindex unsigned int
: The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int
: PROD position including the wrap bit.

stop_marker bool
: If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int
: The StreamID this request is associated with.

substreamid unsigned int
: The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool
: If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

substreamid_X bool
: If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int
: The transaction ID that identifies this request.

untranslated_address unsigned int
: The Untranslated Address that this is requesting.

priqen_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int
: The value of SMMU_PRIQ.CONS.RD_and_RD_wrap.

number_of_pprs unsigned int
: The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int
: This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int
: The number of writes to the PRIQ that are currently in flight.

ovackflg bool
: The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool
: The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool
: There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool
: The value of SMMU_CR0.PRIQEN. The _effective_ value is 0 if SMMUEN == 0.

priqenack bool
: The value of SMMU_CR0ACK.PRIQEN.

prod_incl_wrap unsigned int
: The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool
: The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CR0.PRIQEN.

smmuen bool
: The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool
: The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int
: The size of the table in the number of items it can hold.

ptw_read

Page Table Walk (read). This is the result of the physical access that the SMMU is making. Fields:

abort enum
: Non-zero if the access aborted/failed.

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

data unsigned int
: The data fetch if it didn't abort.

desckind enum
: The kind of descriptor

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st1_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st1_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool
: Access Flag.

AP21 enum
: The access permissions.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

AttrIndx210 unsigned int
: The attribute index into the MAIR0/1.

DBM bool
: Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

NS bool
: The encoding is for non-secure if this is a secure fetch.

PXN bool
: Privileged eXecute Never.

SH10 enum
: The shareability.

XN bool
: eXecute Never.

contiguous bool
: Contiguous hint.

desckind enum
: The kind of descriptor

hwu_pbha unsigned int
: Top four bits are appropriate CD.HWU*, bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by CD.HWU0*/CD.HWU1*.

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

nG bool
: not Global.

nT bool
: SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns bool
: Non-Secure

output_address unsigned int
: Output address.

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

APTable enum
: Remove permissions independently of subsequent descriptors.

NSTable bool
: The next level table descriptor is forced to non-secure.

PXNTable bool
: Force PXN independently of subsequent descriptors.

TableAddress unsigned int
: Address of the next table.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

XNTable bool
: Force XN independently of subsequent descriptors.

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool
: Access Flag.

DBM bool
: Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

HAP21 enum
: The access permissions.

MemAttr3_0 enum
: The memory attributes.

SH10 enum
: The shareability.

XN enum
: eXecute Never.

contiguous bool
: Contiguous hint.

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

nT bool
: SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns bool
: Non-Secure

output_address unsigned int
: Output address.

pa_address unsigned int
: Physical address.

s2hwu_pbha unsigned int
: Top four bits are STE.S2HWU*, bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by STE.S2HWU*.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

APTable enum
: Remove permissions independently of subsequent descriptors.

PXNTable bool
: Force PXN independently of subsequent descriptors.

TableAddress unsigned int
: Address of the next table.

XNTable bool
: Force XN independently of subsequent descriptors.

desckind enum
: The kind of descriptor

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

ns bool
: Non-Secure

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

raw_register_end_read

The raw register read transaction. This is the transaction as directed to the register port. Fields:

id unsigned int
: Id of this transaction.

ok bool
: Was the access OK? The bus response will always be OK, but is the register access reasonable.

read_data unsigned int
: The data read.

raw_register_end_write

The raw register write transaction. This is the transaction as directed to the register port. Fields:

id unsigned int
: Id of this transaction.

ok bool
: Was the access OK? The bus response will always be OK, but is the register access reasonable.

raw_register_start_read

The raw register read transaction. This is the transaction as directed to the register port. Fields:

address unsigned int
: Address of transaction.

id unsigned int
: Id of this transaction. Top bit is set if is a debug transaction.

ns enum
: Is the transaction non-secure?

number_of_beats unsigned int
: Number of beats.

size_of_beat_in_bytes unsigned int
: Size of each beat in bytes.

raw_register_start_write

The raw register write transaction. This is the transaction as directed to the register port. Fields:

address unsigned int
: Address of transaction

id unsigned int
: Id of this transaction. Top bit is set if is a debug transaction.

ns enum
: Is the transaction non-secure?

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

number_of_beats unsigned int
: Number of beats.

size_of_beat_in_bytes unsigned int
: Size of each beat in bytes.

write_data unsigned int
: The data to write.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string
: The text description of the register value read.

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string
: The text description of the register value written.

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string
: The text description of the register value.

register_read_string

A text representation of the read of a register. Fields:

out string
: The text description of the register value read.

register_write_reserved

A text representation of an access to a register address that is reserved or a write.to a RES0 field in a register. Fields:

in string
: The text description of the register value.

register_write_string

A text representation of the write of a register. Fields:

in string
: The text description of the register value written.

reset_in

The reset signal. Fields:

value bool
: The value of the signal.

s_cmd_sync_completed_irq

Secure CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

s_cmd_sync_completed_no_action

Secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

s_cmd_sync_completed_sev

Secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

s_cmd_sync_completed_with_error

Secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

cerror enum
: The error associated with the CMD_SYNC

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

s_cmd_sync_issued

Secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

hazarded bool
: The CMD_SYNC is currently hazarded from completing.

s_cmd_sync_issuing

Secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

s_cmd_sync_starting_completion_action_irq

Secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int
: The ID of the command being issued.

cons_incl_wrap unsigned int
: CONS pointer of CMD_SYNC.

msiaddress unsigned int
: The MSI address to use (or 0 if not sending an MSI).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

msidata unsigned int
The MSI data to send.

s_cmd_sync_starting_completion_action_sev

Secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int
The ID of the command being issued.
cons_incl_wrap unsigned int
CONS pointer of CMD_SYNC.

s_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum
The CERROR to attach.
cmd_queue unsigned int
The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

s_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum
The CERROR to attach.
cmd_id unsigned int
Command ID of the CMD_SYNC

s_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum
The error being exposed, if any.
cmd_queue unsigned int
The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.
enack bool
The value of ENACK.
forced_error bool
The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

s_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int
Command ID of the command being executed.
cons unsigned int
CONS of the command.
what string
What is being executed.

s_cmdq_pointers_state

The command queue pointers. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

disable_fetch bool
: The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int
: The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int
: The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int
: The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int
: The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int
: The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int
: The PROD pointer of the region unfetched (including wrap).

s_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool
: There is a CERROR that can be recognised.

can_cmd_sync bool
: There is a CMD_SYNC that can be recognised.

can_fetch bool
: The SMMU can fetch

can_issue bool
: There are fetched commands that are eligible to be issued.

can_update_cons bool
: The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int
: The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue.

cmd_sync enum
: Why a CMD_SYNC cannot be issued

cmdqen bool
: CMDQEN, when enabled then the CMDQ can fetch commands

cmdqen_1_to_0_unacknowledged bool
: CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum
: The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool
: The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int
: The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum
: The state of the fetch state machine

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool
: If there are too may issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int
: The number of commands that have been fetched but not yet issued.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

issue-number_of_unissuable_commands unsigned int
: This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum
: The internal issued state machine state

outstanding_fetches_since_reset unsigned int
: The number of outstanding fetches.

s_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int
: The transaction id that caused the event.

s_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int
: Transaction id of the auto-retried transaction.

why enum
: Why the transaction retried.

s_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int
: The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int
: The current programmer-visible prod including wrap bit.

s_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum
: Some more information about the queue state.

cons_incl_wrap unsigned int
: The CONS pointer (including wrap bits).

eventqen bool
: EVENTQEN.

eventqenack bool
: EVENTQENACK.

prod_incl_wrap unsigned int
: The PROD pointer (including wrap bits).

s_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/ s_eventq_lost_event_records trace. Fields:

prod unsigned int
: The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int
: The transaction id that produced the event record that aborted.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

s_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD index of the event if appropriate or ~0u otherwise.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

s_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool
: If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int
: This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

s_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code.

is_prior_set bool
: The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete

trans_id unsigned int
: The transaction id that this corresponds to.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

s_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int
: The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int
: The number of events available to the programmer.

prog_cons unsigned int
: The programmer-visible CONS pointer.

prog_prod unsigned int
: The programmer-visible PROD pointer.

what enum
: What changed?

s_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

s_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int
: The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum
: The reason the event was removed.

trans_id unsigned int
: The transaction id that caused the event.

s_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

reason enum
: The reason the record was lost.

trans_id unsigned int
: The transaction id that this corresponds to.

s_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

s_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool
: The write aborted.

dword0 unsigned int
: Double word 0 of event.

dword1 unsigned int
: Double word 1 of event.

dword2 unsigned int
: Double word 2 of event.

dword3 unsigned int
: Double word 3 of event.

event enum
: Event code that was thrown away.

prod unsigned int
: The PROD pointer (without wrap) that this event will be written to.

stall_event bool
: Describes an event for a stalled transaction.

trans_id unsigned int
: Transaction ID that generated this event.

s_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool
: True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int
: GERRORN register value.

interrupt_potentially_sent bool
: An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interupt.

new_gerror unsigned int
: GERROR register value after any invertion.

which enum
: Which bit was attempted to be inverted.

s_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum
: Which GERROR was acknowledged.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

sev

Send a SEV. Fields:

why enum
: Why the SEV was generated.

smmu_atc_inv

The CMD_ATC_INV command is sent. Fields:

address unsigned int
: Untranslated Address to invalidate.

cmd_id unsigned int
: Command id, if top-bit is set then was issued from the Non-secure CMDQ.

cons unsigned int
: CONS of the command.

global bool
: Global flag.

log2_size_in_bytes unsigned int
: Log 2 of the size in bytes of the region to invalidate.

ns_number_in_flight unsigned int
: Number of ATC invalidates in flight issued from the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

s_number_in_flight unsigned int
: Number of ATC invalidates in flight issued from the Secure CMDQ.

s_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

streamid unsigned int
: StreamID in the invalidate command.

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

smmu_atc_inv_completed

The CMD_ATC_INV command completed. Fields:

cmd_id unsigned int
: Command id, if top-bit is set then was issued from the Non-secure CMDQ.

ns_number_in_flight unsigned int
: Number of ATC invalidates in flight now this one has completed, that were issued by the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

response enum
: The response.

s_number_in_flight unsigned int
: Number of ATC invalidates in flight now this one has completed, that were issued by the Secure CMDQ.

s_number_waiting_to_go_out unsigned int
: The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

smmu_atc_inv_end

An ATC invalidate request has been started. Fields:

PASID_global bool
: If has a SubstreamID (PASID) then if it is 'global' or not.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

address unsigned int
: The Untranslated Address to use.

log2_size_in_bytes unsigned int
: Log2 of the size of the region in bytes to invalidate.

response enum
: The response to the ATC invalidate

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_atc_inv_start

An ATC invalidate request has been started. Fields:

PASID_global bool
: If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int
: The Untranslated Address to use.

log2_size_in_bytes unsigned int
: Log2 of the size of the region in bytes to invalidate.

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_ats_initial

This is the initial ATS request. Fields:

ia unsigned int
: Input address

max_number_of_replies unsigned int
: The maximum number of replies allowed to return

no_write bool
: The NW (no write flag) of the ATS request. If clear then the requester is going to do a write.

pasid_execute_requested bool
: If there is a PASID (substreamid != ~0u) then this represents the requester asking for execution permissions.

pasid_privileged_mode_requested bool
: If there is a PASID (substreamid != ~0u) then this represents the requester asking for the privileged mode's permissions.

ssd_ns bool
: Incoming SSD, only non-secure ATS requests are legal.

streamid unsigned int
: StreamID of the ATS request.

substreamid unsigned int
: SubstreamID (which is identical to the PASID) of the ATS request. If no PASID-prefix is sent then this is ~0u

tbu unsigned int
: Translation Buffer Unit number

smmu_ats_reply_failure

This is an ATS reply indicating failure. Fields:

event enum
: Equivalent event number that would have been generated for an equivalent ordinary transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

failure enum
: What is the failure response code?

state enum
: The transaction state of the successfully ATS request.

smmu_ats_reply_success

This is an ATS reply, typically the SMMU will only return a single response, even if the requester indicated it could accept more replies. NOTE that the SMMU responds with 'success' in some cases when a fault is encountered and RW==0. Fields:

N bool
: Non-snooped access. If one then the requester must clear the NoSnoop bit on transactions, unless otherwise enabled in a Function-specific manner.

P bool
: Privileged mode. These permissions related to privileged mode.

RWX enum
: Read/Write/Execute

U bool
: Untranslated access. If one, and RW !=0 then use UntranslatedAccesses for the allowed accesses by RW(X).

inner enum
: The inner cacheability attributes to use for TranslatedAccesses

input_address unsigned int
: Input address of the ATS request

instcfg enum
: The STE.INSTCFG field

outer enum
: The outer cacheability attributes to use for TranslatedAccesses

privcfg enum
: The STE.PRIVCFG field

shareability unsigned int
: The shareability to use for TranslatedAccesses

size unsigned int
: The size of the region covered by this translation.

state enum
: The transaction state of the successfully ATS request.

translated_address unsigned int
: If RW!=0 && U != 0, then the Translated Address that a TranslatedAccess can be made with

smmu_final_transaction

This is the transaction group request to remap has completed one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. If it stalls then it will report through this trace source, stall (stag_if_stalling != ~0u) and when resume will issue another smmu_initial_transaction as it undergoes remapping again. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum
: The AxMMUFLOW for this transaction group. stallable -- allow the transaction to be stalled if configured. translated-access -- is a PCIe Translated Access non-stallable -- do not stall transaction even if configured. transfault-flow -- do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum
: The point associated with the CMO, if applicable

input_address unsigned int
: The input address of the transaction group.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

input_inner enum
: Inner cacheability for the input attributes.

input_outer enum
: Outer cacheability for the input attributes.

input_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

input_sh enum
: Shareability for the input attributes.

ipa_address unsigned int
: The IPA of the transaction.

kind enum
: The kind of access this transaction group that this represents.

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

operation enum
: The kind of operation that this represents.

output_address unsigned int
: The input address of the transaction group.

output_inner enum
: Inner cacheability for the output attributes.

output_outer enum
: Outer cacheability for the output attributes.

output_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

output_sh enum
: Shareability for the output attributes.

output_vmid unsigned int
: The output VMID/GBPA.IMPDEF or ~0u if not valid.

size_of_region_in_bytes unsigned int
: An imp def size of region for which this translation is valid for.

ssd_ns enum
: The security state of the transaction

stag_if_stalling unsigned int
: This is the STAG used by the transaction if it is going to stall. It is ~0u if it is not going to stall.

state enum
: The final transaction state.

streamid unsigned int
: The StreamID of the transsction.

substreamid unsigned int
: The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int
: Translation Buffer Unit number.

trans_id unsigned int
: Transaction id. Top bit set if debug transaction.

smmu_initial_transaction

This is the transaction group request to remap is going to start one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. A stalling transaction will report through this trace source when it unstalls. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

axmmuflow enum
: The AxMMUFLOW for this transaction group. stallable -- allow the transaction to be stalled if configured. translated-access -- is a PCIe Translated Access non-stallable -- do not stall transaction even if configured. transfault-flow -- do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum
: The point associated with the CMO, if applicable

input_address unsigned int
: The input address of the transaction group.

input_inner enum
: Inner cacheability for the input attributes.

input_outer enum
: Outer cacheability for the input attributes.

input_prot enum
: The instruction/data, bus-ns/s and privileged/user marking

input_sh enum
: Shareability for the input attributes.

kind enum
: The kind of access this transaction group that this represents.

operation enum
: The kind of operation that this represents.

ssd_ns enum
: The security state of the transaction

streamid unsigned int
: The StreamID of the transcton.

substreamid unsigned int
: The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int
: Translation Buffer Unit number.

trans_id unsigned int
: Transaction id. Top bit set if debug transaction.

smmu_poison_tw_data

Poison data has been returned to a table walk transaction. Fields:

bitmap_of_poison unsigned int
: The bitmap of which beats of the transaction where poisoned.

is_cas bool
: True if this is a compare-and-swap operation.

ns bool
: Non-secure state of the bus transaction.

number_of_64bit_beats unsigned int
: Number of beats this transaction fetched.

paddress unsigned int
: Physical address of the table walk transaction.

ras_group_id unsigned int
: If non-~0u then is the RAS group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

ras_record_index_in_group unsigned int
: If non-~0u then is the RAS record index in the group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

what enum
: What table walk was being performed.

smmu_pri_resp

The CMD_PRI_RESP command is queued to be sent to the PCIe system. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cmd_id unsigned int
: Command id

cons unsigned int
: CONS of the command.

prgindex unsigned int
: PRG Index.

response enum
: If has a SubstreamID (PASID) then if it is 'global' or not.

streamid unsigned int
: StreamID in the invalidate command.

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

smmu_pri_resp_nop

The CMD_PRI_RESP command was NOPped. Fields:

cmd_id unsigned int
: Command id

cons unsigned int
: CONS of the command.

prgindex unsigned int
: PRG Index.

response enum
: If has a SubstreamID (PASID) then if it is 'global' or not.

streamid unsigned int
: StreamID in the invalidate command.

substreamid unsigned int
: SubstreamID or ~0u if SSValid == false.

why enum
: Why the CMD_PRI_RESP was NOPped.

smmu_priq_resp_fake_return

A PRIQ Response is posted to the PCIe subsystem and so has no acknowledgement that it is received. However, in the model then we artificially know when the the PRIQ Response has been delivered to the PCIe subsystem, even if the ATC has not yet acted on it. Fields:

prgindex unsigned int
: The PRG Index this request corresponds to.

streamid unsigned int
: The StreamID to use.

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

what enum
: What happened.

smmu_priq_resp_start

A PRIQ Response has been posted to the PCIe subsystem. As the response is posted then there is no way of knowing when it is received by the EndPoint. Fields:

prgindex unsigned int
: The PRG Index this request corresponds to.

response enum
: If has a SubstreamID (PASID) then if it is 'global' or not.

streamid unsigned int
: The StreamID to use.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

substreamid unsigned int
: The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_thread_wait_wake

Traces a thread's wait/wake status. Fields:

current_ticks unsigned int
: The current tick count of simulated time.

event enum
: What is happening to this thread.

thread_index unsigned int
: The ID of this thread.

ticks unsigned int
: If the event relates to a time then this is held in this field. Otherwise, 0.

stall_transaction

A transaction is about to stall. Fields:

stag unsigned int
: STAG.

streamid unsigned int
: StreamID.

streamid_ns bool
: The StreamID was for the non-secure world.

trans_id unsigned int
: Transaction id.

stall_transaction_inhibited_by_STALL_MAX

A transaction is about to stall but the maximum number of transactions have stalled and we can't report this one to the event queue (even if non-full). Fields:

streamid unsigned int
: StreamID.

streamid_ns bool
: The StreamID was for the non-secure world.

trans_id unsigned int
: Transaction id.

stall_transaction_resuming

A stalled transaction is resuming. Fields:

stag unsigned int
: STAG if appropriate, or if was inhibited by STALL_MAX then 0xFAFA.

stallresult enum
: What the transaction resumed to do.

streamid unsigned int
: StreamID.

streamid_ns bool
: The StreamID was for the non-secure world.

trans_id unsigned int
: Transaction id.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum
: The actual attributes of the access that was used, after IMP DEF mangling.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

aprot enum
: The actual attributes of the access that was used, after IMP DEF mangling.

desckind enum
: The kind of descriptor

inner_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int
: Input address this lookup is for (after TBI normalisation).

mpam_pmg_and_partid unsigned int
: Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

ns bool
: Non-Secure

outer_cache enum
: The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int
: Physical address.

ssd_ns enum
: Security state of stream

streamid unsigned int
: The StreamID this is for.

substreamid unsigned int
: The SubstreamID this is for.

trans_id unsigned int
: Transaction id

ttb_grain_stage_and_level unsigned int
: Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 -- 4 KiB 1 -- 16 KiB 2 -- 64 KiB 3 -- 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address Stage in bits[15:8]. Level in bits[7:0].

ste_cc.STE_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

ste_cc.STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

ste_entry_allocated

An STE entry has been allocated. Fields:

entry_id unsigned int
: The id of the cache entry. Top bit is set if is a debug entry.

ns enum
: For the non-secure world

ste string
: A textual description of the STE.

streamid unsigned int
: The StreamID of the entry this will match.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

tlb_entry_allocated

A TLB entry has been allocated. Fields:

aset unsigned int
: The ASET of this entry.

asid unsigned int
: ASID if appropriate.

index unsigned int
: Index of TLB entry.

input_end_incl_address unsigned int
: The end inclusive address of the input range that this matches.

input_start_address unsigned int
: The start address of the input range that this matches.

output_end_incl_address unsigned int
: The end inclusive address of the output range.

output_start_address unsigned int
: The start address of the output range.

scheme enum
: The tagging scheme used

ssd_ns enum
: Security State

tbi bool
: Was the entry formed using Top Byte Ignore (TBI).

vmid unsigned int
: VMID if appropriate.

tlb_info_tlb_entries_overlap

A TLB entry was inserted into the TLB and it overlaps an existing entry. This isn't a problem as it was inserted in such a way that it architecturally works. Fields:

end_address_of_new_entry unsigned int
: End address of new entry.

end_address_of_old_entry unsigned int
: End address of old entry.

how_inserted enum
: How the entry was inserted.

index_of_new_entry unsigned int
: Index of new entry.

index_of_old_entry unsigned int
: Index of old entry.

start_address_of_new_entry unsigned int
: Start address of new entry.

start_address_of_old_entry unsigned int
: Start address of old entry.

verbose_commentary

This is a verbose commentary on the translation process the SMMU is performing. Fields:

output string
: The stream output.

warning_MSI_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
: The untruncated address of the MSI.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

warning_MSI_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
: The untruncated address of the MSI.

warning_MSI_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
: The untruncated address of the MSI.

warning_MSI_S_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
: The untruncated address of the MSI.

warning_MSI_S_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int
: The untruncated address of the MSI.

warning_MSI_pmcg_address_out_of_range_of_oas

The MSI Address of the Performance Monitor Counter Group (PMCG) is out of range of the OAS and so will be silently truncated. Fields:

address unsigned int
: The untruncated address of the MSI.

pmcg_index unsigned int
: Index of the PMCG.

ssd_ns bool
: True if this PMCG controlled by the non-secure world.

warning_discarding_interrupt_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_S_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_S_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.GERROR_IRQEN.

warning_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is UNPREDICTABLE if this will generate an interrupt or not. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

which enum
: Which GERROR was acknowledge when there was no active error.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc string
: The textual description of what happened.

warning_s_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is UNPREDICTABLE if this will generate an interrupt or not. Fields:

which enum
: Which GERROR was acknowledge when there was no active error.

what_going_to_do_with_terminated_event

A terminating transaction has produced an event, this tells you what the model is going to do with the event. Fields:

CD.S bool
: The CD.S field if available.

S2 bool
: The event is related to Stage 2.

STE.S1STALLD bool
: The STE.S1STALLD field if available.

STE.S2S bool
: The STE.S2S field if available.

aborts bool
: The transaction will abort.

axmmuflow enum
: The AxMMUFLOW for this transaction group. stallable -- allow the transaction to be stalled if configured. translated-access -- is a PCIe Translated Access non-stallable -- do not stall transaction even if configured. transfault-flow -- do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

is_tr_fault bool
: Is a Translation Related fault.

reports bool
: The transaction will attempt to report.

ssd_ns bool
: The transaction is classified as SSD non-secure.

supports_stall_model bool
: The implementation supports the stall model.

trans_id unsigned int
: The transaction id.

why_abort_decision enum
: The reason why the transaction aborted/did not abort.

why_report_decision enum
: The reason why the transaction reported/did not report.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.112 SMMUv3TestEngine - trace

This section describes the trace sources.

access_denied_due_to_security

The access was denied as the frame and the security PCTRL.SSD_NS did not allow access. Fields:

address unsigned int
: Address.

frame_in_set unsigned int
: Which frame in the 64 KiB set it belongs to.

is_read bool
: Is the transaction a read.

ns bool
: The NS of the transaction.

priv bool
: Is the set the privileged set of frames?

set_pair unsigned int
: Which 128 KiB set-pair it belongs to.

ssd_ns bool
: The SSD NS of the frame.

frame_misconfigured_trace

The frame was written but is misconfigured. Fields:

cmd unsigned int
: The command that is running.

frame_in_set unsigned int
: Which frame in the 64 KiB set it belongs to.

priv bool
: Is the set the privileged set of frames?

set_pair unsigned int
: Which 128 KiB set-pair it belongs to.

why enum
: Why it is misconfigured?

why_data unsigned int
: Data related to why it is misconfigured:- src-attributes-illegal : the halfword of the attributes dest-attributes-illegal : the halfword of the attributes msi-attributes-illegal : the halfword of the attributes downstream-port-index-out-of-range : port index substreamid-out-of-range : SubstreamID SUM64, begin is not aligned to uint64_t : begin SUM64, end_incl is not aligned to uint64_t : end_incl PCIe MSIAddress field should be 0/1 : msiaddress PCIe MSIData field should be < 2048 : msidata range-* : the end_incl

msi_aborted

An MSI aborted. Fields:

frame unsigned int
: Frame generating MSI.

msiaddress_or_pcie_msi_enable unsigned int
: MSI address, or in PCIe enable MSI

msiattr unsigned int
: MSI attributes. Ignored for PCIe

msidata_or_pcie_msi_index unsigned int
: MSI data, or in PCIe the MSI index to use

pcie_result enum
: If this MSI was generated on PCIe then the result

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

streamid unsigned int
: StreamID.

substreamid unsigned int
: SubstreamID.

msi_generated

An MSI is generated for the specified work load. Fields:

frame unsigned int
: Frame generating MSI.

msiaddress unsigned int
: MSI address.

msiattr unsigned int
: MSI attributes.

msidata unsigned int
: MSI data.

streamid unsigned int
: StreamID.

substreamid unsigned int
: SubstreamID.

read_access

A successful read access occurred. Fields:

address unsigned int
: Address

data unsigned int
: The data that was read.

frame_in_set unsigned int
: Which frame in the 64 KiB set it belongs to.

ns bool
: The NS of the transaction.

offset unsigned int
: Offset of the first byte read.

priv bool
: Is the set the privileged set of frames?

set_pair unsigned int
: Which 128 KiB set-pair it belongs to.

work_completed

The specified work was completed. Fields:

frame unsigned int
: Frame that completed.

work_memcpy

A frame has been setup to do memcpy. Fields:

attributes unsigned int
: Attributes.

begin unsigned int
: begin address.

dest unsigned int
: Destination address.

end_incl unsigned int
: End inclusive address.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

frame unsigned int
: Frame setup.

msiaddress unsigned int
: The msiaddress field.

msiattr unsigned int
: The msiattr field.

msidata unsigned int
: The msidata field.

seed unsigned int
: Seed.

streamid unsigned int
: The streamid to use if controllable.

stride unsigned int
: Stride.

substreamid unsigned int
: The substreamid to use if controllable.

work_rand48

A frame has been setup to do rand48. Fields:

attributes unsigned int
: Attributes.

begin unsigned int
: begin address.

end_incl unsigned int
: End inclusive address.

frame unsigned int
: Frame setup.

msiaddress unsigned int
: The msiaddress field.

msiattr unsigned int
: The msiattr field.

msidata unsigned int
: The msidata field.

seed unsigned int
: Seed.

streamid unsigned int
: The streamid to use if controllable.

stride unsigned int
: Stride.

substreamid unsigned int
: The substreamid to use if controllable.

work_sum64

A frame has been setup to do sum64. Fields:

attributes unsigned int
: Attributes.

begin unsigned int
: begin address.

end_incl unsigned int
: End inclusive address.

frame unsigned int
: Frame setup.

msiaddress unsigned int
: The msiaddress field.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

msiattr unsigned int
: The msiattr field.

msidata unsigned int
: The msidata field.

seed unsigned int
: Seed.

start_of_sum unsigned int
: The value of udata[1] that is the initial value that we start adding to.

streamid unsigned int
: The streamid to use if controllable.

stride unsigned int
: Stride.

substreamid unsigned int
: The substreamid to use if controllable.

work_unit_memcpy_finished

Part (or all) of the memcpy engine has finished a work unit. Fields:

attr unsigned int
: Source/Destination attributes from the frame.

dest_addr unsigned int
: Destination address.

frame unsigned int
: Frame doing work.

number_of_bytes unsigned int
: Number of bytes for this work unit.

ok bool
: Transfer was OK.

src_addr unsigned int
: Source address.

work_unit_memcpy_started

Part (or all) of the memcpy engine has started a work unit. Fields:

attr unsigned int
: Source/Destination attributes from the frame.

dest_addr unsigned int
: Destination address.

frame unsigned int
: Frame doing work.

number_of_bytes unsigned int
: Number of bytes for this work unit.

src_addr unsigned int
: Source address.

work_unit_rand48_finished

Part (or all) of the rand48 engine has finished a work unit. Fields:

attr unsigned int
: Source/Destination attributes from the frame.

dest_addr unsigned int
: Source address.

frame unsigned int
: Frame doing work.

number_of_bytes unsigned int
: Number of bytes for this work unit.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ok bool
: Transfer was OK.

seed_for_work_unit unsigned int
: The seed used for the work unit.

work_unit_rand48_started

Part (or all) of the rand48 engine has started a work unit. Fields:

attr unsigned int
: Source/Destination attributes from the frame.

dest_addr unsigned int
: Destination address.

frame unsigned int
: Frame doing work.

number_of_bytes unsigned int
: Number of bytes for this work unit.

seed_for_work_unit unsigned int
: The seed used for the work unit.

work_unit_sum64_finished

Part (or all) of the sum64 engine has finished a work unit. Fields:

attr unsigned int
: Source/Destination attributes from the frame.

frame unsigned int
: Frame doing work.

number_of_bytes unsigned int
: Number of bytes for this work unit.

ok bool
: Transfer was OK.

running_sum unsigned int
: The current running sum.

src_addr unsigned int
: Source address.

work_unit_sum64_started

Part (or all) of the sum64 engine has started a work unit. Fields:

attr unsigned int
: Source/Destination attributes from the frame.

frame unsigned int
: Frame doing work.

number_of_bytes unsigned int
: Number of bytes for this work unit.

src_addr unsigned int
: Source address.

write_access

A successful write access occurred. Fields:

address unsigned int
: Address

data unsigned int
: The data that was read.

frame_in_set unsigned int
: Which frame in the 64 KiB set it belongs to.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ns bool
: The NS of the transaction.

offset unsigned int
: Offset of the first byte read.

priv bool
: Is the set the privileged set of frames?

set_pair unsigned int
: Which 128 KiB set-pair it belongs to.

write_denied_as_running

The write was denied as the frame is running. Fields:

address unsigned int
: Address.

cmd unsigned int
: The command that is running.

frame_in_set unsigned int
: Which frame in the 64 KiB set it belongs to

priv bool
: Is the set the privileged set of frames?

set_pair unsigned int
: Which 128 KiB set-pair it belongs to

write_to_PCTRL_SSD_NS_ignored_trace

The write to PCTRL.SSD_NS was ignored as it was a non-secure transaction trying to change the frame to secure. The rest of the write to PCTRL has taken effect. Fields:

address unsigned int
: Address.

frame_in_set unsigned int
: Which frame in the 64 KiB set it belongs to

set_pair unsigned int
: Which 128 KiB set-pair it belongs to

Non-Confidential

4.113 SignalLogger - trace

This section describes the trace sources.

SIGNAL

Input signal to SignalLogger driven. Fields:

Value enum
: Value of signal being driven

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.114 TLB - trace

This section describes the trace sources.

MMU_TLB_CONFLICT

TLB conflict. Fields:

ASID unsigned int
: The Address Space Identifier of this TLB entry.

CORE_NUM unsigned int
: Core number in a multi processor.

Hyp bool
: Entry matches in Hyp state only

NS enum
: Secure state in which TLB Entry will match

PAGESIZE unsigned int
: Size of the region (log2)

PBASE unsigned int
: Physical base address of the region.

REGIME_EL unsigned int
: Entry matches in this translation regime

VBASE unsigned int
: Virtual base address of the region.

VMID unsigned int
: Virtual Machine Identifier

nG enum
: Flag indicating whether ASID will be matched

MMU_TLB_EVICT

TLB evict. Fields:

ASID unsigned int
: The Address Space Identifier of this TLB entry.

CORE_NUM unsigned int
: Core number in a multi processor.

Hyp bool
: Entry matches in Hyp state only

NS enum
: Secure state in which TLB Entry will match

PAGESIZE unsigned int
: Size of the region (log2)

PBASE unsigned int
: Physical base address of the region.

REGIME_EL unsigned int
: Entry matches in this translation regime

VBASE unsigned int
: Virtual base address of the region.

VMID unsigned int
: Virtual Machine Identifier

nG enum
: Flag indicating whether ASID will be matched

MMU_TLB_FILL

TLB fill. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ASID unsigned int
: The Address Space Identifier of this TLB entry.

ATA_PRIVILEGED bool
: Is the allocation tag access enabled for privileged accesses

ATA_UNPRIVILEGED bool
: Is the allocation tag access enabled for unprivileged accesses

CORE_NUM unsigned int
: Core number in a multi processor.

EPAN bool
: Enhanced PAN cached value for this page

Hyp bool
: Entry matches in Hyp state only

INNERCACHE_RA bool
: Is the inner cache allocate on read

INNERCACHE_TYPE enum
: Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool
: Is the inner cache allocate on write

MEMTYPE enum
: Memory type.

NS enum
: Secure state in which TLB Entry will match

NSDesc enum
: Secure state of transactions made using the TLB Entry

OUTERCACHE_RA bool
: Is the outer cache allocate on read

OUTERCACHE_TYPE enum
: Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool
: Is the outer cache allocate on write

PAGESIZE unsigned int
: Size of the region (log2)

PBASE unsigned int
: Physical base address of the region.

PXN bool
: Privileged Execute Never

REGIME_EL unsigned int
: Entry matches in this translation regime

SH enum
: Shareability

SIDE enum
: Inst / Data.

TCMA bool
: Is the relevant TCMA/TCMA0/TCMA1 bit enabled

VBASE unsigned int
: Virtual base address of the region.

VMID unsigned int
: Virtual Machine Identifier

X16HINT bool
: 16 Entry Contiguous Hint

XN bool
: Execute Never

XS bool
: Limited TLBI XS value for this page

nG enum
: Flag indicating whether ASID will be matched

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MMU_TLB_FLUSH

TLB flush.

MMU_TLB_FLUSH_ADDR

TLB flush, match address. Fields:

ADDR unsigned int
: Address

NS bool
: Is Non-Secure

NSHYP bool
: Is Non-Secure HYP

MMU_TLB_FLUSH_ADDR_RANGE

TLB flush, match address range. Fields:

ADDR_FIRST unsigned int
: First address in range

ADDR_LAST unsigned int
: Last address in range

NS bool
: Is Non-Secure

NSHYP bool
: Is Non-Secure HYP

MMU_TLB_FLUSH_ALL

TLB flush all entries.

MMU_TLB_FLUSH_ASID

TLB flush, match ASID. Fields:

ASID unsigned int
: ASID of TLB flush

MMU_TLB_FLUSH_VMID

TLB flush, match VMID. Fields:

VMID unsigned int
: VMID of TLB flush

MMU_TLB_HIT

TLB accesses hit. Fields:

ASID unsigned int
: The Address Space Identifier of this TLB entry.

CORE_NUM unsigned int
: Core number in a multi processor.

Hyp bool
: Entry matches in Hyp state only

NS enum
: Secure state in which TLB Entry will match

REGIME_EL unsigned int
: Entry matches in this translation regime

SIDE enum
: Inst / Data.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VADDR unsigned int
: Virtual address of the access.

VMID unsigned int
: Virtual Machine Identifier

MMU_TLB_MISS

TLB access miss. Fields:

ASID unsigned int
: The Address Space Identifier of this TLB entry.

CORE_NUM unsigned int
: Core number in a multi processor.

Hyp bool
: Entry matches in Hyp state only

NS enum
: Secure state in which TLB Entry will match

REGIME_EL unsigned int
: Entry matches in this translation regime

SIDE enum
: Inst / Data.

VADDR unsigned int
: Virtual address of the access.

VMID unsigned int
: Virtual Machine Identifier

MMU_TLB_SPILL

TLB removals caused by fill to a occupied slot.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.115 V550 - trace

This section describes the trace sources.

ArchMsg.Info.IgnoredRead

Read to reserved area attempted. Fields:

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.IgnoredWrite

Write to reserved area attempted. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.JobqueueUpdated

Job queue updated. Fields:

NEWVAL unsigned int
: New JOBQUEUE value

OLDVAL unsigned int
: Previous JOBQUEUE value

ArchMsg.Info.LSID0.Firmware.CommandFailure

Command failed. Fields:

CMD unsigned int
: The OMX Command that failed.

ERR unsigned int
: The reported error code.

ArchMsg.Info.LSID0.Firmware.InputBufferReceived

Received input buffer.

ArchMsg.Info.LSID0.Firmware.InvalidBufferHeader

Received invalid buffer header, cannot convert.

ArchMsg.Info.LSID0.Firmware.InvalidCallback

Invalid callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID0.Firmware.OutputBufferReceived

Received output buffer.

ArchMsg.Info.LSID0.Firmware.UnexpectedCallback

Unexpected callback. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REASON string
Reason for the invalidity of the callback.

ArchMsg.Info.LSID0.Firmware.Unimplemented

Unimplemented firmware feature. Fields:

MESSAGE string
Short description of the missing feature.

ArchMsg.Info.LSID0.Firmware.UnknownMessageReceived

Received unknown message.

ArchMsg.Info.LSID0.Firmware.WaitingForInterrupt

Firmware is waiting for IRQ. Fields:

LSID unsigned int
The session ID of the firmware

ArchMsg.Info.LSID0.FirmwareV1.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
The message code.
REASON string
Why the message is invalid.

ArchMsg.Info.LSID0.FirmwareV1.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID0.FirmwareV1.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID0.FirmwareV2.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
The message code.
REASON string
Why the message is invalid.

ArchMsg.Info.LSID0.FirmwareV2.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID0.FirmwareV2.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
The message code.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Info.LSID1.Firmware.CommandFailure

Command failed. Fields:

CMD unsigned int
: The OMX Command that failed.

ERR unsigned int
: The reported error code.

ArchMsg.Info.LSID1.Firmware.InputBufferReceived

Received input buffer.

ArchMsg.Info.LSID1.Firmware.InvalidBufferHeader

Received invalid buffer header, cannot convert.

ArchMsg.Info.LSID1.Firmware.InvalidCallback

Invalid callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID1.Firmware.OutputBufferReceived

Received output buffer.

ArchMsg.Info.LSID1.Firmware.UnexpectedCallback

Unexpected callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID1.Firmware.Unimplemented

Unimplemented firmware feature. Fields:

MESSAGE string
: Short description of the missing feature.

ArchMsg.Info.LSID1.Firmware.UnknownMessageReceived

Received unknown message.

ArchMsg.Info.LSID1.Firmware.WaitingForInterrupt

Firmware is waiting for IRQ. Fields:

LSID unsigned int
: The session ID of the firmware

ArchMsg.Info.LSID1.FirmwareV1.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
: The message code.

REASON string
: Why the message is invalid.

ArchMsg.Info.LSID1.FirmwareV1.MessageReceived

Firmware received meesage from driver. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CODE enum
: The message code.

ArchMsg.Info.LSID1.FirmwareV1.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.LSID1.FirmwareV2.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
: The message code.

REASON string
: Why the message is invalid.

ArchMsg.Info.LSID1.FirmwareV2.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.LSID1.FirmwareV2.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.LSID2.Firmware.CommandFailure

Command failed. Fields:

CMD unsigned int
: The OMX Command that failed.

ERR unsigned int
: The reported error code.

ArchMsg.Info.LSID2.Firmware.InputBufferReceived

Received input buffer.

ArchMsg.Info.LSID2.Firmware.InvalidBufferHeader

Received invalid buffer header, cannot convert.

ArchMsg.Info.LSID2.Firmware.InvalidCallback

Invalid callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID2.Firmware.OutputBufferReceived

Received output buffer.

ArchMsg.Info.LSID2.Firmware.UnexpectedCallback

Unexpected callback. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REASON string
Reason for the invalidity of the callback.

ArchMsg.Info.LSID2.Firmware.Unimplemented

Unimplemented firmware feature. Fields:

MESSAGE string
Short description of the missing feature.

ArchMsg.Info.LSID2.Firmware.UnknownMessageReceived

Received unknown message.

ArchMsg.Info.LSID2.Firmware.WaitingForInterrupt

Firmware is waiting for IRQ. Fields:

LSID unsigned int
The session ID of the firmware

ArchMsg.Info.LSID2.FirmwareV1.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
The message code.
REASON string
Why the message is invalid.

ArchMsg.Info.LSID2.FirmwareV1.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID2.FirmwareV1.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID2.FirmwareV2.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
The message code.
REASON string
Why the message is invalid.

ArchMsg.Info.LSID2.FirmwareV2.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID2.FirmwareV2.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
The message code.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Info.LSID3.Firmware.CommandFailure

Command failed. Fields:

CMD unsigned int
: The OMX Command that failed.

ERR unsigned int
: The reported error code.

ArchMsg.Info.LSID3.Firmware.InputBufferReceived

Received input buffer.

ArchMsg.Info.LSID3.Firmware.InvalidBufferHeader

Received invalid buffer header, cannot convert.

ArchMsg.Info.LSID3.Firmware.InvalidCallback

Invalid callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID3.Firmware.OutputBufferReceived

Received output buffer.

ArchMsg.Info.LSID3.Firmware.UnexpectedCallback

Unexpected callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID3.Firmware.Unimplemented

Unimplemented firmware feature. Fields:

MESSAGE string
: Short description of the missing feature.

ArchMsg.Info.LSID3.Firmware.UnknownMessageReceived

Received unknown message.

ArchMsg.Info.LSID3.Firmware.WaitingForInterrupt

Firmware is waiting for IRQ. Fields:

LSID unsigned int
: The session ID of the firmware

ArchMsg.Info.LSID3.FirmwareV1.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
: The message code.

REASON string
: Why the message is invalid.

ArchMsg.Info.LSID3.FirmwareV1.MessageReceived

Firmware received meesage from driver. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CODE enum
: The message code.

ArchMsg.Info.LSID3.FirmwareV1.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.LSID3.FirmwareV2.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
: The message code.

REASON string
: Why the message is invalid.

ArchMsg.Info.LSID3.FirmwareV2.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.LSID3.FirmwareV2.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.MmuTranslateAccessFailure

MMU translation failed (mismatched access rights). Fields:

ACC enum
: Page access rights

INTENT enum
: Intent of the memory transaction, e.g. read+execute, read-only, write

VA unsigned int
: MVE virtual address to be translated

ArchMsg.Info.MmuTranslateLxFailure

MMU translation failed (entry missing). Fields:

LEVEL unsigned int
: The translation level at which the failure occurred; either 1 or 2

VA unsigned int
: MVE virtual address to be translated

ArchMsg.Info.MmuTranslateSuccess

MMU translation succeeded. Fields:

ACC enum
: Access rights to the address/page

ATTR enum
: Bus attributes for the memory transactions

PA unsigned int
: Resultant physical address

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VA unsigned int
: MVE virtual address to be translated

ArchMsg.Info.NSReadFromSecureRam

NS read of secure RAM attempted. Fields:

OFFSET unsigned int
: Access offset

ArchMsg.Info.NSReadFromSecureRegister

NS read of secure register attempted. Fields:

NAME string
: Register name

OFFSET unsigned int
: Access offset

ArchMsg.Info.NSWriteToSecureRam

NS write to RAM of secure session attempted. Fields:

OFFSET unsigned int
: Access offset

ArchMsg.Info.NSWriteToSecureRegister

NS write to secure register attempted. Fields:

DATA unsigned int
: The data written to the address

NAME string
: Register name

OFFSET unsigned int
: Access offset

ArchMsg.Info.ReadFromWriteOnlyRegister

Read of write-only register attempted. Fields:

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.ReadInReset

Attempt to read register during reset. Fields:

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.RegisterRead

Register has been read. Fields:

DATA unsigned int
: The data returned by the component

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Register access offset

ArchMsg.Info.RegisterWrite

Register written. Fields:

DATA unsigned int
: The data written to the register

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Register access offset

ArchMsg.Info.SessionStarted

Session started. Fields:

COREMASK unsigned int
: 8-bit 1-hot encoded value of newly-assigned cores

LSID unsigned int
: Session ID

NUMCORES unsigned int
: Number of cores for the session

ArchMsg.Info.SessionStopped

Session stopped. Fields:

COREMASK unsigned int
: 8-bit 1-hot encoded value of freed cores

LSID unsigned int
: Session ID

NUMCORES unsigned int
: Number of cores for the session

ArchMsg.Info.UnalignedRead

Unaligned read attempted. Fields:

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.UnalignedWrite

Unaligned write attempted. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Info.WriteInReset

Attempt to write register during reset. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.WriteToReadOnlyRegister

Write to read-only register attempted. Fields:

DATA unsigned int
: The data written to the address

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.WriteToSecureRegisterOfUnallocatedLSID

Write to secure register of unallocated LSID attempted. Fields:

DATA unsigned int
: The data written to the address

NAME string
: Register name

OFFSET unsigned int
: Access offset

ArchMsg.Warning.AxiReadFailure

AXI read failed. Fields:

ADDR unsigned int
: The address of the failed transaction

PURPOSE string
: The reason for the AXI transaction

WIDTH unsigned int
: The access width of the transaction

ArchMsg.Warning.AxiWriteFailure

AXI write failed. Fields:

ADDR unsigned int
: The address of the failed transaction

PURPOSE string
: The reason for the AXI transaction

WIDTH unsigned int
: The access width of the transaction

ArchMsg.Warning.InsecureNSAIDConfiguration

Potentially insecure NSAID configuration. Fields:

NSAID string
: The NSAID whose value is potentially causing insecure configurations.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.LSID0.Firmware.BackendError

Backend reported error when executing command. Fields:

COMMAND string
: String describing the command.

ArchMsg.Warning.LSID0.Firmware.ComponentInstantiationFailure

Failed to instantiate OMX component. Fields:

ERR unsigned int
: The error returned by the OMX core.

NAME string
: The name or role of the OMX IL component.

ArchMsg.Warning.LSID0.Firmware.ComponentNotInitialized

OMX component failed to initialize, refusing to use it.

ArchMsg.Warning.LSID0.Firmware.InvalidFirmwareLoaded

Driver loaded an invalid firmware image.

ArchMsg.Warning.LSID0.Firmware.UnexpectedSessionLoaded

Loaded an unexpected session from the firmware's memory map. Creating a blank session.

ArchMsg.Warning.LSID0.Firmware.UnsupportedFwProtocolVersion

Encountered unsupported protocol version. Fields:

MAJOR unsigned int
: Major version number of the firmware protocol.

MINOR unsigned int
: Minor version number of the firmware protocol.

ArchMsg.Warning.LSID0.FirmwareV2.UnableToChangeQpMidStream

Changing Qp mid-stream is not supported by the model.

ArchMsg.Warning.LSID1.Firmware.BackendError

Backend reported error when executing command. Fields:

COMMAND string
: String describing the command.

ArchMsg.Warning.LSID1.Firmware.ComponentInstantiationFailure

Failed to instantiate OMX component. Fields:

ERR unsigned int
: The error returned by the OMX core.

NAME string
: The name or role of the OMX IL component.

ArchMsg.Warning.LSID1.Firmware.ComponentNotInitialized

OMX component failed to initialize, refusing to use it.

ArchMsg.Warning.LSID1.Firmware.InvalidFirmwareLoaded

Driver loaded an invalid firmware image.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.LSID1.Firmware.UnexpectedSessionLoaded

Loaded an unexpected session from the firmware's memory map. Creating a blank session.

ArchMsg.Warning.LSID1.Firmware.UnsupportedFwProtocolVersion

Encountered unsupported protocol version. Fields:

MAJOR unsigned int
: Major version number of the firmware protocol.

MINOR unsigned int
: Minor version number of the firmware protocol.

ArchMsg.Warning.LSID1.FirmwareV2.UnableToChangeQpMidStream

Changing Qp mid-stream is not supported by the model.

ArchMsg.Warning.LSID2.Firmware.BackendError

Backend reported error when executing command. Fields:

COMMAND string
: String describing the command.

ArchMsg.Warning.LSID2.Firmware.ComponentInstantiationFailure

Failed to instantiate OMX component. Fields:

ERR unsigned int
: The error returned by the OMX core.

NAME string
: The name or role of the OMX IL component.

ArchMsg.Warning.LSID2.Firmware.ComponentNotInitialized

OMX component failed to initialize, refusing to use it.

ArchMsg.Warning.LSID2.Firmware.InvalidFirmwareLoaded

Driver loaded an invalid firmware image.

ArchMsg.Warning.LSID2.Firmware.UnexpectedSessionLoaded

Loaded an unexpected session from the firmware's memory map. Creating a blank session.

ArchMsg.Warning.LSID2.Firmware.UnsupportedFwProtocolVersion

Encountered unsupported protocol version. Fields:

MAJOR unsigned int
: Major version number of the firmware protocol.

MINOR unsigned int
: Minor version number of the firmware protocol.

ArchMsg.Warning.LSID2.FirmwareV2.UnableToChangeQpMidStream

Changing Qp mid-stream is not supported by the model.

ArchMsg.Warning.LSID3.Firmware.BackendError

Backend reported error when executing command. Fields:

COMMAND string
: String describing the command.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.LSID3.Firmware.ComponentInstantiationFailure

Failed to instantiate OMX component. Fields:

ERR unsigned int
: The error returned by the OMX core.

NAME string
: The name or role of the OMX IL component.

ArchMsg.Warning.LSID3.Firmware.ComponentNotInitialized

OMX component failed to initialize, refusing to use it.

ArchMsg.Warning.LSID3.Firmware.InvalidFirmwareLoaded

Driver loaded an invalid firmware image.

ArchMsg.Warning.LSID3.Firmware.UnexpectedSessionLoaded

Loaded an unexpected session from the firmware's memory map. Creating a blank session.

ArchMsg.Warning.LSID3.Firmware.UnsupportedFwProtocolVersion

Encountered unsupported protocol version. Fields:

MAJOR unsigned int
: Major version number of the firmware protocol.

MINOR unsigned int
: Minor version number of the firmware protocol.

ArchMsg.Warning.LSID3.FirmwareV2.UnableToChangeQpMidStream

Changing Qp mid-stream is not supported by the model.

ArchMsg.Warning.ReadFromRamOfUnallocatedSession

Attempt to read from unallocated session. Fields:

OFFSET unsigned int
: Access offset

ArchMsg.Warning.ReservedProtctrlConfig

Mismatch between CPS field and L1R/L2R fields in PROTCTRL. Accepted combinations are: CPS == 0 && L1R == L2R == 0; CPS == 1 && L1R == L2R == 3. Using any other combination is reserved and undefined. .

ArchMsg.Warning.UninitialisedHardware

Attempt to write to register before hardware is initialised. Fields:

DATA unsigned int
: Data written to register

REGNAME string
: The name of the register

ArchMsg.Warning.WriteOfInvalidDataToRegister

Write of invalid data to register attempted. Fields:

DATA unsigned int
: The data written to the address

NAME string
: Register name

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REASON enum
A short description of why the value was rejected

ArchMsg.Warning.WriteToRamOfUnallocatedSession

Write to session RAM of unallocated session attempted. Fields:

OFFSET unsigned int
Access offset

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.116 V61 - trace

This section describes the trace sources.

ArchMsg.Info.IgnoredRead

Read to reserved area attempted. Fields:

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.IgnoredWrite

Write to reserved area attempted. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.JobqueueUpdated

Job queue updated. Fields:

NEWVAL unsigned int
: New JOBQUEUE value

OLDVAL unsigned int
: Previous JOBQUEUE value

ArchMsg.Info.LSID0.Firmware.CommandFailure

Command failed. Fields:

CMD unsigned int
: The OMX Command that failed.

ERR unsigned int
: The reported error code.

ArchMsg.Info.LSID0.Firmware.InputBufferReceived

Received input buffer.

ArchMsg.Info.LSID0.Firmware.InvalidBufferHeader

Received invalid buffer header, cannot convert.

ArchMsg.Info.LSID0.Firmware.InvalidCallback

Invalid callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID0.Firmware.OutputBufferReceived

Received output buffer.

ArchMsg.Info.LSID0.Firmware.UnexpectedCallback

Unexpected callback. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REASON string
Reason for the invalidity of the callback.

ArchMsg.Info.LSID0.Firmware.Unimplemented

Unimplemented firmware feature. Fields:

MESSAGE string
Short description of the missing feature.

ArchMsg.Info.LSID0.Firmware.UnknownMessageReceived

Received unknown message.

ArchMsg.Info.LSID0.Firmware.WaitingForInterrupt

Firmware is waiting for IRQ. Fields:

LSID unsigned int
The session ID of the firmware

ArchMsg.Info.LSID0.FirmwareV1.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
The message code.
REASON string
Why the message is invalid.

ArchMsg.Info.LSID0.FirmwareV1.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID0.FirmwareV1.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID0.FirmwareV2.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
The message code.
REASON string
Why the message is invalid.

ArchMsg.Info.LSID0.FirmwareV2.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID0.FirmwareV2.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
The message code.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Info.LSID1.Firmware.CommandFailure

Command failed. Fields:

CMD unsigned int
: The OMX Command that failed.

ERR unsigned int
: The reported error code.

ArchMsg.Info.LSID1.Firmware.InputBufferReceived

Received input buffer.

ArchMsg.Info.LSID1.Firmware.InvalidBufferHeader

Received invalid buffer header, cannot convert.

ArchMsg.Info.LSID1.Firmware.InvalidCallback

Invalid callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID1.Firmware.OutputBufferReceived

Received output buffer.

ArchMsg.Info.LSID1.Firmware.UnexpectedCallback

Unexpected callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID1.Firmware.Unimplemented

Unimplemented firmware feature. Fields:

MESSAGE string
: Short description of the missing feature.

ArchMsg.Info.LSID1.Firmware.UnknownMessageReceived

Received unknown message.

ArchMsg.Info.LSID1.Firmware.WaitingForInterrupt

Firmware is waiting for IRQ. Fields:

LSID unsigned int
: The session ID of the firmware

ArchMsg.Info.LSID1.FirmwareV1.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
: The message code.

REASON string
: Why the message is invalid.

ArchMsg.Info.LSID1.FirmwareV1.MessageReceived

Firmware received meesage from driver. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CODE enum
: The message code.

ArchMsg.Info.LSID1.FirmwareV1.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.LSID1.FirmwareV2.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
: The message code.

REASON string
: Why the message is invalid.

ArchMsg.Info.LSID1.FirmwareV2.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.LSID1.FirmwareV2.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.LSID2.Firmware.CommandFailure

Command failed. Fields:

CMD unsigned int
: The OMX Command that failed.

ERR unsigned int
: The reported error code.

ArchMsg.Info.LSID2.Firmware.InputBufferReceived

Received input buffer.

ArchMsg.Info.LSID2.Firmware.InvalidBufferHeader

Received invalid buffer header, cannot convert.

ArchMsg.Info.LSID2.Firmware.InvalidCallback

Invalid callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID2.Firmware.OutputBufferReceived

Received output buffer.

ArchMsg.Info.LSID2.Firmware.UnexpectedCallback

Unexpected callback. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REASON string
Reason for the invalidity of the callback.

ArchMsg.Info.LSID2.Firmware.Unimplemented

Unimplemented firmware feature. Fields:

MESSAGE string
Short description of the missing feature.

ArchMsg.Info.LSID2.Firmware.UnknownMessageReceived

Received unknown message.

ArchMsg.Info.LSID2.Firmware.WaitingForInterrupt

Firmware is waiting for IRQ. Fields:

LSID unsigned int
The session ID of the firmware

ArchMsg.Info.LSID2.FirmwareV1.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
The message code.
REASON string
Why the message is invalid.

ArchMsg.Info.LSID2.FirmwareV1.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID2.FirmwareV1.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID2.FirmwareV2.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
The message code.
REASON string
Why the message is invalid.

ArchMsg.Info.LSID2.FirmwareV2.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
The message code.

ArchMsg.Info.LSID2.FirmwareV2.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
The message code.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Info.LSID3.Firmware.CommandFailure

Command failed. Fields:

CMD unsigned int
: The OMX Command that failed.

ERR unsigned int
: The reported error code.

ArchMsg.Info.LSID3.Firmware.InputBufferReceived

Received input buffer.

ArchMsg.Info.LSID3.Firmware.InvalidBufferHeader

Received invalid buffer header, cannot convert.

ArchMsg.Info.LSID3.Firmware.InvalidCallback

Invalid callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID3.Firmware.OutputBufferReceived

Received output buffer.

ArchMsg.Info.LSID3.Firmware.UnexpectedCallback

Unexpected callback. Fields:

REASON string
: Reason for the invalidity of the callback.

ArchMsg.Info.LSID3.Firmware.Unimplemented

Unimplemented firmware feature. Fields:

MESSAGE string
: Short description of the missing feature.

ArchMsg.Info.LSID3.Firmware.UnknownMessageReceived

Received unknown message.

ArchMsg.Info.LSID3.Firmware.WaitingForInterrupt

Firmware is waiting for IRQ. Fields:

LSID unsigned int
: The session ID of the firmware

ArchMsg.Info.LSID3.FirmwareV1.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
: The message code.

REASON string
: Why the message is invalid.

ArchMsg.Info.LSID3.FirmwareV1.MessageReceived

Firmware received meesage from driver. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CODE enum
: The message code.

ArchMsg.Info.LSID3.FirmwareV1.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.LSID3.FirmwareV2.InvalidMessageReceived

Firmware received an invalid meesage from driver. Fields:

MESSAGE enum
: The message code.

REASON string
: Why the message is invalid.

ArchMsg.Info.LSID3.FirmwareV2.MessageReceived

Firmware received meesage from driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.LSID3.FirmwareV2.MessageSent

Firmware sent meesage to driver. Fields:

CODE enum
: The message code.

ArchMsg.Info.MmuTranslateAccessFailure

MMU translation failed (mismatched access rights). Fields:

ACC enum
: Page access rights

INTENT enum
: Intent of the memory transaction, e.g. read+execute, read-only, write

VA unsigned int
: MVE virtual address to be translated

ArchMsg.Info.MmuTranslateLxFailure

MMU translation failed (entry missing). Fields:

LEVEL unsigned int
: The translation level at which the failure occurred; either 1 or 2

VA unsigned int
: MVE virtual address to be translated

ArchMsg.Info.MmuTranslateSuccess

MMU translation succeeded. Fields:

ACC enum
: Access rights to the address/page

ATTR enum
: Bus attributes for the memory transactions

PA unsigned int
: Resultant physical address

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VA unsigned int
: MVE virtual address to be translated

ArchMsg.Info.NSReadFromSecureRam

NS read of secure RAM attempted. Fields:

OFFSET unsigned int
: Access offset

ArchMsg.Info.NSReadFromSecureRegister

NS read of secure register attempted. Fields:

NAME string
: Register name

OFFSET unsigned int
: Access offset

ArchMsg.Info.NSWriteToSecureRam

NS write to RAM of secure session attempted. Fields:

OFFSET unsigned int
: Access offset

ArchMsg.Info.NSWriteToSecureRegister

NS write to secure register attempted. Fields:

DATA unsigned int
: The data written to the address

NAME string
: Register name

OFFSET unsigned int
: Access offset

ArchMsg.Info.ReadFromWriteOnlyRegister

Read of write-only register attempted. Fields:

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.ReadInReset

Attempt to read register during reset. Fields:

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.RegisterRead

Register has been read. Fields:

DATA unsigned int
: The data returned by the component

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Register access offset

ArchMsg.Info.RegisterWrite

Register written. Fields:

DATA unsigned int
: The data written to the register

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Register access offset

ArchMsg.Info.SessionStarted

Session started. Fields:

COREMASK unsigned int
: 8-bit 1-hot encoded value of newly-assigned cores

LSID unsigned int
: Session ID

NUMCORES unsigned int
: Number of cores for the session

ArchMsg.Info.SessionStopped

Session stopped. Fields:

COREMASK unsigned int
: 8-bit 1-hot encoded value of freed cores

LSID unsigned int
: Session ID

NUMCORES unsigned int
: Number of cores for the session

ArchMsg.Info.UnalignedRead

Unaligned read attempted. Fields:

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.UnalignedWrite

Unaligned write attempted. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Info.WriteInReset

Attempt to write register during reset. Fields:

DATA unsigned int
: The data written to the address

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.WriteToReadOnlyRegister

Write to read-only register attempted. Fields:

DATA unsigned int
: The data written to the address

NAME string
: Register name

NSECURE bool
: True when the access is not a secure access

OFFSET unsigned int
: Access offset

ArchMsg.Info.WriteToSecureRegisterOfUnallocatedLSID

Write to secure register of unallocated LSID attempted. Fields:

DATA unsigned int
: The data written to the address

NAME string
: Register name

OFFSET unsigned int
: Access offset

ArchMsg.Warning.AxiReadFailure

AXI read failed. Fields:

ADDR unsigned int
: The address of the failed transaction

PURPOSE string
: The reason for the AXI transaction

WIDTH unsigned int
: The access width of the transaction

ArchMsg.Warning.AxiWriteFailure

AXI write failed. Fields:

ADDR unsigned int
: The address of the failed transaction

PURPOSE string
: The reason for the AXI transaction

WIDTH unsigned int
: The access width of the transaction

ArchMsg.Warning.InsecureNSAIDConfiguration

Potentially insecure NSAID configuration. Fields:

NSAID string
: The NSAID whose value is potentially causing insecure configurations.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.LSID0.Firmware.BackendError

Backend reported error when executing command. Fields:

COMMAND string
: String describing the command.

ArchMsg.Warning.LSID0.Firmware.ComponentInstantiationFailure

Failed to instantiate OMX component. Fields:

ERR unsigned int
: The error returned by the OMX core.

NAME string
: The name or role of the OMX IL component.

ArchMsg.Warning.LSID0.Firmware.ComponentNotInitialized

OMX component failed to initialize, refusing to use it.

ArchMsg.Warning.LSID0.Firmware.InvalidFirmwareLoaded

Driver loaded an invalid firmware image.

ArchMsg.Warning.LSID0.Firmware.UnexpectedSessionLoaded

Loaded an unexpected session from the firmware's memory map. Creating a blank session.

ArchMsg.Warning.LSID0.Firmware.UnsupportedFwProtocolVersion

Encountered unsupported protocol version. Fields:

MAJOR unsigned int
: Major version number of the firmware protocol.

MINOR unsigned int
: Minor version number of the firmware protocol.

ArchMsg.Warning.LSID0.FirmwareV2.UnableToChangeQpMidStream

Changing Qp mid-stream is not supported by the model.

ArchMsg.Warning.LSID1.Firmware.BackendError

Backend reported error when executing command. Fields:

COMMAND string
: String describing the command.

ArchMsg.Warning.LSID1.Firmware.ComponentInstantiationFailure

Failed to instantiate OMX component. Fields:

ERR unsigned int
: The error returned by the OMX core.

NAME string
: The name or role of the OMX IL component.

ArchMsg.Warning.LSID1.Firmware.ComponentNotInitialized

OMX component failed to initialize, refusing to use it.

ArchMsg.Warning.LSID1.Firmware.InvalidFirmwareLoaded

Driver loaded an invalid firmware image.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.LSID1.Firmware.UnexpectedSessionLoaded

Loaded an unexpected session from the firmware's memory map. Creating a blank session.

ArchMsg.Warning.LSID1.Firmware.UnsupportedFwProtocolVersion

Encountered unsupported protocol version. Fields:

MAJOR unsigned int
: Major version number of the firmware protocol.

MINOR unsigned int
: Minor version number of the firmware protocol.

ArchMsg.Warning.LSID1.FirmwareV2.UnableToChangeQpMidStream

Changing Qp mid-stream is not supported by the model.

ArchMsg.Warning.LSID2.Firmware.BackendError

Backend reported error when executing command. Fields:

COMMAND string
: String describing the command.

ArchMsg.Warning.LSID2.Firmware.ComponentInstantiationFailure

Failed to instantiate OMX component. Fields:

ERR unsigned int
: The error returned by the OMX core.

NAME string
: The name or role of the OMX IL component.

ArchMsg.Warning.LSID2.Firmware.ComponentNotInitialized

OMX component failed to initialize, refusing to use it.

ArchMsg.Warning.LSID2.Firmware.InvalidFirmwareLoaded

Driver loaded an invalid firmware image.

ArchMsg.Warning.LSID2.Firmware.UnexpectedSessionLoaded

Loaded an unexpected session from the firmware's memory map. Creating a blank session.

ArchMsg.Warning.LSID2.Firmware.UnsupportedFwProtocolVersion

Encountered unsupported protocol version. Fields:

MAJOR unsigned int
: Major version number of the firmware protocol.

MINOR unsigned int
: Minor version number of the firmware protocol.

ArchMsg.Warning.LSID2.FirmwareV2.UnableToChangeQpMidStream

Changing Qp mid-stream is not supported by the model.

ArchMsg.Warning.LSID3.Firmware.BackendError

Backend reported error when executing command. Fields:

COMMAND string
: String describing the command.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.LSID3.Firmware.ComponentInstantiationFailure

Failed to instantiate OMX component. Fields:

ERR unsigned int
: The error returned by the OMX core.

NAME string
: The name or role of the OMX IL component.

ArchMsg.Warning.LSID3.Firmware.ComponentNotInitialized

OMX component failed to initialize, refusing to use it.

ArchMsg.Warning.LSID3.Firmware.InvalidFirmwareLoaded

Driver loaded an invalid firmware image.

ArchMsg.Warning.LSID3.Firmware.UnexpectedSessionLoaded

Loaded an unexpected session from the firmware's memory map. Creating a blank session.

ArchMsg.Warning.LSID3.Firmware.UnsupportedFwProtocolVersion

Encountered unsupported protocol version. Fields:

MAJOR unsigned int
: Major version number of the firmware protocol.

MINOR unsigned int
: Minor version number of the firmware protocol.

ArchMsg.Warning.LSID3.FirmwareV2.UnableToChangeQpMidStream

Changing Qp mid-stream is not supported by the model.

ArchMsg.Warning.ReadFromRamOfUnallocatedSession

Attempt to read from unallocated session. Fields:

OFFSET unsigned int
: Access offset

ArchMsg.Warning.ReservedProtctrlConfig

Mismatch between CPS field and L1R/L2R fields in PROTCTRL. Accepted combinations are: CPS == 0 && L1R == L2R == 0; CPS == 1 && L1R == L2R == 3. Using any other combination is reserved and undefined. .

ArchMsg.Warning.UninitialisedHardware

Attempt to write to register before hardware is initialised. Fields:

DATA unsigned int
: Data written to register

REGNAME string
: The name of the register

ArchMsg.Warning.WriteOfInvalidDataToRegister

Write of invalid data to register attempted. Fields:

DATA unsigned int
: The data written to the address

NAME string
: Register name

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

REASON enum
A short description of why the value was rejected

ArchMsg.Warning.WriteToRamOfUnallocatedSession

Write to session RAM of unallocated session attempted. Fields:

OFFSET unsigned int
Access offset

Non-Confidential

4.117 Value64Logger - trace

This section describes the trace sources.

VALUE

Input signal to ValueLogger driven. Fields:

Value `unsigned int`
: Value of signal being driven

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.118 ValueLogger - trace

This section describes the trace sources.

VALUE

Input signal to ValueLogger driven. Fields:

Value `unsigned int`
Value of signal being driven

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.119 VirtioBlockDevice - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

data_read

The data read by the device. Fields:

addr unsigned int
: Address.

data unsigned int
: The data read.

ns bool
: Non-secure access.

data_read_abort

The data read by the device aborted. Fields:

addr unsigned int
: Address.

ns bool
: Non-secure access.

size_in_bytes unsigned int
: The data size in bytes.

data_read_start

The data read by the device. Fields:

addr unsigned int
: Address.

ns bool
: Non-secure access.

size_in_bytes unsigned int
: The size to read.

data_write

The data write by the device completed successfully. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

addr unsigned int
: Address.

ns bool
: Non-secure access.

size_in_bytes unsigned int
: The size of the write that completed successfully.

data_write_abort

The data write by the device aborted. Fields:

addr unsigned int
: Address.

ns bool
: Non-secure access.

size_in_bytes unsigned int
: The size of the write that aborted.

data_write_start

The data attempted to be written by the device. Fields:

addr unsigned int
: Address.

data unsigned int
: The data attempted to be written.

ns bool
: Non-secure access.

register_read

A read of the register file. Fields:

addr unsigned int
: Address.

data unsigned int
: Data read.

what enum
: What region of MMIO space it accessed.

register_read_abort

A read of the register file caused an abort. Fields:

addr unsigned int
: Address.

what enum
: What region of MMIO space it accessed.

width_in_bytes unsigned int
: Width of data read.

register_write

A write of the register file. Fields:

addr unsigned int
: Address.

data unsigned int
: Data written.

what enum
: What region of MMIO space it accessed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

register_write_abort

A write of the register file caused an abort. Fields:

addr `unsigned int`
: Address.

data `unsigned int`
: Data attempted to be written.

what `enum`
: What region of MMIO space it accessed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.120 VirtioP9Device - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message `string`
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.121 VirtioPCIBlockDevice - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

data_read

The data read by the device. Fields:

addr unsigned int
: Address.

data unsigned int
: The data read.

ns bool
: Non-secure access.

data_read_abort

The data read by the device aborted. Fields:

addr unsigned int
: Address.

ns bool
: Non-secure access.

size_in_bytes unsigned int
: The data size in bytes.

data_read_start

The data read by the device. Fields:

addr unsigned int
: Address.

ns bool
: Non-secure access.

size_in_bytes unsigned int
: The size to read.

data_write

The data write by the device completed successfully. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

addr unsigned int
: Address.

ns bool
: Non-secure access.

size_in_bytes unsigned int
: The size of the write that completed successfully.

data_write_abort

The data write by the device aborted. Fields:

addr unsigned int
: Address.

ns bool
: Non-secure access.

size_in_bytes unsigned int
: The size of the write that aborted.

data_write_start

The data attempted to be written by the device. Fields:

addr unsigned int
: Address.

data unsigned int
: The data attempted to be written.

ns bool
: Non-secure access.

register_read

A read of the register file. Fields:

addr unsigned int
: Address.

data unsigned int
: Data read.

what enum
: What region of MMIO space it accessed.

register_read_abort

A read of the register file caused an abort. Fields:

addr unsigned int
: Address.

what enum
: What region of MMIO space it accessed.

width_in_bytes unsigned int
: Width of data read.

register_write

A write of the register file. Fields:

addr unsigned int
: Address.

data unsigned int
: Data written.

what enum
: What region of MMIO space it accessed.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

register_write_abort

A write of the register file caused an abort. Fields:

addr `unsigned int`
: Address.

data `unsigned int`
: Data attempted to be written.

what `enum`
: What region of MMIO space it accessed.

Non-Confidential

4.122 VirtualEthernetCrossover - trace

This section describes the trace sources.

FRAME

Trace Ethernet frames as they go through. Fields:

data string
: ASCII encoded packet data. Each line starts with a hex packet offset (in bytes) followed by up to 16 space separated bytes encoded as 2 hex digits. This data can be read by the tool text2pcap to generate a file which can be read by wireshark.

source enum
: Identifies the source port from which the frame originated

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.123 atc - trace

This section describes the trace sources.

ArchMsg.Error.error

These messages are about activity occurring on the ATC that is considered an error. Fields:

output string
: The stream output

ArchMsg.Info.info

These are information messages about what is happening in the ATC. Fields:

output string
: The stream output

ArchMsg.Warning.atc_pri_allocation_changed_whilst_not_stopped

The PRI has PRGs in flight that were using credit_used credits, however, the PRI interface was disabled and the allocation of credits changed. Fields:

credits_used unsigned int
: The number of credits currently in use by in-flight PRGs

new_allocation unsigned int
: The new allocation of credits set in the PRI header.

ArchMsg.Warning.atc_pri_allocation_reduced_below_current_credits_used

The PRI has PRGs in flight that were using credit_used credits, however, the PRI interface was disabled and the allocation of credits changed to a value less than that of those that are currently in use. The SW should probably of first have serviced the outstanding PRGs and then waited for the interface to report Stopped before reducing the allocation. The PCIe spec is unclear as to the required behaviour. The model will continue to count credits. It will not allow the PRI interface to be re-enabled until Stopped (this is an implementation defined choice) and so when successfully re-enabled will then obey the new allocation. Fields:

credits_used unsigned int
: The number of credits currently in use by in-flight PRGs.

new_allocation unsigned int
: The new allocation of credits set in the PRI header.

ArchMsg.Warning.atc_pri_members_of_prg_inconsistent

A client has formed a PRG and all the members of the PRG should have the same execute mode and privilege request in. However, this PRG member has different ones to the first. PCIe says that the effect is undefined. The trace source pri_members_of_prg traces all members of the group. Fields:

PRGIndex unsigned int
: The PRGIndex of this request.

expected_execute bool
: The expected execute permission requested.

expected_priv bool
: The expected privilege permission requested.

member_index unsigned int
: The index of this member within the PRG.

number_of_members unsigned int
: The number of members in this PRG.

page_address unsigned int
: Page address of the request.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

priv bool
: Privileged permissions requested. Valid only for those requests with a PASID (SubstreamID).

rwx enum
: Requested Read/Write/Execute permissions. Execute permission are only available for those requests with a PASID (SubstreamID), and read permission will automatically be asked for as well.

streamid unsigned int
: The StreamID of the PRI request.

substreamid unsigned int
: The SubstreamID sent with the PRG request.

trans_id unsigned int
: The transaction id of the failing ATS transaction.

ArchMsg.Warning.atc_pri_reset_received_whilst_outputting_PRG

The ATC was in the process of sending the members of a PRG to the SMMU but before it had finished sending them, then a PRI Reset or signal reset occurred and the rest of the PRG will not be sent. The may leave a partial PRG in the PRI queue of the SMMU. Note the difference to having sent the entire PRG (including Last) and then receiving some sort of reset. Fields:

id unsigned int
: The ID of this request.

number_of_PRG_members unsigned int
: The number of members of the PRG, or 0 if run out of credits or PRGIndexes.

prgindex unsigned int
: The PRGIndex expected, or ~0u if run out of credits or PRGIndexes.

signal_reset bool
: True if it was a signal reset, false if it was a PRI Reset via the PRI Capability Header.

substreamid unsigned int
: The expected PASID on the _response_.

which_member_was_being_sent unsigned int
: The index of which member of the PRG was being sent whilst we received reset. All subsequent members of the PRG will not be sent.

ArchMsg.Warning.atc_pri_response_Response_Failure

A PRI Response has been received with a Response Failure. The PRI interface is required to disable itself, set RF in the header and will wake all waiting PRGs, forcing them to fault. Fields:

pasid unsigned int
: The PASID prefix on the response, or ~0u if none.

prgindex unsigned int
: The PRGIndex in the response.

response enum
: The response code

ArchMsg.Warning.atc_pri_response_ignored_as_RF_set

Any PRI Responses received whilst the RF (Response Failure) bit of the PRI header is required to be ignored by the PCIe specification. This is a response being ignored due to that reason. Fields:

pasid unsigned int
: The PASID prefix on the response, or ~0u if none.

prgindex unsigned int
: The PRGIndex in the response.

response enum
: The response code

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ArchMsg.Warning.pri_enabled_with_zero_allocation

The PRI interface was enabled but the assigned credit allocation is zero. There is no useful way that the PRI interface can operate in this state and the model will fault any transaction that needs to use PRI. Fields:

capacity unsigned int
: The PRI Credit Capacity for this device.

ArchMsg.Warning.warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the ATC. Fields:

output string
: The stream output

atc_commentary

A commentary from the cache about what is going on. Fields:

output string
: The stream output.

atc_entry

This monitors the formation or change of an atc entry. Fields:

atc_entry_id unsigned int
: An ID identifying this entry.

change_inconsistent_nug bool
: The change was inconsistent in NUG, and was ignored. This is almost certainly an error.

change_inconsistent_permissions bool
: The change was inconsistent in the permissions granted that were known before. The change was rejected for known changes. This may represent an error.

change_inconsistent_remap bool
: The input and/or output address ranges were changed. This may represent an error.

id unsigned int
: The ID of the transaction that caused this fill.

input_address_begin unsigned int
: The input address range covered by this entry.

input_address_end_incl unsigned int
: The input address range covered by this entry.

nugrwxrwx_change string
: The N, U, G and rwxrwx flags before and after any change.

output_address_begin unsigned int
: The output address range covered by this entry.

output_address_end_incl unsigned int
: The output address range covered by this entry.

reply_is_cacheable bool
: The reply was cacheable and so changed the known permissions.

substreamid unsigned int
: The SubstreamID of the entry.

atc_entry_allocated

An ATC entry has been allocated. Fields:

atc_entry_id unsigned int
: Index of ATC entry.

input_address_begin unsigned int
: The input address range covered by this entry.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

input_address_end_incl unsigned int
: The input address range covered by this entry.

nugrwxrwx string
: N, U, G bits and which permissions are unknown ('?'), granted (r/w/x) and denied ('-').

output_address_begin unsigned int
: The input address range covered by this entry.

output_address_end_incl unsigned int
: The input address range covered by this entry.

substreamid unsigned int
: The SubstreamID of the entry.

atc_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int
: The entry id that is being invalidated.

reason enum
: Why the entry is being invalidated.

atc_entry_none_formed

An ATC entry was attempted to be created but the ATS request forbade it being created. Fields:

fault enum
: Fault reason

id unsigned int
: The ID of the transaction that caused this fill.

input_address unsigned int
: The input address range covered by this entry.

substreamid unsigned int
: The SubstreamID that would have been used.

atc_inv_wait

An ATC Invalidate has to wait before completing because of outstanding transactions that are using the entry. Fields:

atc_inv_id unsigned int
: The ID of the ATC Invalidate transaction.

atc_inv_woke

An ATC Invalidate had to wait before completing because of outstanding transactions that are using the entry. This is it waking up. Fields:

atc_inv_id unsigned int
: The ID of the ATC Invalidate transaction.

because_of_reset bool
: The ATC Invalidate was killed because of reset.

atc_invalidate

An ATC Invalidate message was received. Fields:

Global_if_substreamid bool
: If has a SubstreamID then the Global flag.

aligned_address unsigned int
: The aligned address to invalidate.

atc_inv_id unsigned int
: The ID of this ATC Invalidate message.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

size_mask unsigned int
: The mask implied by the Size field.

substreamid unsigned int
: The SubstreamID (or ~0u if no SubstreamID)

atc_invalidate_kills_in_flight_ats

If an ATC Invalidate comes in whilst an ATS request is in flight that is affected by that ATC invalidate then it is killed and will be remade. Fields:

Global_if_substreamid bool
: If has a SubstreamID then the Global flag.

aligned_address unsigned int
: The aligned address to invalidate.

atc_id unsigned int
: The ID of the ATC that caused the ATS request.

atc_inv_id unsigned int
: The ID of this ATC Invalidate message.

size_mask unsigned int
: The mask implied by the Size field.

substreamid unsigned int
: The SubstreamID (or ~0u if no SubstreamID)

atc_pri_allocation_reduced_whilst_client_forming_prg

The client device was creating a PRG whilst the allocation for the PRI was changed. This left the PRI unable to satisfy the client device's request and we have to ask the client again what to do. Fields:

credits_used unsigned int
: The number of credits currently in use by in-flight PRGs.

new_allocation unsigned int
: The new allocation of credits set in the PRI header.

atc_pri_ats_transaction_failed

The ATS transaction failed to get the required permissions from the SMMU. PRI has been enabled so it now tries to form a PRI request. Fields:

allocation unsigned int
: The number of credits allocated to this device.

capacity unsigned int
: The advertised capacity of the device.

credits_used unsigned int
: The number of credits that are in use by in-flight PRG requests.

pri_enabled bool
: The PRI interface is enabled.

priv bool
: Privileged mode requested.

rwx enum
: Requested Read/Write/Execute permissions. Execute permission are only available for those requests with a PASID (SubstreamID), and read permission will automatically be asked for as well.

streamid unsigned int
: The StreamID of the request.

substreamid unsigned int
: The SubstreamID (PASID) of the request or ~0u if none.

trans_id unsigned int
: The transaction id of the ATS request.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

untranslated_address unsigned int
: The untranslated address of the ATS request.

atc_pri_client_device_chose_not_to_form_a_prg

The client device was given an opportunity to form a PRG and it chose not to. Instead the transaction will be faulted. Fields:

trans_id unsigned int
: The id of the failing ATS request.

atc_pri_could_not_form_prg_due_to_lack_of_prgindexes_or_credits

The client device was told that it couldn't form a PRG because of a lack of free PRGIndexes or because there were no free credits. The client device has the opportunity to either fault the transaction or to wait for some to become free. Fields:

trans_id unsigned int
: The id of the failing ATS request.

wait bool
: The client device chose to wait.

atc_pri_is_stopped

Traces why the PRI interface reports itself as stopped or not. Fields:

Stopped bool
: Is the PRI Stopped?

client_device_forming_requests bool
: The number of requests to the client device that are forming a PRG.

credits_outstanding bool
: The number of outstanding credits in outstanding PRGs.

atc_pri_members_of_prg

A client has formed a PRG and this describes each member of that PRG. Fields:

PRGIndex unsigned int
: The PRGIndex of this request.

member_index unsigned int
: The index of this member within the PRG.

number_of_members unsigned int
: The number of members in this PRG.

page_address unsigned int
: Page address of the request.

priv bool
: Privileged permissions requested. Valid only for those requests with a PASID (SubstreamID).

rwx enum
: Requested Read/Write/Execute permissions. Execute permission are only available for those requests with a PASID (SubstreamID), and read permission will automatically be asked for as well.

streamid unsigned int
: The StreamID of the PRI request.

substreamid unsigned int
: The SubstreamID sent with the PRG request.

trans_id unsigned int
: The transaction id of the failing ATS transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

atc_pri_outstanding_prg_request_killed_by_PRI_Reset_or_Response_Failure

This indicates that a PRI request (or one that was waiting for credits or a PRGIndexes to become free) was killed because either:- * software used PRI Reset in the PCIe PRI header, or * a PRI response was received with Response Failure, the effect of which is to kill all requests waiting for a PRG response. Fields:

trans_id unsigned int
: The transaction id of the ATS request that formed the PRI request.

atc_pri_outstanding_prg_when_interface_disabled

The PRI interface was disabled but there are outstanding PRI requests that have to be completed before the interface is stopped. Fields:

credits unsigned int
: The number of credits that this group uses.

expected_PASID_on_response unsigned int
: The expected PASID that should be on the PRI response (or ~0u if none expected).

prgindex unsigned int
: The PRGIndex of the outstanding request.

trans_id unsigned int
: The transaction id of the ATS request that formed the PRI request.

atc_pri_prg_request

A PRI Page Request Group (PRG) has. Fields:

PASID_on_response unsigned int
: The expected PASID on the response, or ~0u if none.

allocation unsigned int
: The number of credits allowed to be used.

credits_used unsigned int
: The number of credits in use now.

number_of_members unsigned int
: The number of members in the group.

prgindex unsigned int
: The PRGIndex used.

trans_id unsigned int
: The transaction id of the failing ATS transaction.

atc_pri_response_unrecognised_causes_uprgi

A PRI Response has been received that doesn't match a waiting PRG. The UPRGI bit in the PRI header will be set and then this response will be ignored. Fields:

match_PRG_currently_committing bool
: This is true if the PRI Response does match a PRG that is currently being sent to the SMMU, but because it is not yet complete then it should not have received a response yet and so the device treats this as UPRGI.

pasid unsigned int
: The PASID prefix on the response, or ~0u if none.

prgindex unsigned int
: The PRGIndex in the response.

response enum
: The response code

atc_pri_response_valid

A PRI Response has been received that is valid and we are going to wake up some threads of activity. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

credits_to_return unsigned int
: Credits that were used by the PRG and are now returned.

pasid unsigned int
: The PASID prefix on the response, or ~0u if none.

prgindex unsigned int
: The PRGIndex in the response.

response enum
: The response code

atc_pri_throwing_away_ppr

A client device asked for too many PRI Page Requests (PPR) in the PRG. The model is discarding PPRs to form the PRG. Fields:

page_address unsigned int
: Page address of the request.

priv bool
: Privileged permissions requested. Valid only for those requests with a PASID (SubstreamID).

rwx enum
: Requested Read/Write/Execute permissions. Execute permission are only available for those requests with a PASID (SubstreamID), and read permission will automatically be asked for as well.

streamid unsigned int
: The StreamID of the PRI request.

substreamid unsigned int
: SubstreamID (PASID), or ~0u if none.

trans_id unsigned int
: The transaction id of the failing ATS transaction.

atc_pri_waiting

Track a transaction that is waiting for a PRI request. Fields:

id unsigned int
: The ID of this request.

number_of_PRG_members unsigned int
: The number of members of the PRG, or 0 if run out of credits or PRGIndexes.

prgindex unsigned int
: The PRGIndex expected, or ~0u if run out of credits or PRGIndexes.

sleeping bool
: True if this is the trace of the transaction sleeping, false if it is waking.

substreamid unsigned int
: The expected PASID on the _response_.

atc_pri_woken_response

A transaction that was waiting for a PRI Response has been woken. Fields:

action enum
: The action now to take now woken.

id unsigned int
: The ID of this request.

prgindex unsigned int
: The PRGIndex expected, or ~0u if run out of credits or PRGIndexes.

substreamid unsigned int
: The expected PASID on the _response_.

control_write

This indicates a write to one of the control field of the ATC. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

comments enum
: Comments on the change

value_after_write unsigned int
: The value that the field was after the write.

which enum
: Which control field was written to

written_value unsigned int
: The value that was written

error_atc_entries_overlap

An ATC entry was attempted to be inserted into the ATC and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

end_address_of_new_entry unsigned int
: End address of new entry.

end_address_of_old_entry unsigned int
: End address of old entry.

index_of_new_entry unsigned int
: Index of new entry.

index_of_old_entry unsigned int
: Index of old entry.

start_address_of_new_entry unsigned int
: Start address of new entry.

start_address_of_old_entry unsigned int
: Start address of old entry.

final_remap_request

The final ATS result of the remap request. If this fails then PRI might be applied. In addition, PRI might make this remap request retry multiple times and is tracked by the retry_number. Fields:

address unsigned int
: Address of the request.

id unsigned int
: ID of ATC transaction.

inner enum
: The inner memory attribute.

instruction bool
: Is an instruction access.

is_debug bool
: Is a debug.

is_read bool
: Is a read request.

outer enum
: The outer memory attribute.

output_address unsigned int
: Output address.

privileged bool
: Is a privileged access.

result enum
: The result of the translation.

retry_number unsigned int
: The number of times this transaction has retried.

substreamid unsigned int
: Substream ID of the request (or ~0u if no SubstreamID).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

initial_remap_request

The remap request for a bunch of transactions round this address. PRI might make this remap request retry multiple times and is tracked by the retry_number field. Fields:

address unsigned int
: Address of the request.

id unsigned int
: Unique ID of this request.

instruction bool
: Is an instruction access.

is_debug bool
: Is a debug.

is_read bool
: Is a read request.

privileged bool
: Is a privileged access.

retry_number unsigned int
: The number of times this transaction has retried.

substreamid unsigned int
: Substream ID of the request (or ~0u if no SubstreamID).

same_as

This request is the same as the specified other ATC transaction. Fields:

atc_entry_id unsigned int
: ID of the ATC Entry that it uses (or ~0ull if not relevant).

id unsigned int
: ID of ATC transaction.

same_as_id unsigned int
: ID of the ATC transaction it is the same as.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

4.124 v7_VGIC - trace

This section describes the trace sources.

CHECKPOINT_MESSAGE

Report error messages from the checkpointing process. Fields:

message string
: Message contents.

CHECKPOINT_RESTORE_END

Checkpoint restore completed.

CHECKPOINT_RESTORE_START

Checkpoint restore about to start.

CHECKPOINT_SAVE_END

Checkpoint save completed.

CHECKPOINT_SAVE_START

Checkpoint save about to start.

debug_out

Debug trace from the VGIC model, this contains implementation detail that is unlikely to be generally useful. Fields:

message string
: The message from the VGIC

sequence_id unsigned int
: Each successive message is labeled with an increasing number

gic_log_errors_out

Errors from the VGIC model. Fields:

message string
: The message from the VGIC

sequence_id unsigned int
: Each successive message is labeled with an increasing number

gic_log_fatal_out

Fatal error from the VGIC model. Fields:

message string
: The message from the VGIC

gic_log_warnings_out

Warnings from the VGIC model. Fields:

message string
: The message from the VGIC

sequence_id unsigned int
: Each successive message is labeled with an increasing number

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

vgic_cfgsdisable

The VGIC CFGSDISABLE pin has changed its state, this (un)locks down some configuration registers. Fields:

state bool
: The state of the signal

vgic_distributor_register_access

Distributor interface accesses on the VGIC. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_fiq_out

The FIQ output signal to the core. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_hypervisor_register_access

Hypervisor interface register accesses. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_irq_out

The IRQ output signal to the core. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

vgic_legacy_fiq_in

The legacy FIQ input signal into the VGIC. Fields:

cpu_id unsigned int
: The CPU id. There is one legacy IRQ/FIQ per core.

state bool
: The state of the signal

vgic_legacy_irq_in

The legacy IRQ input signal into the VGIC. Fields:

cpu_id unsigned int
: The CPU id. There is one legacy IRQ/FIQ per core.

state bool
: The state of the signal

vgic_physical_register_access

Physical interface accesses on the VGIC. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_reset

The reset pin on the VGIC has been changed. Fields:

state bool
: The state of the SPI signal

vgic_spi

Shared Peripheral Interrupt signal changed. Fields:

id unsigned int
: The interrupt id this will generate. SPIs start at ID 32 and so you will only see ids of >= 32

state bool
: The state of the SPI signal

vgic_vfiq_out

The VFIQ output signal to the core. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_virq_out

The VIRQ output signal to the core. Fields:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_virtual_machine_register_access

Virtual machine interface register accesses. Fields:

cpu_id unsigned int
: The CPU that is making the request

data unsigned int
: The data in the access aligned to the LSB.

is_read enum
: Is the access a read?

offset enum
: Register within interface, top bit indicates NS state

offset_in_word unsigned int
: The offset of the access in the word.

size_in_bytes unsigned int
: The size of the access in bytes.

vgic_virtual_maintenance_interrupt

The VGIC is signaling that it needs software help from the hypervisor to maintain theVGIC interfaces. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_wakeup_fiq

The wakeup FIQ signal. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

vgic_wakeup_irq

The wakeup IRQ signal. Fields:

cpu_id unsigned int
: The CPU id.

state bool
: The state of the signal

Non-Confidential

Chapter 5
Plug-ins for Fast Models

This chapter describes the plug-ins that are available for Fast Models.

Prebuilt plug-ins can be found at `$PVLIB_HOME/plugins/<OS_compiler>/`. The source code for some of these plug-ins is provided as programming examples, under `$PVLIB_HOME/examples/MTI/`.

It contains the following sections:

- *5.1 Loading a plug-in* on page 5-2891.
- *5.2 ArchMsgTrace* on page 5-2893.
- *5.3 BranchPrediction* on page 5-2894.
- *5.4 CADIIPCRemoteConnection* on page 5-2898.
- *5.5 CDE* on page 5-2899.
- *5.6 Crypto* on page 5-2909.
- *5.7 Fastline* on page 5-2911.
- *5.8 GDBRemoteConnection* on page 5-2919.
- *5.9 GenericCounter* on page 5-2921.
- *5.10 GenericTrace* on page 5-2922.
- *5.11 ListTraceSources* on page 5-2924.
- *5.12 PipelineModel* on page 5-2925.
- *5.13 RunTimeParameterTest* on page 5-2930.
- *5.14 ScalableVectorExtension* on page 5-2931.
- *5.15 Sidechannel* on page 5-2934.
- *5.16 TarmacText* on page 5-2935.
- *5.17 TarmacTrace* on page 5-2936.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

5.1 Loading a plug-in

The method of loading a plug-in depends on the type of model being used.

This section contains the following subsections:

- *5.1.1 --plugin command-line option* on page 5-2891.
- *5.1.2 scx::scx_load_plugin() method* on page 5-2891.
- *5.1.3 FM_TRACE_PLUGINS environment variable* on page 5-2891.

5.1.1 --plugin command-line option

For an FVP, or a SystemC EVS that uses the `scx::scx_parse_and_configure()` method, or when using Model Shell or Model Debugger, specify the plug-in using the `--plugin <path_to_plugin>/<plugin_name>.so` switch.

If more than one plug-in is required, use multiple `--plugin` switches.

Specify plug-in parameters using the `-C` option when launching the platform model, or in a configuration file.

For example, to load the `TarmacTrace` plug-in on Windows:

1. Run the following command to list both the model parameters and the plug-in parameters:

```
FVP_Base_AEMv8A.exe --plugin="%PVLIB_HOME%\plugins\Win64_VC2017\Release\TarmacTrace.dll"
--list-params
```

2. Run the following command:

```
FVP_Base_AEMv8A.exe -C bp.secure_memory=0 \
--plugin="%PVLIB_HOME%\plugins\Win64_VC2017\Release\TarmacTrace.dll" \
-C TRACE.TarmacTrace.trace-file=trace.log \
-a cluster0.cpu0=startup_AEMv8-FVP_AArch64_AC6.axf
```

   This command does the following:

   - Loads the `TarmacTrace` plug-in into the model using the model option `--plugin`.
   - Specifies the `TarmacTrace` log file using the plug-in parameter `TRACE.TarmacTrace.trace-file`.
   - Specifies the application to run on the `cluster0.cpu0` instance on the model, using the model option `-a`.

Related information

scx::scx_parse_and_configure

5.1.2 scx::scx_load_plugin() method

Fast Models that are exported to SystemC can call the method `scx::scx_load_plugin()` to hard code the path to the plug-in, before calling `sc_start()`.

For example:

```
scx::scx_load_plugin("$PVLIB_HOME/plugins/<OS_Compiler>/<plug-in_name>.so");
```

Related information

scx::scx_load_plugin

5.1.3 FM_TRACE_PLUGINS environment variable

When it is not possible to specify a trace plug-in to the launching tool, use the environment variable `FM_TRACE_PLUGINS`. This variable must be set to the full path of the plug-in.

For example, on Linux:

```
export FM_TRACE_PLUGINS=<installation_path>/plugins/<OS_Compiler>/TarmacTrace.so
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

or on Windows:

```
set FM_TRACE_PLUGINS=<installation_path>\plugins\<OS_Compiler>\<version>\TarmacTrace.dll
```

To set multiple trace plug-ins at the same time, separate them with a semicolon, for example:

```
set FM_TRACE_PLUGINS=%PVLIB_HOME%\plugins\Win64_VC2017\Release\TarmacTrace.dll;%PVLIB_HOME%
\plugins\Win64_VC2017\Release\GenericTrace.dll
```

You can also load the same plug-in multiple times.

Give the plug-in instance a name by adding the prefix `<instancename>=` to the plug-in path or paths.

Specify parameters for plug-ins that you load using `FM_TRACE_PLUGINS`, using the following syntax:

```
|<param0_without_prefix=value>||<param1_without_prefix=value>||
<paramN_without_prefix=value>|<absolute_path_to_plugin.dll>
```

where `<param*_without_prefix=value>` means you must specify the parameter without the prefix that would be used on the command line. For example, use `trace-file=file.txt` instead of `TRACE.TarmacTrace.trace-file=file.txt`.

For example, on Linux:

```
export FM_TRACE_PLUGINS='|trace-file=/home/myname/work/trace.txt||end-instruction-count=1000|
$PVLIB_HOME/plugins/Linux64_GCC-6.4/TarmacTrace.so'
```

or on Windows:

```
set FM_TRACE_PLUGINS=^|trace-file=c:\work\trace.txt^|^|end-instruction-count=1000^|
%PVLIB_HOME%\plugins\Win64_VC2017\Release\TarmacTrace.dll
```

Note

- Do not specify a pipe character `|` at the end of the environment variable value.
- Separate individual parameters with two pipe characters `||`, not one.
- Separate the plug-in from the parameters using a single pipe character `|`.
- Do not specify quotes around paths that contain spaces, or escape spaces. Spaces are resolved automatically.
- Do not specify environment variables within this environment variable.
- Specify the parameters before you specify the plug-in.
- On Windows, you can either set the environment variable using the **Advanced System Settings** window, or if you are using the command line, you might need to escape each pipe character, for example `^|`.
- The parameter values that you set using this environment variable are not displayed by the `--list-params` or `-l` command-line options. This is because the environment variable is processed at a later stage, when launching the simulation.

Related concepts

5.2 ArchMsgTrace

The Architecture Message plug-in prints warnings and error messages to `stdout` or to a file when the core executes unsafe or nonrecommended code.

This section contains the following subsection:

- *5.2.1 ArchMsgTrace parameters* on page 5-2893.

5.2.1 ArchMsgTrace parameters

This section describes the parameters for the ArchMsgTrace plug-in.

Each parameter is prefixed with `TRACE.ArchMsgTrace`, for example:

```
TRACE.ArchMsgTrace.suppress_sources
```

Table 5-1 ArchMsgTrace parameters

Parameter	Type	Allowed values	Default value	Runtime	Description
`exit_on_first_output`	`bool`	`true`, `false`	`false`	`false`	Exit the simulation process after the first message has been written.
`suppress_categories`	`string`	-	`"Why"`	`false`	Space-separated list of categories that should not be printed.
`suppress_repeated`	`bool`	`true`, `false`	`true`	`false`	Suppress repeated messages from similar call sites.
`suppress_sources`	`string`	-	-	`false`	Space-separated list of components or events that should not be printed.
`trace-file`	`string`	-	-	`false`	ArchMsgTrace output file.

5.3 BranchPrediction

Fast Models supports branch prediction modeling by using the `BranchPrediction` plug-in.

Branch prediction is an aspect of Timing Annotation. For more details, see *Timing Annotation* in the *Fast Models User Guide*.

This section contains the following subsections:

- *5.3.1 BranchPrediction parameters* on page 5-2894.
- *5.3.2 BranchPrediction output* on page 5-2895.

5.3.1 BranchPrediction parameters

This section describes the parameters for the BranchPrediction plug-in.

Each parameter is prefixed with `BranchPrediction.BranchPrediction`, for example:

```
BranchPrediction.BranchPrediction.bpstat-branchcount
```

Table 5-2 BranchPrediction parameters

Name	Type	Default value	Allowed values	Runtime	Description
`bpstat-branchcount`	`int`	`-0x1`	`0x0 - 0x7fffffffffffffff`	`false`	The number of branch data to display. Set to -1 to display all branch instructions.
`bpstat-pathfilename`	`string`	-	-	`false`	The path and filename of the branch statistics log, relative to the current directory. If you omit it, no log file is generated.
`mispredict-latency`	`int`	`0x8`	`0x0 - 0x7fffffffffffffff`	`false`	The number of instructions that are flushed for every misprediction. It is equal to the pipeline length of the processor. For example, in a processor where the prefetch unit has three stages and the execution units have five stages, the pipeline length is eight. Therefore the `mispredict-latency` is eight clock cycles.
`predictor-type`	`string`	`"CortexA53Predictor"`	See the note following the table.	`false`	The type of branch predictor to use.

Note

`predictor-type` can be one of the following example branch predictors that Arm provides, or a user-defined one:

`FixedDirectionPredictor`
An example predictor that always takes a preset fixed direction.

`BiModalPredictor`
An example of a standard 2-bit strength predictor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GSharePredictor
An example of a standard global history sharing predictor.

HybridPredictor
An example predictor that selects the majority result from the bimodal predictor, fixed-direction predictor, and a random predictor.

CortexA53Predictor
Cortex-A53 branch predictor. This is the default.

5.3.2 BranchPrediction output

The following example command line loads the BranchPrediction plug-in into a model:

```
./EVS_Base_Cortex-A73x1 -a __image.axf \
…
--plugin $PVLIB_HOME/plugins/Linux64_GCC-6.4/BranchPrediction.so \
-C BranchPrediction.BranchPrediction.predictor-type=BiModalPredictor \
-C BranchPrediction.BranchPrediction.mispredict-latency=8 \
-C BranchPrediction.BranchPrediction.bpstat-pathfilename=bpstat.txt \
-C BranchPrediction.BranchPrediction.bpstat-branchcount=5
```

This command produces the following log file:

```
Processor Core: ARM_Cortex-A73
Cluster instance: 0
Core instance: 0
Mispredict Latency: 8
Image executed: __image.axf
PredictorType: BiModalPredictor
Total branch calls: 7757
Total Mispredictions: 130
Average prediction accuracy: 0.983241
Conditional Branches: 139
Total unique branch instructions: 289
--Branch instructions--
          PC Addr      Calls    Mispredict Accuracy
    [0]    0x0          2        0          1
    [1]    0x80000000   1        0          1
    [2]    0x8000000c   10       0          1
    [3]    0x80000014   10       0          1
    [4]    0x8000001c   10       0          1
```

5.3.3 Other ways to report branch mispredictions

These are some alternative ways to report branch mispredictions:

- The GenericTrace plug-in can generate MTI trace events that report branch mispredictions.

  Specify the following parameter to the `GenericTrace` plug-in:

  ```
  --plugin $PVLIB_HOME/plugins/Linux64_GCC-6.4/GenericTrace.so /
  -C TRACE.GenericTrace.trace-sources=BRANCH_MISPREDICT
  ```

  Note

  The `BranchPrediction` plug-in must also be loaded to generate these events.

- The `BranchPrediction` plugin is integrated with the PMU event counters. On a Linux boot simulation, you can track the number of simulated branch mispredictions in an application by loading the `BranchPrediction` plugin and running the `perf` tool. For example, the following command displays the number of branch mispredictions that are made in an application called `testapp`:

  ```
  perf stat –e branch-misses testapp
  ```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

5.3.4 Create a branch predictor

The example predictors that Arm provides are intended to show different techniques for branch prediction to help you create new ones. The source code for them is located in `$PVLIB_HOME/plugins/source/BranchPrediction/`.

A user-defined branch predictor must:

- Derive from the abstract interface class `PredictorInterface`.
- Implement the following functions:
  - `Direction getPredictedDirection(VAddr64_t pc_) SG_OVERRIDE;`

    Returns the predicted branch direction, that is, taken or not taken.
  - `void updateStructures(VAddr64_t pc_, Direction actual_direction_) SG_OVERRIDE;`

    Updates any tables or structures that the user-defined predictor implements, based on the actual branch direction.
- Implement the following static functions:
  - `static const char* getPredictorName()`

    Returns the name of the predictor. This is displayed in the log file.
  - `static PredictorInterface* createInstance()`

    Creates an instance of the predictor.
- Register the predictor in the `registerPredictors()` function, which is defined in `PredictorFactory.h`. For example:

```
void registerPredictors(){
      // All predictor types must be registered here
      map_predictor_instances[SamplePredictor::getPredictorName()] =
          &SamplePredictor::createInstance;
      …
}
```

Example 5-1 Branch predictor

```
// SamplePredictor.h
#include <ct/BranchPredictionPluginInterfaces.h>
#include "PredictorInterface.h"

namespace BranchPrediction
{
    class SamplePredictor : public PredictorInterface
    {
    public:
        Direction getPredictedDirection(VAddr64_t pc_) SG_OVERRIDE;
        void updateStructures(VAddr64_t pc_, Direction actual_direction_) SG_OVERRIDE;

    public:
        SamplePredictor(Direction dir_ = Direction::TAKEN);
        ~ SamplePredictor();

        static const char* getPredictorName() {
            return "SamplePredictor";
        }

        static PredictorInterface* createInstance() {
            return new SamplePredictor();
        }

    private:
        Direction default_direction;
    };
};

// SamplePredictor.cpp
#include "SamplePredictor.h"

namespace BranchPrediction
{
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

```
    SamplePredictor::SamplePredictor()
    {
        // Initialize the predictor
    }

    SamplePredictor::~SamplePredictor()
    {
        // Do nothing
    }

    Direction SamplePredictor::getPredictedDirection(VAddr64_t pc_)
    {
        // Return the predicted direction
        // This is called when the CPU makes a branch prediction
        return Direction::TAKEN;
    }

    void SamplePredictor::updateStructures(VAddr64_t pc_, Direction actual_direction_)
    {
        // Update any structure or tables that this predictor uses
        // This is called when the branch has committed and the direction
        // taken is known.
    }
};
```

5.4 CADIIPCRemoteConnection

Fast Models can be configured so that a remote CADI connection can be made to them.

The remote connection can be from a client on another machine, or a client on the same machine but using a specific port.

Explicitly enable remote connection support by adding the `CADIIPCRemoteConnection` command-line parameters. A CADI server must also be running, specified with `-S`.

This section contains the following subsection:

- *5.4.1 CADIIPCRemoteConnection parameters* on page 5-2898.

5.4.1 CADIIPCRemoteConnection parameters

This section describes the parameters for the `CADIIPCRemoteConnection` plug-in.

Each parameter is prefixed with `REMOTE_CONNECTION.CADIIPCRemoteConnection`, for example:

```
REMOTE_CONNECTION.CADIIPCRemoteConnection.range
```

Note

The default value restricts connections to be from the localhost only. To enable remote connections, specify an IP address to listen to, or specify `0.0.0.0` to listen to all adapters.

Table 5-3 CADIIPCRemoteConnection parameters

Name	Type	Default value	Allowed values	Runtime	Description
`enable_remote_cadi`	`bool`	`false`	`true`, `false`	`false`	Allow connections from remote hosts.
`listen_address`	`string`	`"127.0.0.1"`	`""`	`false`	If `enable_remote_cadi` is set, this parameter is the network address the server listens on.
`port`	`int`	`0x7b8b`	`0x1 - 0xffff`	`false`	If `enable_remote_cadi` is set, this parameter is the TCP port the server listens on.
`range`	`int`	`0x0`	`0x0 - 0x64`	`false`	If the requested port is not available, search for the next available port in the range [port:port+range]. The default is zero, which means only try the requested port.

5.5 CDE

Custom Datapath Extension (CDE) allows you to improve performance and efficiency by adding application domain-specific features to embedded processors, while maintaining the advantages of the Arm software ecosystem.

CDE allows you to add a customizable module inside an Arm Cortex-M33 or Cortex-M55 processor. This module is driven by the pre-decoded CDE instructions and shares the same interface as the standard Arithmetic Logic Unit (ALU) of the processor.

Fast Models implements CDE using Model Trace Interface (MTI) plug-ins, with CADI parameters to allow the plug-ins to be configured at runtime.

The following model parameters are exposed for configuring CDE:

`has_cde`
: Controls whether CDE is enabled. If enabled, a plug-in must be provided.

`--plugin` *`path/to/plugin.so`*
: This option can be specified multiple times, once for each CDE plug-in implementation. Alternatively, plug-ins can be loaded by setting the `FM_PLUGINS` or `FM_TRACE_PLUGINS` environment variable.

`cpu.cde_impl_name=`*`plugin_name`*
: The CDE implementation name to use with this core. If multiple CDE plug-in implementations are provided, each core can be requested to use a specific plug-in by using `cpu<`*`n`*`>.cde_impl_name=`….

Two example plug-ins are available, CDETester and CDEConstant. They are provided as pre-built libraries and as source code, located in `$PVLIB_HOME/plugins/source/`, from which you can derive your own plug-ins.

This section contains the following subsections:

- *5.5.1 CDETester* on page 5-2899.
- *5.5.2 CDETester parameters* on page 5-2900.
- *5.5.3 CDEConstant* on page 5-2902.
- *5.5.4 CDEConstant parameters* on page 5-2902.
- *5.5.5 Implementing a CDE plug-in* on page 5-2902.
- *5.5.6 CDE API* on page 5-2904.

5.5.1 CDETester

CDETester is a basic example plug-in that allows you to specify at runtime which CDE instructions are supported by individual coprocessors and to specify the behavior, either NOP or UNDEFINED.

To specify the instructions that coprocessors support, provide a plug-in parameter of the form:

```
CDE.CDETester.cde_tester_trivial.cps_implemented_instr=0xn
```

where `0x`*`n`* represents a hexadecimal bitmask of coprocessors that implement this instruction and *`instr`* represents a CDE instruction name.

The full list of CDE instruction names is as follows, where `d` represents dual variants and `v` represents vector variants:

- `cx1`
- `cx2`
- `cx3`
- `cx1d`
- `cx2d`
- `cx3d`
- `vcx1`

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- vcx2
- vcx3
- vcx1v
- vcx2v
- vcx3v

Accumulate variants are handled in the same function implementation as the non-accumulate variants.

The bitmask takes the form:

bits [7:0]
For non-accumulate variants.

bits [23:16]
For accumulate variants.

The plug-in also allows control over which coprocessors implement CDE through the `CDE.CDETester.cde_tester_trivial.cps_implemented=0x`*n* parameter, where `0x`*n* represents a hexadecimal bitmask of coprocessors that implement CDE.

An example invocation to enable `CX1` and `CX1A` (accumulate) for CP3 might be written as:

```
CDE.CDETester.cde_tester_trivial.cps_implemented=0x8 // enable CDE support for CP3
CDE.CDETester.cde_tester_trivial.cps_implemented_cx1=0x80008 // enable CX1 and CX1A on CP3 (behaves as nop
rather than undef)
```

On Linux, you can retrieve an up-to-date list of parameters from the model by using:

```
-l | grep -i cdetester
```

5.5.2 CDETester parameters

This section describes the parameters for the CDETester plug-in.

Each parameter is prefixed with `CDE.CDETester`, for example:

```
CDE.CDETester.cde_tester_trivial.cps_implemented_vcx1
```

Table 5-4 CDETester parameters

Name	Type	Default value	Allowed values	Runtime	Description
`cde_tester_trivial.cps_implemented`	`int`	`0xff00ff`	`0x0 - 0xffffffff`	`false`	Bitmask indicating coprocessors implemented.
`cde_tester_trivial.cps_implemented_cx1`	`int`	`0xff00ff`	`0x0 - 0xffffffff`	`false`	Coprocessor enables CX1 instructions ([23:16] for CX1A, [7:0] for CX1).
`cde_tester_trivial.cps_implemented_cx1d`	`int`	`0xff00ff`	`0x0 - 0xffffffff`	`false`	Coprocessor enables CX1D instructions ([23:16] for CX1DA, [7:0] for CX1D).
`cde_tester_trivial.cps_implemented_cx2`	`int`	`0xff00ff`	`0x0 - 0xffffffff`	`false`	Coprocessor enables CX2 instructions ([23:16] for CX2A, [7:0] for CX2).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 5-4 CDETester parameters (continued)

Name	Type	Default value	Allowed values	Runtime	Description
cde_tester_trivial.cps_implemented_cx2d	int	0xff00ff	0x0 - 0xffffffff	false	Coprocessor enables CX2D instructions ([23:16] for CX2DA, [7:0] for CX2D).
cde_tester_trivial.cps_implemented_cx3	int	0xff00ff	0x0 - 0xffffffff	false	Coprocessor enables CX3 instructions ([23:16] for CX3A, [7:0] for CX3).
cde_tester_trivial.cps_implemented_cx3d	int	0xff00ff	0x0 - 0xffffffff	false	Coprocessor enables CX3D instructions ([23:16] for CX3DA, [7:0] for CX3D).
cde_tester_trivial.cps_implemented_vcx1	int	0xff00ff	0x0 - 0xffffffff	false	Coprocessor enables VCX1 instructions ([23:16] for VCX1A, [7:0] for VCX1).
cde_tester_trivial.cps_implemented_vcx1v	int	0xff00ff	0x0 - 0xffffffff	false	Coprocessor enables VCX1 (Vector) instructions ([23:16] for VCX1A (Vector), [7:0] for VCX1 (Vector)).
cde_tester_trivial.cps_implemented_vcx2	int	0xff00ff	0x0 - 0xffffffff	false	Coprocessor enables VCX2 instructions ([23:16] for VCX2A, [7:0] for VCX2).
cde_tester_trivial.cps_implemented_vcx2v	int	0xff00ff	0x0 - 0xffffffff	false	Coprocessor enables VCX2 (Vector) instructions ([23:16] for VCX2A (Vector), [7:0] for VCX2 (Vector)).
cde_tester_trivial.cps_implemented_vcx3	int	0xff00ff	0x0 - 0xffffffff	false	Coprocessor enables VCX3 instructions ([23:16] for VCX3A, [7:0] for VCX3).
cde_tester_trivial.cps_implemented_vcx3v	int	0xff00ff	0x0 - 0xffffffff	false	Coprocessor enables VCX3 (Vector) instructions ([23:16] for VCX3A (Vector), [7:0] for VCX3 (Vector)).
has_cde_tester_trivial	bool	true	true, false	false	Tells the model whether the CDETester plug-in is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

5.5.3 CDEConstant

This is an example plug-in that provides an implementation for every CDE instruction variant, for example [V]CX*n*, [V]CX*n*A, and [V]CX*n*D. Each instruction simply performs an XOR with some arguments and a constant.

To load this plug-in, use the following parameters when launching the model:

```
--plugin path/to/plugin/CDEConstant.so -C cpu.has_cde=1 -C cpu.cde_impl_name=CDE_CONSTANT
```

5.5.4 CDEConstant parameters

This section describes the parameters for the CDEConstant plug-in.

Each parameter is prefixed with `CDE.CDEConstant`, for example:

```
CDE.CDEConstant.has_cde_constant
```

Table 5-5 CDEConstant parameters

Name	Type	Default value	Allowed values	Runtime	Description
has_cde_constant	bool	true	true, false	false	Tells the model whether the CDEConstant plug-in is implemented.

5.5.5 Implementing a CDE plug-in

Fast Models supports prototyping of custom instructions through a modular plug-in system, which uses the Model Trace Interface (MTI) framework.

Multiple CDE plug-ins can be registered with the model and each core can be instructed which plug-in behavior to use. Run-time configuration of CDE plug-ins is performed using CADI parameters, although plug-in developers can use alternative approaches, for example configuration files.

This guide shows how to implement a basic MTI-based CDE plug-in, using the CDETester plug-in as an example. It is intended to be a quick start to plug-in development, and does not describe details about MTI. To learn more about MTI, see *Model Trace Interface Reference Manual*. The source code for CDETester can be found in `$PVLIB_HOME/plugins/source/CDETester/`.

A CDE plug-in performs three main tasks:

- MTI and CDE interface registration.
- Handling of parameters passed through the command line or CADI.
- Implementing CDE instructions.

Prerequisites

To build the CDE plug-in examples, you need the following:

- A compiler that matches the Fast Models build you are using, for example Linux64_GCC7.3.
- A recent version of CMake.
- An installation of the Fast Models package and libraries.

Plug-in registration

After a CDE plug-in has been loaded into the model through the `--plugin` argument, or the `FM_TRACE_PLUGINS` environment variable, it must register itself with the CDE interface registry using the MTI framework API.

The CDE interface registry is responsible for:

- Managing all loaded CDE plug-ins.
- Passing any parsed arguments to the relevant CDE plug-in.
- Assigning CDE plug-ins to cores, as requested by the model arguments.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The CDE interface registry requires an interface name and version to be registered through MTI, as shown in `CDETester.cpp` and `CDETesterTrivialImpl.h`.

Plug-in parameters

After the plug-in has registered itself with the CDE interface registry, the model passes any parsed command-line parameters to the CDE plug-in they are associated with.

The parameters to the CDETester example plug-in allow you to specify which custom instructions result in a no operation (NOP) for each coprocessor. Any instructions that are not enabled result in an Undefined Instruction exception being raised.

The plug-in handles parameters that it receives from the model in `CDETester.cpp` by passing them through the `CDETesterFactory` interface to the handler implementation in `CDETrivialImpl::consumeParameter()`, defined in `CDETesterTrivialImpl.cpp`.

Related references

5.5.2 CDETester parameters on page 5-2900

Plug-in instruction handler interface

After plug-in registration and optional parameter handling, the plug-in should implement handlers for all available CDE instructions, even if it does not intend to implement custom functionality for all instruction variants.

To help you do this, Fast Models provides a utility header, `$PVLIB_HOME/include/ct/CDE/CDEInstHandlerInterface.h`. This header defines the `CDEInstHandlerInterface` class for handling CDE instruction calls, which plug-ins must inherit.

This interface declares pure virtual methods for each CDE instruction variant, for example dual and accumulator, as well as the structures containing decode information and call results. A typical signature follows this pattern:

```
CDEResult64 CDETrivialImpl::exec_cx2_d(const CX2DecodeInfo& decode_info, uint64_t rfd_val, uint32_t rn_val)
```

The CDETester example plug-in inherits this interface in `CDETesterBaseImpl.h` and implements the instructions in `CDETesterTrivialImpl.h` and `CDETesterTrivialImpl.cpp`.

Plug-in instruction implementations

Each CDE instruction is mapped to a single function definition, except for accumulate variants, which are handled by checking for the accumulate flag in the parameters passed to the instruction implementations.

The full list of instructions that a plug-in is expected to implement is given in *5.5.1 CDETester* on page 5-2899.

Each instruction implementation accepts as parameters:

- A structure containing decoded instruction opcode parameters, including register numbers and immediate. For example `CX1DecodeInfo`.
- The contents of registers specified in the instruction opcode.

Instruction implementations should return a result structure of varying size, for example `CDEResult32` or `CDEResult64`. This structure indicates whether the instruction is supported, and if so, the return value and the number of cycles taken for execution, which is used in trace and performance analysis.

If a plug-in needs to raise an Undefined Instruction exception for a particular instruction, it can simply return a default-initialized result structure.

For full details of the expected function declarations and parameter types, see the file `$PVLIB_HOME/include/ct/CDE/CDEInstHandlerInterface.h`.

Non-Confidential

Building the plug-in

During plug-in development, either modify the example `CMakeLists.txt` files provided with the CDE plug-ins to reflect any changes to the file structure, or alternatively, use your own build system.

To build the example plug-ins:

1. Run `CMake` on the root directory of the plug-in to generate the project file, for example a Makefile or Visual Studio solution.
2. Run `make`.

5.5.6 CDE API

Reference documentation for the CDE API.

The CDE API is defined in the following header files, which are located in `$PVLIB_HOME/include/ct/CDE/`:

- `CDEFactoryInterface.h`
- `CDEInstHandlerInterface.h`
- `CDERegistryInterface.h`

CDEFactoryInterface.h

Defines the interface for obtaining an instance of a `CDEInstHandlerInterface` for a specific core.

CDE::CDEFactoryInterface class

The factory interface for obtaining an instance of a `CDEInstHandlerInterface` for a specific core.

CDE::CDEFactoryInterface::instantiateCDEInstHandler()

Instantiate a `CDEInstHandlerInterface`.

Instantiate a `CDEInstHandlerInterface` for a given core. The caller owns the result.

```
virtual std::unique_ptr<CDEInstHandlerInterface> instantiateCDEInstHandler(std::string component_hierarchy) =
0;
```

`component_hierarchy`
: String representing the hierarchy of the current component.

CDE::CDEFactoryInterface::CDEImplName()

Name of the CDE implementation.

Return the name of the CDE implementation. A core can use this method to disambiguate multiple CDE implementations in a simulation.

```
virtual std::string CDEImplName() const = 0;
```

CDE::CDEFactoryInterface::CDEImplDescription()

Description of the CDE implementation.

Return the description of the CDE implementation that can be instantiated.

```
virtual std::string CDEImplDescription() const = 0;
```

CDE::CDEFactoryInterface::CDEImplProviderName()

Provider name of the CDE implementation.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Return the name of the component providing the CDE implementation, for example a plug-in. This name might be used in informative diagnostic messages.

```
virtual std::string CDEImplProviderName() const = 0;
```

CDEInstHandlerInterface.h

Defines the interface for executing CDE instructions.

CDE::CDEResult32 struct

32-bit result of a CDE instruction.

Members

instr_not_supported
: Whether the instruction is supported.

value
: Return value of the instruction.

cycles
: Number of cycles of instruction execution.

CDE::CDEResult64 struct

64-bit result of a CDE instruction.

Members

instr_not_supported
: Whether the instruction is supported.

value
: Return value of the instruction.

cycles
: Number of cycles of instruction execution.

CDE::CDEResult128 struct

128-bit result of a CDE instruction.

Members

instr_not_supported
: Whether the instruction is supported.

value_lo
: Low 64 bits of the return value of the instruction.

value_hi
: High 64 bits of the return value of the instruction.

cycles
: Number of cycles of instruction execution.

CDE::CX1DecodeInfo struct

Decoded information for the `CX1` instruction.

Members

accumulate
: Whether to accumulate with existing register contents.

coproc
: Number of coproc.

imm
: Immediate value.

rd_num
: General-purpose destination register number.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

CDE::CX2DecodeInfo struct

Decoded information for the `CX2` instruction.

Members

`accumulate`
: Whether to accumulate with existing register contents.

`coproc`
: Number of coproc.

`imm`
: Immediate value.

`rd_num`
: General-purpose destination register number.

`rn_num`
: General-purpose source register number.

CDE::CX3DecodeInfo struct

Decoded information for the `CX3` instruction.

Members

`accumulate`
: Whether to accumulate with existing register contents.

`coproc`
: Number of coproc.

`imm`
: Immediate value.

`rd_num`
: General-purpose destination register number.

`rn_num`
: General-purpose source register number.

`rm_num`
: General-purpose source register number.

CDE::VCX1DecodeInfo struct

Decoded information for the `VCX1` instruction.

Members

`accumulate`
: Whether to accumulate with existing register contents.

`coproc`
: Number of coproc.

`imm`
: Immediate value.

`vd_num`
: Source and destination vector register number.

CDE::VCX2DecodeInfo struct

Decoded information for the `VCX2` instruction.

Members

`accumulate`
: Whether to accumulate with existing register contents.

`coproc`
: Number of coproc.

`imm`

Immediate value.

vd_num
Source and destination vector register number.

vn_num
Source vector register number.

vm_num
Source vector register number.

CDE::CDEInstHandlerInterface class

Interface for executing CDE instructions.

This class defines the following methods for executing CDE instructions:

exec_cx1()	CX1 instruction.
exec_cx1_d()	CX1D instruction.
exec_cx2()	CX1 instruction.
exec_cx2_d()	CX2D instruction.
exec_cx3()	CX3 instruction.
exec_cx3_d()	CX3D instruction.
exec_vcx_1_s()	VCX1 instruction with S register.
exec_vcx_1_d()	VCX1 instruction with D register.
exec_vcx_1_q()	VCX1 instruction with Q register.
exec_vcx_2_s()	VCX2 instruction with S register.
exec_vcx_2_d()	VCX2 instruction with D register.
exec_vcx_2_q()	VCX2 instruction with Q register.
exec_vcx_3_s()	VCX3 instruction with S register.
exec_vcx_3_d()	VCX3 instruction with D register.
exec_vcx_3_q()	VCX3 instruction with Q register.
exec_vcx_1_beatwise()	VCX1 instruction for one beat. Caller handles predicated writeback.
exec_vcx_2_beatwise()	VCX2 instruction for one beat. Caller handles predicated writeback.
exec_vcx_3_beatwise()	VCX3 instruction for one beat. Caller handles predicated writeback.

CDE::CDEInstHandlerInterface::getCDECoprocessorMask()

Return a bitmask indicating which coprocessor numbers this CDE implementation subsumes.

```
virtual uint8_t getCDECoprocessorMask() = 0;
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CDERegistryInterface.h

Defines the interface to allow components, for instance plug-ins, to contribute CDE implementations to the simulation.

CDE::CDERegistryInterface class

Interface to register the CDE factory.

```
class CDERegistryInterface : public eslapi::CAInterface
```

This class is the interface to register the CDE factory into the Fast Models simulation component registry.

CDE::CDERegistryInterface::registerCDEFactory()

Register the CDE factory with the simulation.

```
virtual bool registerCDEFactory(std::ostream& error_stream, CDEFactoryInterface* interface) = 0;
```

`error_stream`
: The error stream.

`interface`
: The CDE factory interface used to register.

CDE::CDERegistryInterface::unregisterCDEFactory()

Unregister the CDE factory from the simulation.

```
virtual void unregisterCDEFactory(CDEFactoryInterface* interface) = 0;
```

`interface`
: The CDE factory interface used to unregister.

CDE::CDERegistryInterface::sendToCores()

Instantiate a `CDEInstHandler` and send it to the core.

The core can then call the CDE instruction execution functions provided by the plug-in on that `CDEInstHandler`.

```
virtual bool sendToCores() = 0;
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

5.6 Crypto

The `Crypto` plug-in enables Armv8 processor models to support the Armv8.0 Cryptographic Extensions and Armv8.3 architected Pointer Authentication algorithms.

When the plug-in is loaded:

- All Armv8 processors in the system implement all functionality from the Armv8.0 Cryptographic Extensions by default, although you can disable it by setting the `CRYPTODISABLE` parameter for the core.
- All Armv8.3 processors in the system implement the architected algorithms for Pointer Authentication and Generic Authentication by default. Plug-in parameters are provided to control which processors in the system have architected algorithms enabled.

For AEMs, some parameters are available that allow you to restrict the `Crypto` plug-in features. These parameters use the same encodings as the flags within the AArch32 `ID_ISAR5` and AArch64 `ID_AA64ISAR0_EL1` system registers. You can set these parameters for a specific AEM core using this syntax:

```
-C cpu.cpu<X>.<feature_name>=<value>
```

Where *`feature_name`* can be one of the following:

- `crypto_aes`, with these possible values:
  - **0** No AES instructions are implemented
  - **1** The `AESE`, `AESD`, `AESMC`, and `AESIMC` instructions are implemented
  - **2** As 1, but in addition, the `PMULL` and `PMULL2` instructions can operate on 64-bit data values. This is the default value.
- `crypto_sha1`, with these possible values:
  - **0** No SHA-1 instructions are implemented
  - **1** The `SHA1C`, `SHA1P`, `SHA1M`, `SHA1H`, `SHA1SU0`, and `SHA1SU1` instructions are implemented. This is the default value.
- `crypto_sha256`, with these possible values:
  - **0** No SHA-256 instructions are implemented
  - **1** The `SHA256H`, `SHA256H2`, `SHA256SU0`, and `SHA256SU1` instructions are implemented. This is the default value.
- `crypto_sha3`, with these possible values:
  - **0** No Armv8.4 SHA-3 instructions are implemented. This is the default value.
  - **1** SHA-3 instructions are implemented if Armv8.4 is enabled.
  - **2** SHA-3 instructions are implemented.
- `crypto_sha512`, with these possible values:
  - **0** No Armv8.4 SHA-512 instructions are implemented. This is the default value.
  - **1** SHA-512 instructions are implemented if Armv8.4 is enabled.
  - **2** SHA-512 instructions are implemented.
- `crypto_sm3`, with these possible values:
  - **0** No Armv8.4 SM-3 instructions are implemented. This is the default value.
  - **1** SM-3 instructions are implemented if Armv8.4 is enabled.
  - **2** SM-3 instructions are implemented.
- `crypto_sm4`, with these possible values:
  - **0** No Armv8.4 SM-4 instructions are implemented. This is the default value.
  - **1** SM-4 instructions are implemented if Armv8.4 is enabled.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

2 SM-4 instructions are implemented.

Note

These parameters are only available for AEMv8-A core models. For other Armv8-A models, the behavior is fixed to the default values.

For example to disable the AES instructions on core 0:

```
./isim_system --plugin Crypto.so -C cpu.cpu0.crypto_aes=0
```

This section contains the following subsection:

- *5.6.1 Crypto parameters* on page 5-2910.

5.6.1 Crypto parameters

This section describes the parameters for the `Crypto` plug-in.

The parameters are prefixed with `CRYPTO.Crypto`, for example:

```
CRYPTO.Crypto.verbose=1
```

Table 5-6 Crypto parameters

Name	Type	Default value	Runtime	Description
`generic_authentication_core_pattern`	`string`	`*`	`false`	Install the Armv8.3 architected Generic Authentication algorithm on Armv8.3 cores that match one of these patterns. [t]
`pointer_authentication_core_pattern`	`string`	`*`	`false`	Install the Armv8.3 architected Pointer Authentication algorithm on Armv8.3 cores that match one of these patterns. [t]
`verbose`	`int`	`0x0`	`false`	Verbosity level: **0** Terse **1** Verbose

[t] The value is a comma-separated list of glob-style patterns which are matched against the instance names of cores in the system. If there is a match, the architected algorithm is installed on the core, if it supports Armv8.3. For example:

`*`	Install the algorithm on all supported cores
`cluster0.*`	Install the algorithm on all cores in cluster0
`cluster0.cpu0`	Install the algorithm only on cluster0.cpu0
`cluster0.*,cluster1.cpu1`	Install the algorithm on all cores in cluster0 and also on cluster1.cpu1
Empty string	Do not install the algorithm on any core

5.7 Fastline

Fastline is an MTI plug-in that enables you to use Streamline to analyze code running on Fast Models. The plug-in filename is `FastlineTrace.so` or `FastlineTrace.dll`.

Note

Fastline is deprecated from Fast Models release 11.12.

Fastline generates traces in `.apc` format that you can import into Streamline for analysis. It enables analysis of Linux-based kernels, native applications running on a Linux-based OS, and bare-metal applications that are built with debug information, without the need for extra instrumentation.

Fastline needs to be set up differently depending on whether it is running on a bare-metal or Linux target. Before you load the plug-in into a model, you must run one of the following Python scripts:

- For Linux, run `extract-offsets.py` to extract the address offsets of Linux kernel data structures.
- For bare-metal, run `process-elf.py` to generate a csv file that contains function addresses and symbol names.

These scripts are located in `$PVLIB_HOME/plugins/source/FastlineTrace/scripts/`.

Fastline has the following features:

- Allows you to set the sampling frequency. Increasing this value improves the accuracy of the trace, at the cost of increased file sizes and reduced simulation speed.
- Traces Linux thread context switches and `open()` and `execve()` syscalls.
- Works on SMP and multi-cluster systems.
- Maps MTI trace sources to Streamline counters.
- Allows you to set conditions on MTI trace sources, based on their field values.

Fastline has the following limitations:

- It only supports Linux kernel versions that use the process control and memory management corresponding to Linux kernel version 4.5.

This section contains the following subsections:

- *5.7.1 Using Fastline* on page 5-2911.
- *5.7.2 Cluster configuration file format* on page 5-2913.
- *5.7.3 System configuration file format* on page 5-2914.
- *5.7.4 Counter configuration file format* on page 5-2915.
- *5.7.5 Fastline parameters* on page 5-2917.

5.7.1 Using Fastline

Setting up Fastline involves the following steps.

Prerequisites

- An Armv7 or Armv8 model.
- The `FastlineTrace.so` or `FastlineTrace.dll` plug-in.
- Python 3.*. This is needed to run the `extract-offsets.py` or `process-elf.py` scripts.
- The `fromelf` executable. This is available in an Arm Compiler or Arm Development Studio installation. `fromelf` is used by the `extract-offsets.py` and `process-elf.py` scripts. The `PATH` variable must include the path to `fromelf`. These scripts have been tested with `fromelf` version 6.3 and later.
- Extra prerequisites for Linux applications:
  - The `System.map` file for the Linux kernel.
  - A Linux kernel image and a vmlinux file that was built with the `CONFIG_DEBUG_INFO` kernel option enabled.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Procedure

1. This step applies to Linux only. Run `extract-offsets.py` using the syntax:

   `extract-offsets.py` *`path/vmlinux_file`* `{1|0}`

   Specify 1 for 64-bit Linux or 0 for 32-bit Linux.

   Example:
   For example:

   ```
   ./extract-offsets.py vmlinux.o 1
   ```

   ———— **Note** ————

   You might need to change the access permissions for the current directory because the script creates a temporary file there.

   ————————————

   Results: The parameter that the script outputs might look like the following example. You will need to specify this parameter in the cluster configuration file:

   ```
   "linux-
   offsets-64":"16,0,1160,18446744073709551615,1048,1224,1228,1648,16,760,16,8,0,32,24,8,0,8,
   160,152,32,16,8,0,8,16"
   ```

2. This step applies to bare-metal applications only. Run `process-elf.py` to generate a csv file that you will need to specify in the cluster configuration file. Use the syntax:

   `process-elf.py` *`elf_file`*

   Example:

   For example:

   ```
   ./process-elf.py __image.axf
   ```

3. Create a cluster configuration file for each cluster that you want to profile. This is a JSON file that provides the Fastline plug-in with information about the bare-metal application or Linux kernel that is running on the cluster, and parameters to configure Fastline. The fields that you need to include in the file depend on whether you are targeting Linux or bare-metal. See `$PVLIB_HOME/plugins/config/FastlineTrace/` for the following cluster configuration file examples:

   `v8a_cluster_config_sample.json`
   : is a Linux example.

   `v7m_cluster_config_sample.json`
   : is a bare-metal example.

4. Create a system configuration file. This is a JSON file that maps cluster configuration files to clusters. See `$PVLIB_HOME/plugins/config/FastlineTrace/system_config_sample.json` for an example.
5. Optionally, create a counter configuration file. This is a JSON file that defines the parameters for the capture and maps MTI trace sources to Streamline counters. If you omit this parameter, the capture contains an instruction count only. See `$PVLIB_HOME/plugins/config/FastlineTrace/sample_counters.json` for an example.
6. Run the model, specifying the following parameters:
   - The Fastline plug-in library. Use the `--plugin <`*`path_to_plugin`*`>/<`*`plugin_name`*`>.so` parameter.
   - The system configuration file. Use the `config` parameter, for example:

     ```
     -C TRACE.FastlineTrace.config=config/system_config_sample.json
     ```

   - Optionally, the counter configuration file. Use the `counters-config-file` parameter, for example:

     ```
     -C TRACE.FastlineTrace.counters-config-file=config/sample_counters.json
     ```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- Optionally, the filename and output directory for the capture file that Fastline generates. Use the `output-directory` and `apc-capture` parameters, for example:

```
-C TRACE.FastlineTrace.output-directory=/output_directory \
-C TRACE.FastlineTrace.apc-capture=test_run
```

- The model parameters.

Example:

For example:

```
./SVP_Base_Cortex-A73x1 --plugin FastlineTrace.so \
…
-C TRACE.FastlineTrace.config=config/system_config_sample.json \
-C TRACE.FastlineTrace.counters-config-file=config/sample_counters.json \
-C TRACE.FastlineTrace.output-directory=/output_directory \
-C TRACE.FastlineTrace.apc-capture=test_run
```

Results: This command generates a capture in `/output_directory/`, called `test_run.apc`, which you can import into Streamline for analysis.

7. Add the directory containing the capture to Streamline using the Streamline **Analysis Data Locations** dialog.
8. Double-click on the imported capture in the **Streamline Data** view to open the **Analyze** dialog. Select the ELF images for Streamline to analyze.
   Results: Streamline analyzes the capture and displays the analysis report in the **Timeline** view.

5.7.5 Fastline parameters on page 5-2917

5.7.2 Cluster configuration file format

The Fastline cluster configuration file is a JSON file that provides the Fastline plug-in with information about the bare-metal application or Linux kernel that is running on the cluster, along with other parameters that configure the capture.

Example cluster configuration files are located in `$PVLIB_HOME/plugins/config/FastlineTrace/`:

- `v8a_cluster_config_sample.json` is a Linux example.
- `v7m_cluster_config_sample.json` is a bare-metal example.

The file can contain the following fields:

Table 5-7 Cluster configuration file fields

Name	Type	Applies to	Description
`operating-system`	`string`	Both	Either `"none"` to configure the plug-in for bare-metal applications, or `"Linux"`. Mandatory.
`sampling-frequency`	`int`	Both	The number of instructions to execute between samples. This value controls the rate at which backtrace messages are generated. These messages are used to construct the **Call Paths** and **Functions** views in Streamline. It is recommended to set this to a value that is greater than 50000. Mandatory.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 5-7 Cluster configuration file fields (continued)

Name	Type	Applies to	Description
`callstack-depth`	`int`	Linux only	The maximum depth to which the call stack will be unwound when generating the call path. Optional. The default is 100.
`linux-offsets-`*nn*	`string`	Linux only	A list of offsets that is generated by the `extract-offsets.py` script, where *nn* is either 32 or 64. This field is mandatory in the configuration file for the cluster that Linux is running on.
`pageshift`	`int`	Linux only	The value of the `PAGE_SHIFT` macro that was used during the kernel build. The size of memory pages that is supported by the kernel is: `1 << PAGE_SHIFT` Mandatory.
`system-map-file`	`string`	Linux only	The `System.map` file for the Linux kernel that is running on the model. Mandatory.
`trace-linux-syscalls`	`bool`	Linux only	Whether or not to trace Linux syscalls. Optional. The default is `true`.
`trace-linux-threads`	`bool`	Linux only	Whether or not to trace Linux context switches and thread lifetimes. This must be `true` to display any process-related activity in the Streamline **Timeline** view. Optional. The default is `true`.
`app-name`	`string`	Bare-metal only	The name of the bare-metal application to be analyzed. Mandatory.
`app-proc-id`	`int`	Bare-metal only	The process ID of the bare-metal application. This value must be unique across the system. Streamline cannot distinguish between a process running on Linux and a bare-metal application running on a different cluster if they have the same ID. Mandatory.
`report-function-activity`	`bool`	Bare-metal only	Whether or not Fastline should add a Function activity chart to the **Timeline** view in Streamline. Optional. The default is `false`.
`symbol-info-files`	`string` or a list of strings.	Bare-metal only	Specifies the path and filename of the csv file that the `process-elf.py` script generates. This field is mandatory in the configuration file for the cluster that the bare-metal application is running on.

5.7.3 System configuration file format

The Fastline system configuration file is a JSON file that defines which cluster configuration file to use for each cluster. Fastline always requires a system configuration file, even if there is only one cluster.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

For an example system configuration file, see `$PVLIB_HOME/plugins/config/FastlineTrace/system_config_sample.json`.

The file contains a list of cluster specifications, each of which has the following fields:

Table 5-8 System configuration file fields

Name	Type	Description
`Subsystem_name`	`string`	The name of the subsystem component to map the cluster configuration file to. This string can end with a wildcard, *.
`Subsystem_config_file`	`string`	The path and filename of the cluster configuration file.

5.7.4 Counter configuration file format

The Fastline counter configuration file is a JSON file that maps MTI trace sources to Streamline counters and defines the counter parameters.

For an example counter configuration file, see `$PVLIB_HOME/plugins/config/FastlineTrace/sample_counters.json`.

The file contains a list of counter specifications, each of which can contain the following fields:

Table 5-9 Counter configuration file fields

Name	Type	Description
`StartTime`	`uint64_t`	The simulated time in nanoseconds at which trace is enabled for this counter. Optional. The default is zero.
`EndTime`	`uint64_t`	The simulated time in nanoseconds at which trace is disabled for this counter. Optional. The default is `0xffffffffffffffff`.
`Component`	`string`	The MTI trace source component. This field can end with a wildcard, to match multiple components. If this field contains an empty string, this is equivalent to specifying a wildcard, `"*"`. Mandatory.
`MTISrcName`	`string`	The name of the MTI trace source. Mandatory. **Note** To list all the MTI trace sources that are present in the model, run it with the `ListTraceSources` plug-in.
`Condition`	`string`	One or more conditions to apply to the fields in the trace source. The counter is only incremented if the condition is met. Each entity in the comparison string must be space-separated, and you can use logical operators to compare them. For example: `"Condition" : "( FIELD1 == FIELD2 ) || ( ( FIELD3 >= VALUE1 ) && ( FIELD4 != VALUE2 ) )",` Optional. The default is `"true"`.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 5-9 Counter configuration file fields (continued)

Name	Type	Description
`Title`	`string`	The title of the chart under which the counter is displayed in the **Timeline** view in Streamline. Mandatory.
`CounterName`	`string`	The counter name. This corresponds to the series name in the **Timeline** view in Streamline. Mandatory.
`Type`	`string`	A string that is used by Streamline to uniquely identify the counter. If this field is omitted, Fastline uses the `Title` + `CounterName` strings as the `Type`. You only need to set this field if the `Title` + `CounterName` string does not uniquely identify the counter. Optional.
`Display`	`string`	Determines how the event counts that were collected in a given time period are processed and displayed when the user zooms out. The possible values are: **`Average`** Averages the underlying data. For example, this value might be used for energy probe data. **`Maximum` or `Minimum`** Displays the maximum or minimum value of the underlying data, and maintains that value until a new value is received from the target. For example, this value might be used for a memory chart. **`Accumulate`** Sums all underlying values. For example, this value might be used for branch mispredictons. **`Hertz`** Accumulates the data and normalizes it to one second. For example, this value might be used for clock cycles. Mandatory.
`Units`	`string`	Defines the unit of measurement. For example IPS (instructions per second) for an instruction count. Streamline converts this to MIPS or KIPS, depending on the value of the counter and displays this value. Optional. The default is `"units"`.
`AverageSelection`	`bool`	Whether Streamline should display an average of the values for the selected time period. Optional. The default is `true`.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 5-9 Counter configuration file fields (continued)

Name	Type	Description
`PerCpu`	`bool`	Whether the counter should be reported per core. For example, in traces that were generated using the example counter configuration file, `sample_counters.json`, the instruction count can be expanded to show per-core values, while cache events cannot. The `PerCpu` value controls this behavior. Optional. The default is `false`.
`MessageInterval`	`uint64_t`	Controls the rate at which messages are generated for the counter. For example, if you specify a `MessageInterval` of 100, Fastline produces 1 message that says the event occurred 100 times, instead of 100 messages that each say it occurred once. Increasing this value helps to reduce the trace file size and improve simulation speed, at the cost of accuracy. If it is not specified, the message is emitted every time the event occurs. Optional. The default is 1.

5.7.5 Fastline parameters

This section describes the parameters for the Fastline plug-in.

Each parameter is prefixed with `TRACE.FastlineTrace`, for example:

```
TRACE.FastlineTrace.config
```

Note

The `trace-start-time` and `trace-end-time` parameters apply to every counter. You can also specify a `StartTime` and `EndTime` for individual counters in the counter configuration file. If so, the time period in which trace occurs for a counter is the overlap between the two periods specified.

Table 5-10 Fastline parameters

Name	Type	Default value	Allowed values	Description
`apc-capture`	`string`	`"fastmodels.apc"`	`""`	Name of the APC capture directory that Fastline generates. Optional.
`config`	`string`	`""`	`""`	The system configuration file. This JSON file defines which cluster configuration file to use for each cluster. Mandatory.
`counters-config-file`	`string`	`""`	`""`	The counter configuration file. This JSON file maps MTI trace sources to Streamline counters and sets the parameters for the capture. Optional. If omitted, no counters are generated in the capture.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 5-10 Fastline parameters (continued)

Name	Type	Default value	Allowed values	Description
`output-directory`	`string`	`"."`	`""`	Directory for the APC capture that Fastline generates. Optional. If omitted, the APC is created in the current directory.
`time-base`	`int`	`0x0`	`0x0 - 0x1`	Selects whether time stamps are based on simulated time or host time: **0** This value is the default. Time stamps are based on simulated time and therefore are deterministic. This is useful when the `trace-start-time` or `trace-end-time` parameters are used, or if a repeatable time logging result is required. **1** Time stamps are based on host time, and therefore are non-deterministic. This can be useful for performance benchmarking, but is generally not recommended.
`trace-start-time`	`int`	`0x0`	`0x0 - -0x1`	The simulated time in nanoseconds at which trace is enabled for Fastline. Optional. If omitted, the default is zero.
`trace-end-time`	`int`	`-0x1`	`0x0 - -0x1`	The simulated time in nanoseconds at which trace is disabled for Fastline. Optional. If omitted, the default is `0xffffffffffffffff`.

5.8 GDBRemoteConnection

The `GDBRemoteConnection` plug-in allows the model to be debugged using GDB. It is installed as part of the Third-Party IP add-on package.

Load the plug-in into a model using the following command-line options:

- `--allow-debug-plugin`, or the short version, `-D`.
- `--plugin`.

For example:

```
FVP_VE_Cortex-A15x1 --allow-debug-plugin --plugin GDBRemoteConnection.so
```

Then, a suitable GDB can be connected to the model using the GDB `target` command.

It supports the following operations:

- Connection to models that contain a single core cluster.
- Read and write of core registers.
- Read and write of memory.
- Run, stop, single step.
- Breakpoints.
- Connection to AArch32 and AArch64 models.

This section contains the following subsections:

- *5.8.1 GDBRemoteConnection parameters* on page 5-2919.
- *5.8.2 GDBRemoteConnection limitations* on page 5-2919.

5.8.1 GDBRemoteConnection parameters

This section describes the parameters for the `GDBRemoteConnection` plug-in.

Each parameter is prefixed with `REMOTE_CONNECTION.GDBRemoteConnection`, for example:

```
REMOTE_CONNECTION.GDBRemoteConnection.memory_access_size
```

Table 5-11 GDBRemoteConnection parameters

Name	Type	Default value	Allowed values	Runtime	Description
`core_selection`	`int`	0	0-128	`false`	The core to drive with GDB.
`listen_address`	`string`	"0.0.0.0"	-	`false`	Network address the server should listen on.
`memory_access_size`	`int`	1	1-8	`false`	The access size for memory reads/writes in bytes.
`port`	`int`	31627	1-65535	`false`	TCP port the server should listen on.
`shutdown_on_disconnect`	`bool`	`false`	`true`, `false`	`false`	Shut down the model when the client disconnects.

5.8.2 GDBRemoteConnection limitations

This section describes the limitations of the `GDBRemoteConnection` plug-in.

- Connections are only allowed to single-core simulations, not to multiprocessor or multicluster simulations.
- No tracepoint support.
- No parameter support.
- Memory view only shows the current memory space.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- Disassembly only uses the current instruction set.
- Breakpoints can only be set on the current memory space.

You cannot use GDB when debugging software that uses semihosting. When a program tries to use semihosting with the GDB plug-in, the GDB debugger wrongly reports having hit a breakpoint:

```
Program received signal SIGTRAP, Trace/breakpoint trap.
```

When using the `GDBRemoteConnection` plug-in, start the simulation with the `-D` (or `-S`) flag. You cannot attach the `GDBRemoteConnection` plug-in to running simulations. It can cause segmentation faults on the simulation and the GDB client.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

5.9 GenericCounter

`GenericCounter` is an example MTI plug-in that prints to stdout the number of occurrences of a specific trace source, at the end of the simulation.

The source code for this plug-in is provided in `%PVLIB_HOME%\examples\MTI\GenericCounter\`.

Note

This plug-in only counts a single trace source. To count multiple trace sources, load the plug-in multiple times.

This section contains the following subsection:

- *5.9.1 GenericCounter parameters* on page 5-2921.

5.9.1 GenericCounter parameters

This section describes the parameters for the `GenericCounter` plug-in.

The parameter is prefixed with `TRACE.GenericCounter`:

```
TRACE.GenericCounter.trace-source
```

Table 5-12 GenericCounter parameters

Name	Type	Default value	Allowed values	Runtime	Description
`trace-source`	`string`	`"INST"`	`""`	`false`	The trace source that you want to count. For example, `BRA_DIR`.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

5.10 GenericTrace

`GenericTrace` is a flexible MTI plug-in that allows you to configure which events are traced, using a comma-separated list of trace sources. Output can be printed to a text file or to the console.

Specify the trace sources of interest as a parameter to the plug-in, for example:

```
./FVP_Base_AEMv8A \
--plugin $PVLIB_HOME/plugins/Linux64_GCC-6.4/GenericTrace.so \
-C TRACE.GenericTrace.trace-sources=EXCEPTION,EXCEPTION_RETURN
```

Note

To see a list of the available trace sources for each component in the model that provides trace, run the model with the ListTraceSources plug-in. See *5.11 ListTraceSources* on page 5-2924 for details.

If no trace sources are specified, `GenericTrace` by default traces all the instructions.

To specify trace sources that match a pattern, use * or ? wildcards, for example:

```
TRACE.GenericTrace.trace-sources=CACHE_*
```

To trace a specific component only, specify the path to it, for example:

```
TRACE.GenericTrace.trace-sources=FVP_Base_AEMv8A.cluster0.cpu1.*
```

To trace specific fields from a trace source, use a field mask. For example to trace only the `PC` field of the `INST` trace source, use:

```
TRACE.GenericTrace.trace-sources=INST=0x1
```

The source code for this plug-in is provided as a programming example in `%PVLIB_HOME%\examples\MTI\GenericTrace\source\`.

This section contains the following subsection:

- *5.10.1 GenericTrace parameters* on page 5-2922.

5.10.1 GenericTrace parameters

This section describes the parameters for the `GenericTrace` plug-in.

Each parameter is prefixed with `TRACE.GenericTrace`, for example:

```
TRACE.GenericTrace.stop_on_event
```

Table 5-13 GenericTrace parameters

Name	Type	Default value	Allowed values	Runtime	Description
`enabled`	`bool`	`true`	`true`, `false`	`true`	If set to true, tracing is enabled.
`flush`	`bool`	`false`	`true`, `false`	`true`	If set to true, the trace file is flushed after every event. This parameter has a performance impact but can be used to debug crashes.
`hide-fieldnames`	`bool`	`false`	`true`, `false`	`true`	Do not print field names when printing trace output.
`perf-period`	`int`	`0x0`	`0x0` - `0x7fffffffffffff`	`false`	Print performance information after every *N* instructions. Disabled if 0.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 5-13 GenericTrace parameters (continued)

Name	Type	Default value	Allowed values	Runtime	Description
print-timestamp	bool	false	true, false	true	Start each trace entry with the host time.
shorten-paths	bool	true	true, false	true	If set to true, the component paths of trace events are shortened by removing the common prefix. The minimal, non-ambiguous path suffix remains. For example, FVP_VE_Cortex_A7x1.cluster.cpu0.INST is shortened to INST. If all traced sources belong to the same components, no path is logged.
simulated-timestamp	bool	false	true, false	true	Start each trace entry with the simulated time.
start-icount	int	0x0	0x0 - 0x7fffffffffffff	false	Start tracing on a certain instruction count. Tracing starts up to 2048 instructions before this count.
stop-icount	int	0x7fffffffffffff	0x0 - 0x7fffffffffffff	false	Stop tracing on a certain instruction count. Tracing will stop up to 2048 instructions after this count.
stop_on_event	bool	false	true, false	false	Stops the simulation when any event is triggered.
trace-file	string	""	""	true	The trace file to write to. If STDERR, prints to stderr. If empty, prints to stdout.
trace-sources	string	"INST"	""	true	A comma-separated list of trace sources to be traced. A component path can be prepended, with the components separated by dots. Both the component path and the trace source name can contain the wildcards * and ?. A field mask as a number in hex or decimal format can be appended with =. For example, my.subsystem.core.cpu*.TRACE_SOURCE=0x08.
verbose	bool	false	true, false	true	Print debugging information.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

5.11 ListTraceSources

`ListTraceSources` is an MTI plug-in that displays a complete and self-documenting list of the trace sources that a model provides, without running the model.

The source code for this plug-in is provided as a programming example in `%PVLIB_HOME%\examples\MTI\ListTraceSources\source\`.

The plug-in prints output for each component in the model, either to stdout or to a file, for example:

```
…
Component (4) providing trace: FVP_VE_Cortex_A7x1.cluster.cpu0 (ARM_Cortex-A7, 11.4.60)
================================================================================
Component is of type "ARM_Cortex-A7"
Version is "11.4.60"
#Sources: 195

Source ASYNC_MEMORY_FAULT (Context ID Register write.)
    Field FAULT type:MTI_UNSIGNED_INT size:4 (Fault status in ESR format)
    Field VADDR type:MTI_SIGNED_INT size:8 (Virtual Address (or 0 if unavailable))
    Field PADDR type:MTI_UNSIGNED_INT size:8 (Physical Address (or 0 if unavailable))
…
```

This section contains the following subsection:

- *5.11.1 ListTraceSources parameters* on page 5-2924.

5.11.1 ListTraceSources parameters

This section describes the parameters for the `ListTraceSources` plug-in.

Each parameter is prefixed with `TRACE.ListTraceSources`, for example:

```
TRACE.ListTraceSources.print_components_only
```

Table 5-14 ListTraceSources parameters

Name	Type	Default value	Allowed values	Runtime	Description
`file`	`string`	`""`	-	`false`	File to write the list of trace sources to. The default is to write to the console.
`print_components_only`	`bool`	`false`	`true`, `false`	`false`	If true, the plug-in prints the trace component information only, not the trace sources or fields.

Non-Confidential

5.12 PipelineModel

Use the `PipelineModel` plug-in to estimate the performance of workloads within a Fast Models environment.

The plug-in models first-order effects of microarchitecture components on the overall Cycles Per Instruction (CPI) value. Examples of such effects are data and structural hazards due to instruction dependencies.

The `PipelineModel` is implemented as a Fast Models plug-in. It processes instruction traces and injects cycle latencies into the simulation. The plug-in is non-intrusive to the functional accuracy of the simulation.

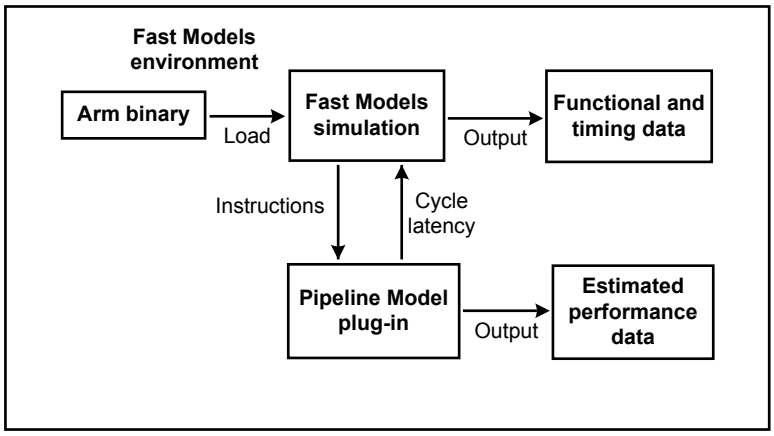

Figure 5-1 PipelineModel plug-in overview

Fast Models provides the following prebuilt example PipelineModel plugins:

CortexA53PipelineModel

An approximation of the performance characteristics of the in-order, dual issue properties of the Cortex-A53 processor. The model provides estimated performance characteristics of a given compute-bound workload in terms of Cycles Per Instruction.

Note

The model should not be used as a reference for hardware performance as it has limitations, such as the absence of a cache model.

InOrderPipelineModel

An implementation of a single-issue 4-stage pipelined processor that illustrates the basic components of a CPU. It demonstrates how components such as Fetch, Decode, and Execute can be implemented as a Fast Models plug-in.
The source code is provided in `%PVLIB_HOME%\plugins\source\PipelineModel\Cores\InOrder\`. It contains a README and a makefile for building the example.

Note

The model does not represent any Arm core and is intended only as a guide for developing more advanced PipelineModels using Fast Models.

The `PipelineModel` is an aspect of Timing Annotation. For more details, see *Timing Annotation* in the *Fast Models User Guide*.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

This section contains the following subsections:

- *5.12.1 PipelineModel parameters* on page 5-2926.
- *5.12.2 PipelineModel example* on page 5-2927.
- *5.12.3 Naming the plug-in instance* on page 5-2927.
- *5.12.4 Example command lines* on page 5-2927.
- *5.12.5 PipelineModel output* on page 5-2929.

5.12.1 PipelineModel parameters

This section describes the parameters for the `CortexA53PipelineModel` plug-in example. Other PipelineModel plug-ins might have different parameters.

Each parameter is prefixed with `PipelineModel` and the plug-in name, or plug-in instance name. For example:

```
PipelineModel.CortexA53PipelineModel.core-type
```

Table 5-15 PipelineModel parameters

Name	Type	Default value	Description
`core-type`	`string`	`""`	The name of the core. This value should match the platform that the plug-in is being attached to. For example: `ARM_Cortex-A53` This parameter is required.
`instance-name`	`string`	`""`	The cluster and core instance name, for example: `cluster0.cpu0` This parameter is optional. If it is specified, the plug-in only attaches to the specified instance. If it is not specified, the plug-in attaches to any instance.
`output`	`string`	`""`	The path and filename of the output statistics file, or `"stderr"`. This parameter is optional. If it is not specified, output is sent to `stdout`.
`start-pc`	`string`	`"0x00000000"`	The `PipelineModel` starts processing instructions from this PC value. If you want the `PipelineModel` to process only a subset of a program, use the `start-pc` and `end-pc` plug-in parameters. These values might represent the entry and exit of a function call, for example. After the `start-pc` address is hit, the `PipelineModel` processes instructions until one of the following occurs: • `end-pc` is hit. • A cycle limit, specified using the `--cyclelimit` model option, has elapsed. • The simulation is terminated. If `end-pc` is hit, the `PipelineModel` stops processing instructions and only resumes if `start-pc` is hit again. This parameter is optional. If it is not specified, or if `start-pc` and `end-pc` are the same, the plug-in processes all instructions.
`end-pc`	`string`	`"0x00000000"`	The `PipelineModel` stops processing instructions when this PC value is reached. This parameter is optional. If it is not specified, or if `start-pc` and `end-pc` are the same, the plug-in processes all instructions.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

5.12.2 PipelineModel example

This example shows how the `PipelineModel` plug-in generates data. This example uses a single issue, 6-stage pipeline. The stages are Fetch, Decode, Issue, EX1, EX2, and WR.

```
                         0   1   2   3   4   5   6   7   8   9   10
[0] ADD R1, R2, R3       IF  ID  IS  X0  X1  WR
[1] MUL R4, R1, R2           IF  ID  IS  IS  X0  X1  WR
[2] ADD R5, R4, R6               IF  ID  ID  IS  IS  X0  X1  WR
[3] ADD R7, R8, R9                   IF  IF  ID  ID  IS  X0  X1  WR
```

In the instruction sequence shown, pipeline stalls are underlined. The following stalls occur:

- Instruction [1] stalls one cycle in the Issue stage until R1 has been written.
- Instruction [2] stalls one cycle in the Decode stage due to a structural hazard because the Issuer is still in use by Instruction [1].
- Instruction [2] stalls one cycle in the Issue stage until R4 has been written.
- Instruction [3] stalls one cycle in the Fetch stage due to a structural hazard because the Decoder is still in use by Instruction [2].
- Instruction [3] stalls one cycle in the Decode stage due to a structural hazard because the Issuer is still in use by Instruction [2].

The `PipelineModel` plug-in uses the accumulated stalls for each instruction to calculate the runtime latency as follows:

- Instruction [0] latency = 0 cycles.
- Instruction [1] latency = 1 cycle.
- Instruction [2] latency = 2 cycles.
- Instruction [3] latency = 2 cycles.

In this example, there are five stall cycles in total. At the end of the simulation, the `PipelineModel` plug-in uses the accumulated stalls to produce a total cycle count. It uses the cycle count to determine the final Cycles Per Instruction (CPI) or Instructions Per Cycle (IPC) value.

5.12.3 Naming the plug-in instance

You can optionally assign a name to the plug-in instance. This is useful in a multiprocessor platform if you load the same plug-in multiple times. The assigned name is used to identify which plug-in instance the parameters apply to.

For example, the following commands load the `PipelineModel` plug-in twice and assign the names `CortexA53_0` and `CortexA53_1` to the first and second instances respectively:

```
--plugin CortexA53_0=CortexA53PipelineModel.so
--plugin CortexA53_1=CortexA53PipelineModel.so
```

You can then specify the plug-in instance name in the plug-in parameters. For example:

```
-C PipelineModel.CortexA53_0.core-type=ARM_Cortex-A53
-C PipelineModel.CortexA53_0.instance-name=Base.cluster0.cpu0

-C PipelineModel.CortexA53_1.core-type=ARM_Cortex-A53
-C PipelineModel.CortexA53_1.instance-name=Base.cluster0.cpu1
```

5.12.4 Example command lines

The following command lines show how to load the `PipelineModel` plug-in with a variety of platforms. Any parameters that are not relevant to the examples have been omitted.

Default usage, with no options

The following command line attaches the plug-in to any instance and sends output to `stdout`:

```
./EVS_Base_Cortex-A53x1.x
…
--plugin CortexA53PipelineModel.so
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Single cluster, single processor platform

The following command line attaches the plug-in to `cluster0.cpu0`, which is a Cortex-A53 processor. It outputs the file `stat.txt`:

```
./EVS_Base_Cortex-A53x1.x
…
--plugin CortexA53PipelineModel.so
-C PipelineModel.CortexA53PipelineModel.core-type=ARM_Cortex-A53
-C PipelineModel.CortexA53PipelineModel.instance-name=Base.cluster0.cpu0
-C PipelineModel.CortexA53PipelineModel.output=stat.txt
```

Single cluster, multiprocessor platform, default usage

The following command line attaches the plug-in to all Cortex-A53 processors:

```
./EVS_Base_Cortex-A53x2.x
…
--plugin CortexA53PipelineModel.so
```

Single cluster, multiprocessor platform

The following command line loads two plug-in instances in a dual-processor platform. The first plug-in instance is named `CortexA53_0` and is attached to `cluster0.cpu0`. The second plug-in instance is named `CortexA53_1` and is attached to `cluster0.cpu1`:

```
./EVS_Base_Cortex-A53x2.x
…
--plugin CortexA53_0=CortexA53PipelineModel.so
--plugin CortexA53_1=CortexA53PipelineModel.so
-C PipelineModel.CortexA53_0.core-type=ARM_Cortex-A53
-C PipelineModel.CortexA53_0.instance-name=Base.cluster0.cpu0
-C PipelineModel.CortexA53_1.core-type=ARM_Cortex-A53
-C PipelineModel.CortexA53_1.instance-name=Base.cluster0.cpu1
```

Multicluster, single processor platform

The following command line names the plug-in instance `Core1` and attaches it to `cluster1.cpu0`:

```
./EVS_Base_Cortex-A73x1-A53x1.x
…
--plugin Core1=CortexA53PipelineModel.so
-C PipelineModel.Core1.core-type=ARM_Cortex-A53
-C PipelineModel.Core1.instance-name=Base.cluster1.cpu0
```

Plug-in core-type mismatch

The following command line specifies a Cortex-A55 processor. This mismatches the platform, which is Cortex-A53. The plug-in will fail to load:

```
./EVS_Base_Cortex-A53x1.x
…
--plugin CortexA53PipelineModel.so
-C PipelineModel.CortexA53PipelineModel.core-type=ARM_Cortex-A55
```

Plug-in instance-name mismatch

The following command line specifies an `instance-name` that does not exist. The plug-in will fail to load:

```
./EVS_Base_Cortex-A53x1.x
…
--plugin CortexA53PipelineModel.so
-C PipelineModel.CortexA53PipelineModel.instance-name=Base.cluster0.cpu2
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Range processing

The following command line specifies an address range. The `PipelineModel` only processes instructions within this range:

```
-C PipelineModel.CortexA53PipelineModel.start-pc=0x80000001
-C PipelineModel.CortexA53PipelineModel.end-pc=8000FFFF
```

If the start and end of the range are identical, the `PipelineModel` processes all instructions. This is the same as not specifying a range at all:

```
-C PipelineModel.CortexA53PipelineModel.start-pc=0x80000001
-C PipelineModel.CortexA53PipelineModel.end-pc=0x80000001
```

Cycle limit

It might be useful to run the `PipelineModel` with a cycle limit. You can do this using the model option `--cyclelimit`. When the cycle limit is reached, the simulation terminates and the output file is generated.

The following command line causes the `PipelineModel` to process all instructions until the specified cycle limit is reached:

```
./EVS_Base_Cortex-A53x1.x
…
--cyclelimit=30000000
--plugin CortexA53PipelineModel.so
```

Note

The `--cyclelimit` option starts counting from the instruction at the beginning of the simulation, not from the instruction at `start-pc`. If the cycle limit has been reached and the `start-pc` has not yet been hit, the `PipelineModel` will not process any instructions.

5.12.5 PipelineModel output

At the end of the simulation, the `PipelineModel` generates a *Cycles Per Instruction* (CPI) value along with other performance data. You can use this for further analysis.

For example:

```
Elapsed time: 8 seconds
Instructions per second: 484186
Simulated CPU speed: 1.484186 MHz
CPU cycles: 5159984
RAW stalls: 3551018
Instructions issued: 3873492
Instructions retired: 3873491
Loads executed: 921403
Stores executed: 923306
IPC: 0.750679
CPI: 1.33213
```

The CPI value is the primary metric that measures the performance of workloads, where:

CPI = cycles elapsed / instructions retired

The lower the CPI, the better the performance. As a general indication, a CPI of 0.5 on a dual-issue, in-order or out-of-order processor means that an instruction takes 0.5 cycles to complete. In this case, the pipeline units are maximized and no latencies are generated.

Conversely, performance can be measured in *Instructions Per Cycle* (IPC), where:

IPC = instructions retired / cycles elapsed

The higher the IPC, the better the performance. As a general indication, an IPC of two on a dual issue, in-order or out-of-order processor means that on average, two instructions commit in each cycle.

5.13 RunTimeParameterTest

`RunTimeParameterTest` is an example MTI plug-in that demonstrates how to add new string, integer, and boolean parameters at runtime.

This plug-in is provided only as source code, in `%PVLIB_HOME%\examples\MTI\RunTimeParameterTest\source\`.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

5.14 ScalableVectorExtension

The `ScalableVectorExtension` plug-in enables AEMv8-A and AEMvA models to support the Scalable Vector Extension (SVE) and SVE2.

Note

SVE and SVE2 are optional extensions to the Armv8 AArch64 architecture. Information about SVE is available in the *SVE supplement* to the Armv8-A Architecture Reference Manual. For a comparison of SVE and SVE2, see *SVE vs SVE2*.

This section contains the following subsection:

- *5.14.1 ScalableVectorExtension parameters* on page 5-2931.

5.14.1 ScalableVectorExtension parameters

This section describes the parameters for the `ScalableVectorExtension` plug-in.

Each parameter is prefixed with `SVE.ScalableVectorExtension`, for example:

```
SVE.ScalableVectorExtension.veclen
```

Note

To enable or disable support for particular features in the plug-in, use the `has_*` parameters.

Table 5-16 ScalableVectorExtension parameters

Name	Type	Default value	Runtime	Description
`clear_constrained_lanes`	`int`	`0x0`	`false`	When a constrained vector length increases, previously inaccessible bits are set to zero according to the value of this parameter. Possible values are: `0x0` Never `0x1` Always `0x2` If the register was written to while the vector length was constrained.
`combine_movprfx_and_destructive`	`bool`	`false`	`false`	Attempt to combine the execution of `MOVPRFX` and the destructively encoded instruction that follows it.
`disable_speculative_accesses`	`bool`	`false`	`false`	All speculative memory accesses behave as though faulting without accessing memory.
`enable_at_reset`	`bool`	`false`	`false`	Start with system registers set up for Scalable Vector Extension use.
`ffr_16b_pattern_UNKNOWN`	`int`	`0x0`	`false`	A specific 16-bit UNKNOWN value that is used by parameter `force_UNKNOWN_to_ffr`.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 5-16 ScalableVectorExtension parameters (continued)

Name	Type	Default value	Runtime	Description
force_UNKNOWN_to_ffr	int	0x0	false	Governs behavior if WRFFR writes a non-monotonic value to FFR. Possible values are: 0x0 Write non-canonical value to FFR. 0x1 Overwrite FFR with a specific 16-bit UNKNOWN value. See ffr_16b_pattern_UNKNOWN. 0x2 Clear all bits above first zero.
fp_exception_report_lowest	bool	false	false	If true, for multiple trapped FP exceptions, report the lowest lane in VECITR. Otherwise, report the highest.
fp_exception_set_tfv	bool	true	false	Set ESR_ELx.TFV during FP exception. Trapped exception flags are valid.
fp_exception_set_vecitr	bool	false	false	If true, set ESR_ELx.VECITR during FP exception. Otherwise, set RES0.
has_sve_bf16	bool	true	false	Whether SVE BFloat16 instructions are implemented.
has_sve_mm_f32	bool	true	false	Whether the SVE FP32 Matrix Multiply instructions are implemented.
has_sve_mm_f64	bool	true	false	Whether the SVE FP64 Matrix Multiply instructions are implemented.
has_sve_mm_i8	bool	true	false	Whether the SVE Int8 Matrix Multiply instructions are implemented.
has_sve2	bool	true	false	Whether SVE2 is implemented.
has_sve2_aes	int	0x2	false	If SVE2 is implemented, whether SVE2 AES instructions are implemented. Possible values are: 0x0 Not implemented. 0x1 SVE2 AESE, AESD, AESMC, and AESIMC are implemented. 0x2 Same as 1, but in addition, SVE2 PMULLB and PMULLT with 64-bit source are implemented.
has_sve2_bit_perm	bool	true	false	If SVE2 is implemented, whether BitPerm instructions are implemented.
has_sve2_sha3	bool	true	false	If SVE2 is implemented, whether SHA3 instructions are implemented.
has_sve2_sm4	bool	true	false	If SVE2 is implemented, whether SM4 instructions are implemented.

Non-Confidential

Table 5-16 ScalableVectorExtension parameters (continued)

Name	Type	Default value	Runtime	Description
movprfx_unpredictable_behavior	int	0x0	false	Defines the behavior of MOVPRFX and the instruction it immediately precedes when the behavior is CONSTRAINED UNPREDICTABLE. Possible values are: **0** UNDEF execution from MOVPRFX. **1** MOVPRFX and second half of instruction executes as NOP. **2** NOP MOVPRFX only.
predicated_sp_align_check_behaviour	int	0x0	false	Governs behavior of SP alignment checking for predicated memory accesses. Possible values are: 0x0 Always perform. 0x1 Skip if governing predicate is 0. 0x2 Skip for contiguous accesses if governing predicate is 0. 0x3 Skip for gather-scatter accesses if governing predicate is 0.
support_npot_vl	bool	true	false	Whether vector lengths that are not a power of two are supported.
undef_invalid_combined_movprfx	bool	true	false	If a combined MOVPRFX is invalid, raise an UNDEF exception. Otherwise NOP the second half of the register. This parameter is deprecated.
unknown_value	int	0xdeaddeaddeaddead	false	Simulated value for a state that has an UNKNOWN value after reset.
veclen	int	0x8	false	Size of the vector in units of 64-bit blocks. Allowed range is 0x2-0x20.
z_reg_on_load_fault_behaviour	int	0x0	false	Governs the behavior of destination Z-registers in case of a load fault. Possible values are: 0x0 Register becomes UNKNOWN. 0x1 Register is preserved.

5.15 Sidechannel

The Generic Graphics Accelerator uses this plug-in for communication between the target and the host.

For more information, see *Graphics Acceleration in Fast Models* in the Fast Models User Guide.

This section contains the following subsection:

- *5.15.1 Sidechannel parameters* on page 5-2934.

5.15.1 Sidechannel parameters

This section describes the parameters for the Sidechannel plug-in.

Each parameter is prefixed with `DEBUG.Sidechannel`, for example:

```
DEBUG.Sidechannel.sh-diagnostics
```

Table 5-17 Sidechannel parameters

Name	Type	Default value	Allowed values	Runtime	Description
`diagnostics`	`int`	`0x0`	`0x0 - 0x3`	`false`	Diagnostic level: **0** None. **1** Calls. **2** With data dump.
`interceptor`	`string`	`-`	`-`	`false`	Interceptor `.so` to load.
`sh-diagnostics`	`int`	`0x0`	`0x0 - 0x3`	`false`	Diagnostic level for semihosting mechanism.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

5.16 TarmacText

TarmacText is an MTI plug-in that extracts the architectural execution trace, also known as Tarmac, of a processor. TarmacText extracts the trace in a textual form and saves it in a file. The trace that is produced conforms to the RTL execution trace.

The plug-in allows you to trace multiple processors simultaneously, saving the generated traces in different files.

Enable trace generation by setting `component` to the required component names, space-separated if multiple components are given. The default value of `component` is empty, which means the plug-in finds and traces all active processors.

Filenames are composed of a common prefix, configurable with the `log` parameter, followed by the name of the component, and terminated with the extension `.log`. The default value of `log` is `"tarmac"`.

Note

The platform name is trimmed from the component name.

This section contains the following subsection:

- *5.16.1 TarmacText parameters* on page 5-2935.

5.16.1 TarmacText parameters

This section describes the parameters for the TarmacText plug-in.

Each parameter is prefixed with `TRACE.TarmacText`, for example:

```
TRACE.TarmacText.start
```

Table 5-18 TarmacText parameters

Name	Type	Default value	Runtime	Description
`component`	`string`	`""`	`false`	Space-separated paths of the CPU instances to trace.
`log`	`string`	`"tarmac"`	`false`	Log tarmac text in a file named *<Log>*`.`*<component_name>*`.log`.
`start`	`int`	`0x0`	`false`	Start tracing after the specified number of steps. **Note** Tracing starts at the end of the quantum in which the count has been reached. Reducing the quantum size reduces the latency but might impact performance.
`use_instr_cnt_as_timestamp`	`int`	`0x0`	`false`	Use the instruction count as the timestamp instead of the simulation time.

5.17 TarmacTrace

`TarmacTrace` is an MTI trace plug-in that prints information to `stdout` or to a file.

This information might include instructions, program flow, or memory accesses for ARMv7 or ARMv8 processors in the simulation. Plug-in parameters control the amount and type of information that is traced.

This section contains the following subsections:

- *5.17.1 TarmacTrace parameters* on page 5-2936.
- *5.17.2 TarmacTrace file format* on page 5-2939.
- *5.17.3 Instruction trace* on page 5-2939.
- *5.17.4 Program flow trace* on page 5-2941.
- *5.17.5 Register trace* on page 5-2941.
- *5.17.6 Cache maintenance trace* on page 5-2942.
- *5.17.7 Cache content trace* on page 5-2943.
- *5.17.8 Translation table walk trace* on page 5-2944.
- *5.17.9 TLB trace* on page 5-2945.
- *5.17.10 Event trace* on page 5-2946.
- *5.17.11 Processor memory access trace* on page 5-2948.
- *5.17.12 Processor memory update trace* on page 5-2948.
- *5.17.13 Memory bus trace* on page 5-2949.
- *5.17.14 Tarmac Trace output example* on page 5-2951.

5.17.1 TarmacTrace parameters

This section describes the parameters for the `TarmacTrace` plug-in.

Each parameter is prefixed with `TRACE.TarmacTrace`, for instance:

```
TRACE.TarmacTrace.end-instruction-count
```

Table 5-19 TarmacTrace parameters

Name	Type	Default value	Allowed values	Description
`end-instruction-count`	`int`	`0`	`0 - 0x7FFFFFFFFFFFFFFF`	The instruction count at which to stop tracing. Default is to never stop tracing.
`instruction-count-is-per-target`	`bool`	`true`	`true`, `false`	If true (default) then the `start-instruction-count` and `end-instruction-count` parameters apply to individual targets separately. If false, all components start and stop tracing when the first component reaches the instruction count.
`loadstore-display-width`	`int`	`8`	`0 - 40`	Memory transactions can involve up to 64 bytes. For easier readability, these transactions can be broken up into multiple memory access records with a smaller number of bytes. 0 means do not break up any transaction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 5-19 TarmacTrace parameters (continued)

Name	Type	Default value	Allowed values	Description
quantum-size	int	0x2710	0x1 - 0x7fffffff	Set the default quantum size that is used in computing when the tracing should start and stop. The CORE_INFO.QUANTUM_SIZE trace source field of the component overrides this parameter, when present.
quiet	bool	false	true, false	Limit output to trace information.
start-instruction-count	int	0	0 - 0x7FFFFFFFFFFFFFFF	The instruction count at which the tracing starts. Default is to trace from the beginning.
trace_aarch64_vfp_full_width	bool	false	true, false	Trace a write to an S or D register in AArch64 as a write to the corresponding V register.
trace_atomic	bool	true	true, false	Trace memory updates by atomic operations.
trace_branches	bool	false	true, false	Trace changes of the program flow like direct or indirect branches and exception returns.
trace_bte	bool	true	true, false	Trace opcodes rejected by BTE (Branch Target Enforcement) instructions.
trace_bus_accesses	bool	false	true, false	Trace bus accesses of the core, including accesses by the caches of the core. This trace slows down the model considerably.
trace_cache	bool	true	true, false	Trace cache fills and evictions.
trace_core_registers	bool	true	true, false	Trace the core registers R0-R14, the CPSR, and the SPSR.
trace_cp15	bool	true	true, false	Trace writes to CP15 registers.
trace_dap	bool	true	true, false	Trace accesses on the debug access port.
trace_ete	bool	true	true, false	Trace packets generated by the ETE.
trace_events	bool	true	true, false	Trace events, for example exceptions and mode changes.
trace_exception_reasons	bool	true	true, false	Trace INFO_EXCEPTION_REASONS (M-class processors only).
trace-file	string	""	-	Trace output file (stdout by default, stderr if "STDERR").
trace-file-per-comp	bool	false	true, false	Write trace to multiple files.
trace_generic_events	bool	false	true, false	Trace generic events.
trace_gicv3	bool	true	true, false	Trace GICv3 memory-mapped accesses.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 5-19 TarmacTrace parameters (continued)

Name	Type	Default value	Allowed values	Description
trace_gicv3_comms	int	0	0 - 7	Trace GICv3 communications between cores and distributor. Bitfield: **1** Trace processor. **2** Trace RD0. **4** Trace internal.
trace_gicv3_its	bool	false	true, false	Trace GICv3 ITS command execution.
trace_gicv3_reads	bool	false	true, false	Trace GICv3 memory-mapped reads.
trace-inst-stem	string	""	-	Base instance path to select an instance or group of instances to trace. For example: `-C TRACE.TarmacTrace.trace-inst-stem=css.cluster0.cpu3`
trace_instructions	bool	true	true, false	Trace instructions.
trace_loads_store_memtype	bool	false	true, false	Show memory type information for core loads and stores.
trace_loads_stores	bool	true	true, false	Trace loads and stores that are triggered by instructions. These loads and stores might go into the memory subsystem, into a cache, or into a TCM. This trace slows down the model considerably.
trace_memory	bool	false	true, false	Trace memory accesses just outside the core.
trace_mmu	bool	true	true, false	Trace MMU tablewalks and associated information.
trace_spe	bool	true	true, false	Trace SPE data that is written to memory.
trace_tag_loads_stores	bool	true	true, false	Trace tag loads and stores that are triggered by MTE instructions. These might go into the memory subsystem, into a cache, or into a TCM. This trace slows down the model considerably.
trace_vfp	bool	true	true, false	Trace the VFP and Neon registers, including FPSCR and FPEXC.
unbuffered	bool	false	true, false	Trace events as they arrive, and flush each `fwrite`. Prints `IT` even when `IS` should be printed.
updated-registers	bool	false	true, false	Trace updated value of registers rather than the written value.
use_instr_cnt_as_timestamp	bool	false	true, false	Use the instruction count as the timestamp instead of the simulation time.

5.17.2 TarmacTrace file format

This section describes the TarmacTrace file format.

Note

[*X*|*Y*]
Indicates a choice between *X* and *Y*.

{*X*}
Indicates that *X* is optional or configuration dependent.

The common address definition that is used in the trace command syntax:

```
<vaddr>{:<paddr><psecurity>}
```

`<vaddr>`
The virtual address in hexadecimal format. See the note below.

`<paddr>`
The physical address of the instruction, if available, in hexadecimal. See the note below.

`<psecurity>`
Append `_NS` if the security regime of the physical address is Non-secure. Append nothing if the regime is Secure.

Note

For 64-bit addresses, the value is written as either:

- 8 hex digits, if the value can be represented in 32 bits.
- 16 hex digits otherwise.

The virtual regime definition that is used in the trace command syntax:

```
0x<vbase>{_NS} <el>{ vmid=<vmid>}{, nG asid=<asid>}
```

`0x<vbase>`
Virtual address in hexadecimal format.

`_NS`
If present, this element specifies that the address is Non-secure. If not present, the address is Secure.

`<el>`
Translation regime that owns the mapping. One of:

- `EL1_n`, meaning the Non-secure EL1&0 translation regime.
- `EL2_n`
- `EL1_s`
- `EL3_s`

`<vmid>`
For Non-secure, non-hyp regimes, specify the VMID.

`nG`
If present, this element specifies that the virtual regime is non-global.

`asid`
For non-global regimes, specify the ASID.

5.17.3 Instruction trace

If enabled, this trace source generates one record for every instruction started.

The records (lines) of the instruction trace have this syntax:

```
<time> <scale> <cpu> [IT|IS] (<inst_id>) <addr> <opcode> [A|T|X|O]
<mode>_<security> : <disasm>
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

<time>

Timestamp (decimal value).

<scale>

Unit for <time>. clk indicates that the timestamp is not related to real time, but an increasing count.

<cpu>

Processor, or other component, that gave the instruction.

[IT|IS]

IT
Instruction passed the condition code (taken).

IS
Instruction failed the condition code (skipped).

<inst_id>

Tick count of this processor, which is equivalent to the number of instructions that are executed, except for certain instructions like WFI/WFE (decimal value).

<addr>

Fetch source address for this instruction. Format according to the common address definition.

<opcode>

16-bit/32-bit hexadecimal opcode of the instruction.

[A|T|X|O]

Instruction set:

A
A32.

T
T32.

X
T32EE.

O
A64

<mode>

Processor execution mode.

AArch32 modes are svc, irq, fiq, usr, mon, sys, abt, und, hyp.

AArch64 modes are EL3h, EL3t, EL2h, EL2t, EL1h, EL1t, EL0t.

<security>

Processor security state (s or ns).

<disasm>

Disassembly of the instruction.

Non-Confidential

5.17.4 Program flow trace

If enabled, every executed branch instruction triggers this trace source, which is a more efficient way to reconstruct the program flow than by tracing every instruction.

Output syntax:

`<time> <scale> {<cpu>} [FD|FI] (<inst_id>) <addr> <targ_addr> [A|T|X|O]`

`<time>`

Timestamp (decimal value).

`<scale>`

Unit for `<time>`. Gives consistency with device-specific Tarmac Trace formats.

`<cpu>`

Processor, or other component, that gave the instruction.

`[FD|FI]`

Program flow change by:

`FD`
A direct branch.

`FI`
An indirect branch.

`<inst_id>`

Tick count of this processor, which is equivalent to the number of instructions that are executed, except for certain instructions like `WFI`/`WFE` (decimal value).

`<addr>`

Fetch source address for this instruction. Format according to the common address definition.

`<targ_addr>`

Address (virtual) at which the execution continues. Format according to the common address definition.

`[A|T|X|O]`

Instruction set after the branch:

`A`
A32.

`T`
T32.

`X`
T32EE.

`O`
A64

Related references
5.17.2 TarmacTrace file format on page 5-2939

5.17.5 Register trace

If enabled, this source traces all writes to the processor registers.

This trace source includes writes to core registers `R0` to `R14`, `X0` to `X30`, `CPSR`, and `SPSR`, VFP registers such as `S0` to `S31`, `D0` to `D31`, `FPSCR`, and `FPEXC`, and writes to system registers including `CP14`, `CP15`, and

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GIC. Banked registers are traced separately using the mode as a suffix to the register name, for example r13 (current register R13) and r13_mon (banked register R13).

Output syntax:

```
<time> <scale> {<cpu>} R <register> <value>
```

<time>

Timestamp (decimal value).

<scale>

Unit for <time>, which gives consistency with device-specific Tarmac Trace formats.

<cpu>

Processor, or other component, that gave the instruction.

<register>

Register name in lowercase letters. Banked core registers can have a mode appended to them with a single underscore. Banked CP14/CP15 registers have _s or _ns appended to indicate access of either the Secure or Non-secure banked register.

<value>

Hexadecimal value that is written to the register (64 bits maximum).

If the SVE plug-in is loaded in the model, there are additional registers in the program view. The output examples below show how these registers are traced when the value changes. These data values can be very large.

```
8463 clk cpu0 IT (8439) 000282c0:0000152282c0_NS 053fc01f O EL1h_n : SEL
z31.B,p0,z0.B,z31.B
8463 clk cpu0 R z31 00000000_00000000_00000000_00000000
```

R indicates a register write. z0 to z31 are the vector registers. The written data are hexadecimal digits, which are separated by an underscore every 32 bits. The length of the written data varies with the configuration, depending on the vector length.

```
9756 clk cpu0 IT (9732) 01000074:000011000074_NS 2518e3e0 O EL1t_n : PTRUE    p0.B,ALL
9756 clk cpu0 R p0 ffff
```

R indicates a register write. p0 to p15 are the predicate registers. The written data are hexadecimal digits. If they are long enough to require one, the digits are separated by an underscore every 32 bits. The length of the written data varies with the configuration, depending on the vector length. Predicate registers contain 1 bit per byte of vector register length.

5.17.6 Cache maintenance trace

If enabled, this source traces all cache maintenance operations that the processor initiates.

Output syntax:

```
<time> <scale> <cpu> CACHE MAINTENANCE <side> <operation> <scope> <data> {<pagesize>
<memtype>}
```

<time>

Timestamp (decimal value).

<scale>

Unit for <time>. clk indicates that the timestamp is not related to real time, but an increasing count.

<cpu>

Processor, or other component, that gave the instruction.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

<side>
Data or instruction cache.

<operation>
Clean, invalidate, or both.

<scope>
By MVA or set/way, to Point of Coherency or Point of Unification, Inner Sharable or not.

<data>
Data that is associated with the operation. If the operation is by MVA, format according to the common address definition, otherwise use raw hexadecimal.

<pagesize>
If the operation is by MVA, this element is the size of the memory region that is described by the TLB entry which contains the MVA.

<memtype>
If the operation is by MVA, this element is the type of memory in the TLB entry which contains the MVA.

Related references
5.17.2 TarmacTrace file format on page 5-2939

5.17.7 Cache content trace

Traces the movement of data into and out of the cache.

Output syntax:

```
<time> <scale> <cpu> CACHE <id> LINE <line> <operation> 0x<paddr><ns>
```

<time>

Timestamp (decimal value).

<scale>

Unit for `<time>`. `clk` indicates that the timestamp is not related to real time, but an increasing count.

<cpu>

Processor, or other component, that gave the instruction.

<id>
Level and side, or system identifier, of the cache.

<line>
Identifier of this line uniquely within this cache, expressed in hexadecimal.

<operation>
Notification for this cache line. One of the following options:

`ALLOC`
(Processor caches) Line contains new read data.

`INVAL`
(Processor caches) Line contains no data.

`DIRTY`
(Processor caches) Line contains new write data.

`CLEAN`
(Processor caches) Write data is written back, still valid for reads.

`FILL`
(System caches) Line is filled.

`EVICT`
(System caches) Line is evicted due to space pressure.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`CLEAN`
(System caches) Line is cleaned due to maintenance operation.
`INVAL`
(System caches) Line is invalidated due to maintenance operation.

`<paddr>`
Cache line physical address in hexadecimal.

`<ns>`
Cacheline security. Blank for Secure regime, or `_NS` for Non-secure regime.

5.17.8 Translation table walk trace

If enabled, this source traces all translation table walks initiated by the processor

Output syntax:

```
<time> <scale> <cpu> [TTW|TTU] <side> <format> <stage>:<level> <address> <data> : <result>
```

`<time>`

Timestamp (decimal value).

`<scale>`

Unit for `<time>`. `clk` indicates that the timestamp is not related to real time, but an increasing count.

`<cpu>`

Processor, or other component, that gave the instruction.

`[TTW|TTU]`
Translation table walks (reads) or translation table update (writes).

`<side>`
Data or instruction TLB.

`<format>`
VMSA or LPAE format translation table entries.

`<stage>`
Walk stage, within the range 1-2.

`<level>`
Walk level, within the range 1-3.

`<address>`
Physical address of lookup in hexadecimal.

`<data>`
Raw translation table entry in hexadecimal.

`<result>`
Parsed result. One of the following options:
`ABORTED`
The memory access caused a synchronous abort and no data was returned.
`FAULT`
The data that was returned is not valid for this stage and level.
`RESERVED`
The data that was returned is not valid for this stage and level.
`TABLE {<attr>=<value>}+`
Pointer to the next level of lookup, in LPAE format.
`BLOCK {<attr>=<value>}`
LPAE region descriptor.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`SUPERSECTION {<attr>=<value>}`
: VMSA region descriptor.

`SECTION {<attr>=<value>}`
: VMSA region descriptor.

`PAGETABLE {<attr>=<value>}`
: Pointer to the next level of lookup, in VMSA format.

`LARGEPAGE {<attr>=<value>}`
: VMSA region descriptor.

`SMALLPAGE {<attr>=<value>}`
: VMSA region descriptor.

5.17.9 TLB trace

If enabled, this source traces TLB entries that are filled and evicted by the processor.

Output syntax:

```
<time> <scale> <cpu> [TLB|WALKCACHE] FILL <id> <size> <virtualregime>:<paddr> {<memtype>}
{<attr>=<value>}+
```

```
<time> <scale> <cpu> [TLB|WALKCACHE] EVICT <id> <size> <virtualregime>
```

`<time>`

Timestamp (decimal value).

`<scale>`

Unit for `<time>`. `clk` indicates that the timestamp is not related to real time, but an increasing count.

`<cpu>`

Processor, or other component, that gave the instruction.

`<id>`

Identifies which TLB or walk cache to trace.

`<size>`

Size of the region being mapped.

`<virtualregime>`

Virtual address and regime of the region being mapped, formatted according to the common virtual regime definition.

`<paddr>`

Physical base address of mapped region, formatted according to the common address definition.

`<memtype>`

For TLB entries, the memory type of the result. One of the following options:

`Device-[G|nG][R|nR][E|nE] {(<alias>)}`
: Device memory, where:

  `[G|nG]`
  : Gathering or nongathering.

  `[R|nR]`
  : Reordering or nonreordering.

  `[E|nE]`
  : Early write acknowledgement or not.

  `<alias>`
  : Device-nGnRnE was previously known as StronglyOrdered.

`Normal [NonShareable|Shareable] Inner=<cachetype> Outer=<cachetype>`

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Normal memory, where:

[NonShareable|Shareable]
Shareability

<cachetype>
[NonCacheable|WriteBack|WriteThrough]{NonReadAllocate}{Non}{WriteAllocate}

[NonCacheable|WriteBack|WriteThrough]
Cacheability

{NonReadAllocate}
For cacheable memory, Read allocate hint. (Read allocate is assumed if not specified.)

{Non}{WriteAllocate}
For cacheable memory, Write allocate hint.

5.17.10 Event trace

If enabled, this source traces exceptions, interrupts, and exception returns. In AArch64, it also traces changes to the SPSel and to the current exception level, by generating a CoreEvent_ModeChange.

Output syntax:

`<time> <scale> {<cpu>} E <value> {<mode>} {<value1>} <number> <desc>`

<time>

Timestamp (decimal value).

<scale>

Unit for `<time>`, which gives consistency with device-specific Tarmac Trace formats.

<cpu>

Processor, or other component, that gave the instruction.

<value>

A value that is associated with the event. Format according to the common address definition.

<mode>
For mode change events only, the new mode being entered.

<value1>
Where available, the hexadecimal representation of a second value that is associated with the event.

<number>

Event number.

<desc>

Event name.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 5-20 Supported values for value, number, and desc

Number	Event description	Value
0x00000001	CoreEvent_Reset	-
0x00000002	CoreEvent_UndefinedInstr	-
0x00000003	CoreEvent_SWI	SWI number
0x00000004	CoreEvent_PrefetchAbort	-

5.17.2 TarmacTrace file format on page 5-2939

5.17.11 Processor memory access trace

If enabled, this source traces processor data accesses.

Output syntax:

```
<time> <scale> {<cpu>} M<rw><sz><attrib> <addr> <data>
```

<time>

Timestamp (decimal value).

<scale>

Unit for <time>. This element gives consistency with device-specific Tarmac Trace formats.

<cpu>

Processor, or other component, that gave the instruction.

<rw>

R
Read access.

W
Write access.

<sz>

Size of the data transfer in bytes (1, 2, 4, 8).

<attrib>

Optional access attribute:

X
Exclusive access.

T
Translated (unprivileged) access.

L
Locked access (SWP, SWPB instructions).

<addr>

Virtual address that is used to access memory. Format according to the common address definition.

<data>

Hexadecimal value of data transferred. The data padding is according to the size of the transfer. Data of 64 bits or more contains an underscore (_) separator every eight characters (32 bits).

5.17.12 Processor memory update trace

If enabled, this source traces memory update accesses caused by atomic operations.

Output syntax:

```
<time> <scale> {<cpu>} MU<sz>_<atomic_op> <addr> <data>
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

<time>

Timestamp (decimal value).

<scale>

Unit for <time>. This element gives consistency with device-specific Tarmac Trace formats.

<cpu>

Processor, or other component, that gave the instruction.

<sz>

Size of the data transfer in bytes (1, 2, 4, 8, 16).

<atomic_op>

Atomic operation performed on this memory address:

ADD
Atomic add operation.

BIC
Atomic bit clear operation.

CAS
Atomic compare and swap operation.

EOR
Atomic exclusive or operation.

ORR
Atomic bit set operation.

SMAX
Atomic signed max operation.

SMIN
Atomic signed min operation.

SWP
Atomic swap operation.

UMAX
Atomic unsigned max operation.

UMIN
Atomic unsigned min operation.

<addr>

Physical address that is used to access memory. Format according to the common address definition.

<data>

Hexadecimal value of the data transferred. The data padding is according to the size of the transfer. Data of 64 bits or more contains an underscore (_) separator every eight characters (32 bits).

5.17.13 Memory bus trace

If enabled, this source traces transactions that are initiated through the memory bus master port of the processor. These accesses use physical addresses.

Output syntax:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`<time> <scale> {<cpu>} B<rw><sz><fd><lk><p><s> I<wrcbs> O<wrcbs> <master_id> <addr> <data>`

`<time>`

Timestamp (decimal value).

`<scale>`

Unit for `<time>`. This element gives consistency with device-specific Tarmac Trace formats.

`<cpu>`

Processor, or other component, that gave the instruction.

`<rw>`

`R`
Read access.

`W`
Write access.

`<sz>`

Size of the data transfer in bytes.

`<fd>`

`I`
Opcode fetch.

`D`
Data load/store or an MMU access.

`<lk>`

`L`
Locked access.

`X`
Exclusive access.

_, underscore
Normal access.

`<p>`

`P`
Privileged access.

_, underscore
Normal access.

`<s>`

`S`
Secure access.

`N`
Non-secure access.

`I<wrcbs>`

Inner cache attributes. See `O<wrcbs>`.

`O<wrcbs>`

Outer cache attributes:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

<w>

W
Allocate on write.

_, underscore
No allocate on write.

<r>

R
Allocate on read.

_, underscore
No allocate on read.

<c>

C
Cacheable access.

_, underscore
Non-cacheable access.

<b>

B
Bufferable access.

_, underscore
Non-bufferable access.

<s>

S
Shareability access.

_, underscore
Non-shareability access.

<master_id>

Master ID of the transaction.

<addr>

Physical address that is used to access memory, in hexadecimal format.

<data>

Hexadecimal value of data transferred. The data padding is according to the size of the transfer. Byte ordering is from lowest to highest byte. This ordering means that for accesses in little endian mode, the data occurs mirrored compared to the register/memory access records.

5.17.14 Tarmac Trace output example

This is an example of a trace that was produced by the Tarmac Trace plug-in, showing instruction, register, event, and memory access traces.

Chapter 6
Fast Models examples

The following top-level example directories are installed in `$PVLIB_HOME/examples`.

Table 6-1 Fast Models examples directories

Directory name	Description
`CADI`	Example C++ applications that demonstrate how to use the CADI debug API. **Note** CADI is deprecated and is being replaced by the Iris debug API.
`LISA`	LISA+ source code and project files for FVPs.
`LISAPlus`	Example LISA+ components that show how to capture and generate MTI trace, remap `PVBus` transactions, and handle burst transactions.
`MTI`	MTI plug-in examples that show how to extract and use trace information from models. The following examples are also available as pre-built libraries under `$PVLIB_HOME/plugins`: • GenericCounter. • GenericTrace. • ListTraceSources.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 6-1 Fast Models examples directories (continued)

Directory name	Description
`python`	Python debug script examples that show how to use the `fm.debug` Python module for common debugging tasks.
`SystemCExport`	• Source code and makefiles for EVS platform examples and SVPs. • LISA+ source for bridges and EVS components. • Header files required for exporting LISA+ protocols to SystemC.

Note

On Microsoft Windows, the Fast Models installer creates a copy of the examples in `%USERPROFILE%\ARM\FastModelsPortfolio_%FM-VERSION%\examples\`. This copy allows you to save configuration changes to the examples without needing Administrator permissions.

It contains the following sections:

- *6.1 CADI examples* on page 6-2955.
- *6.2 LISA examples* on page 6-2956.
- *6.3 LISAPlus examples* on page 6-2957.
- *6.4 MTI examples* on page 6-2958.
- *6.5 Python examples* on page 6-2959.
- *6.6 SystemCExport examples* on page 6-2960.

Non-Confidential

6.1 CADI examples

Example CADI clients that demonstrate how to use the CADI API to perform common debugger operations. These include instantiating a new simulation, connecting to a running simulation, accessing memory and registers, setting breakpoints, and registering callbacks for asynchronous feedback from the simulation.

Each of these examples has a `readme.txt` that describes the example, how to run it, and in some cases, gives the expected output. The following CADI examples are provided:

Table 6-2 CADI examples

Example	Description
`breakpoints`	Sets a code breakpoint at a specific address in the application that is running on the model.
`cache_dump`	Displays information about the caches in the running simulation.
`cadi_lib`	Implements a shared library that contains a CADI simulation. You can load the library into Model Shell and connect a CADI-compliant debugger to it.
`cadi_server`	Implements an executable that contains a CADI simulation. It loads the plug-in library `CADIIPCRemoteConnection.so`, which enables you to connect a CADI-compliant debugger to it. You can run the `connecting_running_target` CADI example to mimic this connection.
`connecting_instantiating_model`	Instantiates a simulation that is a shared library, prints a list of all targets in the simulation, and connects to one of them.
`connecting_remote_target`	Connects to a remote simulation that has been configured to allow remote connections. The IP address and listening port are passed as parameters to the CADI client.
`connecting_running_target`	Connects to a running CADI target.
`disassembly`	Prints the disassembly of the instruction at the PC address in the application that is running on the model.
`memory`	Displays memory space information. Reads and displays some values from memory in the application that is running on the model.
`mti`	Loads the TarmacTrace MTI plug-in into the application that is running on the model and displays some tarmac trace output.
`registers`	Reads and displays register information for a CPU target in the model and reads and writes a specific register.
`tlb_dump`	Connects to a model and displays the contents of the TLBs.

6.2 LISA examples

LISA+ source and project files for FVPs.

Note

The LISA platform examples are built as ISIMs. For more information about building an ISIM, see *Building an ISIM* in the Fast Models User Guide.

The following LISA examples are provided:

Table 6-3 LISA examples

Example	Description
`BusComponents`	Example LISA+ components that demonstrate different ways of using the `PVBus` interface.
`Common`	FVP-specific LISA+ components that are common to different types of FVPs.
`CSS`	Source and project files for SGI_575 and SGM_775 Reference Data FVPs.
`FVP_Base`	Source and project files for Base Platform FVPs. For information about the Base Platform, see *Chapter 7 Base Platform* on page 7-2961.
`FVP_BaseR`	Source and project files for BaseR Platform FVPs.
`FVP_Base_RevC`	Source and project files for Base Platform RevC FVPs. For information about the Base Platform RevC, see *7.2 Base Platform RevC* on page 7-2963.
`FVP_Coproc_Demo`	Example implementation of the `Coprocessor` interface. Registers the coprocessor with a ARMCortexM33CT or ARMAEMv8MCT model. For more information, see *2.6.1 CoprocBusProtocol protocol* on page 2-81.
`FVP_MPS2`	Source and project files for MPS2 FVPs. For information about the MPS2 platforms, see *Chapter 8 Microcontroller Prototyping System 2* on page 8-2988.
`FVP_VE`	Source and project files for VE FVPs. For information about the VE platform, see *Chapter 9 Versatile Express Model* on page 9-2999.
`VP_PChannel`	Shows how to create power controllers to control the power state of the cores and cluster, using the `PChannel` protocol. For information about `PChannel`, see *2.5.1 PChannel protocol* on page 2-80.

6.3 LISAPlus examples

Source code and System Canvas project files for some example LISA+ components.

Table 6-4 LISAPlus examples

Example	Description
`CapturingTraceFromLISA`	Instantiates and uses an MTI plug-in from a LISA+ component. Uses the SimpleTrace plug-in as an example.
`GeneratingTraceFromLISA`	Generates MTI trace information from a LISA+ component.
`PVBusBursts`	Uses a `PVBusMaster` to generate burst read transactions, which are handled by a `PVBusSlave`.
`RemappingWithPVBusMapper`	Uses the `PVBusMapper` component to remap transactions based on their attributes.

Related references

6.4 MTI examples

Example MTI plug-ins that show how to use MTI to extract and use trace information from models.

The following MTI examples are provided:

Table 6-5 MTI examples

Example	Description
`CallTrace`	Displays a function call sequence by tracing the `PC` field of `INST` trace sources, then compares the output with values in a symbol table. See the `readme` for more information.
`CountingCacheStats`	Registers counters for cache-related trace sources, for example `CACHE_READ_HIT`. Prints the cache stats before terminating.
`DCCTrace`	Prints the value of `DBGDTRxX_EL0` when data is written. Updates the `TXFull` bit in MDSCR to indicate the data was read. See the `readme` for more information.
`GenericCounter`	Registers a counter for trace sources. Prints the counter value for each `INST` trace source before terminating. This example is also available as a pre-built library, see *5.9 GenericCounter* on page 5-2921.
`GenericTrace`	A flexible plug-in that traces one or more trace sources specified by the user. Prints the trace to a text file or to stdout. This example is also available as a pre-built library, see *5.10 GenericTrace* on page 5-2922.
`ListTraceSources`	Displays either the trace sources provided by all trace components in the model, or just the trace components, to a text file or to stdout, without running the simulation. For more information, see `readme.txt`. This example is also available as a pre-built library, see *5.11 ListTraceSources* on page 5-2924.
`RunTimeParameterTest`	Uses MTI to set runtime parameters.
`SimpleTrace`	Simple trace plug-in that prints a trace of the PC.
`SoftwareTrigger`	Traces `SEMIHOSTING_PRECALL` trace events, intercepts semihosting calls, and prints out register information. For more information, see the `readme`.
`TraceOnBreak`	Similar to the `SimpleTrace` example, but prints the PC value only when a breakpoint is hit.

6.5 Python examples

Python debug scripting examples.

These examples show how to use the `fm.debug` Python module to connect to targets, read the contents of caches, read/write memory and registers, set breakpoints, and perform run control. Some of these scripts use images that are supplied as assembly language source files.

Table 6-6 Python examples

Example	Description
`checkpointing.py`	Saves or restores the state of a library model, or a specific component in it, using either the default checkpoint delegate, or an example of a custom delegate.
`DemoBreakpoints.py`	Enables exception breakpoints and sets program and memory breakpoints in an application running on a library model. Prints the breakpoints that were hit.
`DemoCaches.py`	Prints the contents of `PVCache` CADI targets that are selected by the user.
`DemoDumpAllRegisters.py`	Prints register names and values. You can specify a list of registers and targets, or if not, it prints all registers for all CPU targets.
`DemoMemory.py`	Writes to and reads from target memory, as bytes and words, to show the effect of toggling the endianness of the processor.
`DemoParameters.py`	Gets and sets instantiation time and run-time model parameters.
`DemoRegisters.py`	Reads and writes registers. Shows different ways of specifying register names.
`DemoSemihosting.py`	Binds semihosting stdin and stdout calls to the semihosting stdin and stdout of the target.
`DemoStopOnStringOut.py`	Stops the model when a string is entered in the UART terminal.
`DemoTLB.py`	Prints the contents of the `TlbCadi` CADI targets selected by the user.
`DemoTraceOnBpt.py`	Starts tracing a model from the address at which a breakpoint is hit. The GenericTrace plug-in must have been loaded on the model that it connects to. For information about GenericTrace, see *5.10 GenericTrace* on page 5-2922.
`LoadModel.py`	Loads a library model that is specified as a parameter.

6.6 SystemCExport examples

Components and platform models that are created by exporting LISA+ components or platforms to SystemC. Also, bridge components for converting transactions between LISA+ protocols and SystemC.

Table 6-7 SystemCExport examples

Directory	Description
`Bridges`	LISA+ source for bridge components. For more information, see *3.1 Bridge components* on page 3-88.
`Common`	Source files and makefile rules that are common to the EVS and SVP examples.
`Common/Protocols`	Header files that are required for the export of LISA+ protocols to SystemC.
`EVS_Components`	LISA+ files and project files for EVS (Exported Virtual Subsystem) components. These are LISA+ components with a SystemC wrapper and bridges that allow them to be used in an SVP. Build the component to generate the header file and libraries required to include it in a SystemC simulation.
`EVS_Platforms`	LISA+ source and makefiles for EVS platform examples. An EVS platform is a LISA+ platform that has been exported as a SystemC object to allow it to be integrated into a SystemC simulation. The EVS platform examples are minimal platforms that are designed for a specific use case, for example running the Dhrystone benchmark application or booting Linux. The Dhrystone images `dhrystone_v8.axf` and `dhrystone.axf` for Armv7, are provided in the Fast Models Third Party IP package. They are loaded from `$PVLIB_HOME/images/`. For more information about building EVS platforms, see *Building Fast Models* in the Fast Models User Guide.
`SVP_Platforms`	SVPs (SystemC Virtual Platforms) are platform models in which each component or subsystem has been individually exported to SystemC using the Fast Models Multiple Instantiation (MI) feature. For more information, see *Building an SVP* in the Fast Models User Guide. SVP platforms can be modified by replacing EVS components with other Fast Models EVSs, or with native SystemC components. There are three subdirectories: **SVP_Base** Armv8 Base Platform SVPs. **SVP_bigLITTLE** Armv7 big.LITTLE™ SVP, containing Cortex-A15 and Cortex-A7 clusters. **SVP_LinuxBoot** Minimal Armv7 platform that is suitable for booting Linux, containing a Cortex-A15 cluster.

Chapter 7
Base Platform

This chapter describes the Base Platform system model.

It contains the following sections:

- *7.1 Base - about* on page 7-2962.
- *7.2 Base Platform RevC* on page 7-2963.
- *7.3 Base - memory* on page 7-2967.
- *7.4 Base - interrupt assignments* on page 7-2971.
- *7.5 Base - clocks* on page 7-2974.
- *7.6 Base - parameters* on page 7-2975.
- *7.7 Base - components* on page 7-2976.
- *7.8 Base - differences between the AEMv8-A FVP and core FVPs* on page 7-2984.
- *7.9 Base - VE compatibility* on page 7-2985.
- *7.10 Base - unsupported VE features* on page 7-2987.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

7.1 Base - about

The Base Platform system model allows early development, distribution, and demonstration of software deliverables. A range of Base FVPs are supplied as standalone products and as examples in Fast Models.

For a list of the Base and BaseR Platform FVPs and the instances in them, see *Base Platform FVPs* and *BaseR Platform FVPs* in the FVP Reference Guide.

See `$PVLIB_HOME/examples/LISA/FVP_Base/` for LISA+ source and project files for the Base Platform FVP examples.

The standard peripheral set enables software development and porting. The platform is an evolution of the VE *Fixed Virtual Platforms* (FVPs), based on the Arm Versatile Express (VE) hardware development platform.

The Base Platform system model provides:

- Two configurable clusters of up to four core models that implement:
  - AArch64 at all exception levels.
  - Configurable AArch32 support at all exception levels.
  - Configurable support for little and big endian at all exception levels.
  - Generic timers.
  - Self-hosted debug.
  - CADI debug.
  - GICv3 memory-mapped processor interfaces and distributor.
- Peripherals for multimedia or networking environments.
- Four PL011 UARTs.
- A CoreLink™ CCI-400 Cache Coherent Interconnect.
- Architectural GICv3 model.
- High Definition LCD Display Controller, 1920×1080 resolution at 60fps, with single I2S and four stereo channels.
- 64MB NOR flash and board peripherals.
- CoreLink TZC-400 TrustZone Address Space Controller.

7.2 Base Platform RevC

Base Platform RevC is a configuration of the Base Platform that includes a PCI subsystem.

LISA+ source and project files for Base Platform RevC FVPs are located in `$PVLIB_HOME/examples/LISA/FVP_Base_RevC/`.

This section contains the following subsections:

- *7.2.1 Base Platform RevC changes* on page 7-2963.
- *7.2.2 BasePlatformPCIRevC component* on page 7-2964.

7.2.1 Base Platform RevC changes

The Base Platform RevC includes the following additions to the previous Base Platform version.

- A PCIe config region and two PCIe memory regions. See the memory map for details.
- A CoreLink CCI-550 Cache Coherent Interconnect.
- An AHCI controller model including a SATA disk model.
- An SMMUv3 AEM. This is an architectural model that implements the SMMUv3.0 and SMMUv3.1 architectures. These architectures are for I/O virtualization of devices. The SMMU is placed so that accesses to memory by PCI devices acting as bus masters are affected by it.

  The SMMU has the following features:

  — Memory that is mapped to the range `0x2B400000-0x2B4FFFFF`.
  — Interrupts with IRQ IDs in the range 103-111.
  — The event output pin of the SMMU is passed to the clusters.
  — The downstream ports of the SMMU attach to the coherent bus infrastructure and so are coherent with the core clusters. All cores and the SMMU are in the same shareability domain. There is no distinction between the inner and outer shareability domains.
  — The parameters of the SMMU determine its capabilities and have default values which can be overwritten if necessary.
  — The SMMU is configured to only accept 16-bit StreamIDs and there is a 1:1 correspondence between RequestorID and StreamID.
  — By default, the SMMU uses DeviceID `0x10000` to identify itself to the GIC (`pci.pci_smmuv3.mmu.smmu_msi_device_id`).

    The parameter `gic_distributor.ITS-device-bits` is set to 17 by default to support the 17-bit DeviceIDs.

  The SMMU has the following limitations:
  — It does not support RAS.
  — The PMU has limited functionality. Only a subset of the architecturally mandatory events are supported, as indicated by the `SMMU_PMCG_CEID0` fields. The PMU is intended for demonstration purposes only and for driver development.
- An SMMUv3TestEngine component with a control region at `0x002bfe0000-0x002bfFFFFF`. This component is a traffic generator that acts as a (secure) device upstream of the SMMUv3.
- Two PCIe virtio devices are above the SMMU. By default they are configured to be device 0 and 2 on bus 0.
- The PCIe devices use a DeviceID that is the same as their RequestorID (BDF).
- Legacy PCI interrupts:
  — Each PCI device is hardwired to use INTA, with a value of 1 in the `interrupt_pin` register. This is required by the PCI specification for single-function devices.
  — The interrupts in the PCI host bridge are mapped according to section 2.2.6 of the PCI Local Bus Specification Revision 3.0, using the following formula, where the values for DeviceInterrupt are INTA = 0, INTB = 1, INTC = 2, INTD = 3:

  ```
  BridgeInterrupt = (Device + DeviceInterrupt) % 4
  ```

  This formula produces the following mappings:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

BridgeInterrupt ID	DeviceInterrupt
200	INTA
201	INTB
202	INTC
203	INTD
207	SERR

- The model optionally implements MSI-X, depending on whether a parameter is set. If this parameter is set, an MSI-X capability is advertised as a PCI capability.

  Note

  The virtio specification is not fully compliant with the PCI specification and the virtio block device cannot be used in a pure-polling mode where MSI-X is always masked and only polling the pending bit array is used.

  The MSIs produced by the models, when directed to the GIC, have their payload rewritten to carry the DeviceID of the originating device to the GIC.
- The processor models implement architecture version v8.0, which does not support the Statistical Profiling Extension (SPE). To include SPE, add parameter `cluster0.has_arm_v8-3=1`, or similar, to the command line.

7.2.2 BasePlatformPCIRevC component

This component is an integrated PCIe subsystem which forms part of the Base Platform RevC. It incorporates an SMMUv3, a PCIe, an AHCI controller, and two PCI devices which wrap a pair of virtio PCI block devices. This model is written in LISA+.

Note

- You can include this component in a platform model, but Arm does not support using its subcomponents to create your own PCIe platform.
- The PCIe is not an implementation of any specific IP, but a functional, and limited, implementation of the PCIe standard.

`BasePlatformPCIRevC` is composed of the following model components:

`pci.pvbus2pci`

The bridge from the Programmer's View bus to the PCI bus.

`pci.pcidevice<n>`

A wrapper around the underlying virtio block device. There are two block devices in the system, 0 and 1.

`pci.pcivirtioblockdevice<n>`

The instances of the virtio block device component.

pci.ahci_pci.ahci

An AHCI_SATA component with the following features:

- Each AHCI controller supports up to 32 simulated SATA disks. The configuration parameter `image_path` is a comma-separated list of one or more disk images.
- Supports 64-bit addresses.
- Supports plain, linear disk images, but also works with sparse files.

Some interesting options are:

- If the following options are set to non-zero values, they print messages about the operation of the bridge. The higher the value, the more verbose the component is:

```
pci.pvbus2pci.diagnostics=0x0    # (int) default = '0x0': Diagnostics level: [0x0..0x4]
pci.pcidevice<N>.diagnostics=0x0 # (int) default = '0x0': Diagnostics level: [0x0..0x4]
```

- Each PCI device uses three BARs; one for config space, one for the MSI-X table structure and one for the MSI-X Pending Bit Array. Each of these can be configured to be 32 bits or 64 bits wide.

  The Bus and Device number can be configured for each PCI device. If the device advertises MSI-X, support can be configured.

```
pci.pcidevice<N>.bus=0x0        # (int ) default = '0x0' : Bus number for this device : [0x0..0xFF]
pci.pcidevice<N>.device=0x0     # (int ) default = '0x0' : Device number on this bus : [0x0..0x1F]
pci.pcidevice<N>.bar0_64bit=0   # (bool) default = '0' : If BAR 0 is 64 bits wide, if region size is nonzero
pci.pcidevice<N>.msix_support=0 # (bool) default = '0' : Enable device support for MSI-X
pci.pcidevice<N>.bar2_64bit=0   # (bool) default = '0' : If BAR 2 is 64 bits wide, if region size is nonzero
pci.pcidevice<N>.bar4_64bit=0   # (bool) default = '0' : If BAR 4 is 64 bits wide, if region size is nonzero
```

- The following option configures the image file that the virtio block device exposes:

```
pci.pcivirtioblockdevice<N>.image_path="" # (string) default = '' : image file path
```

- There are two `PVBusLogger`s in the `pvbus2pci` component. One is in front of the Configuration space and one is in front of the Device space:

```
FVP_Base_AEMv8A_AEMv8A-PCI.pci.pvbus2pci.devicelogger
FVP_Base_AEMv8A_AEMv8A-PCI.pci.pvbus2pci.cfglogger
```

- There is one `PVBusLogger` in the `pcidevice` component. This reports on DMA accesses by the PCI device:

```
FVP_Base_AEMv8A_AEMv8A-PCI.pci.pcidevice0.dmalogger
```

- There is a `PVBusLogger` downstream of the SMMU. This reports on the transactions after they have been transformed by the SMMU:

```
FVP_Base_AEMv8A_AEMv8A_PCI.pci.smmulogger
```

  For example, you can see all accesses to device space by adding the following options to the command line:

```
--plugin GenericTrace.so
-C TRACE.GenericTrace.trace-sources="FVP_Base_AEMv8A_AEMv8A-PCI.pci.pvbus2pci.devicelogger.*"
```

- To supply the AHCI controller with one or more SATA disk images, use the `image_path` parameter. For example:

```
-C pci.ahci_pci.ahci.image_path=disk1tb.img,disk8tb.img
```

Table 7-1 BasePlatformPCIRevC ports

Name	Protocol	Type	Description
`pvbus_address_map_s`	PVBus	Slave	Input port to service transactions based on the PVBus protocol.
`pvbus_address_map_m`	PVBus	Master	Output port to send out PVBus transactions that are not handled by this component.
`system_reset`	Signal	Slave	Input port to handle reset signals. It is used to reset the internal state of this component.
`sev_out`	Signal	Peer	Port to send out a notification of the occurrence of an event as sg::Signal to a peer.

Non-Confidential

Table 7-1 BasePlatformPCIRevC ports (continued)

Name	Protocol	Type	Description
`interrupts[224]`	Signal	Master	Array of output ports of type sg::Signal to send out interrupts generated by this component.
`pvbus_pci_dma_m`	PVBus	Master	Output port to send out any DMA (of PVBus protocol) accesses originating from this component.
`clk_in`	ClockSignal	Slave	Input port to connect to a ClockSignal provider.

Table 7-2 BasePlatformPCIRevC parameters

Name	Type	Allowed values	Default value	Description
`ITS0-base`	`uint64_t`	`0-0xFFFFFFFFFFFFFFFF`	`0x2f020000`	The ITS0 Base address.
`pci_smmuv3.mmu.SMMU_IDR1`	`uint32_t`	`0-0xFFFFFFFF`	`0xe739d10`	SMMU_IDR1.
`pci_smmuv3.mmu.smmu_msi_device_id`	`uint32_t`	`0-0xFFFFFFFF`	`0x10000`	When appropriately enabled, assume that MSIs that are generated by the SMMU are presented to the GIC with this DeviceID. See parameter `msi_attribute_transform` and `enable_device_id_checks`.

7.3 Base - memory

This section describes the memory of the Base Platform.

This section contains the following subsections:

- *7.3.1 Base - secure memory* on page 7-2967.
- *7.3.2 Base Platform memory map* on page 7-2967.
- *7.3.3 BaseR Platform memory map* on page 7-2969.
- *7.3.4 Base - DRAM* on page 7-2970.

7.3.1 Base - secure memory

Enable security checking on memory transactions by the TZC-400 by using the `bp.secure_memory` parameter.

Table 7-3 Secure and Non-secure access permissions

Security	`bp.secure_memory=false`	`bp.secure_memory=true`
S	Secure and Non-secure access permitted.	Secure access is permitted, Non-secure access aborts.
S/NS	Secure and Non-secure access permitted.	Secure and Non-secure access permitted.
P	Secure and Non-secure access permitted.	Access conditions are programmable by the TZC-400.

Note

The default state of the TZC-400 is to abort all accesses, even from Secure state.

Table 7-4 NSAIDs and filters that masters present to the TZC-400

Component	NSAID[u]	Filter
Cluster 0	9	0
Cluster 1	9	0
VirtIO	8	0
HDLCD0	2	2
CLCD	1	2

7.3.2 Base Platform memory map

The Base Platform memory map is based on the Versatile Express RS2 memory map with extensions.

Table 7-5 Base Platform memory map

Peripheral	Start address	Size	End address	Security
Trusted Boot ROM, secure flash, IntelStrataFlashJ3	`0x00_0000_0000`	64MB	`0x00_03FF_FFFF`	S

7.3.3 BaseR Platform memory map on page 7-2969

7.3.3 BaseR Platform memory map

The BaseR Platform copies its memory map from the Base Platform, but swaps the upper 2GB of address space with the lower 2GB.

[v] Base Platform RevC only
[w] You can configure the address of this region using parameters to the model. See *3.9.29 GICv3IRI* on page 3-746.
[x] Base Platform RevC AEMv8 FVPs only

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Therefore:

- Any peripherals in the memory range [0x0-0x7FFFFFFF] in the Base Platform are available at the same offset in the memory range [0x80000000-0xFFFFFFFF] in the BaseR Platform.
- Memory in the range [0x80000000-0xFFFFFFFF] in the Base Platform is available at the same offset in the range [0x0-0x7FFFFFFF] in the BaseR Platform. For example, DRAM in the Base Platform memory map starts at address 0x80000000. In the BaseR Platform, this is mapped to 0x0.

The reason for this difference is that in the Armv8-R architecture, the upper 2GB of memory does not have execution permissions by default. So if DRAM in the BaseR Platform memory map started at address 0x80000000, code could not run from DRAM after reset.

Related references

7.3.2 Base Platform memory map on page 7-2967

7.3.4 Base - DRAM

The multiple DRAM regions do not alias each other and form a contiguous 4PB area. The total amount of DRAM on the Base Platform system model is configurable. This ability affects where usable DRAM appears.

If the Base Platform system model has bp.dram_size=4, the default, then 2GB of DRAM is accessible at 0x00_8000_0000 to 0x00_FFFF_FFFF, and the remaining 2GB is accessible at 0x08_8000_0000 to 0x08_FFFF_FFFF.

If, instead, the Base Platform system model has bp.dram_size=8, then 2GB of DRAM is accessible at 0x00_8000_0000 to 0x00_FFFF_FFFF and the remaining 6GB is accessible at 0x08_8000_0000 to 0x09_FFFF_FFFF.

The default contents of RAM not otherwise written by the simulation is a repeating sequence of the following 64-bit value: 0xCFDFDFDFDFDFDFCF.

——— **Note** ———

Memory is allocated on demand, and performance degrades if very large amounts of memory are used.

7.6 Base - parameters

This section describes the parameters.

Table 7-9 Base Platform parameters

Parameter	Type	Allowed values	Default value	Description
`bp.dram_size`	`int`	2, 4, or 8-4000000	4	Size of main memory in gigabytes: 2, 4, or any value between 8 and 4000000.
`bp.proc_id`*n* [aa]	`uint32_t`	-	- [ab]	Processor ID for VE_SysRegs SYS_PROCID*n*.
`bp.secure_memory`	`bool`	`true`, `false`	`true`	The security state of the processor limits access to peripherals and RAM. [ac]
`bp.variant` [aa]	`uint32_t`	`0x0-0xF`	- [ab]	Board variant for VE_SysRegs SYS_ID.
`cache_state_modelled`	`bool`	`true`, `false`	`true`	Enable d-cache and i-cache state for all components.

Table 7-10 Base Platform debug parameters

Parameter	Type	Allowed values	Default value	Description
`dbgen`	`bool`	`true`, `false`	`true`	Debug authentication signal, **dbgen**.
`niden`	`bool`	`true`, `false`	`true`	Debug authentication signal, **niden**.
`spiden`	`bool`	`true`, `false`	`true`	Debug authentication signal, **spiden**.
`spniden`	`bool`	`true`, `false`	`true`	Debug authentication signal, **spniden**.

VE_SysRegs - parameters on page 7-2982

aa Some platforms do not expose this parameter.
ab Platform specific.
ac When loading an image on an EVS, you might see the following warning:

```
Warning: Base.cluster0.cpu0: Uncaught exception, thread terminated
                 In file: gen/scx_scheduler_mapping.cpp:523
                 In process: Base.thread_p_5 @ 0 s
```

This warning means that the image is attempting to run from DRAM, but this is access-controlled by the TZC_400 component. To disable security checking by the TZC_400, specify `-C Base.bp.secure_memory=false` when running the EVS.

7.7 Base - components

This section describes the components.

This section contains the following subsections:

- *7.7.1 Base - components - about* on page 7-2976.
- *7.7.2 Base - Base_PowerController component* on page 7-2976.
- *7.7.3 Base - DebugAccessPort component* on page 7-2980.
- *7.7.4 Base - simulator visualization component* on page 7-2981.
- *7.7.5 Base - VE_SysRegs component* on page 7-2982.

7.7.1 Base - components - about

These component models implement some of the functionality of the Versatile Express (VE) hardware.

A complete model implementation of a Base Platform system model includes both Base Platform-specific components and generic components such as buses and timers. To see a list of all the component instances in the model, run it with the `--list-instances` option.

7.7.2 Base - Base_PowerController component

This section describes the Base_PowerController component.

Base_PowerController - control interface

The Base_PowerController provides a basic register interface for software to control the power-up and power-down of cores in the cluster.

Identify cores in the system to the Base_PowerController by writing 24 bits in MPIDR format, providing the following levels of affinity:

Bits [23:16]
Affinity level 2.

Bits [15:8]
Affinity level 1.

Bits [7:0]
Affinity level 0.

Examples of affinity usage are `not_applicable`/`cluster`/`processor` and `cluster`/`processor`/`thread`.

Base_PowerController - parameters

This section describes the parameters.

Table 7-11 Base_PowerController parameters

Parameter	Allowed values	Default value	Description
`startup`	-	'0.0.0.*'	A comma-separated list of cores to power up at startup or system reset. Specify core affinities with a dotted-quad ('0.0.0.0' refers to cluster0.cpu0 and '0.0.1.1' refers to cluster1.cpu1). Use wildcards to indicate all cores at an affinity level ('0.0.0.*' indicates all cores in cluster 0 and is equivalent to '0.0.0.0,0.0.0.1,0.0.0.2,…,0.0.0.255').

Base_PowerController - registers

This section describes the registers.

Register summary

0x10	PSYSR	RW	0x---	32	Power Control SYS Status Register

PPOFFR

The *Power Control Processor Off Register* (PPOFFR) characteristics are: purpose, usage constraints, configurations, and attributes.

Purpose

Processor SUSPEND command when PWKUPR and the GIC are programmed appropriately to provide wakeup events from IRQ and FIQ events to that processor.

Usage constraints

Processor must make power-off requests only for itself.

Configurations

Available in all configurations.

Attributes

See the register summary table.

Table 7-13 Power Control Processor Off Register bit assignments

Bits	Name	Function
[31:24]	-	Reserved.
[23:0]	ID	MPIDR format affinity value of the processor to be switched off. Programming error if MPIDR != self.

PPONR

The *Power Control Processor On Register* (PPONR) characteristics are: purpose, usage constraints, configurations, and attributes.

Purpose

Brings up a processor from low-power mode.

Usage constraints

Processor must make power-on requests only for other powered-off processors in the system.

Configurations

Available in all configurations.

Attributes

See the register summary table.

[23:0]	ID	MPIDR format affinity value of the processor to be switched on. Programming error if MPIDR == self.

PCOFFR

The *Power Control Cluster Off Register* (PCOFFR) characteristics are: purpose, usage constraints, configurations, and attributes.

Purpose

Turns the cluster off.

Usage constraints

Cluster must make power-off requests only for itself.

Configurations

Available in all configurations.

Attributes

See the register summary table.

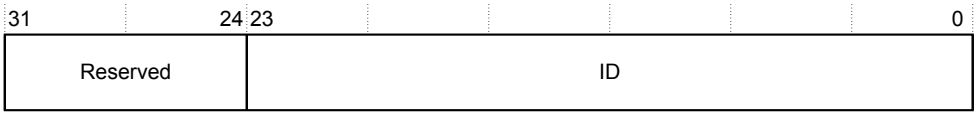

Figure 7-3 Power Control Cluster Off Register bit assignments

Table 7-15 Power Control Cluster Off Register bit assignments

Bits	Name	Function

[23:0]	ID	MPIDR format affinity value of powered-on processor in the cluster to be switched off. Programming error if MPIDR != self.

PWKUPR

The *Power Control Wakeup Register* (PWKUPR) characteristics are: purpose, usage constraints, configurations, and attributes.

Purpose

Configures whether wakeup requests from the GIC are enabled for this cluster.

Usage constraints

There are no usage constraints.

Configurations

Available in all configurations.

Attributes

See the register summary table.

Bits	Name	Function
[31]	WEN	If set, enables wakeup interrupts (return from SUSPEND) for this cluster.
[30:24]	-	Reserved.
[23:0]	ID	MPIDR format affinity value of processor whose Wakeup Enable bit is to be configured.

PSYSR

The *Power Control SYS Status Register* (PSYSR) characteristics are: purpose, usage constraints, configurations, and attributes.

Purpose

Provides information on the powered status of a given core. Software writes bits [23:0] for the required core and reads the value along with the associated status in bits [31:24].

Usage constraints

There are no usage constraints.

Configurations

Available in all configurations.

Attributes

See the register summary table.

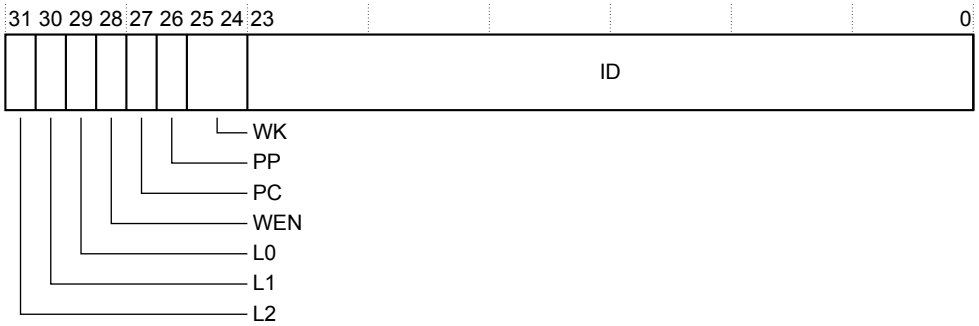

Figure 7-5 Power Control SYS Status Register bit assignments

Table 7-17 Power Control SYS Status Register bit assignments

Bits	Name	Function
[31]	L2	Read-only. A value of 1 indicates that affinity level 2 is active/on. If affinity level 2 is not implemented this bit is RAZ.
[30]	L1	Read-only. A value of 1 indicates that affinity level 1 is active/on. If affinity level 1 is not implemented this bit is RAZ.

Table 7-17 Power Control SYS Status Register bit assignments (continued)

Bits	Name	Function
[29]	L0	Read-only. A value of 1 indicates that affinity level 0 is active/on.
[28]	WEN	Read-only. A value of 1 indicates wakeup interrupts, return from SUSPEND, enabled for this processor. This is an alias of PWKUPR.WEN for this core.
[27]	PC	Read-only. A value of 1 indicates pending cluster off, the cluster enters low-power mode the next time it raises signal STANDBYWFIL2.
[26]	PP	Read-only. A value of 1 indicates pending processor off, the processor enters low-power mode the next time it raises signal STANDBYWFI.
[25:24]	WK	Read-only. Indicates the reason for LEVEL0 power on: **0b00** Cold power-on. **0b01** System reset pin. **0b10** Wake by PPONR. **0b11** Wake by GIC WakeRequest signal.
[23:0]	ID	MPIDR format affinity value.

7.7.3 Base - DebugAccessPort component

This section describes the DebugAccessPort component, a model of the *Debug Access Port* (DAP) for external debug connections.

DebugAccessPort - ports

This section describes the ports.

Table 7-18 DebugAccessPort ports

Name	Protocol	Type	Description
`ap_pvbus_m[2]`	PVBus	Master	Debug-access port to bus master channels 0 and 1.
`clock`	ClockSignal	Slave	Clock input.
`paddrdbg31`	Signal	Master	Output signal that indicates which master the access came from, AP0 or AP1. Configurable.

DebugAccessPort - parameters

This section describes the parameters.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 7-19 Base Platform DebugAccessPort parameters

Name	Type	Allowed values	Default value	Description
ap0_rom_base_address	uint64_t	0x0-0xffffffffffffffff	0x0	ROM base address for AP0.
ap1_rom_base_address	uint64_t	0x0-0xffffffffffffffff	0x0	ROM base address for AP1.
ap0_has_debug_rom	bool	true, false	false	AP0 has a Debug ROM.
ap1_has_debug_rom	bool	true, false	false	AP1 has a Debug ROM.
ap0_set_paddrdbg31	bool	true, false	false	Set paddrdbg31 signal during accesses on AP0.
ap1_set_paddrdbg31	bool	true, false	false	Set paddrdbg31 signal during accesses on AP1.

7.7.4 Base - simulator visualization component

This section describes the simulator visualization component.

Simulator visualization - parameters

This section describes the parameters.

Table 7-20 Simulator visualization parameters

Parameter	Allowed values	Default value	Description
cluster0_name	-	"Cluster0"	Cluster0 name.
cluster1_name	-	"Cluster1"	Cluster1 name.
cpu_name	-	""	Window title displays core name.
disable_visualisation	true, false	false	Enables or disables visualization.
rate_limit-enable	true, false	true	Rate limit simulation.
recorder.checkInstructionCount	true, false	true	Checks instruction count in recording file against actual instruction count during playback.
recorder.playbackFileName	-	""	Playback filename. An empty string disables playback.
recorder.recordingFileName	-	""	Recording filename. An empty string disables recording.
recorder.recordingTimeBase	-	0x5F5E100	Timebase in 1/s relative to the master clock. For example, 100 000 000 means 10 nanoseconds resolution simulated time for a 1Hz master clock. Used for recording. Higher values give a higher time resolution. Playback time base is always taken from the playback file.
recorder.verbose	-	0x0	Enables verbose messages. 0x0, no messages. 0x1, normal. 0x2, more detail.

Table 7-20 Simulator visualization parameters (continued)

Parameter	Allowed values	Default value	Description
`trap_key`	-	`0x4a`	Trap key that works with left **`Ctrl`** to toggle mouse display.
`window_title`	-	"Fast Models - CLCD %cpu%"	`cpu_name` replaces window title, `%cpu%`.

7.7.5 Base - VE_SysRegs component

This section describes the VE system registers component.

VE_SysRegs - parameters

This section describes the parameters.

Table 7-21 Base Platform VE_SysRegs parameters

Name	Type	Allowed values	Default value	Description
`exit_on_shutdown`	`bool`	`true`, `false`	`false`	`true`: if software uses the `SYS_CFGCTRL` function `SYS_CFG_SHUTDOWN`, then the simulator shuts down and exits.[ad]
`mmbSiteDefault`	`uint8_t`	`0x0-0x2`	`0x1`	Default MMB source. `0x0`, MB. `0x1`, DB1. `0x2`, DB2.
`tilePresent`	`bool`	`true`, `false`	`true`	Tile fitted.
`user_switches_value`	`uint32_t`	-	`0x0`	User switches.

7.8 Base - differences between the AEMv8-A FVP and core FVPs

This section describes implementation features of the core models that the AEMv8-A model does not implement, or implements with significant differences.

- The default value of `cache_state_modelled` is 0.
- Components `cluster0` and `cluster1` are implementation cores, not AEMs. All parameters in these components are the parameters of the core implementation, not the parameters of the AEM. The values of `bp.proc_id0` and `bp.proc_id1` have fixed values consistent with the cores and are not configurable.
- The core defines the memory map of register banks within the GIC region, and the map is therefore not configurable. The parameter `bp.variant` communicates the nature of the memory map to target software. The parameter has a fixed value consistent with the memory map of the core, and is not configurable. Because the core implementations contain a specific version of the GIC, the parameter `gicv3.gicv2-only` is not available. The following registers in the GIC distributor are given fixed values to match the implementation, and are not configurable: `gic_distributor.reg-base`, `gic_distributor.reg-base-per-distributor`, `gic_distributor.GICD-alias`, `gic_distributor.ITS0-base`.
- The GICv2 CPU IDs are contiguous in implementation platform models, because the number of cores in each cluster is fixed. They can be non-contiguous in the AEMv8-A Base Platform FVP because there is space for four cores in the cluster. You can configure fewer than four cores.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

7.9 Base - VE compatibility

Arm expects software that ran on the previous VE model to be compatible with this system model, but you might need to apply some configuration options.

This section contains the following subsections:

- *7.9.1 Base - VE compatibility - GICv2* on page 7-2985.
- *7.9.2 Base - VE compatibility - GICv3* on page 7-2985.
- *7.9.3 Base - VE compatibility - system global counter* on page 7-2986.
- *7.9.4 Base - VE compatibility - disable security* on page 7-2986.

7.9.1 Base - VE compatibility - GICv2

This system model uses GICv3 by default. You can configure it to support GICv2 or GICv2m.

To configure the model as GICv2m, set the following:

```
-C gicv3.gicv2-only=1                          \
-C cluster0.gic.GICD-offset=0x10000            \
-C cluster0.gic.GICC-offset=0x2F000            \
-C cluster0.gic.GICH-offset=0x4F000            \
-C cluster0.gic.GICH-other-CPU-offset=0x50000  \
-C cluster0.gic.GICV-offset=0x6F000            \
-C cluster0.gic.PERIPH-size=0x80000            \
-C cluster1.gic.GICD-offset=0x10000            \
-C cluster1.gic.GICC-offset=0x2F000            \
-C cluster1.gic.GICH-offset=0x4F000            \
-C cluster1.gic.GICH-other-CPU-offset=0x50000  \
-C cluster1.gic.GICV-offset=0x6F000            \
-C cluster1.gic.PERIPH-size=0x80000            \
-C gic_distributor.GICD-alias=0x2c010000
```

To configure the model as GICv2, set the following:

```
-C gicv3.gicv2-only=1                         \
-C cluster0.gic.GICD-offset=0x1000            \
-C cluster0.gic.GICC-offset=0x2000            \
-C cluster0.gic.GICH-offset=0x4000            \
-C cluster0.gic.GICH-other-CPU-offset=0x5000  \
-C cluster0.gic.GICV-offset=0x6000            \
-C cluster0.gic.PERIPH-size=0x8000            \
-C cluster1.gic.GICD-offset=0x1000            \
-C cluster1.gic.GICC-offset=0x2000            \
-C cluster1.gic.GICH-offset=0x4000            \
-C cluster1.gic.GICH-other-CPU-offset=0x5000  \
-C cluster1.gic.GICV-offset=0x6000            \
-C cluster1.gic.PERIPH-size=0x8000            \
-C gic_distributor.GICD-alias=0x2c010000
```

To configure MSI frames for GICv2m, parameters are available to set the base address and configuration of each of 16 possible frames. Eight frames are Secure and eight frames are Non-secure:

```
-C gic_distributor.MSI_S-frame0-base=ADDRESS  \
-C gic_distributor.MSI_S-frame0-min-SPI=NUM   \
-C gic_distributor.MSI_S-frame0-max-SPI=NUM
```

In this example, you can replace `MSI_S` with MSI_NS, for NS frames, and you can replace `frame0` with `frame1` to `frame7` for each of the possible 16 frames. If the base address is not specified for a given frame, or the SPI numbers are out of range, the corresponding frame is not instantiated.

7.9.2 Base - VE compatibility - GICv3

If a Base Platform includes an implementation of the GICv3 system registers, it is enabled by default.

The GIC distributor and CPU (core) interface have parameters that allow configuration of the model to match different implementation options. Use `--list-params` to get a full list. Configuration options for the GIC model must be available under:

- `cluster[0-`*n*`].gic.*`
- `cluster[0-`*n*`].gicv3.*`
- `gic_distributor.*`

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

7.9.3 Base - VE compatibility - system global counter

The Generic Timer registers of the cores do not operate by default.

The model provides a memory-mapped interface to the system global counter, and enables the free-running timer from reset. However, the architectural requirement is that such a counter is not enabled at reset. As a result, the Generic Timer registers of the cores do not operate unless either:

- Software enables the counter peripheral by writing the FCREQ[0] and EN bits in CNTCR at `0x2a430000`. Arm recommends this approach.
- The `-C bp.refcounter.non_arch_start_at_default=1` parameter is set. This approach provides compatibility with older software.

7.9.4 Base - VE compatibility - disable security

Base Platform FVPs have an enhanced security map for peripherals. By default, it restricts access to some peripherals.

Software must program the TZC-400 to make any accesses to DRAM, because the reset configuration blocks all accesses.

For backward compatibility with software that cannot program the TZC-400, this parameter setting permits all accesses regardless of security state:

```
-C bp.secure_memory=false
```

7.10 Base - unsupported VE features

This system model does not support software that relies on some features of the VE model.

This section contains the following subsections:

- *7.10.1 Base - unsupported VE features - memory aliasing at 0x08_00000000* on page 7-2987.
- *7.10.2 Base - unsupported VE features - boot ROM alias at 0x00_0800_0000* on page 7-2987.
- *7.10.3 Base - unsupported VE features - change of older parameters* on page 7-2987.

7.10.1 Base - unsupported VE features - memory aliasing at 0x08_00000000

The VE model permits an alias of the 2GB region of DRAM between addresses `0x80000000` and `0xFFFFFFFF` with addresses `0x08_00000000` to `0x08_7FFFFFFF`. The Base Platform does not have this alias and the region `0x08_00000000` to `0x08_7FFFFFFF` is Reserved.

7.10.2 Base - unsupported VE features - boot ROM alias at 0x00_0800_0000

In the VE model, the region at `0x00_0800_0000` was an alias of the trusted boot ROM at `0x00_0000_0000`. It is now an independent region of NOR flash.

7.10.3 Base - unsupported VE features - change of older parameters

Most parameter names have been simplified between the VE model and the Base Platform system model.

Components that were previously in *motherboard* or *daughterboard* groups are now in a *bp* group. The model does not recognize the previous parameter names.

In a change to the previous default, the Base Platform models the core cache state by default. You can disable this using a single parameter for all cores in the simulation, using the `cache_state_modelled` parameter.

```
-C cache_state_modelled=0
```

Note

Cortex Base Platforms do not model the cache state by default.

Chapter 8
Microcontroller Prototyping System 2

This chapter describes the MPS2 system model.

It contains the following sections:

- *8.1 MPS2 - about* on page 8-2989.
- *8.2 MPS2 platform types* on page 8-2990.
- *8.3 MPS2 - memory maps* on page 8-2991.
- *8.4 MPS2 - interrupt assignments* on page 8-2997.
- *8.5 MPS2 - differences between models and hardware* on page 8-2998.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

8.1 MPS2 - about

The *Microcontroller Prototyping System 2* (MPS2) *Fixed Virtual Platform* (FVP) models implement a subset of the functionality of the Arm Versatile Express V2M-MPS2 and V2M-MPS2+ motherboard hardware.

For a list of the MPS2 Platform FVPs and the instances in them, see *MPS2 Platform FVPs* in the FVP Reference Guide.

LISA+ source and project files for some MPS2 FVP examples are available in the `$PVLIB_HOME/examples/LISA/FVP_MPS2/` directory.

MPS2 platforms include MPS2-specific components and generic components, such as buses and timers. They are sufficiently accurate to boot the Keil® RTX RTOS and run the Blinky application.

To list the model parameters and their types, allowed values, default values, and descriptions, run the model with the `--list-params` argument.

8.2 MPS2 platform types

Configure the MPS2 FVP platform type using the `fvp_mps2.platform_type` parameter.

It has the following possible values:

0 This value is the default. The FVP acts as a V2M-MPS2 system, with the additions for v8-M, as specified in the Armv8-M MPS2 System Specification (ECM 0468897), v0.8. This specification is confidential and is available only to licensed Arm customers. For details, contact your Arm support representative.

1 The FVP acts as an IoT Kit on an MPS2+ board. For details, see the following documents:

- *Cortex®-M23 processor Arm®v8-M IoT Kit User Guide (ECM 0635473)*.
- *Cortex®-M33 processor Arm®v8-M IoT Kit User Guide (ECM 0601256)*.

2 The FVP acts as an Arm CoreLink SSE-200 Subsystem on an MPS2+ board. For details, see *AN521 - Example SSE-200 Subsystem for MPS2+ Application Note*.

8.3 MPS2 - memory maps

This section describes the MPS2 memory maps.

This section contains the following subsections:

- *8.3.1 MPS2 - memory map for models without the Arm®v8-M additions* on page 8-2991.
- *8.3.2 MPS2 - memory map for models with the Arm®v8-M additions* on page 8-2992.

8.3.1 MPS2 - memory map for models without the Arm®v8-M additions

This section describes the MPS2 memory map for older cores, without the Armv8-M additions.

For standard Arm peripherals, see the TRM for that device.

Note

- A bus error is generated for accesses to memory areas not shown in this table.
- Any memory device that does not occupy the total region is aliased within that region.

Table 8-1 Overview of MPS2 memory map

Description	Modeled	Address range
Ethernet[ae]	Partial	0xA0000000-0xA000FFFF
PSRAM (16MB)	Yes	0x60000000-0x60FFFFFF
VGA Image (512x128) (AHB)	Yes	0x41100000-0x4110FFFF
VGA Console (AHB)	Yes	0x41000000-0x4100FFFF
Block RAM (boot time)[af]	Yes	0x40200000-0x402FFFFF
Reserved	N/A	0x40030000-0x401FFFFF
SCC register	Yes	0x4002F000-0x4002FFFF
Reserved	N/A	0x40029000-0x4002EFFF
FPGA System Control & I/O, APB	Yes	0x40028000-0x40028FFF
Reserved	N/A	0x40025000-0x40027FFF
Audio I2S, APB	Partial	0x40024000-0x40024FFF
SBCon (Audio Configuration), APB	Yes	0x40023000-0x40023FFF
SBCon (Touch for LCD module), APB	Partial	0x40022000-0x40022FFF
PL022 (SPI for LCD module), APB	Partial	0x40021000-0x40021FFF
PL022 (SPI), APB	Yes	0x40020000-0x40020FFF
CMSDK system controller	Yes	0x4001F000-0x4001FFFF
Reserved for extra GPIO & other AHB peripherals	N/A	0x40012000-0x4001EFFF
CMSDK AHB GPIO #1	Yes	0x40011000-0x40011FFF
CMSDK AHB GPIO #0	Yes	0x40010000-0x40010FFF
CMSDK APB subsystem	Yes	0x40000000-0x4000FFFF
Reserved	N/A	0x20800000-0x20FFFFFF

ae Through ahb_to_extmem16. Offset 0x0-0x0FE for CSRs, 0x100-0x1FE for FIFO.
af Reserved 64KB, 16K implemented. This memory is wrapped through the region.

Table 8-1 Overview of MPS2 memory map (continued)

Description	Modeled	Address range
ZBTSRAM 2 & 3 (2x32-bit)[ag]	Yes	`0x20000000-0x207FFFFF`
Reserved	N/A	`0x01010000-0x1FFFFFFF`
Reserved	N/A	`0x00800000-0x00FFFFFF`
ZBTSRAM 1 (64-bit)[ah]	Yes	`0x00400000-0x007FFFFF`
ZBTSRAM 1 (64-bit)	Yes	`0x00004000-0x003FFFFF`
Mappable memory[ai]	Yes	`0x00000000-0x00003FFF`

8.3.2 MPS2 - memory map for models with the Arm®v8-M additions

This section describes the MPS2 memory map for newer cores, with the Armv8-M additions.

For standard Arm peripherals, see the TRM for that device.

Note

- A bus error is generated for accesses to memory areas not shown in this table.
- Any memory device that does not occupy the total region is aliased within that region.

Table 8-2 Overview of MPS2 memory map

Description	IDAU	Modeled	Address range
ZBTSRAM 1 (4MB) in *Non-secure* (NS) world. Reserved 8MB, only 4MB implemented. VTOR initialization value to be configurable in LAC). Second half (4MB) aliased to first half (4MB).	NS	Yes	`0x00000000-0x007FFFFF`
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI.	NS	N/A	`0x00800000-0x0FFFFFFF`
ZBTSRAM 1 (4MB) in *Secure* (S) world. Reserved 8MB, only 4MB implemented. Second half (4MB) aliased to first half (4MB).	S	Yes	`0x10000000-0x107FFFFF`
Not used. Default expansion port: bus error.	S	N/A	`0x10800000-0x1FFFFFFF`
ZBTSRAM 2&3 (4MB) in NS world. Reserved 8MB, only 4MB implemented. For IoT subsystems, different cores have different memory sizes. Second half (4MB) aliased to first half (4MB).	NS	Yes	`0x20000000-0x207FFFFF`
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI.	NS	N/A	`0x20800000-0x20FFFFFF`
PSRAM (16MB)	NS	Yes	`0x21000000-0x21FFFFFF`
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI.	NS	N/A	`0x22000000-0x23FFFFFF`
MTB SRAM. Reserved 64KB, only 16KB implemented. Aliased to `0x0` for booting in RTL simulation.	NS	Yes	`0x24000000-0x2400FFFF`
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI.	NS	N/A	`0x24010000-0x2FFFFFFF`

[ag] Reserved 8MB, 4MB available. The two SRAM blocks are interleaved.
[ah] Wrapped. Only 4MB ZBTSRAM fitted.
[ai] When `zbt_boot_ctrl` = 0, ZBTSRAM 1 is mapped to this region. Otherwise, `Remap_ctrl` = 0 maps Block RAM and `Remap_ctrl` = 1 maps ZBTSRAM 1. The V2M-MPS2 board microcontroller controls the zbt_boot_ctrl signal. The zbt_boot_ctrl signal overrides the boot option to enable use of the ZBT RAM.

8.4 MPS2 - interrupt assignments

This section describes the interrupt assignments.

Table 8-3 Interrupt assignments

Number	Interrupt
NMI	Watchdog.
0	UART 0 receive interrupt.
1	UART 0 transmit interrupt.
2	UART 1 receive interrupt.
3	UART 1 transmit interrupt.
4	UART 2 receive interrupt.
5	UART 2 transmit interrupt.
6	GPIO 0, 2 combined interrupt.
7	GPIO 1, 3 combined interrupt.
8	Timer 0.
9	Timer 1.
10	Dual Timer.
11	SPI #1 (LCD). The LCD had shared SPI #0 and SPI #1.
12	UART overflow (0, 1, 2).
13	Ethernet.
14	Audio I2S.
15	Touch screen.
16-31	GPIO 0 individual interrupts.
32-47	GPIO 1 individual interrupts. Armv8-M additions.
48	SPI #0. Armv8-M addition.
49	Reserved.
50	TRNG (Secure). Armv8-M addition.
51	Unique ID and Secure storage (Secure). Armv8-M addition.
52	DMA controller #0.
53	DMA controller #1.
54	SecureErrorIRQ. Armv8-M addition.[aj]

[aj] Detection of Non-secure access to Secure address spaces (including other bus masters). Generated by Memory Gating unit, Peripheral Gating units, bus gasket for legacy bus masters.

8.5 MPS2 - differences between models and hardware

This section describes the features of the hardware that the models do not implement, or implement with significant differences.

MPS2 implements most devices. Some peripherals have minimal implementations:

- The Ethernet module in the model is a LAN91C111. The hardware provides a LAN9220.
- The Audio module is RAZ/WI.
- The STMPE811 touchscreen module only reports touch positions.
- The model of the Ampire LCD module supports a subset of the graphics modes.

You can display images and text on an emulated VGA output, images on the LCD, and text on the UART.

Arm®v8-M

The model does not support MTB, ETM, and TPIU. MTB RAM is absent.

In the Memory Gating Unit, the model provides a configurable block size. For performance reasons, the minimum block size in the model is 4096 bytes. Hardware and later models might allow smaller block sizes. Software must use the BLK_CFG register to determine block size.

Timing

FVPs enable software applications to run in a functionally accurate simulation. However, because of the relative balance of fast simulation speed over timing accuracy, there are situations where the models might behave unexpectedly.

If your code interacts with real world devices such as timers and keyboards, data arrives in the modeled device in real world, or wall clock, time. However, simulation time can run faster than the wall clock. So, a single key press might be interpreted as several repeated key presses, or a single mouse click might be interpreted as a double click.

To avoid this mismatch, the FVPs provide the Rate Limit feature. Enabling Rate Limit forces the model to run at wall clock time. For interactive applications, Arm recommends enabling Rate Limit. Use the Rate Limit button in the CLCD display or the `rate_limit-enable` model instantiation parameter.

Chapter 9
Versatile Express Model

This chapter describes the components of Fast Models that are specific to the Versatile Express (VE) model of the hardware platform.

It contains the following sections:

- *9.1 VE - about* on page 9-3000.
- *9.2 VE memory map for Cortex®-A series* on page 9-3002.
- *9.3 VE memory map for Cortex®-R series* on page 9-3005.
- *9.4 VE - interrupt assignments for Cortex®-A series* on page 9-3006.
- *9.5 VE - interrupt assignments for Cortex®-R series* on page 9-3007.
- *9.6 VE parameters* on page 9-3009.
- *9.7 VE - components* on page 9-3011.
- *9.8 Differences between the VE hardware and the system models* on page 9-3017.

Non-Confidential

9.1 VE - about

The Versatile Express (VE) FVPs are functionally accurate system models for software execution. A range of VE FVPs are supplied as standalone products and as examples in Fast Models.

For a list of the VE Platform FVPs and the instances in them, see *VE Platform FVPs* in the FVP Reference Guide.

LISA+ source and project files for the VE FVP examples are available in the `$PVLIB_HOME/examples/LISA/FVP_VE/` directory.

Arm produces the VE hardware development platform. The Motherboard Express *µAdvanced Technology Extended* (ATX) V2M-P1 is the basis for an integrated software and hardware development system. This system is also based on the Arm *Symmetric MultiProcessor* (SMP) system architecture.

The VE FVPs are system models implemented in software. Each model contains:

- A virtual implementation of the Arm VE motherboard.
- A single daughterboard containing one or more Arm processors.
- Associated interconnections.

The motherboard provides:

- Peripherals for multimedia or networking environments.
- Access to motherboard peripherals and functions through a static memory bus to simplify access from daughterboards.
- High-performance PCI-Express slots for expansion cards.
- Consistent memory maps with different processor daughterboards that simplify software development and porting.
- Automatic detection and configuration of attached CoreTile Express and LogicTile Express daughterboards.
- Automatic shutdown for over-temperature or power supply failure.
- No system power-on for unconfigurable daughterboards.
- Power sequencing of system.
- Drag and drop file updating of configuration files.
- Support of either a 12V power-supply unit or an external ATX power supply.
- Support of FPGA and processor daughterboards to provide custom peripherals, early access to processor designs, or production test chips.

Note

Arm bases the models on the VE platform memory map, but does not intend them to be accurate representations of a specific VE hardware revision. The VE FVPs support selected peripherals. The models are sufficiently complete and accurate to boot the same operating system images as the VE hardware.

VE FVPs provide functionally accurate models for software execution. However, the models sacrifice timing accuracy to increase simulation speed. Key deviations from hardware are:

- Approximate timing.
- Simplified buses.
- No implementations for processor caches and the related write buffers.

9.2 VE memory map for Cortex®-A series

The global memory map for the Cortex-A series VE model is based on the hardware Versatile Express RS1 memory map with the RS2 extensions.

Note

The VE FVP implementation of memory does not require the memory controller to have the correct values. If you run applications on hardware, ensure that the memory controller is set up properly. Otherwise, applications that run on the FVP might fail on hardware.

Table 9-1 Cortex-A series platform model memory map

Graphics space	No	0x00_2D000000-0x00_2D00FFFF	-
System SRAM	Yes	0x00_2E000000-0x00_2EFFFFFF	64KB
Ext AXI	No	0x00_2F000000-0x00_7FFFFFFF	-
4GB DRAM (in 32-bit address space)[al]	Yes	0x00_80000000-0x00_FFFFFFFF	2GB
Unused	-	0x01_00000000-0x07_FFFFFFFF	-
4GB DRAM (in 36-bit address space)[al]	Yes	0x08_00000000-0x08_FFFFFFFF	4GB
Unused	-	0x09_00000000-0x7F_FFFFFFFF	-
4GB DRAM (in 40-bit address space)[al]	Yes	0x80_00000000-0xFF_FFFFFFFF	4GB

The model has a `secure_memory` option. When you enable this option, the memory map changes for a number of peripherals.

[ak] The private peripheral region address `0x2c000000` is mapped in this region. You can use the parameter PERIPHBASE to map the peripherals to a different address.

[al] The model contains a single 4GB block of DRAM, which is aliased across the three different regions. In other words, it can be accessed at three different physical addresses, which are all mapped to the same area of DRAM. For example, a write to address `0x00_80000000` will be visible to reads at address `0x80_00000000`. The lowest of the physical address regions is only 2GB in size.

9.6 VE parameters

This section describes the VE FVP instantiation parameters.

This section contains the following subsections:

- *9.6.1 VE instantiation parameters* on page 9-3009.
- *9.6.2 VE secure memory parameters* on page 9-3009.
- *9.6.3 VE switch S6* on page 9-3009.

9.6.1 VE instantiation parameters

This section describes the instantiation parameters for VE models.

Table 9-9 VE instantiation parameters

Component	Parameter	Type	Allowed values	Default value	Description
`ve_sysregs`	`user_switches_value`	Integer	See *9.6.3 VE switch S6* on page 9-3009.	`0`	Switch S6 setting.
`flashloader0`	`fname`	String	Valid filename	`""`	Path to flash image file.
`flashloader1`	`fname`	String	Valid filename	`""`	Path to flash image file.
`mmc`	`p_mmc_file`	String	Valid filename	`mmc.dat`	Multimedia card filename.
`pl111_clcd`	`pixel_double_limit`	Integer	-	`0x12c`	Sets threshold in horizontal pixels below which pixels sent to framebuffer are doubled in size in both dimensions.
`sp810_sysctrl`	`use_s8`	Boolean	`true`, `false`	`false`	Indicates whether to read `boot_switches_value`.

9.6.2 VE secure memory parameters

This section describes the VE FVP secure memory parameters that you can change when you start the model.

Table 9-10 VE secure memory parameters

Name	Type	Allowed values	Default value	Description
`daughterboard.secure_memory`	Boolean	`true`, `false`	`false`	**`false`** The platform behaves as before. **`true`** The address space is segregated according to the security mode of the core. Some memory blocks near the bottom of the address space are available to Secure transactions only. The rest of the address space is available to Non-secure transactions only.

9.6.3 VE switch S6

This section describes the behavior and default positions of the VE system model switch.

Switch S6 is equivalent to the Boot Monitor configuration switch on the VE hardware.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

If you have the standard Arm Boot Monitor flash image loaded, the setting of switch S6-1 changes what happens on model reset. Otherwise, the function of switch S6 is implementation dependent.

To write the switch position directly to the S6 parameter in the model, you must convert the switch settings to an integer value from the equivalent binary, where 1 is on and 0 is off.

Table 9-11 Default positions of VE system model switch

Switch	Default position	Function in default position
S6-1	OFF	Displays prompt permitting Boot Monitor command entry after system start.
S6-2	OFF	See STDIO redirection, below.
S6-3	OFF	See STDIO redirection, below.
S6-4 to S6-8	OFF	Reserved for application use.

If S6-1 is in the ON position, the Boot Monitor executes the boot script that was loaded into flash. If there is no script, the Boot Monitor prompt is displayed.

The settings of S6-2 and S6-3 affect STDIO source and destination on model reset.

Table 9-12 STDIO redirection

S6-2	S6-3	Output	Input	Description
OFF	OFF	UART0	UART0	STDIO autodetects whether to use semihosting I/O or a UART. If a debugger is connected, STDIO is redirected to the debugger output window, otherwise STDIO goes to UART0.
OFF	ON	UART0	UART0	STDIO is redirected to UART0, regardless of semihosting settings.
ON	OFF	CLCD	Keyboard	STDIO is redirected to the CLCD and keyboard, regardless of semihosting settings.
ON	ON	CLCD	UART0	STDIO output is redirected to the LCD and input is redirected to UART0, regardless of semihosting settings.

9.7 VE - components

A complete model implementation of the VE platform includes both VE-specific components and generic components, such as buses and timers.

To see a list of all the component instances in the model, run it with the `--list-instances` option.

The generic components are documented in *Chapter 3 Fast Models components* on page 3-87.

This section contains the following subsections:

- *9.7.1 VEVisualisation component* on page 9-3011.
- *9.7.2 VE_SysRegs component* on page 9-3015.

9.7.1 VEVisualisation component

This section describes the VEVisualisation component.

VEVisualisation - about

This component can generate events from the host mouse or keyboard when the visualization window is in focus. For example, you can toggle the switch elements from the visualization window.

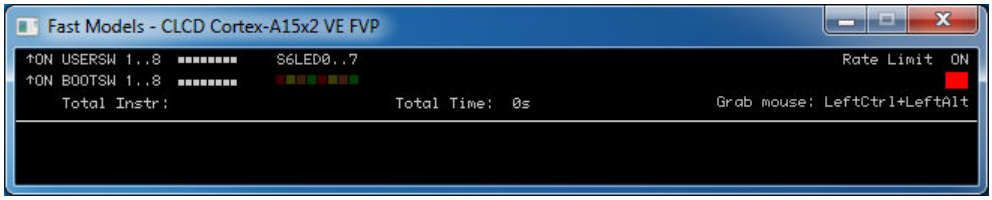

Figure 9-2 Startup VE FVP CLCD visualization window

When a suitable application or system image loads, and configures the PL111_CLCD controller registers, the window expands to show the contents of the frame buffer.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

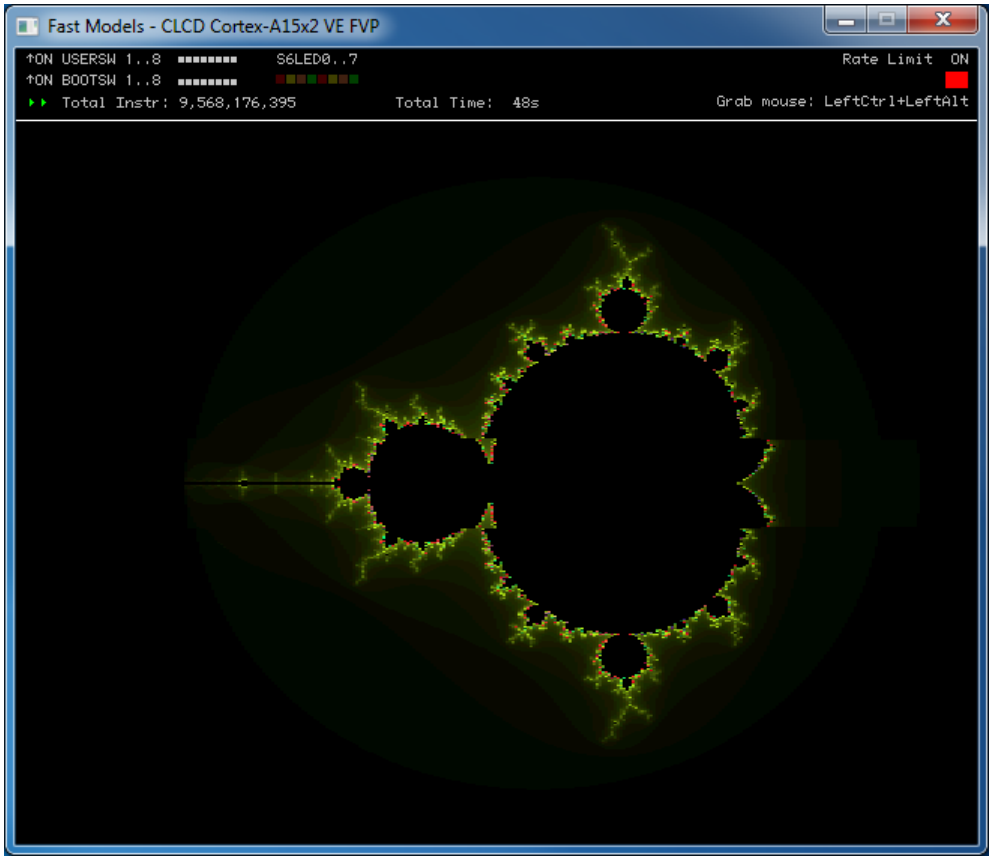

Figure 9-3 VE FVP CLCD with brot.axf image

The VEVisualisation LISA+ component can be found in the `$PVLIB_HOME/examples/LISA/FVP_VE/LISA/` directory.

Note

Using this component can reduce simulation performance. Use the `rate_limit-enable` parameter to control simulation speed.

VEVisualisation - ports

This section describes the VEVisualisation component ports.

Table 9-13 VEVisualisation ports

Name	Protocol	Type	Description
`boot_switch`	ValueState	Slave	Provides state for the eight Boot DIP switches on the right side of the CLCD status bar.
`clock_50Hz`	ClockSignal	Slave	50Hz clock input.
`cluster0_ticks[4]`	InstructionCount	Slave	Connection from processor model in cluster 0 to show its current instruction count.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 9-13 VEVisualisation ports (continued)

Name	Protocol	Type	Description
`cluster1_ticks[4]`	InstructionCount	Slave	Connection from processor model in cluster 1 to show its current instruction count.
`daughter_leds`	ValueState	Slave	A read/write port to read and set the value of the LEDs. 1 bit per LED, LSB left-most, up to 32 LEDs available. The LEDs appear only when parameter `daughter_led_count` is set to nonzero.
`daughter_user_switches`	ValueState	Slave	A read port to return the value of the daughter user switches. Write to this port to set the value of the switches, and use during reset only. LSB is left-most, up to 32 switches available.
`keyboard`	KeyboardStatus	Master	Output port providing key change events when the visualization window is in focus.
`lcd`	LCD	Slave	Connection from a CLCD controller for visualization of the frame buffer.
`lcd_layout`	LCDLayoutInfo	Master	Layout information for alphanumeric LCD display.
`leds`	ValueState	Slave	Displays state using the eight colored LEDs on the status bar.
`mouse`	MouseStatus	Master	Output port providing mouse movement and button events when the visualization window is in focus.
`touch_screen`	MouseStatus	Master	Provides mouse events when the visualization window is in focus.
`user_switches`	ValueState	Slave	Provides state for the eight User DIP switches on the left side of the CLCD status bar, equivalent to switch S6 on VE hardware.

VEVisualisation - parameters

This section describes the configuration parameters.

The syntax to use in a configuration file or on the command line is:

`motherboard.vis.`*`parameter=value`*

Note

Setting the `rate_limit-enable` parameter to `true` (the default) prevents the simulation from running too fast on fast workstations and enables timing loops and mouse actions to work correctly. However, it reduces the overall simulation speed. If your priority is high simulation speed, set `rate_limit-enable` to `false`.

Table 9-14 VEVisualisation parameters

Name	Type	Allowed values	Default value	Description
`cluster0_name`	`string`	-	Cluster0	Label for cluster 0 performance values.
`cluster1_name`	`string`	-	Cluster1	Label for cluster 1 performance values.
`cpu_name`	`string`	-	-	Processor name displayed in window title.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 9-14 VEVisualisation parameters (continued)

Name	Type	Allowed values	Default value	Description
daughter_led_count	int	0-32	0	Set to nonzero to display up to 32 LEDs. See the daughter_leds port.
daughter_user_switch_count	int	0-32	0	Set this parameter to display up to 32 switches. See the daughter_user_switches port.
disable_visualisation	bool	true, false	false	Disable the VEVisualisation component on model startup.
rate_limit-enable	bool	true, false	true	Restrict simulation speed so that simulation time more closely matches real time rather than running as fast as possible.
recorder.checkInstructionCount	bool	true, false	true	Check instruction count in recording file against actual instruction count during playback.
recorder.playbackFileName	string	-	""	Playback filename (empty string disables playback).
recorder.recordingFileName	string	-	""	Recording filename (empty string disables recording).
recorder.recordingTimeBase	int	-	0x5F5E100	Timebase in 1/s (relative to the master clock (where 100000000 means 10 nanoseconds resolution simulated time for a 1Hz master clock)) for recording (higher values give higher time resolution, playback timebase is always taken from the playback file).
recorder.verbose	int	-	0x0	Enable verbose messages (1=normal, 2=even more).
trap_key	int	Valid ATKeyCode key value[ap]	74, 0x4A[aq]	Trap key that works with left **Ctrl** key to toggle mouse display.
window_title	string	-	"Fast Models - CLCD %cpu%"	Window title (cpu_name replaces %cpu%).

VEVisualisation - verification and testing

This component passes tests by use as an I/O device for booting Linux and other operating systems.

VEVisualisation - performance

Arm expects the elements in the status bar to have little effect on the performance of PV systems. However, applications that often redraw the contents of the frame buffer might incur overhead through GUI interactions on the host OS.

VEVisualisation - library dependencies

This component relies on the *Simple DirectMedia Layer* (SDL) libraries, specifically libSDL2-2.0.so.0.4.0.

[ap] See the header file, $PVLIB_HOME/include/components/KeyCode.h for a list of ATKeyCode values.
[aq] This is equivalent to the left **Alt** key, so pressing Left Alt and Left Ctrl simultaneously toggles the mouse display.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

This library is bundled with the Model Library and is also available as an rpm for Red Hat Enterprise Linux. On Windows, the library is called `SDL2.dll`.

Simple DirectMedia Layer Cross-platform Development Library

9.7.2 VE_SysRegs component

This section describes the VE system registers component.

VE_SysRegs - about

This LISA+ component is a model of the VE status and system control registers.

VE_SysRegs - ports

This section describes the ports.

Table 9-15 VE_SysRegs ports

Name	Protocol	Type	Description
`cb[0-1]`	`VECBProtocol`	Master	The *Configuration Bus* (CB) controls the power and reset sequence.
`clock_24Mhz`	`ClockSignal`	Slave	Reference clock for internal counter register.
`clock_100Hz`	`ClockSignal`	Slave	Reference clock for internal counter register.
`clock_CLCD`	`ClockRateControl`	Master	The clock for the LCD controller.
`lcd`	`LCD`	Master	Multimedia bus interface output to the LCD.
`leds`	`ValueState`	Master	Displays state of the SYS_LED register using the eight colored LEDs on the status bar.
`mmb[0-2]`	`LCD`	Slave	Multimedia bus interface input.
`mmc_card_present`	`StateSignal`	Slave	Indicates the presence of a *MultiMedia Card* (MMC) image.
`pvbus`	`PVBus`	Slave	Slave port for connection to PV bus master/decoder.
`system_reset`	`Signal`	Master	Signal to the platform a complete system reset. Writes to the System Configuration registers can trigger the reset signal.
`user_switches`	`ValueState`	Master	Provides state for the eight User DIP switches on the left side of the CLCD status bar, equivalent to switch S6 on VE hardware.

VE_SysRegs - parameters

This section describes the parameters.

Table 9-16 VE_SysRegs parameters

Name	Type	Default value	Description
`exit_on_shutdown`	`bool`	`false`	Used to shut down the system. When `true`, if software uses the `SYS_CFGCTRL` function `SYS_CFG_SHUTDOWN`, then the simulator shuts down and exits.[ar]
`mmbSiteDefault`	`int`	`0x1`	Default MultiMedia Bus (MMB) source (0=motherboard, 1=daughterboard 1, 2=daughterboard 2).
`sys_proc_id0`	`int`	`0x0c000000`	Processor ID register at CoreTile Express Site 1.
`sys_proc_id1`	`int`	`0xff000000`	Processor ID at CoreTile Express Site 2.

[ar] For more information on the `SYS_CFGCTRL` function values, see the *Motherboard Express µATX V2M-P1 Technical Reference Manual*.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 9-16 VE_SysRegs parameters (continued)

Name	Type	Default value	Description
tilePresent	bool	true	Tile fitted.
user_switches_value	int	0	User switches.

VE_SysRegs - registers

This section describes the configuration registers.

Table 9-17 VE_SysRegs registers

Name	Offset	Access	Description
SYS_ID	0x00	Read/write	System identity.
SYS_SW	0x04	Read/write	Bits[7:0] map to switch S6.
SYS_LED	0x08	Read/write	Bits[7:0] map to user LEDs.
SYS_100HZ	0x24	Read only	100Hz counter.
SYS_FLAGS	0x30	Read/write	General purpose flags.
SYS_FLAGSCLR	0x34	Write only	Clear bits in general purpose flags.
SYS_NVFLAGS	0x38	Read/write	General purpose non-volatile flags.
SYS_NVFLAGSCLR	0x3C	Write only	Clear bits in general purpose non-volatile flags.
SYS_MCI	0x48	Read only	MCI.
SYS_FLASH	0x4C	Read/write	Flash control.
SYS_CFGSW	0x58	Read/write	Boot select switch.
SYS_24MHZ	0x5C	Read only	24MHz counter.
SYS_MISC	0x60	Read/write	Miscellaneous control flags.
SYS_DMA	0x64	Read/write	DMA peripheral map.
SYS_PROCID0	0x84	Read/write	Processor ID.
SYS_PROCID1	0x88	Read/write	Processor ID.
SYS_CFGDATA	0xA0	Read/write	Data to be read/written from/to motherboard controller.
SYS_CFGCTRL	0xA4	Read/write	Control data transfer to motherboard controller.
SYS_CFGSTAT	0xA8	Read/write	Status of data transfer to motherboard.

VE_SysRegs - verification and testing

This component was tested as part of the Versatile Express model.

9.8 Differences between the VE hardware and the system models

This section describes features of the hardware that the models do not implement, or implement with significant differences.

This section contains the following subsections:

- *9.8.1 Memory map* on page 9-3017.
- *9.8.2 Memory aliasing* on page 9-3017.
- *9.8.3 VE hardware features absent* on page 9-3017.
- *9.8.4 VE hardware features different* on page 9-3017.
- *9.8.5 Timing considerations for the VE FVPs* on page 9-3018.

9.8.1 Memory map

The model represents the memory map of the hardware VE platform, but is not an accurate representation of a specific revision.

The memory map in the supplied model is sufficiently complete and accurate to boot the same operating system images as for the VE hardware.

In the memory map, memory regions that are not explicitly occupied by a peripheral or by memory are unmapped. This includes regions otherwise occupied by a peripheral that is not implemented, and those areas that are documented as reserved. Accessing these regions from the host processor results in the model presenting a warning.

9.8.2 Memory aliasing

The model implements address-space aliasing of the DRAM. This means that the same physical memory locations are visible at different addresses.

The lower 2GB of the DRAM is accessible at `0x00_80000000`. The full 4GB of DRAM is accessible at `0x08_00000000` and again at `0x80_00000000`. The aliasing of DRAM then repeats from `0x81_00000000` up to `0xFF_FFFFFFFF`.

9.8.3 VE hardware features absent

These FVPs do not implement the following features of the hardware:

- Two-wire serial bus interfaces.
- USB interfaces.
- PCI Express interfaces.
- Compact flash.
- *Digital Visual Interface* (DVI).
- Debug and test interfaces.
- *Dynamic Memory Controller* (DMC).
- *Static Memory Controller* (SMC).

9.8.4 VE hardware features different

These Fixed Virtual Platforms only partially implement some features of the hardware.

The partially implemented features might not work as you expect. Check the model release notes for the latest information.

Sound

The VE FVPs implement the PL041 AACI PrimeCell and the audio CODEC as in the VE hardware, but with a limited number of sample rates.

9.8.5 Timing considerations for the VE FVPs

The Rate Limit feature matches simulation time to wall-clock time.

The *Fixed Virtual Platforms* (FVPs) provide an environment that enables running software applications in a functionally-accurate simulation. However, because of the relative balance of fast simulation speed over timing accuracy, there are situations where the models might behave unexpectedly.

When code interacts with real world devices like timers and keyboards, data arrives in the modeled device in real world, or wall clock, time, but simulation time can run much faster than the wall clock. This means that a single key press might register as several repeated key presses, or a single mouse click incorrectly becomes a double click.

Enabling Rate Limit, either using the Rate Limit button in the CLCD display, or the `rate_limit-enable` model instantiation parameter, forces the model to run at wall-clock time. This avoids issues with two clocks running at significantly different rates. For interactive applications, Arm recommends enabling Rate Limit.
