Release Information

Document History

Issue	Date	Confidentiality	Change
A	31 May 2014	Non-Confidential	New document for Fast Models v9.0, from DUI0423Q for v8.3.
B	30 November 2014	Non-Confidential	Update for v9.1.
C	28 February 2015	Non-Confidential	Update for v9.2.
D	31 May 2015	Non-Confidential	Update for v9.3.
E	31 August 2015	Non-Confidential	Update for v9.4.
F	30 November 2015	Non-Confidential	Update for v9.5.
G	29 February 2016	Non-Confidential	Update for v9.6.
H	31 May 2016	Non-Confidential	Update for v10.0.
I	31 August 2016	Non-Confidential	Update for v10.1.
J	11 November 2016	Non-Confidential	Update for v10.2.
K	17 February 2017	Non-Confidential	Update for v10.3.
1100-00	31 May 2017	Non-Confidential	Update for v11.0. Document numbering scheme has changed.
1101-00	31 August 2017	Non-Confidential	Update for v11.1.
1102-00	17 November 2017	Non-Confidential	Update for v11.2.
1103-00	23 February 2018	Non-Confidential	Update for v11.3.
1104-00	22 June 2018	Non-Confidential	Update for v11.4.
1104-01	17 August 2018	Non-Confidential	Update for v11.4.2.
1105-00	23 November 2018	Non-Confidential	Update for v11.5.
1106-00	27 February 2019	Non-Confidential	Update for v11.6.
1106-01	25 March 2019	Non-Confidential	Update for v11.6.1.
1107-00	17 May 2019	Non-Confidential	Update for v11.7.
1108-00	05 September 2019	Non-Confidential	Update for v11.8.
1109-00	28 November 2019	Non-Confidential	Update for v11.9.
1110-00	12 March 2020	Non-Confidential	Update for v11.10.
1111-00	09 June 2020	Non-Confidential	Update for v11.11.
1112-00	22 September 2020	Non-Confidential	Update for v11.12.
1113-00	09 December 2020	Non-Confidential	Update for v11.13.

Contents
Fast Models Reference Manual

Preface

About this book 10

Chapter 1 Introduction

1.1 About the models 1-13
1.2 Model capabilities 1-14
1.3 Fast Models accuracy 1-15
1.4 Processor implementation 1-19
1.5 Fast Models CADI implementation 1-25
1.6 CADI interactions with processor behavior 1-27
1.7 CADI sync watchpoints 1-28
1.8 Non-CADI sync watchpoints 1-29
1.9 SCADI 1-32
1.10 Using the TelnetTerminal 1-36
1.11 Network set up 1-38
1.12 Model Trace Interface 1-46
1.13 Using parameters to set port values 1-48
1.14 About PVBus system components 1-49
1.15 PVBus C++ transaction and Tx_Result classes 1-50
1.16 Visualisation Library 1-53

Chapter 2 Protocols

2.1 AMBA-PV protocols 2-59
2.2 Clocking protocols 2-65

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

2.3 Debug interface protocols 2-67
2.4 Peripheral protocols 2-71
2.5 Power management protocols 2-80
2.6 Processor protocols 2-81
2.7 Signaling protocols 2-85

Chapter 3 Fast Models components

3.1 Bridge components 3-88
3.2 Bus components 3-102
3.3 Clocking components 3-113
3.4 Core components 3-117
3.5 Media components 3-601
3.6 Other components 3-616
3.7 Peripheral components 3-618
3.8 Signals components 3-644
3.9 SystemIP components 3-647

Chapter 4 Trace components

4.1 AHCI_SATA - trace 4-864
4.2 AMBAPVSignal2SGSignalx8 - trace 4-869
4.3 ARM_AEM-A_MP - trace 4-870
4.4 ARM_AEMv8-A_MP - trace 4-908
4.5 ARM_AEMv8M - trace 4-946
4.6 ARM_Cortex-A15 - trace 4-979
4.7 ARM_Cortex-A17 - trace 4-1015
4.8 ARM_Cortex-A32 - trace 4-1051
4.9 ARM_Cortex-A35 - trace 4-1089
4.10 ARM_Cortex-A5 - trace 4-1127
4.11 ARM_Cortex-A53 - trace 4-1152
4.12 ARM_Cortex-A55 - trace 4-1190
4.13 ARM_Cortex-A57 - trace 4-1228
4.14 ARM_Cortex-A5MP - trace 4-1266
4.15 ARM_Cortex-A65 - trace 4-1291
4.16 ARM_Cortex-A65AE - trace 4-1329
4.17 ARM_Cortex-A7 - trace 4-1367
4.18 ARM_Cortex-A72 - trace 4-1403
4.19 ARM_Cortex-A73 - trace 4-1441
4.20 ARM_Cortex-A75 - trace 4-1479
4.21 ARM_Cortex-A76 - trace 4-1517
4.22 ARM_Cortex-A76AE - trace 4-1556
4.23 ARM_Cortex-A77 - trace 4-1595
4.24 ARM_Cortex-A78 - trace 4-1634
4.25 ARM_Cortex-A78C - trace 4-1673
4.26 ARM_Cortex-A8 - trace 4-1712
4.27 ARM_Cortex-A9MP - trace 4-1736
4.28 ARM_Cortex-A9UP - trace 4-1772
4.29 ARM_Cortex-M0 - trace 4-1808
4.30 ARM_Cortex-M0+ - trace 4-1839
4.31 ARM_Cortex-M23 - trace 4-1870
4.32 ARM_Cortex-M3 - trace 4-1901

Chapter 5 Plug-ins for Fast Models

5.1 Loading a plug-in 5-2891
5.2 ArchMsgTrace 5-2893
5.3 BranchPrediction 5-2894
5.4 CADIIPCRemoteConnection 5-2898
5.5 CDE 5-2899
5.6 Crypto 5-2909

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

5.7 Fastline 5-2911
5.8 GDBRemoteConnection 5-2919
5.9 GenericCounter 5-2921
5.10 GenericTrace 5-2922
5.11 ListTraceSources 5-2924
5.12 PipelineModel 5-2925
5.13 RunTimeParameterTest 5-2930
5.14 ScalableVectorExtension 5-2931
5.15 Sidechannel 5-2934
5.16 TarmacText 5-2935
5.17 TarmacTrace 5-2936

Chapter 6 Fast Models examples
6.1 CADI examples 6-2955
6.2 LISA examples 6-2956
6.3 LISAPlus examples 6-2957
6.4 MTI examples 6-2958
6.5 Python examples 6-2959
6.6 SystemCExport examples 6-2960

Chapter 7 Base Platform
7.1 Base - about 7-2962
7.2 Base Platform RevC 7-2963
7.3 Base - memory 7-2967
7.4 Base - interrupt assignments 7-2971
7.5 Base - clocks 7-2974
7.6 Base - parameters 7-2975
7.7 Base - components 7-2976
7.8 Base - differences between the AEMv8-A FVP and core FVPs 7-2984
7.9 Base - VE compatibility 7-2985
7.10 Base - unsupported VE features 7-2987

Chapter 8 Microcontroller Prototyping System 2
8.1 MPS2 - about 8-2989
8.2 MPS2 platform types 8-2990
8.3 MPS2 - memory maps 8-2991
8.4 MPS2 - interrupt assignments 8-2997
8.5 MPS2 - differences between models and hardware 8-2998

Chapter 9 Versatile Express Model
9.1 VE - about 9-3000
9.2 VE memory map for Cortex®-A series 9-3002
9.3 VE memory map for Cortex®-R series 9-3005
9.4 VE - interrupt assignments for Cortex®-A series 9-3006
9.5 VE - interrupt assignments for Cortex®-R series 9-3007
9.6 VE parameters 9-3009
9.7 VE - components 9-3011
9.8 Differences between the VE hardware and the system models 9-3017

Preface

This preface introduces the *Fast Models Reference Manual*.

It contains the following:

- *About this book* on page 10.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

About this book

This document provides a reference for signaling, clock, bus, generic peripheral, and processor components included in Fast Models.

Using this book

This book is organized into the following chapters:

Chapter 1 Introduction

This chapter introduces the document.

Chapter 2 Protocols

Components communicate through connected ports. Ports have protocols that define the function calls for different connections.

Chapter 3 Fast Models components

This chapter describes all model components in Fast Models, organized by component type.

Chapter 4 Trace components

This chapter describes the trace components that are provided by Fast Models components.

Chapter 5 Plug-ins for Fast Models

This chapter describes the plug-ins that are available for Fast Models.

Chapter 6 Fast Models examples

The following top-level example directories are installed in `$PVLIB_HOME/examples`.

Chapter 7 Base Platform

This chapter describes the Base Platform system model.

Chapter 8 Microcontroller Prototyping System 2

This chapter describes the MPS2 system model.

Chapter 9 Versatile Express Model

This chapter describes the components of Fast Models that are specific to the Versatile Express (VE) model of the hardware platform.

Glossary

The Arm® Glossary is a list of terms used in Arm documentation, together with definitions for those terms. The Arm Glossary does not contain terms that are industry standard unless the Arm meaning differs from the generally accepted meaning.

See the *Arm® Glossary* for more information.

Typographic conventions

italic
: Introduces special terminology, denotes cross-references, and citations.

bold
: Highlights interface elements, such as menu names. Denotes signal names. Also used for terms in descriptive lists, where appropriate.

`monospace`
: Denotes text that you can enter at the keyboard, such as commands, file and program names, and source code.

`mono`space
: Denotes a permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.

`monospace italic`
: Denotes arguments to monospace text where the argument is to be replaced by a specific value.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`monospace bold`
Denotes language keywords when used outside example code.

`<and>`
Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example:

```
MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>
```

SMALL CAPITALS
Used in body text for a few terms that have specific technical meanings, that are defined in the *Arm® Glossary*. For example, IMPLEMENTATION DEFINED, IMPLEMENTATION SPECIFIC, UNKNOWN, and UNPREDICTABLE.

Feedback

Feedback on this product

If you have any comments or suggestions about this product, contact your supplier and give:

- The product name.
- The product revision or version.
- An explanation with as much information as you can provide. Include symptoms and diagnostic procedures if appropriate.

Feedback on content

If you have comments on content then send an e-mail to *errata@arm.com*. Give:

- The title *Fast Models Reference Manual*.
- The number 100964_1113_00_en.
- If applicable, the page number(s) to which your comments refer.
- A concise explanation of your comments.

Arm also welcomes general suggestions for additions and improvements.

Note

Arm tests the PDF only in Adobe Acrobat and Acrobat Reader, and cannot guarantee the quality of the represented document when used with any other PDF reader.

Chapter 1
Introduction

This chapter introduces the document.

It contains the following sections:

- *1.1 About the models* on page 1-13.
- *1.2 Model capabilities* on page 1-14.
- *1.3 Fast Models accuracy* on page 1-15.
- *1.4 Processor implementation* on page 1-19.
- *1.5 Fast Models CADI implementation* on page 1-25.
- *1.6 CADI interactions with processor behavior* on page 1-27.
- *1.7 CADI sync watchpoints* on page 1-28.
- *1.8 Non-CADI sync watchpoints* on page 1-29.
- *1.9 SCADI* on page 1-32.
- *1.10 Using the TelnetTerminal* on page 1-36.
- *1.11 Network set up* on page 1-38.
- *1.12 Model Trace Interface* on page 1-46.
- *1.13 Using parameters to set port values* on page 1-48.
- *1.14 About PVBus system components* on page 1-49.
- *1.15 PVBus C++ transaction and Tx_Result classes* on page 1-50.
- *1.16 Visualisation Library* on page 1-53.

1.1 About the models

Programmer's View (PV) models of processors and devices work at a level where functional behavior is equivalent to what a programmer would see using the hardware.

They sacrifice timing accuracy to achieve fast simulation execution speeds: you can use the PV models for confirming software functionality, but you must not rely on the accuracy of cycle counts, low-level component interactions, or other hardware-specific behavior.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

1.2 Model capabilities

Fast Models attempt to accurately model the hardware, but compromises exist between speed of execution, accuracy and other criteria. A processor model might not match the hardware under certain conditions.

Fast Models can:

- Accurately model instructions.
- Correctly execute architecturally-correct code.
- Model some unpredictable behavior.

Fast Models cannot:

- Validate the hardware.
- Model all unpredictable behavior.
- Model cycle counting.
- Model timing sensitive behavior.
- Model SMP instruction scheduling.
- Measure software performance.
- Model bus traffic.

1.3 Fast Models accuracy

This section describes the aspects of Fast Models accuracy, and specific areas where models might differ from hardware.

This section contains the following subsections:

- *1.3.1 How accurate are Fast Models?* on page 1-15.
- *1.3.2 Timing accuracy of Fast Models* on page 1-15.
- *1.3.3 Bus traffic in Fast Models* on page 1-15.
- *1.3.4 Instruction prefetch in Fast Models* on page 1-16.
- *1.3.5 Out-of-order execution and write-buffers in Fast Models* on page 1-17.
- *1.3.6 Caches in Fast Models* on page 1-17.
- *1.3.7 Global exclusive monitor in Fast Models* on page 1-18.

1.3.1 How accurate are Fast Models?

Fast Models aim to be accurate to the view of the system programmer. Architecturally correct software cannot tell between running on hardware and running on the model.

Software is able to detect differences between hardware and the model, but these differences generally depend on behavior that is not precisely specified. For example, it is possible to detect differences in the exact timings of instructions and bus transactions, effects of speculative prefetch and cache victim selection. Certain classes of behavior are specified as unpredictable and these cases are detectable by software. A program that relies on such behavior, even unintentionally, is not guaranteed to work reliably on any device, or on a Fast Model. Programs that exploit this behavior might execute differently between the hardware and the model.

Fast Models are only concerned with accuracy from the point of view of the program running on the processors. They do not attempt to accurately model bus transactions. PVBus provides the infrastructure to ensure that the program gets the correct results.

1.3.2 Timing accuracy of Fast Models

Fast Models do not model instruction timing accurately. The simulation as a whole has a very accurate concept of timing, but the *Code Translation* (CT) processors do not claim to dispatch instructions with device-like timing.

In general, a processor issues a set of instructions (a “quantum”) at the same point in simulation time, and then waits for some amount of time before executing the next quantum. The timing is arranged so that the processor averages one instruction per clock tick.

The consequences of this are:

- The perceived performance of software running on the model differs from real-world software. (In particular, memory accesses and arithmetic operations all take a significant amount of time.)
- A program might be able to detect the quantized execution behavior of a processor, for example by polling a high-resolution timer.
- All instructions in a quantum are effectively atomic.

  ——— **Note** ———

  This might mask some race-condition bugs in software.

  ———————————

1.3.3 Bus traffic in Fast Models

PVBus can simulate the behavior of individual bus transactions passing through a hierarchy of bus fabric, but it employs several techniques to optimize this process.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

1. PVBus generally decodes the path between a bus master and the bus slave the first time a transaction is issued. All subsequent transactions to the same address are automatically sent to the same slave, without passing through the intervening fabric.
2. For accesses to normal memory, the master can cache a pointer to the (host) storage that holds the data contents of the memory. The master can read and write directly to this memory without generating bus-transactions.
3. For instruction-fetch, and for operations such as repeated DMA from framebuffer memory, PVBus provides an optimization called “snooping”, that informs the master if anyone else could have modified the contents of memory. If no changes have occurred the master can avoid the need to re-read memory contents.

If a piece of bus fabric wants to intercept and log all bus transactions, it can defeat these optimizations by claiming to be a slave device. It can then log all transactions and can reissue identical transactions on its own master port. However, doing this slows all bus transactions and significantly impacts simulation performance.

Note

If direct accesses to memory by the CT engine are intercepted by the fabric, the processor is forced to single step. Execution is much slower than normal operation with translated code.

The bus traffic generated by a processor is not representative of real traffic:

Timing differences
Re-ordering and buffering of memory accesses, out-of-order execution, speculative prefetch and drain-buffers can cause timing differences. They are not modeled, since they are not visible to the programmer except in situations where a cluster program contains race conditions that violate serial-consistency expectations.

Bus contention
Fast Models do not model the time taken for a bus transaction, so they cannot model the effects of multiple transactions contending for bus availability.

Size of access
Fast Models do not attempt to generate the same types of burst transaction from the processor for accesses to multiple consecutive locations.

Instruction fetch
The behavior of the instruction prefetch unit of a processor is not modeled to match the hardware implementation.

Behavioral differences
In some software, the trace of instruction execution is dependent on timing effects. For example, if a loop polls a device waiting for a 10ms time-out, the number of iterations of the polling loop depends on the rate of instruction execution.

Related references

1.3.4 Instruction prefetch in Fast Models on page 1-16

1.3.4 Instruction prefetch in Fast Models

The CT engine in the processor models relies on Fast Models PVBus optimizations. It only performs code-translation if it has been able to prefetch and snoop the underlying memory. It then need not issue bus transactions until the snoop handling detects an external modification to memory.

If the CT engine cannot get prefetch access to memory, it drops to single-stepping. This single-stepping is very slow (~1000x slower than translated code execution).

Real processors attempt to prefetch instructions ahead of execution and predict branch destinations to keep the prefetch queue full. The instruction prefetch behavior of a processor can be observed by a program that writes into its own prefetch queue (without using explicit barriers). The architecture does not define the results.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The CT engine processes code in blocks. The effect is as if the processor filled its prefetch queue with a block of instructions, then executed the block to completion. As a result, this virtual prefetch queue is sometimes larger and sometimes smaller than the corresponding hardware. In the current implementation, the virtual prefetch queue can follow small forward branches.

With an L1 instruction cache turned on, the instruction block size is limited to a single cache-line. The processor ensures that a line is present in the cache at the point where it starts executing instructions from that line.

In real hardware, the effects of the instruction prefetch queue are to cause additional fetch transactions. Some of these are redundant because of incorrect branch prediction. This causes extra cache and bus pressure.

1.3.3 Bus traffic in Fast Models on page 1-15

1.3.5 Out-of-order execution and write-buffers in Fast Models

Hardware memory is Weakly Ordered, but Fast Models memory is Strongly Ordered.

The CT implementation executes instructions sequentially. One instruction is retired before the next starts to execute. In a real processor, multiple memory accesses can be outstanding, and can complete in a different order from their program order. Writes can also be delayed in a write-buffer.

The programmer visible effects of these behaviors is defined in the architecture as the Weakly Ordered memory model, which the programmer must be aware of when writing lock-free cluster code.

Within Fast Models, memory accesses happen in program order, effectively as if all memory is Strongly Ordered.

1.3.6 Caches in Fast Models

Fast Models with cache-state modeling enabled can replicate some types of failure-case, but not all types.

The effects of caches are programmer visible because they can cause a single memory location to exist as multiple inconsistent copies. If caches are not correctly maintained, reads can observe stale copies of locations, and flushes/cleans can cause writes to be lost.

There are three ways in which incorrect cache maintenance can be programmer visible:

From the D-side interface of a single processor
: The only way of detecting the presence of caches is to create aliases in the memory map, so that the same range of physical addresses can be observed as both cached and non-cached memory.

From the D-side of a single processor to its I-side
: Stale instruction data can be fetched when new instructions have been written by the D-side. This can either be because of deliberate self-modifying code, or as a consequence of incorrect OS demand paging.

Between one processor and another device
: For example, another processor in a non-coherent MP system, or an external DMA device.

Fast Models with cache-state modeling enabled can replicate all of these failure-cases. However, they do not attempt to reproduce the following effects of caches:

- Changes to timing behavior of a program because of cache hits/misses (because the timing of memory accesses is not modeled).
- Ordering of line-fill and eviction operations.
- Cache usage statistics (because the models do not generate accurate bus traffic).
- Device-accurate allocation of cache victim lines (which is not possible without accurate bus traffic modeling).
- Write-streaming behavior where a cache spots patterns of writes to consecutive addresses and automatically turns off the write-allocation policy.

Non-Confidential

The Cortex®-A9 and Cortex-A5 models do not model device-accurate MESI behavior. The Cortex-A15 and Cortex-A7 models do simulate hardware MOESI state handling, and can handle cache-to-cache snoops. In addition, they model the AMBA® 4 ACE cache-coherency protocols over their PVBus ports, so can be connected to a model of an ACE Coherent Interconnect (such as the CCI-400 model) to simulate coherent sharing of cache contents between processors.

It is not possible to insert devices between the processor and its L1 caches. In particular, you cannot model L1 traffic, although you can tell the model not to model the state of L1 caches.

1.3.7 Global exclusive monitor in Fast Models

This section describes the behavior of the global exclusive monitor, when `cache-state-modelled` is `false` and when it is `true`.

Whether `cache-state-modelled` is `false` or `true`, when the system enables the data caches, they implement the monitor for cacheable nonshared and shared memory using the cache coherency protocol. The monitor includes other clusters that are connected with a cache coherent interconnect. Most global monitor behavior, like exclusive granule size, is the same whether `cache-state-modelled` is `false` or `true`. In particular, the data caches follow behavior that the Arm architecture prescribes in both cases. However, some behaviors do rely on the full modeling of cache functionality. An example is that the clearing of a monitor as a result of a cache line eviction does not happen with `cache-state-modelled` as `false`.

The RAMDevice component and PVBus to AMBAPV bridges do not contain global monitors. As a result, exclusive stores that reach a RAMDevice fail unless they go through an exclusive monitor. Some platforms might need a global monitor outside of the cache coherency domains. These platforms must include a system level monitor in the same place in the bus hierarchy as in the hardware. See the FVP_VE and FVP_Base example platforms for examples of how to use the PVBusExclusiveMonitor component.

1.4 Processor implementation

This section outlines the differences between the code translation models and the hardware.

This section contains the following subsections:

- *1.4.1 Mapping PMU events to MTI trace sources* on page 1-19.
- *1.4.2 Caches in PV models* on page 1-20.
- *1.4.3 GICv3 in PV models* on page 1-22.
- *1.4.4 CP14 Debug coprocessor* on page 1-22.
- *1.4.5 MicroTLBs* on page 1-22.
- *1.4.6 TLBs in PV models* on page 1-22.
- *1.4.7 Memory access in PV models* on page 1-23.
- *1.4.8 Timing in PV models* on page 1-23.
- *1.4.9 VIC ports in PV models* on page 1-24.

1.4.1 Mapping PMU events to MTI trace sources

In Fast Models, many PMU events are modeled using MTI trace sources. These events are exposed through the standard PMU interface. The user does not need to interface with MTI.

The following tables show which PMUv1 and PMUv2 events are modeled, and which MTI trace sources are used to model them. The associated event numbers are as listed in the Arm Architecture Reference Manual Armv7-A and Armv7-R edition, section C12.8.2 *Common event numbers*.

Table 1-1 PMUv1 event mappings

PMUv1 event	MTI trace sources	Notes
Software increment (`0x00`)	-	Modeled, but not using MTI.
Level 1 instruction cache refill (`0x01`)	`ALLOC_LINEFILL`	-
Level 1 instruction TLB refill (`0x02`)	`MMU_TLB_FILL`	-
Level 1 data cache refill (`0x03`)	`ALLOC_LINEFILL`	-
Level 1 data cache access (`0x04`)	`CACHE_READ_HIT`, `CACHE_READ_MISS` `CACHE_WRITE_HIT`, `CACHE_WRITE_MISS`	-
Level 1 data TLB refill (`0x05`)	`MMU_TLB_FILL`	-
Load (`0x06`)	`CORE_LOADS`, `NV2_CORE_LOADS`, `MEMTAG_LOAD_INST`, `SVE_LD_RETIRED`	-
Store (`0x07`)	`CORE_STORES`, `NV2_CORE_STORES`, `MEMTAG_STORE_INST`, `SVE_ST_RETIRED`	-
Instruction architecturally executed (`0x08`)	-	Modeled, but not using MTI.
Exception taken (`0x09`)	`EXCEPTION`	-
Exception return (`0x0A`)	`EXCEPTION_RETURN_PREBRANCH`	-
Write to `CONTEXTIDR` (`0x0B`)	`CONTEXTIDR`	-
Software change of the PC (`0x0C`)	`BRA_DIR`, `BRA_INDIR`.	-
Immediate branch (`0x0D`)	`BRA_DIR`, `BRA_DIR_FAIL`.	-
Procedure return (`0x0E`)	`BRA_RET`	-

Table 1-1 PMUv1 event mappings (continued)

PMUv1 event	MTI trace sources	Notes
Unaligned load or store (0x0F)	UNALIGNED_LDST_RETIRED, SVE_UNALIGNED_LDST_RETIRED	-
Mispredicted or not predicted branch speculatively executed (0x10)	BRANCH_MISPREDICT	Only if the BranchPrediction plug-in is loaded.
Cycle count (0x11)	-	Modeled, but not using MTI.
Predictable branch speculatively executed (0x12)	-	Not modeled.

Table 1-2 PMUv2 event mappings

PMUv2 event	MTI source	Notes
Data memory access (0x13)	-	Not modeled.
Level 1 instruction cache access (0x14)	CACHE_READ_HIT, CACHE_READ_MISS	-
Level 1 data cache write-back (0x15)	-	Not modeled.
Level 2 data cache access (0x16)	CACHE_READ_HIT, CACHE_READ_MISS, CACHE_WRITE_HIT, CACHE_WRITE_MISS	-
Level 2 data cache refill (0x17)	ALLOC_LINEFILL	
Level 2 data cache write-back (0x18)	-	Not modeled.
Bus access (0x19)	CORE_LOADS, CORE_STORES, MEMTAG_LOADS, MEMTAG_STORES	-
Memory error (0x1A)	-	Not modeled.
Instruction speculatively executed (0x1B)	-	Not modeled.
Write to TTBR (0x1C)	TTBR_WRITE	-
Bus cycle (0x1D)	INST	This value is an approximation.

1.4.2 Caches in PV models

Some processor models have PV-accurate caches, but others do not model Level 1 or Level 2 caches.

Cores that have PV-accurate cache implementation provide a functionally-accurate model. For more information, see the processor component descriptions.

Other PV models do not model Level 1 or Level 2 caches. The system coprocessor registers related to cache operations permit cache aware software to work, but in most cases they only check register access permissions.

The registers affected on all code translation processor models are:

- Invalidate and/or Clean Entire ICache/DCache.
- Invalidate and/or Clean ICache/DCache by MVA.
- Invalidate and/or Clean ICache/DCache by Index.
- Invalidate and/or Clean Both Caches.
- Cache Dirty Status.
- Data Write Barrier.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

- Data Memory Barrier.
- Prefetch ICache Line.
- ICache/DCache lockdown.
- ICache/DCache master valid.

Functional caches in Fast Models - about

Fast Models implement two types of cache model: register model and functional model.

A register model provides all the cache control registers so that cache operations succeed, but does not model the state of the cache. All accesses go to memory.

A functional model tracks cache state and its contents at each level of the memory hierarchy. Incorrect cache management might return incorrect data, as it would on real hardware.

Fast Models provide:
- System IPs that support caches.
- Register models of caches on all processors that support caches and also the PL310 cache controller (PL310_L2CC).
- Functional models of caches integrated into Cortex cores.

For a core with no L2 cache, the configuration parameters are:

`icache-state-modelled`
Set whether the I-cache has stateful implementation.

`dcache-state-modelled`
Set whether the D-cache has stateful implementation.

For Armv7-A cores with an L2 cache, the configuration parameters are:

`l1_icache-state-modelled`
Set whether L1 I-cache has stateful implementation.

`l1_dcache-state-modelled`
Set whether L1 D-cache has stateful implementation.

`l2_cache-state-modelled`
Enable unified Level 2 cache state model.

For Armv8-A cores with an L2 cache, the configuration parameters are:

`icache-state_modelled`
Set whether L1 I-cache has stateful implementation. Instructions at L2 or L3 are not cached in Fast Models.

`dcache-state_modelled`
Set whether D-cache has stateful implementation at L1, L2, and L3.

Functional caches in Fast Models - performance

Enabling functional cache modeling is likely to reduce performance.

Enable the L1 and L2 functional caches together. For consistent system operation, ARM recommends that you either disable functional behavior completely or enable it for both I and D L1 caches and the L2 cache.

Cache enablement must be system wide. If you enable cache state modeling in any component then you must enable it in all components in the system, including all cores (L1 and L2) and any external cache controller (such as the PL310_L2CC) and any interconnect that has caches.

If platform memory is being modeled outside of the Fast Models environment, for example in a SystemC environment, use of functional cache modeling might improve performance if there is no other fast route to memory.

1.4.3 GICv3 in PV models

This section describes the model of the GICv3.

GICv3 - about

The PV models implement the *Generic Interrupt Controller architecture version 3* (GICv3).

The GICv3 architecture defines two parts: the core interface (integrated into the core) and the *Interrupt Redistribution Infrastructure* (IRI). You can configure all ARMv8-A cores to include a GICv3 interface. You can integrate a separate GICv3IRI component into your platforms. Communication between the core and the IRI is over an architected packet interface. An internal communication protocol represents the packets that pass over this interface.

You can configure the GICv3 models in some platforms to act as though they were GICv2 or GICv2-M models. Even in this mode, you need a GICv3IRI component and supported core. Configure them to comply with the same standard.

Related references

3.9.29 GICv3IRI on page 3-746

GICv3 - functionality

Some features differ in the model.

- Support of the GITS_CTLR.Quiesce bit is not complete.
- Support of ITS save/restore is not complete. Configuration stays within the model and it does not use allocated memory.
- GICD_CTLR.RWP does not perform adequately. This difference is only an issue if you use the distributor in systems with delaying interface between the distributor and the cores. DO NOT use this version of the model for simulation of the GIC in a setup where interfaces are not instantly reactive.
- Set the environment variable `FASTSIM_GIC_MEMORY_MAP` to 1 so the memory map of certain models that are included in the platform being run will be printed to `stderr`. This functionality is available for all GICv3 and later models.

GICv4 - functionality

GICv4 is an extension of the GICv3 architecture. It allows the direct injection of LPIs into a virtualized system through the `virtual-lpi-support` parameter of the `GICv3IRI` or `GICv3IRI_Filter` component.

In addition to requiring the presence of an ITS that is configured as shown in *3.9.29 GICv3IRI* on page 3-746, GICv4 requires you to enable the virtual LPIs feature and to configure a virtual PE table using the parameters shown in the following example:

```
"virtual-lpi-support"=true,
"GITS_BASER4-type"=2 //Type 2 is Virtual PEs.
                     //Such a table is needed for GICv4 functionality.
```

1.4.4 CP14 Debug coprocessor

Some models fully implement the CP14 Debug coprocessor registers. Other models only implement the DSCR register. This register reads as 0 and ignores writes.

External debugging must be used to debug systems containing PV models.

1.4.5 MicroTLBs

The models do not implement device accurate MicroTLBs, or system coprocessor registers related to MicroTLB state.

1.4.6 TLBs in PV models

The PV models implement *Translation Lookaside Buffers* (TLBs) and model most aspects of TLB behavior.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Note

If the `device-accurate-tlb` parameter is set to `false`, the simulation uses a different number of TLBs if this improves simulation performance. The simulation is architecturally accurate, but not device accurate. Architectural accuracy is almost always sufficient. Set `device-accurate-tlb` parameter to `true` if you require device accuracy.

These TLB registers do not have working implementations:

- Primary memory remap register.
- Normal memory remap register.

In addition, the simulation does not distinguish peripheral accesses from data accesses, so it ignores configuration of the peripheral port memory remap register.

1.4.7 Memory access in PV models

This section describes the kinds of memory access in PV models.

About memory access in PV models

PV models use a PVBusMaster subcomponent to communicate with slaves in a System Canvas generated system. This provides efficient access to memory-like slaves and relatively efficient access to device-like slaves.

Memory access in PV models differs from real hardware to enable fast modeling of the processor:

- All memory accesses are performed in programmer view order.
- Unaligned accesses, where permitted, are always performed as byte transfers.

In addition, some PV models do not use all the transaction states available in a PVBus transaction. The Privileged and Instruction flags are set correctly for ARMv7 processors but might not be set correctly in earlier architectures. However all memory accesses are atomic so SWP instructions behave as expected.

I-side access in PV models

PV models cache translations of instructions fetched from memory-like slaves. The models might not perform further access to those slaves for significant periods. A slave can force the model to reread the memory by declaring that the memory has changed.

PV models do not model a prefetch queue but the code translation mechanism effectively acts as a prefetch queue of variable depth. ARM recommends that you follow the standards in the *Arm® architecture specifications* for dealing with prefetch issues, such as self modifying code, and use appropriate cache flushing and synchronization barriers.

Translation of instructions only occurs for memory-like slaves, which are those declared by devices as having type `pv::MEMORY`. Instructions fetched from device-like slaves are repeatedly fetched, decoded and executed, significantly slowing down model performance.

D-side access in PV models

PV models cache references to the underlying memory of memory-like slaves, and might not perform further accesses to those slaves over the bus for significant periods.

Slaves declared as type `pv::MEMORY` provide the fastest possible memory access for PV processors.

Slaves declared as type `pv::DEVICE` are normally used for peripheral access.

1.4.8 Timing in PV models

Programmer's View (PV) models are loosely timed.

- Caches and write buffers are not modeled, so all memory access timing is effectively zero wait state.
- All instructions execute, in aggregate, in one cycle of the component master clock input.
- Interrupts are not taken at every instruction boundary.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- Some sequences of instructions are executed atomically, ahead of the master clock of a component, so that system time does not advance during execution. This difference in behavior can affect sequential access of device registers, where devices are expecting time to move on between accesses.
- DMA to and from *Tightly Coupled Memory* (TCM) is atomic.

1.4.9 VIC ports in PV models

The ARMCortexR4CT and ARMCortexR5x*n*CT models implement a simplified model of the *Vectored Interrupt Controller* (VIC) port.

The protocol consists of two ports:

- The vic_addr port signals the vectored interrupt address from the external VIC.
- The vic_ack port signals the VIC that an interrupt has been detected and is being serviced.

The expected interrupt sequence is:

1. The software enables the VIC interface by setting the VE bit in the CP15 control register and setting up suitable interrupt routines.
2. The VIC asserts IRQ.
3. Some time later, the processor detects and responds to the IRQ by asserting vic_ack.
4. The VIC writes the vector address to the processor using vic_addr.
5. The processor de-asserts vic_ack.
6. The processor transfers control to the vectored address returned from the VIC.

The interaction between the processor and the VIC is untimed after the processor acknowledges the interrupt, so certain interrupt sequences cannot occur in the code translation processor models.

1.5 Fast Models CADI implementation

Fast Models implement a subset of CADI functionality.

The following CADI methods are not supported by Fast Models:

CADI class:

Register API

`CADIGetCommitedPCs()`

Memory API

`CADIMemGetOverlays()`

Virtual Memory API

`PhysicalToVirtual()`

Cache API

`CADIGetCacheInfo()`
`CADICacheRead()`
`CADICacheWrite()`

Execution API

`CADIExecLoadApplication()` - Implemented by CPU components only.
`CADIExecUnloadApplication()`
`CADIExecGetLoadedApplications()` - Implemented by CPU components only. It only returns the most recently loaded application if more than one have been loaded.
`CADIExecAssertException()`
`CADIExecGetPipeStages()`
`CADIExecGetPipeStageFields()`
`CADIGetCycleCount()`

CADICallbackObj class:

- `appliOpen()`
- `appliClose()`
- `cycleTick()`
- `killInterface()`

CADIDisassembler class:

- `GetSourceReferenceForAddress()`
- `GetAddressForSourceReference()`
- `GetInstructionType()`

CADIDisassemblerCB class:

- `ReceiveSourceReference()`

The following tables describe the implementation of other CADI functionality by processor models:

Table 1-3 CADI broker implementation

Feature	Implemented	Remarks
Factories	Yes	Model DLL provides a single factory.
Instances	Yes	Factory can only instantiate one model at a time.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 1-4 CADI target implementation

Feature	Implemented	Remarks
# breakpoints	Yes	No intrinsic limit.
Breakpoint disabling	Yes	You can disable global breakpoints, but not user breakpoints set through `CADIBptSet()`. Debuggers usually disable breakpoints with `CADIBptClear()` and re-enable them with `CADIBptSet()`, so this does not affect debugger GUIs, but it does affect the CADI C++ interface. Global breakpoints are built-in and permanent, so `CADIBptSet()/Clear()` cannot set or delete them. With `CADIBptConfigure()`, you can only enable/disable these global breakpoints to stop on certain processor events.
Breakpoint ignore count	No	-
Breakpoint formal conditions	No	-
Breakpoint free-form conditions	No	-
Breakpoint setting	Yes[a]	-
Breakpoint types	Yes: `CADI_BPT_MEMORY`, `CADI_BPT_PROGRAM`, `CADI_BPT_PROGRAM_RANGE`	All registers in the Vector register group have disabled register breakpoints. You cannot create new register breakpoints.
Breakpoint triggers	Yes: `CADI_BPT_TRIGGER_ON_MODIFY`, `CADI_BPT_TRIGGER_ON_READ`, `CADI_BPT_TRIGGER_ON_WRITE`	`CADI_BPT_TRIGGER_ON_WRITE` approximates `CADI_BPT_TRIGGER_ON_MODIFY`. If either is set, the simulation stops when a value is written, even when it does not change.
`CADIExecSingleStep()`	Yes	Fast Models ignores the `stepCycle` and `stepOver` arguments.
Intrusive debug	Yes	Stop/start can affect processor scheduling: single stepping and multiple stepping both change scheduling, and so are intrusive.
Memory read/write	Yes[a]	-
Reset	Yes	One reset level is supported. When calling `CADIExecReset()`, Arm recommends the simulation should use a syncLevel of 1 or higher for best results.
Runnable	Yes	-
Stop simulation	Yes	-

[a] Not permitted while target is running.

1.6 CADI interactions with processor behavior

Architecturally, M series processors have different reset behavior to that of A and R series processors.

For both hardware and model processors, a reset consists of asserting, and then deasserting the reset pin. However:

M series
: The architecture documentation specifies that on asserting the reset pin, the processor stops executing instructions. On deasserting the reset pin, the VTOR is given its reset value, SP_main is read from address VTOR+0, and the PC is read from address VTOR+4. See the Reset behavior section and the *Vector Table Offset Register*, VTOR section in the *ARMv7-M Architecture Reference Manual*. Also, the processor begins fetching and executing instructions.

A and R series
: Asserting the reset pin causes the processor to stop executing instructions and the PC to be given its reset value, which depends on VINITHI, and the SP is `UNKNOWN`. See the Reset section in the *ARM Architecture Reference Manual ARMv7-A and ARMv7-R edition*. On deasserting the reset pin, the processor begins fetching and executing instructions.

The behavior of reset on M series processors interacts differently with CADI debugging functionality than it does for A and R series processors.

On A and R series processors, after the reset pin of the processor is asserted, a new application can be loaded using the `CADIExecLoadApplication()` call in CADI. This loads an application into memory, and sets the PC if a start address is specified in the application. When reset is deasserted, the processor begins fetching and executing from the start address as expected. Similarly, if a debugger asserts reset on the processor, it can modify memory with a sequence of `CADIMemWrite()` calls, update the PC with a `CADIRegWrite()` call, and when reset is deasserted the processor begins to fetch and execute from the PC.

On M series processors, these techniques do not work because after reset is deasserted the processor updates SP_main and the PC, overwriting the settings made by the CADI calls.

For these techniques to be possible, the M series processor models differ slightly from the architectural reset behavior. When reset is asserted, the M series makes note of whether the PC or SP are modified before reset is next deasserted. If there are any CADI writes to the PC or SP registers, either directly through `CADIRegWrite` or indirectly through `CADIExecLoadApplication()`, this is tracked. When reset is deasserted, if the PC has been modified using CADI, the PC retains the value written to it, otherwise it reads it from address VTOR+4. Similarly, if the SP has been modified using CADI, SP_main retains the value written to it, otherwise it reads it from address VTOR+0.

1.7 CADI sync watchpoints

The CADI/*Synchronous CADI* (SCADI) interfaces of processor components support watchpoints. Memory components like RAMDevice do not.

When the simulator hits a watchpoint, the CADI/SCADI interface emits a sequence, typically only one, of `modeChange(CADI_EXECMODE_Bpt, bptNumber)` callbacks, where `bptNumber` is the breakpoint ID of the watchpoint. After this sequence it sends a `modeChange(CADI_EXECMODE_Stop)` callback. Only after the debugger receives this `Stop` callback might it inspect the state of the model.

You can read additional information about the last of the hit watchpoints from these CADI registers declared by the processor in register group `Simulation`:

`memoryBptPC`
The PC of the instruction that caused the watchpoint to hit.

`memoryBptAccessVA`
Virtual address of the access or sub-access that caused the watchpoint to hit.

`memoryBptAccessSize`
Size in bytes of the access or sub-access that caused the watchpoint to hit.

`memoryBptAccessRW`
Type of access or sub-access that caused the watchpoint to hit: 1 = read, 2 = write, 3 = both, 0 = no access.

These registers are not memory (or CPnn-) mapped anywhere and are not accessible to target programs. These registers are read-only. `memoryBptPC` and `memoryBptAccessVA` are 32 or 64 bit depending on the architecture. `memoryBptAccessSize` and `memoryBptAccessRW` are 32 bit.

When multiple accesses have hit watchpoints at the same time, for example during the same instruction, the information contained in these registers is valid and consistent only for one of these accesses.

Whenever at least one CADI watchpoint is set on a processor, the syncLevel on that processor is at least 2.

1.8 Non-CADI sync watchpoints

This section describes syncLevel enum values, semantics, and behaviors, with syncLevel values listed from fast to slow simulation, from fewer to more requirements.

This section contains the following subsections:

- *1.8.1 syncLevel definitions* on page 1-29.
- *1.8.2 Controlling and observing the syncLevel* on page 1-30.

1.8.1 syncLevel definitions

Definitions for 0 - OFF, 1 - SYNC_STATE, 2 - POST_INSN_IO, and 3 - POST_INSN_ALL.

`syncLevel 0: OFF`

- The simulator runs as fast as possible. It does not permit inspection of the processor registers while the simulation is running, and does not stop synchronously when requested to do so.
- After enabling or disabling a trace source, it is undefined how many instructions will be executed before the change takes effect.
- Quantum end detection guarantees that a quantum is not overshot indefinitely. Quantum end detection applies to (but is not limited to) backward branches, indirect jumps, exceptions, and atomic operation retries. In addition to temporal quantum end detection, some events may end a quantum, like executing a barrier, entering a low power state, or accessing a peripheral. Target software and simulation controllers must not rely on a specific scheduling pattern based on these quantum end check points.
- Use cases: normal fast simulation and normal CADI debugging while no CADI watchpoint is set.

——— **Note** ———

When using CADI reset on a model, for best results, Arm recommends using a syncLevel of 1 or higher.

———————————

`syncLevel 1: SYNC_STATE`

- The simulation runs slightly slower than syncLevel 0. SCADI can read the up-to-date values of the processor registers, including PC and instruction count. You cannot stop the simulation synchronously.
- After enabling or disabling a trace source, it is undefined how many instructions will be executed before the change takes effect.
- Quantum end detection is as for syncLevel 0.
- Use cases: external breakpoints that block the simulation, inspect state of processor/memory from within a peripheral or memory access.

`syncLevel 2: POST_INSN_IO`

- As for syncLevel 1, except that you can stop the simulation synchronously from within all LD/ST and similar instructions. The simulation stops immediately after the current LD/ST instruction has been completely executed (post instruction).
- After enabling or disabling a trace source, it is likely, but not guaranteed, that the change will be visible sooner than with syncLevel 0 or 1.
- Quantum end detection is as for syncLevel 1, plus it includes the end of LD/ST instructions.
- Use cases: CADI watchpoints, external breakpoints, stopping from within LD/ST-related MTI callbacks.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

syncLevel 3: POST_INSN_ALL

- As for syncLevel 2, except that you can stop the simulation synchronously from within any instruction. The simulation stops immediately after the current instruction has been completely executed (post instruction).
- After enabling or disabling a trace source, the change will be visible at the next instruction that is executed.
- Quantum end detection is as for syncLevel 2. This allows switching between syncLevels 2 and 3 without changing the simulation scheduling.
- Use cases: a `Stop` from within arbitrary MTI callbacks such as the `INST` callback. This syncLevel is a fallback for all use cases that do not fall into syncLevels 0-2.

1.8.2 Controlling and observing the syncLevel

CADI watchpoints automatically register and unregister for their required syncLevel (`POST_INSN_IO`). All other use cases must explicitly register and unregister for the syncLevel they require.

Users of syncLevel write to a set of non-architectural processor registers in the CADI and SCADI interface to register and unregister for specific syncLevels. Processor registers are more suitable than CADI parameters for exposing an interface that has side effects on writes and where values might change spontaneously.

This is the exposed interface to control and observe the value of syncLevel. All these registers are in the CADI/SCADI register group `Simulation` for each CT processor that contains non-architectural, simulator-specific registers. All are 32-bit integer registers. Users of syncLevel write to these registers to register and unregister for the syncLevel they require:

syncLevelSyncStateRegister
Users write to this register for `SYNC_STATE`. Write-only.

syncLevelSyncStateUnregister
Users write this to unregister for `SYNC_STATE`. Write-only.

syncLevelPostInsnIORegister
Users write to this register for `POST_INSN_LDST`. Write-only.

syncLevelPostInsnIOUnregister
Users write this to unregister for `POST_INSN_LDST`. Write-only.

syncLevelPostInsnAllRegister
Users write this to register for `POST_INSN_ALL`. Write-only.

syncLevelPostInsnAllUnregister
Users write this to unregister for `POST_INSN_ALL`. Write-only.

These registers are only for debugging and visibility in the debugger, and syncLevel users do not usually access them at all:

syncLevel
Current syncLevel. Read-only.

syncLevelSyncStateCount
User counter. Read/write (use as read-only).

syncLevelPostInsnIOCount
User counter. Read/write (use as read-only).

syncLevelPostInsnAllCount
User counter. Read/write (use as read-only).

minSyncLevel
Same as the `min_sync_level` parameter, described below. Read/write.

The `*Register` and `*Unregister` registers are for syncLevel users to register and unregister themselves, by writing the value 0 to them. Changes to the syncLevel become effective at the next stop event

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

checkpoint. In addition, syncLevel users can write to these registers any time before the simulation is running, for example from the `init()` simulation phase. The change takes effect immediately when the simulation is run.

The other registers are only present to make the debugging of these mechanisms and their users easier. The `syncLevel` register enables you to see what kind of performance you can expect from the model. You must treat access to these other registers as read-only. You can write to them, however, to permit debugging the syncLevel mechanisms.

These registers are not memory (or CPnn-) mapped anywhere, and are not accessible to target programs.

In addition to this debug register interface, there is a CADI parameter that can influence the syncLevel:

```
min_sync_level (default=0, type=int, runtime=true)
```

This parameter enables you to control the minimum syncLevel by the CADI parameter interface. This is not the intended primary interface to control the syncLevel because it does not enable multiple independent syncLevel users to indicate their requirements to the simulator. It is primarily for debugging purposes and for situations where a single global syncLevel setting is sufficient. You can change this parameter at runtime, and changes become effective at the next stop event checkpoint. Reading this parameter value returns the `min_sync_level`, not the current syncLevel. This parameter is only an additional way of controlling the syncLevel and controls the same mechanisms as the register interface.

1.9 SCADI

This section describes *Synchronous CADI* (SCADI) for components.

This section contains the following subsections:

- *1.9.1 About SCADI* on page 1-32.
- *1.9.2 Intended uses of CADI and SCADI* on page 1-32.
- *1.9.3 Responsibilities of the SCADI caller* on page 1-33.
- *1.9.4 SCADI interface access* on page 1-33.
- *1.9.5 SCADI semantics* on page 1-34.

1.9.1 About SCADI

A SCADI interface enables you to request a synchronous stop of the simulation. It offers direct synchronous, but unsynchronized, register and memory read access.

The intention is that this interface is used by code that is inherently synchronized with the simulation, in particular from code that is part of the simulation itself (simulation thread). Examples of code that could use this interface are SystemC and LISA peripheral device/bus access functions, and MTI callback functions that are always called synchronously by the simulation itself.

Note

The SCADI interface is not a replacement for CADI. It is an additional interface with clear semantics that differ slightly from CADI.

1.9.2 Intended uses of CADI and SCADI

Component Architecture Debug Interface (CADI) and *Synchronous CADI* (SCADI) have separate design principles.

CADI

is used by debuggers and simulation controllers to control the simulation. Execution control functions are always asynchronous and are usually called from a non-simulation thread, usually the debugger GUI thread. You can also use CADI to read/write registers, memory and so on, but only from non-simulation threads, for example only from the debugger thread.

SCADI

implements a specific subset of functions of CADI, that is, mainly read/write registers and memory, set and clear breakpoints, and get disassembly. You can only use SCADI from the simulation thread itself and from threads that can make sure on their own that the simulation is currently blocked, for example a debugger thread while it is sure that the simulation is in a stable state. SCADI is intended to be used from within peripheral read/write accesses while the simulation is running, or from within MTI callbacks that the simulation is running.

SCADI does not implement and execute control functions except `CADIExecStop()`, because only stop makes sense from within the simulation thread. Asynchronous functions such as `CADIExecContinue()` and `CADIExecSingleStep()` are not supported by SCADI, so for these you must use CADI instead. The `SCADI::CADIExecStop()` is the exception, because for CADI this means “stop when it is convenient for the simulation”, which is asynchronous, but `CADIExecStop()` is synchronous and means “stop now”, which you enable with the appropriate syncLevel > = 2.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The guidelines are:

- Use CADI for execution control.
- Use CADI or SCADI for read/write registers and memory, depending on the situation:
  - Use SCADI if the caller can make sure that the accesses are (potentially inherently) synchronized with the simulation.
  - Use CADI if called from a debugger thread that does not know exactly whether the simulation is running or is in a stable state.

1.9.3 Responsibilities of the SCADI caller

Synchronous interface means that the caller of SCADI functions is always responsible for ensuring that the simulation is in a stable state.

Being in a stable state means that the simulation does not advance while the call is being made. The caller is also responsible for meeting all host thread and synchronization requirements of any external bus slaves that are directly or indirectly connected to the memory bus.

1.9.4 SCADI interface access

This section describes the `CAInterface::ObtainInterface()` method and how to use it.

About SCADI interface access

You can obtain the SCADI interface from the same CAInterface pointers that provide the CADI and the MTI interfaces.

This is done using the `CAInterface::ObtainInterface()` method. The interface names for the normal CADI and MTI interfaces are `CADI::IFNAME()` and `ComponentTraceInterface::IFNAME()`, respectively.

The interface name for the SCADI interface to pass into `ObtainInterface()` is `"eslapi.SCADI2"`, the interface revision is 0. There are no `IFNAME()` and `IFREVISION()` static functions defined for SCADI, and a plain string constant and integer constant (0) has to be used instead.

The pointer returned by `CAInterface::ObtainInterface("eslapi.SCADI2")` must be cast into an `eslapi::CADI` class pointer, that is, the same class as for `eslapi.CADI2`, the normal CADI interface class.

Access to SCADI from within LISA components

To access the SCADI interface of the LISA component itself, use the `getSCADI()` function. This returns the SCADI interface of the LISA component itself.

To access the SCADI interfaces of other components in the system, use the `getGlobalInterface()` function. This returns a CAInterface pointer to a simulation-wide Component Registry.

You then have to use this registry pointer with the `obtainComponentInterfacePointer()` function to obtain the SystemTraceInterface. This interface provides a list of all components in the system that provide trace data. You can use this list to access the SCADI interfaces of all the components.

Access to SCADI from within SystemC

To access the SCADI interfaces from within SystemC, use the `scx_get_global_interface()` function. This returns a CAInterface pointer to a simulation-wide Component Registry.

You then have to use this registry pointer with the `obtainComponentInterfacePointer()` function to obtain the SystemTraceInterface. This interface provides a list of all components in the system that provide trace data. You can use this list to access the SCADI interfaces of all the components.

Access to SCADI from MTI plug-ins

MTI plug-ins can gain access to SCADI interfaces by using the CAInterface pointer, which is passed as a parameter to the `RegisterSimulation()` function.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

This pointer has the same semantics as the CAInterface pointer returned by the `getGlobalInterface()` functions in the SystemC or LISA use cases.

Example code for retrieving a SCADI interface pointer of a component

This code demonstrates how to use `getGlobalInterface()` to retrieve a SCADI interface pointer of a specific component.

From within LISA, use `getGlobalInterface()`. From within SystemC, it is assumed that you have a pointer to the Fast Models platform called `platform`. From within an MTI plug-in, you do not have to call `getGlobalInterface()`, and you can use the CAInterface pointer passed to `RegisterSimulation()`.

Retrieving a SCADI interface pointer of a specific component

```
#include "sg/SGComponentRegistry.h"
eslapi::CADI *Peripheral::get_SCADI_interface(const char *instanceName)
{
  // get access to MTI interface (SystemTraceInterface)
  // - this code is for a SystemC peripheral
  // - for LISA this would be just 'getGlobalInterface()'
  // - for MTI plugins this would be just using the CAInterface *caif pointer passed
  //   into RegisterSimulation()
  eslapi::CAInterface *globalInterface = scx::scx_get_global_interface();
  const char *errorMessage = "(no error)";
  MTI::SystemTraceInterface *mti = 0;
  if (globalInterface)
     mti = sg::obtainComponentInterfacePointer<MTI::SystemTraceInterface>
                                        (globalInterface,
                                        "mtiRegistry",
                                        &errorMessage);
  if (mti == 0)
  {
     printf("ERROR:MTI interface not found! (%s)\n", errorMessage);
     return 0;
  }
  // find component with instanceName
  eslapi::CAInterface *compif = 0;
  for (MTI::SystemTraceInterface::TraceComponentIndex i = 0;
      i < mti->GetNumOfTraceComponents();
      i++)
  {
      const char *name = mti->GetComponentTracePath(i);
      if (verbose)
         printf("TEST MTI component '%s'\n", name);
      if (strcmp(name, instanceName) == 0)
         compif = mti->GetComponentTrace(i);
  }
  if (!compif)
  {
      printf("ERROR:instance '%s' not found while trying to get SCADI! \n",
              instanceName);
      return 0;
  }
  // get and return SCADI interface
  return static_cast<eslapi::CADI *>(compif->ObtainInterface("eslapi.SCADI2", 0, 0));
}
```

1.9.5 SCADI semantics

This section lists the available subset of functionality and the differences in semantics from the CADI interface.

The SCADI interface provides a subset of functionality of the CADI interface. All functions in SCADI differ from the CADI functions, that is, the caller is responsible for satisfying the constraints and requirements in terms of synchronization with the simulation.

These functions have the same semantics as in CADI:

- `CADIRegGetGroups()`.
- `CADIRegGetMap()`.
- `CADIRegGetCompount()`.
- `CADIMemGetSpaces()`.
- `CADIMemGetBlocks()`.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- `CADIMemGetOverlays()`.
- `CADIGetParameters()`.
- `CADIGetParameterInfo()`.
- `CADIXfaceGetFeatures()`.

The following debug read access functions have the same semantics as in CADI, but the values that these read access functions return might differ from the values returned by the corresponding CADI functions because some of the accessed resource values might change during the execution of an instruction. The values of resources that are modified by the current instruction are UNKNOWN, except the PC, which always reflects the address of the last instruction that was issued. Reading and writing registers and memory while the simulation is running is generally only useful for `syncLevel >= SL_SYNC_STATE`. For SL_OFF, all registers and all memory locations are always UNKNOWN while the simulation is running.

- `CADIRegRead()`.
- `CADIMemRead()`.
- `CADIGetParameterValues()`.
- `CADIGetInstructionCount()`.
- `CADIGetPC()`.
- `CADIGetDisassembler()`.

The following write access functions always provide write access to the register in the `Simulation` register group. They also might provide limited write access semantics to certain resources. A SCADI implementation might choose not to support any write access to core registers and memory:

- `CADIRegWrite()`.
- `CADIMemWrite()`.
- `CADISetParameters()`.

The breakpoint functions have nearly all the same semantics as in the CADI interface, except that changes to breakpoints only become effective at the next stop event checkpoint defined by the current syncLevel. Changes might also only become visible in `CADIBptRead()` and `CADIBptGetList()` at this next synchronization point.

- `CADIBptGetList()`.
- `CADIBptRead()`.
- `CADIBptSet()`.
- `CADIBptClear()`.
- `CADIBptConfigure()`.

Execution control is limited to stopping the simulation. The simulation stops at the next synchronization point as defined by the current syncLevel:

- `CADIExecStop()`.

All other functions are not supported, and return `CADI_STATUS_CmdNotSupported`.

1.10 Using the TelnetTerminal

This virtual component permits the transfer of UART data between a TCP/IP socket on the host and a serial port on the target.

The following figure shows a block diagram of one possible relationship between the target and host through the Terminal component. The TelnetTerminal block is what you configure when you define Terminal component parameters. The Virtual Machine is your FVP.

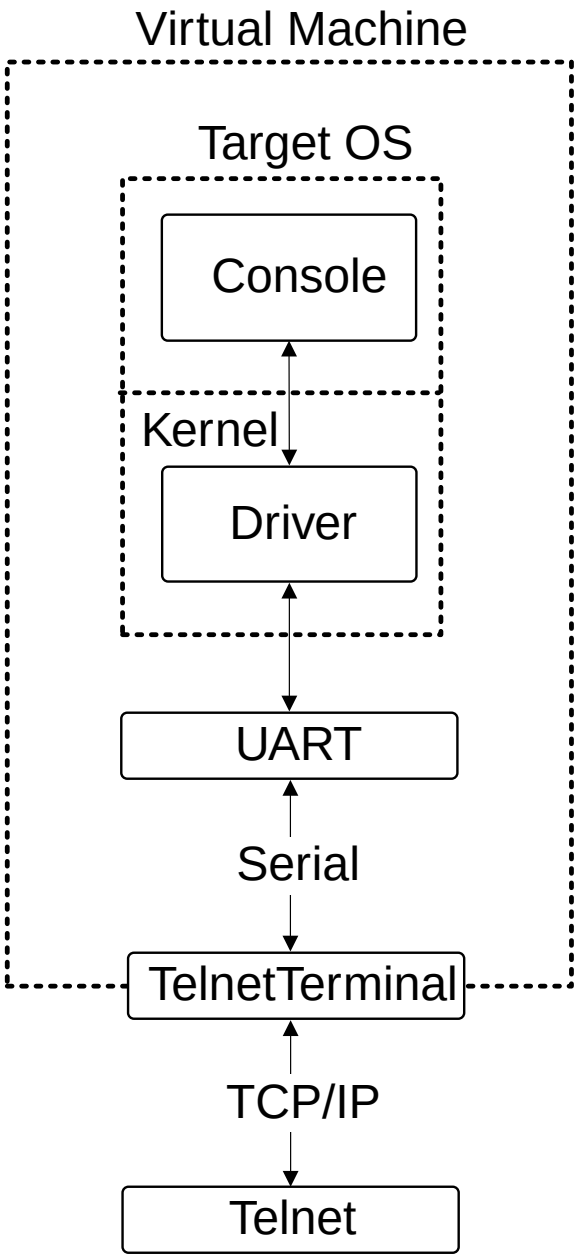

Figure 1-1 Terminal block diagram

On the target side, the console process that is invoked by your target OS relies on a suitable driver being present. Such drivers are normally part of the OS kernel. The driver passes serial data through a UART.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The data is forwarded to the TelnetTerminal component, which exposes a TCP/IP port to the world outside of the model. This port can be connected to by, for example, a Telnet process on the host.

You can change the startup behavior for each of up to four TelnetTerminals by modifying the corresponding component parameters.

If the TelnetTerminal connection is broken, for example by closing a client telnet session, the port is re-opened on the host. This could have a different port number if the original one is no longer available. Before the first data access, you can connect a client of your choice to the network socket. If there is no existing connection when the first data access is made, and the `start_telnet` parameter is true, a host telnet session is started automatically.

The port number of a particular TelnetTerminal instance can be defined when your model system starts. The actual value of the port used by each TelnetTerminal is declared when it starts or restarts, and might not be the value that you specified if the port is already in use. If you are using Model Shell, the port numbers are displayed in the host window in which you started the model.

You can start the TelnetTerminal component in either of the following modes:

Telnet mode
: The terminal component supports a subset of the RFC 854 protocol. This means that the terminal participates in negotiations between the host and client concerning what is and is not supported, but there is no flow control.

Raw mode
: The byte stream passes unmodified between the host and the target. The terminal does not participate in initial capability negotiations between the host and client. Instead it acts as a TCP/IP port. You can use this feature to directly connect to your target through the TelnetTerminal component.

Note

Microsoft Windows 10 disables the Telnet client by default. Follow these steps to enable it:

1. Select **Start** > **Settings**.
2. In the search box, type **Turn Windows features on or off**. The **Windows Features** dialog opens.
3. Select the **Telnet Client** check box and click **OK**. The installation might take several minutes to complete.

1.11 Network set up

This section describes how to set up networks using the serial interface that the TelnetTerminal component exposes.

This section contains the following subsections:

- *1.11.1 User mode networking* on page 1-38.
- *1.11.2 TAP/TUN networking* on page 1-39.

1.11.1 User mode networking

User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts.

This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running. Fast Models supports the following kinds of Ethernet device models:

SMSC_91C111
: This is paired with an external HostBridge component. The user mode networking specification is set on the external HostBridge.

VirtioNetMMIO
: This has a built-in HostBridge sub-component. The user mode networking specification is set on the internal HostBridge.

——— **Note** ———

- You can use TCP and UDP over IP, but not ICMP (ping).
- User mode networking does not support forwarding UDP ports on the host to the model.
- You can only use DHCP within the private network.
- You can only make inward connections by mapping TCP ports on the host to the model. This is common to all implementations that provide host connectivity using NAT.
- Operations that require privileged source ports, for example NFS in its default configuration, do not work.
- If setup fails, or the parameter syntax is incorrect, there is no error reporting.

———————————

To enable user mode networking, run the model with the following CADI parameters to activate the components:

SMSC_91C111:

```
-C motherboard.hostbridge.userNetworking=true
-C motherboard.smsc_91c111.enabled=true
```

VirtioNetMMIO:

```
-C motherboard.virtio_net.hostbridge.userNetworking=true
-C motherboard.virtio_net.enabled=true
```

To map a host TCP port to a model port, run the model with the `userNetPorts` parameter. This parameter allows services to appear to be listening on privileged ports in the model but be mapped to unprivileged ports on the host. The syntax is a comma-separated list of items in the form:

```
[host-ip:]hostport=[model-ip:]modelport
```

For example, to map port 8022 on the host to port 22 on the model, use this parameter:

SMSC_91C111:

```
-C motherboard.hostbridge.userNetPorts=8022=22
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VirtioNetMMIO:

```
-C motherboard.virtio_net.hostbridge.userNetPorts=8022=22
```

Either or both of a host IP address and model IP address can optionally be specified on either side of the assignment to select a specific interface on which the mapping will occur. For example:

```
127.0.0.1:8022=127.0.0.1:22
```

The default is to accept connections on any interface.

1.11.2 TAP/TUN networking

This section describes TAP/TUN networking.

TAP/TUN networking - limitations

This section describes general limitations of TAP/TUN networking for models.

DHCP

If the host uses Dynamic DNS, it inserts records into DNS. If you manage this host with DHCP, then installing TAP networking can cause failure to register in the DNS. After the physical device attaches to the bridge device, the DHCP client reruns, but the DHCP request does not have the correct hostname.

WiFi

Most WiFi adaptors do not implement the required support for TAP networking to work.

Setting up a network connection for Microsoft Windows

This section describes how to set up a network connection.

Prerequisites

The Fast Models networking environment needs the Third Party IP add-on for the Fast Model Portfolio.

Procedure

1. Close all non-essential applications.
2. Install the TAP driver and configure it:
   a. Locate Fast Model Portfolio, default `C:\Program Files\ARM\FastModelPortfolio_X.Y`.
   b. Execute the `ModelNetworking\add_adapter_64.bat` file.
3. Select **Start** > **Control Panel** > **Network Connections** and locate the newly installed TAP device.
4. Select at least one real Ethernet adapter connection. Press the **Ctrl** key to multi-select.
5. Right-click and select **Bridge Connections**.

Configuring the networking environment for Microsoft Windows

This section describes how to set the parameters to make a network connection.

Note

- This procedure has not been tested with wireless network adapters.
- Firewall software might block network traffic in the network bridge, and might result in a networking failure in the model. If the model does not work after configuration, check the firewall settings.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Prerequisites

Use System Canvas or a related Fast Models tool to load a project and build a model, or use Model Shell or Model Debugger to start a prebuilt model.

Procedure

1. Set the appropriate parameters on the `HostBridge` and `SMSC_91C111` components, or on the `VirtioNetMMIO` component and its `HostBridge` subcomponent. For example:
   Example:

   SMSC_91C111:

   ```
   hostbridge.interfaceName="ARM<x>"
   smsc_91c111.enabled=1
   ```

   VirtioNetMMIO:

   ```
   virtio_net.hostbridge.interfaceName="ARM<x>"
   virtio_net.enabled=1
   ```

   `ARM<x>` is an adapter that is built into the network bridge, and is 0 by default. Use `x+1` if `ARM<x>` exists.
2. Optional: Set another parameter on the device, if you have to enable promiscuous mode for the TAP device.
   a. Select **Start** > **Run** > **cmd.exe**.
   b. Enter the following commands.
      Example:

      ```
      netsh bridge show adapter
      netsh bridge set adapter <N> forcecompatmode=enable
      ```

      `<N>` is the id number of the TAP adapter that the first command lists.

Commands for tap_setup_32.exe or tap_setup_64.exe for Microsoft Windows

This section lists the commands for use with `tap_setup_32.exe` or `tap_setup_64.exe`. These files are located in the `ModelNetworking` directory.

`help`
Print help information.

`set_media`
Configure the TAP devices to `Always Connected`.

`set_perm`
Configure the TAP devices to `Non-admin Accessible`.

`restart`
Restart the TAP devices.

`list_dev`
List available TAP devices and output to a file.

`rename`
Rename the device to **ARMx**.

`install <inffile> <id>`
Install a TAP Win32 or Win64 adapter.

`remove <dev>`
Remove TAP Win32 or Win64 adapters. Set ***<dev>*** to `All` to remove all tap devices.

`setup <inffile> <id>`
Automated setup process.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Uninstalling networking for Microsoft Windows

This section describes how to uninstall TAP adapters from the base location of the Fast Models Portfolio, by default `C:\Program Files\ARM\FastModelPortfolio_X.Y`.

Procedure

1. Run the `remove_all_adapters_32.bat` or `remove_all_adapters_64.bat` file. These files are located in the `ModelNetworking` directory.
2. If the uninstallation does not delete the bridge, delete it manually.
   a. Close all non-essential applications.
   b. Select **Network Connections**.
   c. Right-click on the bridge and select **Delete**.

Setting up a network connection for Red Hat Enterprise Linux

This section describes how to set up a network connection.

——— **Note** ———

Perform this procedure once for each host machine.

———————————

——— **Restriction** ———

The set-up and configuration instructions assume that your network provides IP addresses by DHCP. Otherwise, consult your network administrator.

———————————

Prerequisites

Ensure that the `brctl` utility is on your system. This utility is in the installation package, but ARM recommends that you use the standard Linux bridge utilities, which are in the Linux distribution.

Procedure

1. In a shell, change to the `FastModelsPortfolio_X.Y/ModelNetworking` directory.
2. Run the following script from this directory, because it does not work correctly if run from any other location:

   32-bit operating system
   Run `add_adapter_32.sh` as root. For example, `sudo ./add_adapter_32.sh`.

   64-bit operating system
   Run `add_adapter_64.sh` as root. For example, `sudo ./add_adapter_64.sh`.
3. The prompt appears: **Specify the TAP device prefix:(ARM)**. Select **Enter** to accept the default.
4. The prompt appears: **Specify the user list**. Enter a space-separated list of all users who are to use the model on the network, then select **Enter**. All entries in the list must be the names of existing user accounts on the host.
5. The prompt appears: **Enter the network adapter which connects to the network:(eth0)**. Select **Enter** to accept the default, or input the name of a network adapter that connects to your network.
6. The prompt appears: **Enter a name for the network bridge to create:(armbr0)**. Select **Enter** to accept the default, or input a name for the network bridge. You must not have an existing network interface on your system with the selected name.
7. The prompt appears: **Enter the location to write the init script to:(/etc/init.d/FMNetwork)**. Select **Enter** to accept the default, or input another path with a new filename in an existing directory.
8. The prompt appears: **WARNING: the script creates a bridge which includes the local network adapter and tap devices. You may suffer temporary network loss. Do you want to proceed? (Yes or No)**. Verify all values input so far, and enter **Yes**if you want to proceed. If you enter **No**, no changes are made to your system.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

9. A prompt appears to inform you of the changes that the script is to make to your system. Input **Yes** if you are happy to accept these changes, or input **No** to leave your system unchanged.

   ———— **Note** ————

   After entering **Yes**, you might temporarily lose network connectivity. Also, the IP address of the system might change.

   ————————————

Next Steps

The network bridge is disabled after the host system is reset. To configure the host system to support bridged networking, you might have to create links to the `init` script (FMNetwork). The script suggests some appropriate links for Red Hat Enterprise Linux 6.

The default firewall configuration on Red Hat Enterprise Linux 6 blocks packet transmission across the TAP networking bridge device. You can disable the firewall. If the context makes this unwise, then add firewall rules to allow transmission. These `iptables` commands configure the firewall to allow packets across the bridge device:

```
iptables -I FORWARD -m physdev --physdev-is-bridged -j ACCEPT
service iptables save
service iptables restart
```

Setting up a network connection for Ubuntu Linux

This section describes how to set up a network connection.

To use TAP networking with Fast Models on Ubuntu, set up a TAP device manually by following these steps. This guide uses a network interface `eth0` and a username `fmuser`. Replace these values as appropriate.

———— **Note** ————

Typographic errors when modifying network configuration can cause the computer to fail to connect to the network. ARM recommends performing these steps on a machine that you have physical access to.

————————————

Procedure

1. ———— **Note** ————

   Edit the interfaces file with root privileges.

   ————————————

   Add `eth0` to `/etc/network/interfaces` if it is not there.

   This step stops network-manager from managing `eth0`. It can result in network-manager indicating there is no network connection even if there is.

Option	Description

For an interface using DHCP	Add:
	`auto eth0`
	`iface eth0 inet dhcp`

Configure a static IP address	Add the static information, for example:
	`auto eth0`
	`iface eth0 inet static`
	`address 192.168.0.2`
	`netmask 255.255.255.0`
	`gateway 192.168.0.1`

   The network notifier applet launches the GUI tool network-manager. It automatically configures network devices that `/etc/network/interfaces` does not manage, and sets up devices in a way that

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

is incompatible with bridging. This step makes sure that network-manager does not manage the network interface that you want to bridge to. If you are unsure how to configure your network interface, ask your network administrator.

2. Install the bridge-utils package.
   Example: Run:

   ```
   sudo apt-get install bridge-utils
   ```

   Results: This step provides the `brctl` command, for creating and managing the network bridge.

3. Create a bridge device by adding an entry to `/etc/network/interfaces`.
   Example:

   ```
   auto armbr0
   iface armbr0 inet dhcp
   pre-up ifconfig eth0 0.0.0.0 promisc
   post-down ifconfig eth0 0.0.0.0 -promisc
   ```

   The pre-up and post-down lines give commands to execute before bringing up `armbr0` and after bringing it down. These commands put `eth0` into promiscuous mode at pre-up and take it out of promiscuous mode at post-down. Promiscuous mode makes sure that the hardware does not filter out packets for the virtual ethernet device.

   Results: This step creates a bridge device that is called `armbr0` from Fast Models TAP devices to the physical network.

4. Create the TAP devices.

   TAP devices need permission for specific users, so create one for each user who is to run the model with the virtual ethernet device. For example, to create a TAP device that is called `ARMfmuser` for the user `fmuser`, add the following lines to the `armbr0` section of `/etc/network/interfaces`.

   Example:

   ```
   pre-up ip tuntap add dev ARMfmuser mode tap user fmuser
   pre-up ifconfig ARMfmuser 0.0.0.0 promisc
   post-down ip tuntap del dev ARMfmuser mode tap
   ```

   Results: This step creates a TAP device for each user.

5. Create a bridge between the TAP devices and the network interface `eth0` by adding a `bridge_ports` line to the `armbr0` section of `/etc/network/interfaces`. For example, for a TAP device that is named `ARMfmuser`, add the following line:
   Example:

   ```
   bridge_ports eth0 ARMfmuser
   ```

6. The added `/etc/network/interfaces` code now looks like the following:
   Example:

   ```
   auto armbr0
   iface armbr0 inet dhcp
   pre-up ifconfig eth0 0.0.0.0 promisc
   post-down ifconfig eth0 0.0.0.0 -promisc
   pre-up ip tuntap add dev ARMfmuser mode tap user fmuser
   pre-up ifconfig ARMfmuser 0.0.0.0 promisc
   post-down ip tuntap del dev ARMfmuser mode tap
   bridge_ports eth0 ARMfmuser
   ```

7. Restart network services with one of the following options:
   - Run the following commands:

     ```
     sudo ifdown eth0 && sudo ifup eth0
     sudo ifup armbr0
     sudo service network-manager restart
     ```

     Note

     `armbr0` must be explicitly started.

   - Restart the computer.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Results: Both choices disconnect and reconnect all network interfaces.

Configuring the networking environment for Linux

This section describes how to set the parameters to make a network connection.

Note

Firewall software might block network traffic in the network bridge, and result in a networking failure. If the model does not work after configuration, check the firewall settings.

Prerequisites

Use System Canvas or a related Fast Models tool to load a project or model, and then select a component.

Procedure

1. Set the parameters on the `HostBridge` and `SMSC_91C111` components, or on the `VirtioNetMMIO` component and its `HostBridge` subcomponent. For example:
   Example:

   SMSC_91C111:

   ```
   hostbridge.interfaceName=ARM<username>smsc_91c111.enabled=1
   ```

   VirtioNetMMIO:

   ```
   virtio_net.hostbridge.interfaceName=ARM<username>virtio_net.enabled=1
   ```

   `ARM<username>` is an adapter that is built into the network bridge.

Fast Models User Guide

Solutions to networking issues on Linux

This section describes how to solve networking issues.

The model networking works after initial setup, but stops working after reboot

Set the correct access permissions for the `/dev/net/tun` device, by executing `chmod 666 /dev/net/tun` as root. To preserve the change across reboots, modify the udev rules of the TAP device: open `/etc/udev/rules.d/50-udev.rules` as root, and find the line:

```
KERNEL=="tun", NAME="net/%k"
```

If it does not have `MODE="0666"` at the end of the line, append `MODE="0666"`:

```
KERNEL=="tun", NAME="net/%k", MODE="0666"
```

Model networking installs correctly, but when a model starts up, the model cannot receive packets

Disable the firewall on the host machine, or add the TAP device to `trusted devices`.

Note

Refer to the vendor documentation manual.

Disabling and re-enabling networking for Linux

This section describes how to disable and re-enable networking with an `init` script.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Caution

These operations remove/restore TAP devices and the network bridge. There is a temporary loss of network connectivity and your IP address might change.

Procedure

- To disable networking without uninstalling it, invoke the installed `init` script (by default, `/etc/init.d/FMNetwork`) as root with the parameter `stop`.
  Example:

```
sudo /etc/init.d/FMNetwork stop
```

- To re-enable networking, invoke the `init` script as root with the parameter `start`.
  Example:

```
sudo /etc/init.d/FMNetwork start
```

Uninstalling networking for Linux

This section describes the steps to uninstall a network.

Procedure

1. In a shell, change to the `/FastModelsPortfolio_X.Y/ModelNetworking` directory.
2. Run `uninstall.sh` as root, passing the location of the `init` script (FMNetwork):
   Example: `sudo ./uninstall.sh /etc/init.d/FMNetwork`

   You must run this script from the directory in which it is installed, because it does not work correctly if run from any other location.

   Caution

   There is a temporary loss of network connectivity and your IP address might change.

Next Steps

The uninstall script removes everything that can be safely removed. It does not remove:

- symlinks to the `init` script.
- `/sbin/brctl`.

You must remove any symlinks that you have created. Removing `brctl` is optional.

1.12 Model Trace Interface

This section describes the *Model Trace Interface* (MTI).

Fast Models supports the generation of traces that consistently track the execution and related activities in the model. In particular, tracking those activities that affect the state of the modeled IP. Generated virtual platforms provide trace support by using plug-ins in the form of DLLs and shared objects on Windows and Linux, respectively.

The following diagram represents the MTI architecture, where all the tracing information of the system is found.

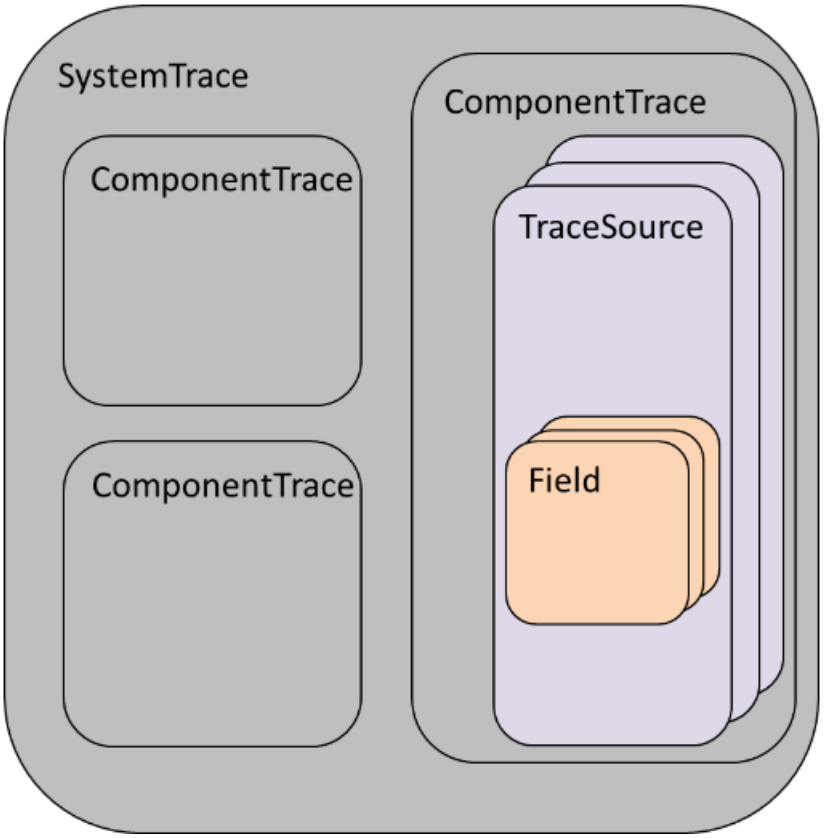

Figure 1-2 MTI architecture

A trace source provides information about a specific event that occurs in the component. In a processor component, this event can be, for example, the execution of an instruction, the taking of a branch, or an MMU translation. It can also be an event that is specific to models, such as the `SYNC` event, which is called at every quantum boundary. Each trace source contains fields that give more information about the event, including a text description. When the field is of type `MTI_ENUM`, the values for this field are also listed. For example:

```
Source CACHE_READ_MISS (Read access cache miss.)
    Field IS_SHARED type:MTI_ENUM size:1 (Is the access shared)
        0x0 = NON_SHARED
        0x1 = SHARED
    Field IS_PRELOAD type:MTI_ENUM size:1 (Is the access a preload)
        0x0 = NOT_PRELOAD
        0x1 = PRELOAD
    Field MASTER_ID type:MTI_UNSIGNED_INT size:4 (Indicates the master associated with this
monitor)
```

After you enable or disable a trace source, there might be a delay before the change takes effect, depending on the current syncLevel. See *1.8.1 syncLevel definitions* on page 1-29 for more information.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Arm produces several pre-built trace plug-ins, which are documented in *Plug-ins for Fast Models* on page 5-2890. Source code for these plug-ins and for other example plug-ins is provided in `$PVLIB_HOME/examples/MTI/`.

1.13 Using parameters to set port values

Some processor and peripheral component ports are almost always static in value when used as part of a typical platform. For example, the reset vector base address register address (RVBARADDR) port in processor components.

To facilitate easy configuration of platform models, the IP models for these components can provide a shadow parameter for these ports. This parameter can be used to change the value that is used by the model. In these cases, the following rules apply:

- If a port is driven in the platform model, then the parameter value is ignored.
- If a port is not driven in the platform model, then the parameter value is sampled at both simulator reset, and at every subsequent simulation reset of the specific IP model.

  Note

  Simulator reset corresponds with the LISA `reset()` behavior and the SystemC `start_of_simulation()` callback.

- All ports and parameters that are sampled at reset are sampled when the simulation reset signal concerned is deasserted.
- If a port is not driven in the platform model, and a parameter has not been set, then the default value for the parameter is used.

In some IP models, the value of some ports can only be set by using a parameter. That is, the parameter is provided instead of the port.

1.14 About PVBus system components

A bus system consists of a number of bus masters, some infrastructure and a number of bus slaves.

Each bus master must contain a `PVBusMaster` subcomponent, and each bus slave must contain a `PVBusSlave` subcomponent. These subcomponents provide `PVBus` master and slave ports. Each `PVBus` master port can only connect to one slave, but any number of other masters can connect to the same slave. `PVBusDecoder`, `PVBusMaster` and `PVBusSlave` components communicate using the `PVBus` protocol.

`PVBusDecoder` components can be added to the bus system. Each of these permits its masters to connect to multiple slaves, each associated with a different bus address range.

`PVBusSlave` subcomponents provide built-in support for declaring memory-like, device-like, abort or ignore address ranges. `PVBus` has support for dealing efficiently with memory-like devices such as RAM, ROM, and Flash.

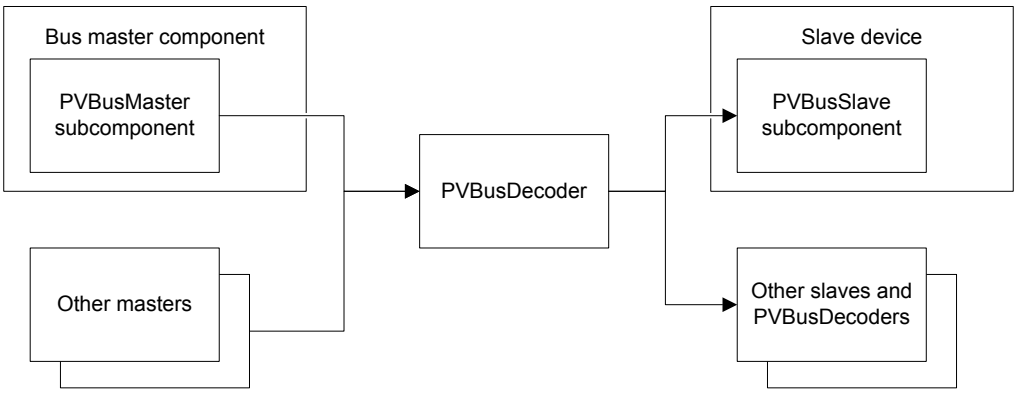

Figure 1-3 Sample bus topology

All communication over the `PVBus` is performed using transactions that are generated by `PVBusMaster` subcomponents and fulfilled by `PVBusSlave` components. Transactions have a 32-bit Master ID, which is the ID of the bus master. Transactions can be routed to the slave device through its `PVBusSlave` subcomponent. When configured, the `PVBusSlave` can handle memory-like transactions efficiently without having to route these transactions to the slave device. Transactions are atomic unless slave devices block transactions, for example an SMMU with stall mode enabled. A slave device that can block transactions and all its upstream bus components must be re-entrant safe for bus transactions.

Fast Models provides some example `PVBus` systems:

- `$PVLIB_HOME/examples/LISA/common/LISA/RemapDecoder.lisa`. This example dynamically modifies routing of requests based on a remap signal, using the `TZSwitch` component.
- The directory `$PVLIB_HOME/examples/LISA/BusComponents/` contains a set of example components that show various ways of using the `PVBus` interface.

1.15 PVBus C++ transaction and Tx_Result classes

This section describes the C++ transaction and `Tx_Result` classes.

This section contains the following subsections:

- *1.15.1 Class pv::TransactionGenerator* on page 1-50.
- *1.15.2 TransactionGenerator efficiency considerations* on page 1-50.
- *1.15.3 Enum pv::AccessWidth* on page 1-51.
- *1.15.4 Class pv::Transaction* on page 1-51.
- *1.15.5 Class pv::ReadTransaction* on page 1-51.
- *1.15.6 Class pv::WriteTransaction* on page 1-52.

1.15.1 Class pv::TransactionGenerator

This class provides efficient mechanisms for bus masters to generate transactions that are transmitted over the `pvbus_m` port of the associated PVBusMaster subcomponent.

You can produce pv::TransactionGenerator objects by invoking the `createTransactionGenerator()` method on the control port of a PVBusMaster component.

```
class pv::TransactionGenerator
{
    // Tidy up when TransactionGenerator is deleted.
    ~TransactionGenerator()

    // Control AXI-specific signal generation for future transactions.
    // Privileged processing mode.
    void setPrivileged(bool priv = true);

    // Instruction access (vs data).
    void setInstruction(bool instr = true);

    // Normal-world access (vs secure).
    void setNonSecure(bool ns = true);

    // Locked atomic access.
    void setLocked(bool locked = true);

    // Exclusive atomic access.
    void setExclusive(bool excl = true);

    // Generate transactions.
    // Generate a read transaction.
    bool read(bus_addr_t, pv::AccessWidth width, uint32_t *data);

    // Generate a write transaction.
    bool write(bus_addr_t, pv::AccessWidth width, uint32_t const *data);

    // Generate read transactions.
    bool read8(bus_addr_t, uint8_t *data);
    bool read16(bus_addr_t, uint16_t *data);
    bool read32(bus_addr_t, uint32_t *data);
    bool read64(bus_addr_t, uint64_t *data);

    // Generate write transactions.
    bool write8(bus_addr_t, uint8_t const *data);
    bool write16(bus_addr_t, uint16_t const *data);
    bool write32(bus_addr_t, uint32_t const *data);
    bool write64(bus_addr_t, uint64_t const *data);
};
```

1.15.2 TransactionGenerator efficiency considerations

TransactionGenerators are most efficient for multiple accesses to one 4KB page.

Each TransactionGenerator caches connection information internally. This improves efficiency for multiple accesses to a single 4KB page. If a component requires repeated access data from different pages, for example when streaming from one location to another, ARM recommends you create a TransactionGenerator for each location.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

You can dynamically create and destroy TransactionGenerators, but it is better to allocate them once at initialization and destroy them at shutdown. See the DMA example in the examples directory of the System Canvas Model Library distribution.

1.15.3 Enum pv::AccessWidth

This enum selects the required bus width for a transaction.

Defined values are:

- `pv::ACCESS_8_BITS`
- `pv::ACCESS_16_BITS`
- `pv::ACCESS_32_BITS`
- `pv::ACCESS_64_BITS`

1.15.4 Class pv::Transaction

This class is a base class for read and write transactions that are visible in the PVBusSlave subcomponent. It contains functionality common to both types of transaction.

This class provides an interface that permits bus slaves to access the details of the transaction. Do not instantiate these classes manually. The classes are generated internally by the PVBus infrastructure.

This base class provides access methods to get the transaction address, access width, and bus signals. It also provides a method to signal that the transaction has been aborted.

```
class pv::Transaction
{
    public:
    // Accessors
    bus_addr_t getAddress() const;          // Transaction address.
    pv::AccessWidth getAccessWidth() const; // Request width.
    int getAccessByteWidth() const;         // Request width in bytes.
    int getAccessBitWidth() const;          // Request width in bits.

    bool isPrivileged() const;  // Privileged process mode?
    bool isInstruction() const; // Instruction request vs data?
    bool isNonSecure() const;   // Normal-world vs secure-world?
    bool isLocked() const;      // Atomic locked access?
    bool isExclusive() const;   // Atomic exclusive access?
    uint32_t getMasterID() const;
    bool hasSideEffect() const;

    // Generate transaction returns
    Tx_Result  generateAbort();          // Cause the transaction to abort.
    Tx_Result  generateSlaveAbort();     // Cause the transaction to abort.
    Tx_Result  generateDecodeAbort();    // Cause the transaction to abort.
    Tx_Result  generateExclusiveAbort(); // Cause the transaction to abort.
    Tx_Result  generateIgnore();
};
```

1.15.5 Class pv::ReadTransaction

This class extends the pv::Transaction class to provide methods for returning data from a bus read request.

```
class ReadTransaction : public Transaction
{
    public:
    /*! Return a 64-bit value on the bus. */
    Tx_Result setReturnData64(uint64_t);

    /*! Return a 32-bit value on the bus. */
    Tx_Result setReturnData32(uint32_t);

    /*! Return a 16-bit value on the bus. */
    Tx_Result setReturnData16(uint16_t);

    /*! Return an 8-bit value on the bus. */
    Tx_Result setReturnData8(uint8_t);

    /*! This method provides an alternative way of returning a Tx_Result
    * success value (instead of just using the value returned from
    * setReturnData<n>()).
    *
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

```
    * This method can only be called if one of the setReturnData<n>
    * methods has already been called for the current transaction.
    */
    Tx_Result readComplete();
};
```

1.15.6 Class pv::WriteTransaction

This class extends the pv::Transaction class to provide methods for returning data from a bus write request.

```
class WriteTransaction : public Transaction
{
    public:
    /*! Get bottom 64-bits of data from the bus. If the transaction width
    * is less than 64-bits, the data will be extended as appropriate.
    */
    uint64_t getData64() const;

    /*! Get bottom 32-bits of data from the bus. If the transaction width
    * is less than 32-bits, the data will be extended as appropriate.
    */
    uint32_t getData32() const;

    /*! Get bottom 16-bits of data from the bus. If the transaction width
    * is less than 16-bits, the data will be extended as appropriate.
    */
    uint16_t getData16() const;

    /*! Get bottom 8-bits of data from the bus. If the transaction width
    * is less than 8-bits, the data will be extended as appropriate.
    */
    uint8_t getData8() const;

    /*! Signal that the slave has handled the write successfully.
    */
    Tx_Result writeComplete();
};
```

1.16 Visualisation Library

This section describes the components and protocols included in the Visualisation Library for Fast Models.

This section contains the following subsections:

- *1.16.1 Visualisation Library - about* on page 1-53.
- *1.16.2 LISA Visualisation models* on page 1-53.
- *1.16.3 Visualisation Library C++ classes* on page 1-54.

1.16.1 Visualisation Library - about

The Visualisation Library does not model hardware directly but instead provides components, protocols, and a library. These permit a GUI display that lets you interact with the external I/O from the model platform.

The types of I/O handled include:

- LCD display, such as the output from the PL110_CLCD component display port.
- LEDs representing values from a ValueState port as either single lights, or as segmented alphanumeric displays.
- DIP switches, which can drive a ValueState port.
- Capture of keyboard and mouse input, using the KeyboardStatus and MouseStatus protocols to feed input to a PS2Keyboard or PS2Mouse component.
- Background graphics, custom rendered graphics, and clickable push buttons, permitting the UI to provide display a skin representing the physical appearance of the device being modeled.
- Status information such as processor instruction counters, with values taken from the InstructionCount port of a processor.

The Visualisation Library provides a C++ API that enables you to write your own visualization components in LISA+. These custom components can display any combination of the supported I/O types.

You can add the prebuilt GUIPoll component to your custom component. The GUIPoll component provides a LISA visualization component with a periodic signal that keeps the display updated, even when the simulation is stopped.

The Visualisation Library supports one signaling protocol, the LCD protocol.

Related references

2.4.7 LCD protocol on page 2-72

1.16.2 LISA Visualisation models on page 1-53

1.16.3 Visualisation Library C++ classes on page 1-54

1.16.2 LISA Visualisation models

The Visualisation components provide a host window to display status information in addition to a frame buffer.

Each example platform model, such as the VE, contains its own LISA Visualisation model. You can use the model as the basis for your own visualization containing components, such as a PL110_CLCD component. To use the Visualisation components in your own system, copy the component LISA files from the relevant platform model directory, because they are not in the generic Model Library.

1.16.3 Visualisation Library C++ classes

This section describes the Visualisation Library C++ classes and structures.

C++ classes inclusion

To use these Visualisation Library classes, begin your LISA component with the correct `#include` statement.

```
includes
{
#include “components/Visualisation.h”
}
```

Visualisation class

This class provides access to the API for creating a custom LISA visualization component.

Visualisation class - about

A component obtains an instance of this class by calling the global function `createVisualisation()`. The component can then use this instance to control the size and layout of the visualization window.

The Visualisation Library is implemented using the *Simple DirectMedia Layer* (SDL) cross-platform rendering library.

Global functions

The global function is `createVisualisation()`.

`Visualisation *createVisualisation()`
This generates an instance of the Visualisation Library. You can only call this function once, because SDL only supports opening a single display window.

Class Visualisation

This section describes the methods of the Visualisation class.

`~Visualisation()`
Destructor for the Visualisation Library. You must only call this method when your simulation is shutting down, after all allocated resources (VisRenderRegions, VisPushButtonRegions, VisBitmaps) have been deleted.

`void configureWindow(unsigned int width, unsigned int height, unsigned int bit_depth)`
This sets the visualization window to the requested size and bit depth. Depending on the display capabilities, the window might actually get a different bit depth from the size you requested.

`VisBitmap *loadImage(char const *filename)`
This allocates a new VisBitmap object, initialized by loading a Microsoft Windows Bitmap (`.BMP`) from the given file.

`VisBitmap *loadImageWithAlphaKey(char const *filename, unsigned int red, unsigned int green, unsigned int blue)`
This allocates a VisBitmap object, as with `loadImage()`. All pixels of the color specified by `red`, `green`, `blue` are converted into a transparent alpha channel.

`VisBitmap *cropImage(VisBitmap *source, int x, int y, unsigned int width, unsigned int height)`
This allocates a new VisBitmap object, by cropping a region from the source bitmap.

`void releaseImage(VisBitmap *)`
This releases the resources held by the given VisBitmap. The underlying bitmap is only be unloaded if it is not in use.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`void setBackground(VisBitmap *background, int x, int y)`
This sets the background image for the visualization window. This takes a copy of the data referenced by the VisBitmap, so it is safe for the client to call `releaseImage(background)` immediately after calling `setBackground()`. The background is not displayed until the first call to `poll()`.

`VisRenderRegion *createRenderRegion()`
This allocates a new VisRenderRegion object that can be used to display arbitrary graphics, including LCD contents, in a rectangular region.

`VisPushButtonRegion *createPushButtonRegion()`
This allocates a new VisPushButtonRegion, which can be placed at a location on the display to provide a clickable push button.

`bool poll(VisEvent *event)`

This call permits the Visualisation Library to poll for GUI events. The client passes a reference to a VisEvent structure, which receives details of a single mouse/keyboard event.

The method returns false if no events have occurred.

Your LISA visualization implementations must call this periodically by using a GUIPoll component. On each `gui_callback()` event, you must ensure that the visualization component repeatedly calls `poll()` until it returns false.

`void lockMouse(VisRegion *region)`
This method locks the mouse to the visualization window and hides the mouse pointer.

`void unlockMouse()`
This unlocks and redisplays the mouse pointer.

`bool hasQuit()`
This returns true if the user has clicked on the close icon of the visualization window.

Class VisRegion

This class is the common base class for VisPushButtonRegion and VisRenderRegion, representing a region of the visualization display.

`~VisRegion()`
Permits clients to delete a VisPushButtonRegion when it is no longer required.

`void setId(void *id)`
Permits a client-defined identifier to be associated with the region.

`void *getId()`
Returns the client-defined identifier.

`void setVisible(bool vis)`
Specifies whether the region is to be displayed on the screen. This is currently ignored by the SDL implementation.

`void setLocation(int x, int y, unsigned int width, unsigned int height)`
Sets the location of this region relative to the visualization window.

Class VisPushButtonRegion : public VisRegion

This class defines a region of the visualization window that represents a clickable button.

Optionally, the button can provide different VisBitmap representations for a button-up and a button-down graphic, and a graphic to use when the mouse pointer rolls over the button.

In addition to the public method defined in VisRegion, this class defines these methods:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`void setButtonUpImage(VisBitmap *bmpUp) : void`

`setButtonDownImage(VisBitmap *bmpDown) : void`

`setButtonRollOverImage(VisBitmap *bmpRollover)`

Sets the graphics to be used for each of the button states. If any image is not specified or is set to NULL, then the corresponding area of the visualization background image is used.

The VisPushButtonRegion takes a copy of the VisBitmap, so the client can safely call Visualisation::releaseBitmap() on its copy.

`void setKeyCode(int code)`
This sets the code for the keypress event that is generated when the button is pressed or released.

Class VisRenderRegion : public VisRegion

This class defines a region of the visualization window that can render client-drawn graphics, including a representation of the contents of an LCD.

In addition to the public method defined in VisRegion, the class defines these methods:

`VisRasterLayout const *lock()`
Locks the region for client rendering. While the buffer is locked, the client can modify the pixel data for the buffer. You must not call the methods `writeText()` and `renderBitmap()` while the buffer is locked.

`void unlock()`
Releases the lock on the render buffer, permitting the buffer to be updated on screen.

`void update(int left, int top, unsigned int width, unsigned int height)`
Causes the specified rectangle to be drawn to the GUI.

`int writeText(const char *text, int x, int y)`
Renders the given ASCII text onto an unlocked VisRenderRegion. The return value is the x co-ordinate of the end of the string. The default font is 8 pixels high, and cannot be changed.

void `renderBitmap(VisBitmap *bitmap, int x, int y)`
Draws a bitmap onto an unlocked VisRenderRegion.

Struct VisRasterLayout

This struct defines the layout of the pixel data in a frame-buffer.

The `lock()` method of the LCD protocol expects to be given a pointer to this structure. You can generate a suitable instance by calling `VisRasterRegion::lock()`.

The structure contains these fields:

`uint8_t *buffer`
This points to the buffer for the rasterized pixel data. The controller can write pixels into this buffer, but must stick within the bounds specified by the width and height.

`uint32_t pitch`
The number of bytes between consecutive raster lines in the pixel data. This can be greater than the number of bytes per line.

`uint32_t width`
The width, in pixels, of the render area. This value can be less than the width requested by the LCD controller when it called `lock()`.

`uint32_t height`
The height, in pixels, of the render area. This value can be less than the height requested by the LCD controller when it called `lock()`.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`VisPixelFormat` format
: This structure defines the format of the pixel data in the raster buffer.

`bool` changed
: This is set to true if the pixel format or buffer size has changed since the previous call to `lock()`.

Pixel data is represented as a one-dimensional array of bytes. The top-left pixel is pointed to by the buffer member. Each pixel takes up a number of bytes, given by `format.pbytes`.

The pixel at location (x, y) is stored in the memory bytes starting at `buffer[y * pitch + x * format.pbytes]`.

Struct VisPixelFormat

This struct specifies the format of pixel data within the buffer.

The members are:

`uint32_t rbits, gbits, bbits`
: The number of bits per color channel.

uint32_t `roff, goff, boff`
: The offset within the pixel data value for the red/green/blue channels.

uint32_t `pbytes`
: The size of a single pixel, in bytes.

`format.pbytes` specifies the number of bytes that make up the data for a single pixel. These bytes represent a single pixel value, stored in host-endian order. The pixel value contains a number of the form `(R<<format.roff) + (G<<format.goff) + (B<<format.boff)`, where `(R,G,B)` represents the values of the color channels for the pixel, containing values from 0 up to `(1<<format.rbits)`, `(1<<format.gbits)`, `(1<<format.bbits)`.

Chapter 2
Protocols

Components communicate through connected ports. Ports have protocols that define the function calls for different connections.

It contains the following sections:

- *2.1 AMBA-PV protocols* on page 2-59.
- *2.2 Clocking protocols* on page 2-65.
- *2.3 Debug interface protocols* on page 2-67.
- *2.4 Peripheral protocols* on page 2-71.
- *2.5 Power management protocols* on page 2-80.
- *2.6 Processor protocols* on page 2-81.
- *2.7 Signaling protocols* on page 2-85.

2.1 AMBA-PV protocols

This section describes the AMBA-PV protocols.

This section contains the following subsections:

- *2.1.1 AMBA-PV protocols - about* on page 2-59.
- *2.1.2 AMBAPV protocol* on page 2-59.
- *2.1.3 AMBAPVACE protocol* on page 2-61.
- *2.1.4 AMBAPVSignal protocol* on page 2-63.
- *2.1.5 AMBAPVSignalState protocol* on page 2-63.
- *2.1.6 AMBAPVValue protocol* on page 2-63.
- *2.1.7 AMBAPVValue64 protocol* on page 2-63.
- *2.1.8 AMBAPVValueState protocol* on page 2-64.
- *2.1.9 AMBAPVValueState64 protocol* on page 2-64.

2.1.1 AMBA-PV protocols - about

The AMBA-PV components and protocols permit you to model a platform that interfaces with an ARM® AMBA-based system.

The protocols are:

AMBAPV
Models the AMBA protocols AXI4, AXI3, AHB and APB.

AMBAPVACE
Models the AMBA ACE and DVM protocols.

AMBAPVSignal
Models interrupts.

AMBAPVSignalState
Transfers and receives signal states.

AMBAPVValue
Models propagation of 32-bit integer values between components.

AMBAPVValue64
Models propagation of 64-bit integer values between components.

AMBAPVValueState
Permits a master to retrieve the current value from a slave, using 32-bit integer values.

AMBAPVValueState64
Permits a master to retrieve the current value from a slave, using 64-bit integer values.

There are ready-to-use components that provide you with conversions between protocols.

AMBA-PV Extensions to TLM 2.0 Developer Guide

2.1.2 AMBAPV protocol

The AMBAPV protocol defines behaviors for single read and single write transactions. This covers ARM AMBA AXI4, AXI3, AHB and APB bus protocol families, at the PV level.

In addition, the AMBAPV protocol provides support for AMBA protocol additional control information:

- Protection units.
- Exclusive access and locked access mechanisms.
- System-level caches.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The behaviors of the protocol are:

read()

Completes a single read transaction at the given address for the given size in bytes. Additional AMBA protocol control information can be specified using the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context.

```
read(int socket_id, const sc_dt::uint64 &addr,
    unsigned char *data, unsigned int size,
    const amba_pv::amba_pv_control *ctrl,
    sc_core::sc_time &t):
    amba_pv::amba_pv_resp_t
```

write()

Completes a single write transaction at the given address with specified data and write strobes. The size of the data is specified in bytes. Additional AMBA protocol control information can be specified using the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context.

```
write(int socket_id, const sc_dt::uint64 &addr,
    unsigned char *data, unsigned int size,
    const amba_pv::amba_pv_control *ctrl,
    unsigned char *strb, sc_core::sc_time &t):
    amba_pv::amba_pv_resp_t
```

debug_read()

Completes a debug read transaction from a given address without causing any side effects. Specify the number of bytes to read in the `length` parameter. The number of successfully read values is returned. Additional AMBA protocol control information can be specified in the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context. This behavior is empty by default and returns 0.

```
debug_read(int socket_id, const sc_dt::uint64 &addr,
    unsigned char *data, unsigned int length,
    const amba_pv::amba_pv_control *ctrl):
    unsigned int
```

debug_write()

Completes a debug write transaction to a given address without causing any side effects. Specify the number of bytes to write in the `length` parameter. The number of successfully written values is returned. Additional AMBA protocol control information can be specified in the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context. This behavior is empty by default and returns 0.

```
debug_write(int socket_id, const sc_dt::uint64 &addr,
    unsigned char *data, unsigned int length,
    const amba_pv::amba_pv_control *ctrl):
    unsigned int
```

b_transport()

This is an optional slave behavior for blocking transport. It completes a single transaction using the blocking transport interface. The `amba_pv::amba_pv_extension` must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
b_transport(int socket_id,
    amba_pv::amba_pv_transaction &trans, sc_core::sctime &t)
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

transport_dbg()

This optional slave behavior implements the TLM debug transport interface. An `amba_pv::amba_pv_extension` object must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
transport_dbg(int socket_id, amba_pv::amba_pv_transaction &trans, sc_core::sctime
&t): unsigned int
```

get_direct_mem_ptr()

This is an optional slave behavior for requesting a DMI access to a given address. It returns a reference to a DMI descriptor that contains the bounds of the granted DMI region. Returns `true` if a DMI region is granted, `false` otherwise.

The `amba_pv::amba_pv_extension` must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
get_direct_mem_ptr(int socket_id,
    amba_pv::amba_pv_transaction &trans,
    tlm::tlm_dmi &dmi_data):
    bool
```

invalidate_direct_mem_ptr()

This is an optional master behavior to invalidate a DMI request. It invalidates DMI pointers that were previously established for the given DMI region. The `socket_id` parameter is 0 in this context.

```
invalidate_direct_mem_ptr(int socket_id,
    sc_dt::uint64 start_range, sc_dt::uint64 end_range)
```

The generic payload data is formatted as an array of bytes in order of ascending bus address. This means that irrespective of the host machine endianness or modeled bus width, a little endian master must write the bytes of a word in increasing significance as the array index increases and a big endian master must write the bytes of a word in decreasing significance as the array index increases. A master or slave whose endianness does not match the endianness of the host machine must endian swap any access to the payload data that is wider than one byte. The same byte ordering rule applies to memory accesses using DMI pointers.

2.1.3 AMBAPVACE protocol

This protocol defines behaviors for bus transactions. This covers ARM AMBA ACE and DVM bus protocol families, all at the PV level.

In addition, this protocol provides support for AMBA protocol additional extension information:

- Secure and privileged accesses.
- Atomic operations.
- System-level caching and buffering control.
- Cache coherency transactions (ACE-Lite).
- Bi-directional cache coherency transactions (ACE).
- Distributed virtual memory transactions (DVM).

The behaviors of the protocol are:

b_transport()

This slave behavior implements the TLM blocking transport interface. An `amba_pv::amba_pv_extension` object must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
b_transport(int socket_id,  amba_pv::amba_pv_transaction &trans, sc_core::sctime &t)
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

transport_dbg()

This optional slave behavior implements the TLM debug transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
transport_dbg(int socket_id,  amba_pv::amba_pv_transaction &trans, sc_core::sctime
&t):  unsigned int
```

get_direct_mem_ptr()

This optional slave behavior is for requesting a DMI access to a given address. It returns a reference to a DMI descriptor that contains the bounds of the granted DMI region. Returns true if a DMI region is granted, false otherwise. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
get_direct_mem_ptr(int socket_id,  amba_pv::amba_pv_transaction &trans,
tlm::tlm_dmi &dmi_data):  bool
```

b_snoop()

This master behavior implements an upstream snooping TLM blocking transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
b_snoop(int socket_id,  amba_pv::amba_pv_transaction &trans, sc_core::sctime &t)
```

snoop_dbg()

This optional master behavior implements an upstream snooping TLM debug transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
snoop_dbg(int socket_id,  amba_pv::amba_pv_transaction &trans, sc_core::sctime &t):
unsigned int
```

invalidate_direct_mem_ptr()

Use this optional master behavior to invalidate a DMI request. It invalidates DMI pointers that were previously established for the given DMI region. The `socket_id` parameter is 0 in this context.

```
invalidate_direct_mem_ptr(int socket_id,  sc_dt::uint64 start_range, sc_dt::uint64
end_range)
```

The generic payload data is in the format of an array of bytes in order of ascending bus address. This means that irrespective of the host machine endianness or modeled bus width, a little endian master must write the bytes of a word in increasing significance as the array index increases and a big endian master must write the bytes of a word in decreasing significance as the array index increases. A master or slave whose endianness does not match the endianness of the host machine must endian swap any access to the payload data that is wider than one byte. The same byte ordering rule applies to memory accesses using DMI pointers.

Special considerations for ACE and cache coherent interconnects

To maintain memory coherency, apply these rules for debug transactions.

An ACE interconnect model must be able to cope with concurrent transactions in accordance with the hazard avoidance and prioritization rules in the ACE specification. Any external bus request, downstream transaction or upstream snoop transaction, can potentially cause a transaction to stall and the calling thread to be blocked, resulting in any number of other threads being scheduled.

To maintain memory coherency, apply these rules for debug transactions:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

debug reads
The bus must return data that represents the values that the bus master expects to observe if it issues a bus read. This must not modify the state of any bus components.

debug writes
must modify the contents of all copies of the location being accessed, so that a subsequent read from this location returns the data in the debug-write request. The debug write must not modify any other state, for example such as cache tags, clean/dirty/shared/unique MOESI state.

The implications for a coherent interconnect are that incoming debug transactions must be broadcast back upstream as debug snoop transactions to all ports other than the one the request came in on. Incoming debug snoops must propagate upwards. Debug reads can terminate as soon as they hit a cache. Debug writes must continue until they propagate to all possible copies of the location, including downstream to main memory.

For cases where a debug transaction hazards with non-debug transactions that are in-flight, the debug transaction must observe a weak memory-order model. Any component that can block a thread whilst responsible for the payload of an in-flight transaction must take particular care. In these cases, the debug transaction must be hazarded against the in-flight payload to ensure that debug reads do not return stale data and debug writes do not cause cache incoherency.

Only use DMI when you can guarantee that subsequent transactions do not result in any state transitions. This means, in general, do not use DMI for ACE coherent cacheable transactions.

2.1.4 AMBAPVSignal protocol

This protocol defines a single behavior to permit masters to change the state of signals such as interrupt. Strictly speaking, AMBA3 does not cover this behavior, but the AMBA-PV components do provide it.

`set_state(int export_id, const bool &state): void`
Transfers a signal state. The `export_id` parameter must be set to 0 in this context.

2.1.5 AMBAPVSignalState protocol

This protocol defines two behaviors that permit a master to change the state of signals such as interrupt and to retrieve the state of such signals from slaves. Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

`set_state(int export_id, const bool &state): void`
Transfers a signal state. The `export_id` parameter must be set to 0 in this context.

`get_state(int export_id, tlm::tlm_tag<bool> * t): bool`
Retrieves a signal state. The `export_id` parameter must be set to 0, and the `t` parameter must be set to `NULL`, in this context.

2.1.6 AMBAPVValue protocol

This protocol models propagation of 32-bit integer values between components. Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

`set_state(int export_id, const uint32_t & value): void`
Transfers a value. The `export_id` parameter must be set to 0 in this context.

2.1.7 AMBAPVValue64 protocol

This protocol models propagation of 64-bit integer values between components. Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

`set_state(int export_id, const uint64_t &value): void`
Transfers a value. The `export_id` parameter must be set to 0 in this context.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

2.1.8 AMBAPVValueState protocol

This protocol permits propagation of 32-bit integer values between components and their retrieval from slaves. Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

`set_state(int export_id, const uint32_t &value):void`
Transfers a value. The `export_id` parameter must be set to 0 in this context.

`get_state(unsigned int export_id, tlm::tlm_tag<uint32_t> *t): uint32_t`
Retrieves a value. The `export_id` parameter must be set to 0, and the `t` parameter must be set to `NULL`, in this context.

2.1.9 AMBAPVValueState64 protocol

This protocol permits propagation of 64-bit integer values between components and their retrieval from slaves.

Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

`set_state(int export_id, const uint64_t &value): void`
Transfers a value. The `export_id` parameter must be set to 0 in this context.

`get_state(int export_id, tlm::tlm_tag<uint64_t> *t): uint64_t`
Retrieves a value. The `export_id` parameter must be set to 0, and the `t` parameter must be set to `NULL`, in this context.

2.2 Clocking protocols

This section describes the clocking protocols.

This section contains the following subsections:

- *2.2.1 Clocking protocols - about* on page 2-65.
- *2.2.2 ClockRateControl protocol* on page 2-65.
- *2.2.3 TimerCallback protocol* on page 2-65.
- *2.2.4 TimerCallback64 protocol* on page 2-65.
- *2.2.5 TimerControl protocol* on page 2-65.
- *2.2.6 TimerControl64 protocol* on page 2-66.

2.2.1 Clocking protocols - about

The clocking components and protocols provide a mechanism for systems to regulate the execution rate of components.

All clocking components that communicate use an opaque ClockSignal protocol. ClockSignal protocols have no behaviors that the user can invoke.

Related references

3.3 Clocking components on page 3-113

2.2.2 ClockRateControl protocol

This protocol sets the ratio of this component.

`set(uint32_t mul, uint32_t div) : void`

`set64(uint64_t mul, uint64_t div) : void`

Set the multiplier and divider that determine the clock divider ratio.

$clk_out_{freq} = clk_in_{freq} * mul / div$

2.2.3 TimerCallback protocol

This protocol invokes a behavior on the component that set the timer. Do not use the `timer_control` port of the timer during the invoked behavior.

`signal() : uint32_t`
Invoked by the timer when the timer countdown expires. The invoked behavior returns the number of ticks after which it is called again or 0 to make the timer one-shot.

2.2.4 TimerCallback64 protocol

This protocol invokes a behavior on the component that set the timer. Do not use the `timer_control` port of the timer during the invoked behavior.

`signal() : uint64_t`
Invoked by the timer when the timer countdown expires. The invoked behavior returns the number of ticks after which it is called again or 0 to make the timer one-shot.

2.2.5 TimerControl protocol

This protocol controls the actions of the component. It permits a timer to be set to schedule a callback after a given number of ticks at the rate of the clock input.

If a timer is set while it is counting, it starts counting the new number of ticks without sending the original callback. Canceling a timer when it is not active has no effect.

`set(uint32_t ticks) : void`
Set the timer to countdown the given number of ticks.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`cancel()`
Cancel an active timer, preventing the callback being invoked.

`isSet() : bool`
Check whether a timer is set to generate a callback.

`remaining() : uint32_t`
Return how many ticks remain before the callback is invoked.

2.2.6 TimerControl64 protocol

This protocol controls the actions of the component. It permits a timer to be set to schedule a callback after a given number of ticks at the rate of the clock input.

If a timer is set while it is counting, it starts counting the new number of ticks without sending the original callback. Canceling a timer when it is not active has no effect.

`set(uint64_t ticks) : void`
Set the timer to countdown the given number of ticks.

`cancel()`
Cancel an active timer, preventing the callback being invoked.

`isSet() : bool`
Check whether a timer is set to generate a callback.

`remaining() : uint64_t`
Return how many ticks remain before the callback is invoked.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

2.3 Debug interface protocols

This section describes the debug interface protocols.

This section contains the following subsections:

- *2.3.1 Debug interface protocols - about* on page 2-67.
- *2.3.2 CADIDisassemblerProtocol protocol* on page 2-67.
- *2.3.3 CADIProtocol protocol* on page 2-68.

2.3.1 Debug interface protocols - about

LISA components can expose aspects of their internal state so that they become visible and usable in the debugger. Some aspects are supported by the native LISA language, and some are supported by debug interface protocols.

Registers and other state variables
See the LISA+ resource REGISTER declaration, especially the `read_function` and `write_function` attributes.

Memories and other memory-like objects
See the LISA+ resource MEMORY declaration, especially the `read_function` and `write_function` attributes.

Disassembly
See CADIProtocol and CADIDisassemblerProtocol.

Instruction count
See CADIProtocol.

Setting, configuring and clearing of breakpoints
For example, code breakpoints, register breakpoints, watchpoints. See CADIProtocol.

Single stepping and instruction stepping support.
See CADIProtocol.

If displaying and editing memory and registers are sufficient, you need not implement CADIProtocol and CADIDisassemblerProtocol. The component must implement them to enable the other debug features.

CADIProtocol and CADIDisassemblerProtocol permit you to implement the features on a *Component Architecture Debug Interface* (CADI) interface level, where the component code takes responsibility for the implementation of these interfaces.

Related information

Component Architecture Debug Interface Developer Guide v2.0

LISA+ Language for Fast Models Reference Manual

2.3.2 CADIDisassemblerProtocol protocol

To support disassembly, implement all of these functions. None of them is optional.

These functions are in a different port, of type CADIDisassemblerProtocol, that can have any name and only need to be implemented when disassembly must be exposed in the debugger. The functionality of this port is then exposed by `CADIProtocol::CADIGetDisassembler()`. See CADIProtocol for information on how to use this port and `CADIDisassemblerAdapter`.

In the function `slave behavior GetType(): eslapi::CADIDisassemblerType;` components must always return `eslapi::CADI_DISASSEMBLER_TYPE_STANDARD`.

The function `slave behavior GetModeCount(): uint32_t;` returns the number of supported disassembler modes, and at least 1 mode must be returned.

The function `slave behavior GetModeNames(eslapi::CADIDisassemblerCB *callback_);` returns information about all supported modes. A component that only supports one mode calls, for example,

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`callback_->ReceiveModeName(0, "Normal");` only once. This is similar for multiple modes with different names and Ids.

The function `slave behavior GetCurrentMode(): uint32_t;` returns the most suitable mode of disassembly at the time, based on the current state variables of the component:

For the function:

```
slave behavior GetSourceReferenceForAddress(eslapi::CADIDisassemblerCB *callback_,
const eslapi::CADIAddr_t &address): eslapi::CADIDisassemblerStatus;
```

components must return `eslapi::CADI_DISASSEMBLER_STATUS_ERROR;`

For the function:

```
slave behavior GetAddressForSourceReference(const char *sourceFile, uint32_t
sourceLine, eslapi::CADIAddr_t &address): eslapi::CADIDisassemblerStatus;
```

components must return `eslapi::CADI_DISASSEMBLER_STATUS_ERROR;`

The following function is the main disassembler function:

```
slave behavior GetDisassembly(eslapi::CADIDisassemblerCB *callback_,
                              const eslapi::CADIAddr_t &address,
                              eslapi::CADIAddr_t &nextAddr,
                              const uint32_t mode,
                              uint32_t desiredCount):
                              eslapi::CADIDisassemblerStatus;
```

The component must call `callback_` for all disassembler lines for the specified address and `desiredCount`, and it must finally set `nextAddr` to the next disassembled address at that point after the requested block.

```
// Query if an instruction is a call instruction
    slave behavior GetInstructionType(const eslapi::CADIAddr_t &address,
eslapi::CADIDisassemblerInstructionType &insn_type): eslapi::CADIDisassemblerStatus;
```

Components must return `insn_type = eslapi::CADI_DISASSEMBLER_INSTRUCTION_TYPE_NOCALL;` and return `eslapi::CADI_DISASSEMBLER_STATUS_OK;`

Component Architecture Debug Interface Developer Guide Version 2.0

2.3.3 CADIProtocol protocol

This protocol supports debugging. To add breakpoint support, implement `CADIBpt...()` functions.

Note

All CADIProtocol protocol behaviors, that is, all sets of functionalities, are optional. A component only has to implement the set of functions for the functionality that it intends to support.

You must define an internal slave port of this type, and the name of this port must always be `cadi_port`. In this port, you can implement this functionality:

```
optional slave behavior CADIBptGetList(uint32_t, uint32_t, uint32_t *, eslapi::CADIBptDescription_t
*):eslapi::CADIReturn_t;
optional slave behavior CADIBptRead(eslapi::CADIBptNumber_t, eslapi::CADIBptRequest_t *):eslapi::CADIReturn_t;
optional slave behavior CADIBptSet(eslapi::CADIBptRequest_t *, eslapi::CADIBptNumber_t
*):eslapi::CADIReturn_t;
optional slave behavior CADIBptClear(eslapi::CADIBptNumber_t):eslapi::CADIReturn_t;
optional slave behavior CADIBptConfigure(eslapi::CADIBptNumber_t,
eslapi::CADIBptConfigure_t):eslapi::CADIReturn_t;
optional slave behavior CADIModifyTargetFeatures(eslapi::CADITargetFeatures_t *):eslapi::CADIReturn_t;
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

You need to implement all of these functions to enable any kind of breakpoint for the component. The component needs to maintain and keep track of all existing breakpoints. For example:

- `CADIBptSet()` and `CADIBptClear()` add and remove breakpoints.
- `CADIBptConfigure()` enable and disable breakpoints.
- `CADIBptGetList()` and `CADIBptRead()` return the current state of the breakpoint list.

The component must also implement `CADIModifyTargetFeatures`. This function permits you to override the automatic default `CADITargetFeatures_t` that System Generator provides for this component just before it is returned to the debugger. Specifically, a component that wants to support any kind of breakpoint must override the `handledBreakpoints` and `nrBreakpointsAvailable` fields of `CADITargetFeatures_t`. For example:

```
targetFeatures->handledBreakpoints = CADI_TARGET_FEATURE_BPT_PROGRAM | CADI_TARGET_FEATURE_BPT_REGISTER;
    // code and register breakpoints supported
targetFeatures->nrBreakpointsAvailable = 0x7fffffff;
    // virtually infinite number of breakpoints supported.
```

By default, LISA components do not support any type of breakpoints. By implementing `CADIBpt...()` functions, you can add breakpoint support. In addition to implementing the stated functions, the component must call `simBreakpointHit(bptNumber)` and then `simHalt()` when an enabled breakpoint is hit. On a breakpoint hit the component must first call `simBreakpointHit()` for each breakpoint that was hit (one or more, usually just one) and then call `simHalt()` once after all `simBreakpointHit()` calls. The `simHalt()` call must always be the last call in the sequence.

A component that wants to provide disassembly must implement the following `CADIGetDisassembler()` behavior and return a CADIDisassembler interface implementation. This automatically follows behind the `CADI::CADIGetDisassembler()` and the `CADI::ObtainInterface("eslapi.CADIDisassembler2")` functions.

```
optional slave behavior CADIGetDisassembler():eslapi::CADIDisassembler*;
```

To do this, instantiate a `CADIDisassemblerAdapter` object in behavior `init` and return its address in this `CADIGetDisassembler()` function. This object must point to an internal slave port that implements the CADIDisassemblerProtocol protocol.

Skeleton code for implementing disassembly

```
component FOO
{
    behavior init()
    {
        disassemblerAdapter = new CADIDisassemblerAdapter(disassPort.getAbstractInterface());
        // ...
    }
    internal slave port <CADIProtocol> cadi_port
    {
        slave behavior CADIGetDisassembler():eslapi::CADIDisassembler*
        {
            return disassemblerAdapter;
        }
        // ...
    }
    internal slave port<CADIDisassemblerProtocol> disassPort
    {
        // ...
    }
}
```

The following function implements the instruction *stepping a component*. It must set up an internal state that stops the simulation when the requested number of instructions is executed completely (exactly like a breakpoint). It must call `simRun()` from within `CADIExecSingleStep()` after setting up this stepping state, and later it must call `simHalt()` when the execution of the required number of instructions finishes.

```
optional slave behavior CADIExecSingleStep(uint32_t instructionCount, int8_t stepCycle, int8_t
stepOver):eslapi::CADIReturn_t;
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The following function is for debugging purposes only. Do not implement it. The function must not alter the state of any component in any way.

```
optional slave behavior callbackModeChange(uint32_t newMode, eslapi::CADIBptNumber_t bptNumber);
```

By implementing any of the following functions, the component can enable the instruction and cycle count display:

```
optional slave behavior CADIGetInstructionCount(uint64_t &instructionCount):eslapi::CADIReturn_t;
optional slave behavior CADIGetCycleCount(uint64_t &instructionCount, bool systemCycles):eslapi::CADIReturn_t;
```

——— **Note** ———

Fast Models systems are not cycle accurate, so you usually only implement an instruction counter, if at all.

2.4 Peripheral protocols

This section describes the peripheral protocols.

This section contains the following subsections:

- *2.4.1 AudioControl protocol* on page 2-71.
- *2.4.2 CharacterLCD protocol* on page 2-71.
- *2.4.3 FlashLoaderPort protocol* on page 2-71.
- *2.4.4 GUIPollCallback protocol* on page 2-71.
- *2.4.5 ICS307Configuration protocol* on page 2-72.
- *2.4.6 KeyboardStatus protocol* on page 2-72.
- *2.4.7 LCD protocol* on page 2-72.
- *2.4.8 LCDLayoutInfo protocol* on page 2-73.
- *2.4.9 MMC_Protocol protocol* on page 2-73.
- *2.4.10 MouseStatus protocol* on page 2-74.
- *2.4.11 PL080_DMAC_DmaPortProtocol protocol* on page 2-74.
- *2.4.12 PS2Data protocol* on page 2-74.
- *2.4.13 PVBusSlaveControl protocol* on page 2-75.
- *2.4.14 PVDevice protocol* on page 2-77.
- *2.4.15 PVTransactionMaster protocol* on page 2-77.
- *2.4.16 SerialData protocol* on page 2-77.
- *2.4.17 SMMUv3AEMIdentifyProtocol protocol* on page 2-78.
- *2.4.18 TZFilterControl protocol* on page 2-79.
- *2.4.19 VirtualEthernet protocol* on page 2-79.

2.4.1 AudioControl protocol

This protocol has get and release audio buffer behaviors.

`getPVAudioBuffer`
Get an underlying host buffer for audio output.

`releasePVAudioBuffer`
Release an underlying host buffer.

2.4.2 CharacterLCD protocol

This protocol has the behaviors `setLayoutInfo` and `draw`.

`setLayoutInfo`
sets the width and height of the touchscreen.

`draw`
sets the character information.

2.4.3 FlashLoaderPort protocol

This protocol initializes the flash contents at model startup and saves flash contents to a file when the model terminates.

`loadFlashFile(FlashLoader *) : uint32`
Initiate loading of the flash contents.

`saveFlashFile(FlashLoader *) : uint32`
Save the flash contents to a file.

2.4.4 GUIPollCallback protocol

This protocol defines one method that signals to the visualization component the end of the update period. You can invoke this callback even when the simulation is stopped.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`gui_callback() : void`
This is sent by the GUIPoll component, at the configured period.

2.4.5 ICS307Configuration protocol

This protocol sets the divider ratio of an ICS307 component at runtime. The output clock rate alters accordingly and any dependent components react to the clock rate change according to their defined behavior.

`setConfiguration(uint32_t vdw, uint32_t rdw,uint32_t od): void`

Set the parameters for deriving the clock divider ratio.

vdw

Range: 0-255.

rdw

Range: 0-255.

od

Range: 0-7.

2.4.6 KeyboardStatus protocol

This protocol passes keyboard events to a component such as the PS2Keyboard component.

Events are only sent when the visualization window is in focus. Keyboard combinations that are filtered by the host OS such as **Ctrl+Alt+Del** are not detected by the visualization. See `components/KeyCode.h` for a list of ATKeyCode `code` values.

The protocol behaviors are:

`keyDown(ATKeyCode code) : void`
This is sent when a key on the host keyboard is pressed.

`keyUp(ATKeyCode code) : void`
This is sent when a key on the host keyboard is released.

VEVisualisation - ports on page 9-3012

2.4.7 LCD protocol

This Visualisation Library signaling protocol provides the interface between an LCD controller peripheral (for example the PL110) and a visualization component. This permits the LCD controller to render the framebuffer contents into a region of the visualization GUI.

LISA visualization components can provide any number of LCD ports. The implementations of these behaviors can delegate the calls to appropriate methods on the VisRenderRegion class.

The behaviors are:

`lock() : VisRasterLayout *`
Lock the raster region of the LCD in preparation for rendering.

`unlock()`
Unlock the raster region, ready to be updated on the screen.

`update(int x, int y, unsigned int w, unsigned int h)`
Update the selected rectangular area on screen from the raster buffer.

`setPreferredLayout(unsigned int width, unsigned int height, unsigned int depth)`
A request from the LCD controller to set the preferred size for the raster region, to match the timing parameters used by the LCD controller.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Related references

VEVisualisation - ports on page 9-3012

2.4.8 LCDLayoutInfo protocol

This protocol has the behavior `setLayoutInfo`.

`setLayoutInfo`
sets the width and height of the touchscreen.

2.4.9 MMC_Protocol protocol

This protocol describes an abstract, untimed interface between an MMC controller and an MMC or SD card.

The protocol contains methods that must be implemented by the master (controller) and some that must be implemented by the slave (card). This protocol is used by the reference PL180 MCI and MMC models. for further information on the protocol implementation, see the source file, `%PVLIB_HOME%\LISA\MMC_Protocol.lisa`.

Use of this protocol assumes knowledge of the MultiMediaCard specification, available from the MultiMediaCard Association, `www.mmca.org`.

The protocol has these behaviors:

`cmd`
Commands are sent from the controller to the card using this behavior, which is implemented by the card model. The MMC command is sent with an optional argument. The card responds as defined by the MMC specification. The controller model checks that the response type matches expectations, and updates its state appropriately. The transaction-level protocol does not model start/stop bits or CRCs on the command/response payload.

For data transfer in the card to controller direction:

`Rx`
After the host and controller have initiated a read through the command interface, the card calls the `Rx` behavior on the controller to provide the read data. The call provides a pointer and a length. The ARM MMC reference model simulates device read latency by waiting a number of clock cycles prior to calling this behavior. If the controller is unable to accept the data, or wants to force a protocol error, it can return false in response to this behavior.

`Rx_rdy`
A handshake, used by the controller to inform the card that the controller is ready to receive more data. The ARM MMC reference model does not time out, so waits indefinitely for this handshake in a multiple block data transfer.

For data transfer in the controller to card direction:

`Tx`
After the host and controller have initiated a write through the command interface, the card calls the `Tx` behavior on the controller. The call provides a pointer to an empty buffer to be written, and a length. The ARM MMC reference model simulates device write latency by waiting a number of clock cycles prior to each buffer being offered.

`Tx_done`
The controller calls this behavior on the card when the block has been written. The card model can then commit the data to its persistent storage.

The card model must also implement:

`cmd_name`
This behavior returns the name of the command issued. A card must implement this behavior, but is free to return an empty string for all requests. Only call this behavior for diagnostic messages.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

2.4.10 MouseStatus protocol

This protocol passes mouse movement and button events to another component such as the PS2Mouse component.

Events are only sent when the visualization window is in focus.

The protocol behaviors are:

`mouseMove(int dx, int dy) : void`
This is sent when the host mouse is moved. Mouse movement events are always relative.

`mouseButton(uint8_t button, bool down) : void`

This is sent when a button on the host mouse is pressed or released.

`button` indicates which button has been pressed or released and is typically 0, 1, or 2 but can be anything up to 7 depending on the OS and attached mouse.

`down` is true if a button is pressed and false if released.

Related references
VEVisualisation - ports on page 9-3012

2.4.11 PL080_DMAC_DmaPortProtocol protocol

This protocol provides methods to permit handshaking between peripherals and the DMA controller.

`request(uint32 request) : void`

Passes requests from a peripheral to the DMA controller. The request is a bitfield with the low four bits defined. The request is level sensitive and latched internally by the DMA controller. It is sampled and interpreted in a manner dependent on the target channel and configured flow control.

`0: PL080_REQ_BURST`

Burst transfer request.

`1: PL080_REQ_SINGLE`
Single transfer request.

`2: PL080_REQ_LBURST`
Last burst request.

`3: PL080_REQ_LSINGLE`
Last single request.

`response(uint32 response) : void`

Passes responses from the DMA controller to peripherals. The response is a bitfield with the low two bits defined. The response is transient rather than level sensitive.

`0: PL080_RES_TC`

Terminal count response.

`1: PL080_RES_CLR`
Clear request response.

2.4.12 PS2Data protocol

This protocol is for communication between the KMI and a PS/2-like device.

For efficiency, the interface is a parallel byte interface rather than a serial clock/data interface. The behaviors are:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

setClockData(enum ps2clockdata) : void
Used by the KMI to simulate forcing the state of the data/clock lines, to indicate whether it is able to receive data, wants to send a command, or is inhibiting communication.

getData() : uint8
Used by the PS/2 device to get command data from the KMI.

putData(uint8 data) : void
Used by the PS/2 device to send device data to the KMI.

2.4.13 PVBusSlaveControl protocol

The PVBusSlaveControl protocol enables you to access and modify the underlying memory that PVBusSlave controls.

setFillPattern(uint32_t fill1, uint32_t fill2)
This sets a two-word alternating fill pattern to be used by uninitialized memory.

setAccess(pv::bus_addr_t base, pv::bus_addr_t top, pv::accessType type, pv::accessMode mode)

This reconfigures handling for a region of memory.

`base` (inclusive value) and `top` (exclusive value) specify the address range to configure.

`type` selects what types of bus access must be reconfigured. It can be one of:

- `pv::ACCESSTYPE_READ`
- `pv::ACCESSTYPE_WRITE`
- `pv::ACCESSTYPE_RW`

`mode` controls what happens when an address is accessed. Legal values for the `pv::accessMode` enumeration are:

pv::ACCESSMODE_MEMORY
Act as memory. The PVBusSlave manages the underlying storage to provide 4KB of memory, which can be ROM or RAM, depending on how you configure it to handle bus write transactions.

pv::ACCESSMODE_DEVICE
Act as a device. Requests to the select pages are routed to the PVBusSlave `device` port, where the necessary behavior can be implemented by the component.

pv::ACCESSMODE_ABORT
Generate bus abort signals for any accesses to this page.

pv::ACCESSMODE_IGNORE
Ignore accesses to this page. Bus read requests return 0.

getReadStorage(pv::bus_addr_t address, pv::bus_addr_t *limit) : const uint8_t *

getWriteStorage(pv::bus_addr_t address, pv::bus_addr_t *limit) : uint8_t *

These two methods permit you to access the underlying storage that PVBusSlave allocates to implement a region of memory.

The return value is a pointer to the byte that represents the storage corresponding to the address of `base`.

The limit pointer returns the device address for the limit of the accessible memory.

The pointer value returned is not guaranteed to remain valid indefinitely. Bus activities, or other calls to the control port, might invalidate the pointer.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

provideReadStorage(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, const uint8_t *storage)

provideWriteStorage(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, uint8_t *storage)

provideReadWriteStorage(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, uint8_t *storage)

These methods enable you to allocate blocks of memory that the PVBusSlave can use to manage regions of RAM/ROM. Only use these methods when you require a high degree of control over memory, such as when you require a device to map specific regions of host memory into the simulation.

The memory region pointed to by `storage` must be large enough to contain `(limit - base)` bytes.

After these calls, PVBusSlave controls access to the underlying memory. The owner must call `getWriteStorage()` before modifying the memory contents and `getReadStorage()` before reading the memory contents.

provideReadStorageEx(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, const uint8_t *storage, double latency)

provideWriteStorageEx(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, const uint8_t *storage, double latency)

provideReadWriteStorageEx(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, uint8_t *storage, double read_latency, double write_latency)

These methods take additional parameters to specify average latencies (in seconds) per byte, used when Timing Annotation is enabled.

In all other aspects they behave the same as `provideReadStorage()`, `provideWriteStorage()` and `provideReadWriteStorage()`, respectively.

slave behavior getRegionIterHandle(): uint32_t;

slave behavior getNextRegionInfo(uint32_t iter_handle, pv::PVBusSlaveRegionInfo *info) : bool;

slave behavior closeRegionIterHandle(uint32_t iter_handle);

These methods form an iterator-like API that allows a PVBusSlave providing storage to report all the regions of the address space that have backing store.

The iteration begins by calling `getRegionIterHandle()`. This allocates an iterator and if successful returns a nonzero `iter_handle` to identify it.

The caller can then repeatedly call `getNextRegionInfo()` with `iter_handle`. If it finds a region, the behavior returns `true` and writes to the `info` struct if the pointer is non-null. Access the data in the region using `getReadStorage()` or `getWriteStorage()`.

The implementation can return regions in any order. They can be of any size or alignment, but must not overlap.

The implementation need not report allocated regions that are filled entirely with the default fill pattern, or allocated regions that contain only the data they had at simulation start.

On reaching the last region, the iterator closes automatically. If the handle is invalid or there are no further regions, the behavior returns `false`.

A caller can close an iterator opened by `getRegionIterHandle()` at any time using `closeRegionIterHandle()`. This deallocates the iterator, and further uses of the handle are invalid.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

2.4.14 PVDevice protocol

The PVDevice protocol enables you to implement support for memory-mapped device registers. Call the two methods through the device port on the PVBusSlave to handle bus read/write transactions.

`read(pv::ReadTransaction) : pv::Tx_Result`
This method permits a device to handle a bus read transaction.

`write(pv::WriteTransaction) : pv::Tx_Result`
This method permits a device to handle a bus write transaction.

The PVDevice protocol uses two behaviors to differentiate between transactions originating from the processor (loads and stores) and transactions originating from an attached debugger:

`slave behavior debugRead(pv::ReadTransaction tx) : pv::Tx_Result`
This method enables the device to handle a debug read transaction.

`slave behavior debugWrite(pv::WriteTransaction tx) : pv::Tx_Result`
This method enables the device to handle a debug write transaction.

The `debugRead` and `debugWrite` behaviors are called for all debug transactions.

For an example component that uses this protocol, see `$PVLIB_HOME/examples/LISA/BusComponents/BitLatch.lisa`.

Related references
1.15 PVBus C++ transaction and Tx_Result classes on page 1-50

2.4.15 PVTransactionMaster protocol

This protocol instantiates a `pv::TransactionGenerator` object from a PVBusMaster.

`createTransactionGenerator( ) : pv::TransactionGenerator *`

This behavior instantiates a new transaction generator to control the bus master. A caller can allocate as many TransactionGenerators as it wants. It is up to the caller to delete TransactionGenerators when they are no longer required. For example:

```
behavior init() {
    tg = master.createTransactionGenerator();
}

behavior terminate() {
delete tg;
}
```

2.4.16 SerialData protocol

This protocol is implemented as a parallel interface for efficiency. All communication is driven by the master port.

This protocol has behaviors:

`dataTransmit(uint16_t data) : void`

Used by the master to send data to the slave.

Table 2-1 Bits for dataTransmit()

Bits	Function
15:8	Reserved
7:0	Transmit data

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`dataReceive(void) : uint16_t`

Used by the master to receive data from the slave.

Table 2-2 Bits for dataReceive()

Bits	Function
15:13	Reserved
12	Set when no data available for reading
11	Reserved
10	Break error
9:8	Reserved
7:0	Receive data

`signalsSet(uint8_t signal) : void`

Used by the master to get the current signal status.

Table 2-3 Bits for signalsSet()

Bits	Function
7	Out1
6	Out2
5	RTS
4	DTR
3:0	Reserved

`signalsGet() : uint8_t`

Used by the master to get the current signal status.

Table 2-4 Bits for signalsGet()

Bits	Function
7:4	Reserved
3	DCD
2	DSR
1	CTS
0	RI

2.4.17 SMMUv3AEMIdentifyProtocol protocol

This protocol is used by the SMMUv3AEM model to identify the SSD, StreamID, and SubStreamID of an incoming transaction. It is only used if the parameter `howto_identify` is set to `"use-identify"`.

```
identify(unsigned tbu_number_, const pv::TransactionAttributes* attributes_, bool*
out_ssd_ns_, unsigned* out_streamid_, unsigned* out_substreamid_) : void
```

Architecturally, a transaction comes into the SMMUv3AEM model with the following side band signals:

- Security State Determination (SSD):

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

0
Transaction belongs to a device controlled by the secure world.

1
Transaction belongs to a device controlled by the non-secure world.

- StreamID.
- SubStreamID and SubStreamID valid.

  If you set `*out_substreamid_ = ~0u`, that is interpreted as no SubStreamID because SubStreamIDs are 20 or fewer bits.

How these are transported in the system is SoC-dependent.

The SMMUv3AEM requires that the SoC provides a way of determining this information by implementing the `identify()` function.

2.4.18 TZFilterControl protocol

This protocol controls the communication between filter units and control registers in the APB control block.

`checkPermission(const pv::TransactionAttributes *attributes_, pv::bus_addr_t page_base_, bool is_read_, pv::RemapRequest &req_, bool &abort_on_error_) : bool`
Check the permission of the transactions filtered by the filter unit. Optional slave behavior.

`isEnabled() : bool`
Check if the filter unit is enabled or not. The APB control block controls the unit. Slave behavior.

`isSecureSlave() : bool`
Check if the connected slave is secure or not. Optional slave behavior.

`setConfig(bool rd_spec_enable, bool wr_spec_enable, uint32_t action) : void`
Pass the configurations to the filter. Optional master behavior.

2.4.19 VirtualEthernet protocol

This protocol has the sendToSlave and sendToMaster behaviors.

`sendToSlave(EthernetFrame *frame)`
Send an Ethernet frame to the slave port.

`sendToMaster(EthernetFrame *frame)`
Send an Ethernet frame to the master port.

The Ethernet frame class encapsulates an Ethernet frame in a broken-up format that is more accessible by components. For information on the class definition, see the `EthernetFrame.h` header file located in `$PVLIB_HOME/include/components/VirtualEthernet/Protocol`.

Non-Confidential

2.5 Power management protocols

This section describes the power management protocols.

This section contains the following subsection:

- *2.5.1 PChannel protocol* on page 2-80.

2.5.1 PChannel protocol

Communicates power state changes between a power controller and a device.

The behaviors of the protocol are:

`pactive (uint32_t pstate) : void`

This master behavior is implemented by a power controller. A device calls this method to give a hint to the power controller that it can change to a particular power state. A power controller can then take appropriate action, typically communicating with the device by calling `device.prequest(new_power_state)`.

The power state is type `uint32_t` because it is the responsibility of the system using PChannels to enumerate the power states that it supports. For example, ARMv8-A cores use the following enumeration for power states:

```
enum { OFF = 0, OFF_EMU, MEM_RET, MEM_RET_EMU, LOGIC_RET, FULL_RET, MEM_OFF,
FUNC_RET, ON, WARM_RST, DBG_RECOV }
```

`prequest (uint32_t pstate) : sg::PChannel::presp_t`

This slave behavior is implemented by a device, for instance a core. A power controller typically calls this method and checks for the response from the device, which can either be `ACCEPT` or `DENY`.

`sg::PChannel::presp_t`

This enumeration provides two values, `ACCEPT` and `DENY`. It is returned by the `prequest()` method, depending on the state requested and the current state of the core.

Usage

You can use PChannels to replace `STANDBYWFI` and `STANDBYWFE` signaling.

For example, using `STANDBYWFI` or `STANDBYWFE`:

- Core drives `STANDBYWFI` signal HIGH.
- Power controller performs logic *x*.

Equivalent behavior using PChannels:

- Core calls `pactive(OFF)`.
- Power controller calls `prequest(OFF)` to change the core to OFF.
- Power controller performs logic *x*.
- To wake up the core, the power controller calls `prequest(ON)`.

Note

- For a LISA+ example that demonstrates how to use PChannel, see `$PVLIB_HOME/examples/LISA/VP_PChannel/`.
- For SystemC test code that demonstrates how to use PChannel, see `$PVLIB_HOME/Platforms/SystemCExport/EVS_Components/EVS_PChannel/`.

2.6 Processor protocols

This section describes the processor protocols.

This section contains the following subsections:

- *2.6.1 CoprocBusProtocol protocol* on page 2-81.
- *2.6.2 CounterInterface protocol* on page 2-84.
- *2.6.3 GICv3Comms protocol* on page 2-84.
- *2.6.4 InstructionCount protocol* on page 2-84.
- *2.6.5 v8EmbeddedCrossTrigger_controlprotocol protocol* on page 2-84.

2.6.1 CoprocBusProtocol protocol

This protocol connects a coprocessor implementation with a CPU component, for instance ARMCortexM33CT.

A coprocessor must derive from the coprocessor callback interface, `Coprocessor`. It can implement the `CDP`, `MCR`, `MRC`, `STC`, `LDC`, `MCRR`, and `MRRC` instructions.

A coprocessor must be registered with a specific coprocessor number, by calling the `addCoprocessor()` method. You can only register an external coprocessor that is not already present in the CPU. If no coprocessor has been registered with the coprocessor number encoded in an instruction, the CPU raises a NOCP fault.

To register coprocessor instruction implementations with the CPU, you must initialize the function pointers. For example, the following code passes the function pointers to the `Coprocessor` constructor. This code was taken from the `$PVLIB_HOME/examples/LISA/FVP_Coproc_Demo` example.

Registering a coprocessor

```
…
    class TestValCoprocessor : public Coprocessor
    {
    public:
        protocol_CoprocBusProtocol * coproc_bus;
        uint32_t coproc_number;
        uint32_t cp_reg[2][NUM_CP_REG] = {{0}}; // [0][NUM_CP_REG] --> Secure, [1][NUM_CP_REG] --> Non-Secure
        TestValCoprocessor()
        : Coprocessor(this, test_CDP, nullptr, test_MCR, nullptr, test_MRC, nullptr, test_LDC, nullptr,
test_STC, nullptr, test_MCRR, nullptr, test_MRRC, nullptr)
        , coproc_bus(nullptr)
        , coproc_number(0)
        {

…
    if (coproc_bus.addCoprocessor.implemented())
    {
        coproc_bus.addCoprocessor(&test_cp, coprocessor_number);
    }
}
```

Coprocessor behaviors

A coprocessor can call the following master behaviors:

`addCoprocessor(Coprocessor*, int num) : void`
Registers the coprocessor with the CPU. `num` identifies which coprocessor to register it as.

`removeCoprocessor(Coprocessor*, int num) : void`
Unregisters the coprocessor from the CPU.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`accessIsPriv(void) : bool`
Checks whether the CPU state is privileged (true) or unprivileged (false).

`accessIsNonSecure(void) : bool`
Checks the security state of the CPU, either true for non-secure, or false for secure.

Coprocessor callback functions

A coprocessor can implement callback functions with the following signatures.

Each function returns a `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in *CoprocState values* on page 2-83.

- Perform a coprocessor data processing operation.

```
CoprocState CDP(void* context, uint32_t inst)
```

Parameters:

`context`
context that was registered with the coprocessor interface.
`inst`
the coprocessor instruction being executed.

- Perform a move to coprocessor register operation.

```
CoprocState MCR(void* context, uint32_t inst, uint32_t data)
```

Parameters:

`context`
context that was registered with the coprocessor interface.
`inst`
the coprocessor instruction being executed.
`data`
register contents.

- Perform a move from coprocessor register operation.

```
CoprocState MRC(void* context, uint32_t inst, uint32_t* data)
```

Parameters:

`context`
context that was registered with the coprocessor interface.
`inst`
the coprocessor instruction being executed.
`data`
pointer to word to fill with coprocessor register contents.

- Perform a load coprocessor register from memory operation.

```
CoprocState LDC(void* context, uint32_t inst, uint32_t data, CoprocState state)
```

Parameters:

`context`
context that was registered with the coprocessor interface.
`inst`
the coprocessor instruction being executed.
`data`
contents of current memory location to load into register.
`state`
current state in a sequence of transactions.

- Perform a store coprocessor register to memory operation.

```
CoprocState STC(void* context, uint32_t inst, uint32_t data, CoprocState state)
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Parameters:

context
: context that was registered with the coprocessor interface.

inst
: the coprocessor instruction being executed.

data
: pointer to word to fill with coprocessor register contents to be transferred to memory.

state
: current state in a sequence of transactions.

- Perform a move to two coprocessor registers operation.

```
CoprocState MCRR(void* context, uint32_t inst, uint32_t data1, uint32_t data2)
```

Parameters:

context
: context that was registered with the coprocessor interface.

inst
: the coprocessor instruction being executed.

data1
: first data word to load to a coprocessor register.

data2
: second data word to load to a coprocessor register.

- Perform a move from two coprocessor registers operation.

```
CoprocState MRRC(void* context, uint32_t inst, uint32_t* data1, uint32_t* data2)
```

Parameters:

context
: context that was registered with the coprocessor interface.

inst
: the coprocessor instruction being executed.

data1
: pointer to first word to fill with coprocessor register contents.

data2
: pointer to second word to fill with coprocessor register contents.

CoprocState values

A `CoprocState` enum value is returned by coprocessor callback functions to indicate the new transaction state of the coprocessor. It is also used as a parameter for `LDC` and `STC` callback functions.

Table 2-5 CoprocState values

Value	State label	Description
`0x0`	`CoprocOk`	Complete/Ok.
`0x1`	`CoprocUndef`	Undefined operation.
`0x2`	`CoprocAbort`	Data abort.
`0x4`	`CoprocFirst`	A parameter value for `LDC` and `STC` callback functions to indicate that this is the first data transfer in a sequence.
`0x5`	`CoprocNext`	A parameter value for `LDC` and `STC` callback functions to indicate that this is a subsequent data transfer in a sequence.
`0x12`	`CoprocNop`	Treat as a NOP.

2.6.2 CounterInterface protocol

This protocol connects the `cntvalueb` port on Generic Timer components to MemoryMappedCounterModule components.

This semi-opaque protocol is exportable across a SystemC interface using a custom bridge.

It is a LISA+ protocol.

2.6.3 GICv3Comms protocol

This protocol connects the `gicv3_redistributor_s` port on components with GICv3 Core Interfaces to platform level GICv3 components.

This semi-opaque protocol is exportable across a SystemC interface using the bridges GICv3CommsPVBus and PVBusGICv3Comms.

It is a LISA+ protocol.

2.6.4 InstructionCount protocol

This protocol has the behaviors `getValue()` and `getRunState()`.

`getValue() : uint64_t`
Obtain the number of instructions executed by the processor.

`getRunState() : uint32_t`
Obtain the power/run status of the processor.

Table 2-6 Run state values

Value	State label	Description
`0x0`	`UNKNOWN`	Run status unknown, that is, simulation has not started
`0x1`	`RUNNING`	Processor running, is not idle and is executing instructions
`0x2`	`HALTED`	External halt signal asserted
`0x3`	`STANDBY_WFE`	Last instruction executed was WFE and standby mode has been entered
`0x4`	`STANDBY_WFI`	Last instruction executed was WFI and standby mode has been entered
`0x5`	`IN_RESET`	External reset signal asserted
`0x6`	`DORMANT`	Partial processor power down
`0x7`	`SHUTDOWN`	Complete processor power down

2.6.5 v8EmbeddedCrossTrigger_controlprotocol protocol

This protocol connects the *Cross Trigger Interface* (CTI) on ARMv8 processor components to platform level *Cross Trigger Matrix* (CTM) components.

This opaque protocol is not exportable across a SystemC interface.

2.7 Signaling protocols

This section describes the signaling protocols.

This section contains the following subsections:

- *2.7.1 Signaling protocols - about* on page 2-85.
- *2.7.2 Signal protocol* on page 2-85.
- *2.7.3 StateSignal protocol* on page 2-85.
- *2.7.4 Value protocol* on page 2-85.
- *2.7.5 Value_64 protocol* on page 2-85.
- *2.7.6 ValueState protocol* on page 2-85.

2.7.1 Signaling protocols - about

Many components use the signaling protocols to indicate changes in state for signals such as interrupt and reset.

Each signaling protocol has two variants:

- One permits components to signal a state change to other components.
- One permits the other components to passively query the current state of the signal.

2.7.2 Signal protocol

The Signal protocol has the setValue behavior.

`setValue(enum sg::Signal::State) : void`
indicates a state change.

Legal values for `sg::Signal::State` are:

- `sg::Signal::Set`.
- `sg::Signal::Clear`.

2.7.3 StateSignal protocol

The StateSignal protocol has the setValue and getValue behaviors.

`setValue(enum sg::Signal::State) : void`
indicates a value change.

`getValue() : sg::Signal::State`
reads the current value.

2.7.4 Value protocol

The Value protocol has the setValue behavior.

`setValue(uint32_t value)`
indicates a state change.

2.7.5 Value_64 protocol

This protocol provides the rules to communicate with the TrustZone® Memory Adapter (TZMA) to signal the remapped range X.

`setValue(uint64_t value)`
Sets a 64-bit wide address to the slave port.

2.7.6 ValueState protocol

The ValueState protocol has the setValue and getValue behaviors.

`setValue(uint32_t value) : void`
indicates a value change.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`getValue() : uint32_t`
reads the current value state.

Chapter 3
Fast Models components

This chapter describes all model components in Fast Models, organized by component type.

It contains the following sections:

- *3.1 Bridge components* on page 3-88.
- *3.2 Bus components* on page 3-102.
- *3.3 Clocking components* on page 3-113.
- *3.4 Core components* on page 3-117.
- *3.5 Media components* on page 3-601.
- *3.6 Other components* on page 3-616.
- *3.7 Peripheral components* on page 3-618.
- *3.8 Signals components* on page 3-644.
- *3.9 SystemIP components* on page 3-647.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

3.1 Bridge components

This section describes the Bridge components.

These components allow conversion between the following protocols:

- PVBus and AMBAPV.
- Signal and AMBAPVSignal.
- StateSignal and AMBAPVSignalState.
- Value(_64) and AMBAPVValue(64).
- ValueState(_64) and AMBAPVValueState(64).

LISA+ source for the bridge components is located in `$PVLIB_HOME/examples/SystemCExport/Bridges/`.

The AMBAPV protocols and components are designed to interface with the AMBA TLM PV library for ASI TLM 2.0. Fast Models provides this library as a standard way of mapping the AMBA protocol on top of ASI TLM 2.0.2 kit at PV level.

For more information about the AMBA TLM PV library for ASI TLM 2.0.2 kit, see the Fast Models documentation in `%MAXCORE_HOME%\AMBA-PV\doc`. On Linux, use the `$MAXCORE_HOME` environment variable instead.

For more information about ASI TLM 2.0, see the Accellera documentation that is provided with the kit.

This section contains the following subsections:

- *3.1.1 AMBAPV2PVBus* on page 3-89.
- *3.1.2 AMBAPVACE2PVBus* on page 3-89.
- *3.1.3 AMBAPVSignal2SGSignal* on page 3-89.
- *3.1.4 AMBAPVSignalState2SGStateSignal* on page 3-90.
- *3.1.5 AMBAPVValue2SGValue* on page 3-90.
- *3.1.6 AMBAPVValue2SGValue64* on page 3-90.
- *3.1.7 AMBAPVValue642SMMUv3AEMIdentify* on page 3-91.
- *3.1.8 AMBAPVValueState2SGValueState* on page 3-91.
- *3.1.9 AMBAPVValueState2SGValueState64* on page 3-91.
- *3.1.10 BroadcastSignal2AMBAPVSignal* on page 3-91.
- *3.1.11 Clock2SystemC* on page 3-92.
- *3.1.12 CounterInterface2SystemC* on page 3-92.
- *3.1.13 InstructionCount2SystemC* on page 3-92.
- *3.1.14 LCD2SystemC* on page 3-93.
- *3.1.15 PChannel2SystemC* on page 3-93.
- *3.1.16 PVBus2AMBAPV* on page 3-94.
- *3.1.17 PVBus2AMBAPVACE* on page 3-95.
- *3.1.18 PVBusBridge* on page 3-96.
- *3.1.19 SGSignal2AMBAPVSignal* on page 3-96.
- *3.1.20 SGStateSignal2AMBAPVSignalState* on page 3-96.
- *3.1.21 SGValue2AMBAPVValue* on page 3-97.
- *3.1.22 SGValue2AMBAPVValue64* on page 3-97.
- *3.1.23 SGValueState2AMBAPVValueState* on page 3-97.
- *3.1.24 SGValueState2AMBAPVValueState64* on page 3-98.
- *3.1.25 SMMUv3AEMIdentify2AMBAPVValue64* on page 3-98.
- *3.1.26 SystemC2Clock* on page 3-98.
- *3.1.27 SystemC2InstructionCount* on page 3-99.
- *3.1.28 SystemC2LCD* on page 3-99.
- *3.1.29 SystemC2PChannel* on page 3-99.
- *3.1.30 SystemC2VirtualEthernet* on page 3-100.
- *3.1.31 SystemC2v7VGICConfig* on page 3-100.
- *3.1.32 VirtualEthernet2SystemC* on page 3-100.

3.1.1 AMBAPV2PVBus

AMBA-PV to PVBus protocol converter. This model is written in LISA+.

AMBAPV2PVBus contains the following CADI targets:

- AMBAPV2PVBus

AMBAPV2PVBus contains the following MTI components:

- *4.106 PVBusMaster - trace* on page 4-2759

About AMBAPV2PVBus

- PVBus does not support transactions with `byte_enable` set (strobing transactions, in AXI terms). This bridge component rejects them.
- Variants of this component also exist with multiple input and output ports.

Table 3-1 Ports

Name	Protocol	Type	Description
amba_pv_s	*AMBAPV* on page 2-59	Slave	-
pvbus_m	PVBus	Master	-

Table 3-2 Parameters for AMBAPV2PVBus

Name	Type	Default value	Description
base_addr	int	0x0	Base address
shareable	bool	0x1	Shareable default

3.1.2 AMBAPVACE2PVBus

AMBA-PV ACE to PVBus protocol converter. This model is written in LISA+.

AMBAPVACE2PVBus contains the following CADI targets:

- AMBAPVACE2PVBus

AMBAPVACE2PVBus contains the following MTI components:

- *4.106 PVBusMaster - trace* on page 4-2759

About AMBAPVACE2PVBus

- AMBAPVACE2PVBus depends on the AMBA-PV API, which must be at least version 1.4.
- The translation of bus transactions by the bridge has some impact on performance. Bus masters that cache memory transactions avoid much of this impact. The bridge does not support DMI.

Table 3-3 Ports

Name	Protocol	Type	Description
amba_pv_ace_s	*AMBAPVACE* on page 2-61	Slave	-
pvbus_m	PVBus	Master	-

3.1.3 AMBAPVSignal2SGSignal

AMBA-PV Signal to SystemGenerator Signal protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-4 Ports

Name	Protocol	Type	Description
amba_pv_signal_s	*AMBAPVSignal* on page 2-63	Slave	Input slave port for connection from top-level AMBAPVSignal slave port.
sg_signal_m	*Signal* on page 2-85	Master	Handles outgoing signal state changes. Converted signal state changes are sent out through this port.

3.1.4 AMBAPVSignalState2SGStateSignal

AMBA-PV SignalState to SystemGenerator StateSignal protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Table 3-5 Ports

Name	Protocol	Type	Description
amba_pv_signal_s	*AMBAPVSignalState* on page 2-63	Slave	-
sg_signal_m	*StateSignal* on page 2-85	Master	-

3.1.5 AMBAPVValue2SGValue

AMBA-PV Value to SystemGenerator Value protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Table 3-6 Ports

Name	Protocol	Type	Description
amba_pv_value_s	*AMBAPVValue* on page 2-63	Slave	-
sg_value_m	*Value* on page 2-85	Master	-

3.1.6 AMBAPVValue2SGValue64

AMBA-PV Value64 to SystemGenerator Value_64 protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Table 3-7 Ports

Name	Protocol	Type	Description
amba_pv_value_s	*AMBAPVValue64* on page 2-63	Slave	-
sg_value_m	*Value_64* on page 2-85	Master	-

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

3.1.7 AMBAPVValue642SMMUv3AEMIdentify

AMBA-PV Value64 to SMMUv3AEMIdentify protocol converter. This model is written in LISA+.

Table 3-8 Ports

Name	Protocol	Type	Description
identify	*SMMUv3AEMIdentifyProtocol* on page 2-78	Master	-
identify_reply	*AMBAPVValue64* on page 2-63	Master	-
identify_request	*AMBAPVValue64* on page 2-63	Slave	-

3.1.8 AMBAPVValueState2SGValueState

AMBA-PV ValueState to SystemGenerator ValueState protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Table 3-9 Ports

Name	Protocol	Type	Description
amba_pv_value_s	*AMBAPVValueState* on page 2-64	Slave	-
sg_value_m	*ValueState* on page 2-85	Master	-

3.1.9 AMBAPVValueState2SGValueState64

AMBA-PV ValueState64 to SystemGenerator ValueState_64 protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Table 3-10 Ports

Name	Protocol	Type	Description
amba_pv_value_s	*AMBAPVValueState64* on page 2-64	Slave	-
sg_value_m	ValueState_64	Master	-

3.1.10 BroadcastSignal2AMBAPVSignal

Broadcast signal to AMBAPVSignal coverter. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

BroadcastSignal2AMBAPVSignal contains the following CADI targets:

- BroadcastSignal2AMBAPVSignal

Table 3-11 Ports

Name	Protocol	Type	Description
amba_pv_signal_m	*AMBAPVSignal* on page 2-63	Master	-
amba_pv_signal_s	*AMBAPVSignal* on page 2-63	Slave	-
b_signal	*Signal* on page 2-85	Broadcast	-

3.1.11 Clock2SystemC

Clock to SystemC Converter. This model is written in LISA+.

Clock2SystemC contains the following CADI targets:

- Clock2SystemC

Table 3-12 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
current_ticks_s	*AMBAPVValueState64* on page 2-64	Slave	-
get_clock_s	*AMBAPVValueState64* on page 2-64	Slave	-
rate_in_Hz_s	*AMBAPVValueState64* on page 2-64	Slave	-
set_clock_m	*AMBAPVValue64* on page 2-63	Master	-

3.1.12 CounterInterface2SystemC

CounterInterface to SystemC Converter. This model is written in LISA+.

CounterInterface2SystemC contains the following CADI targets:

- CounterInterface2SystemC

Table 3-13 Ports

Name	Protocol	Type	Description
amba_pv_eventUpdate_m	*AMBAPVValue* on page 2-63	Master	-
amba_pv_getCounterValue_s	*AMBAPVValueState64* on page 2-64	Slave	-
amba_pv_requestEventUpdate_s	*AMBAPVValue64* on page 2-63	Slave	-
amba_pv_requestSignalUpdate_s	*AMBAPVValue64* on page 2-63	Slave	-
amba_pv_setEnabled_m	*AMBAPVValue* on page 2-63	Master	-
amba_pv_signalUpdate_m	*AMBAPVValue* on page 2-63	Master	-
cntvalueb	*CounterInterface* on page 2-84	Slave	-

3.1.13 InstructionCount2SystemC

InstructionCount to SystemC Converter. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

InstructionCount2SystemC contains the following CADI targets:

- InstructionCount2SystemC

Note

Variants of this component also exist with multiple input and output ports.

Table 3-14 Ports

Name	Protocol	Type	Description
inst_count	*AMBAPVValueState64* on page 2-64	Slave	-
run_state	*AMBAPVValueState* on page 2-64	Slave	-
ticks	*InstructionCount* on page 2-84	Slave	-

3.1.14 LCD2SystemC

Converts LCD protocol to SystemC. This model is written in LISA+.

LCD2SystemC contains the following CADI targets:

- LCD2SystemC

Table 3-15 Ports

Name	Protocol	Type	Description
all_received_sPL	*AMBAPVSignal* on page 2-63	Master	-
all_received_u	*AMBAPVSignal* on page 2-63	Master	-
lcd_s	*LCD* on page 2-72	Slave	-

setPreferredLayout_d	*AMBAPVValue* on page 2-63	Master	-
setPreferredLayout_h	*AMBAPVValue* on page 2-63	Master	-
setPreferredLayout_w	*AMBAPVValue* on page 2-63	Master	-
unlock_m	*AMBAPVSignal* on page 2-63	Master	-
update_h	*AMBAPVValue* on page 2-63	Master	-
update_w	*AMBAPVValue* on page 2-63	Master	-
update_x	*AMBAPVValue* on page 2-63	Master	-
update_y	*AMBAPVValue* on page 2-63	Master	-

3.1.15 PChannel2SystemC

PChannel to SystemC Converter. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PChannel2SystemC contains the following CADI targets:

- PChannel2SystemC

Table 3-16 Ports

Name	Protocol	Type	Description
pchannel	*PChannel* on page 2-80	Slave	-
sc_pchannel	SystemCPChannel	Master	-

3.1.16 PVBus2AMBAPV

PVBus to AMBA-PV protocol converter. This model is written in LISA+.

PVBus2AMBAPV contains the following CADI targets:

- PVBus2AMBAPV

PVBus2AMBAPV contains the following MTI components:

- *4.101 PVBusBridge - trace* on page 4-2751

About PVBus2AMBAPV

DMI viewer provides the debugging functionality of the PVBus2AMBAPV bridge. When activated, it dumps the content of the DMI cache in the bridge in the following CSV format:

```
Range start, Range end incl, Pointer, Latency, R/W, Attributes
```

To be able to activate this functionality, a name for the counters output file must be set, using the `counters-file-name` parameter. If the counters file name is set, when `dump-dmi-cache` is set to 1 at runtime, the DMI cache of the bridge is dumped. The runtime parameter is always reset to 0 when the dump has completed.

Note

Variants of this component also exist with multiple input and output ports.

Table 3-17 Ports

Name	Protocol	Type	Description
amba_pv_m	*AMBAPV* on page 2-59	Master	-
pvbus_s	PVBus	Slave	-

Table 3-18 Parameters for PVBus2AMBAPV

Name	Type	Default value	Description
counters-file-name	string	""	Prefix of the file name to store counters at the end of simulation
dmi-container-type	string	"TZAttr"	Type of the DMI cache. Allowed values: TZAttr and FullAttr
dump-dmi-cache	bool	0x0	Dumps the content of the DMI cache into a file
dump-dmi-file-name	string	""	Prefix of the file name to dump the content of the DMI when requested
force-dmi-size	bool	0x1	Force DMI start and end address to be 4kB-aligned
min-range-to-cache	int	0x10000	Min DMI range size to cache in the bridge
size	int	0x1000000000000	Maximum size of memory region

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

3.1.17 PVBus2AMBAPVACE

PVBus to AMBA-PV ACE protocol converter. This model is written in LISA+.

PVBus2AMBAPVACE contains the following CADI targets:

- PVBus2AMBAPVACE

PVBus2AMBAPVACE contains the following MTI components:

- *4.100 PVBus2AMBAPVACE - trace* on page 4-2750
- *4.101 PVBusBridge - trace* on page 4-2751
- *4.105 PVBusMapper - trace* on page 4-2758

About PVBus2AMBAPVACE

PVBus2AMBAPVACE depends on the AMBA-PV API, which must be at least version 1.4.

The translation of bus transactions by the bridge has some impact on performance. Bus masters that cache memory transactions avoid much of this impact.

DMI viewer provides the debugging functionality of the PVBus2AMBAPV bridge. When activated, it dumps the content of the DMI cache in the bridge in the following CSV format:

```
Range start, Range end incl, Pointer, Latency, R/W, Attributes
```

To be able to activate this functionality, a name for the counters output file must be set, using the `counters-file-name` parameter. If the counters file name is set, when `dump-dmi-cache` is set to 1 at runtime, the DMI cache of the bridge is dumped. The runtime parameter is always reset to 0 when the dump has completed.

Table 3-19 Ports

Name	Protocol	Type	Description
amba_pv_ace_m	*AMBAPVACE on page 2-61*	Master	-
pvbus_over_tlm_control	PVBusOverTLMControl	Slave	-
pvbus_s	PVBus	Slave	-

Table 3-20 Parameters for PVBus2AMBAPVACE

Name	Type	Default value	Description
counters-file-name	string	""	Prefix of the file name to store counters at the end of simulation
dmi-cache-name	string	""	DEPRECATED: This parameter will be ignored. Name of the DMI cache. Useful for multiple bridges to share the same cache
dmi-container-type	string	"TZAttr"	Type of the DMI cache. Allowed values: TZAttr and FullAttr. When there are caches downstream of this bridge and cache-state-modelled=1 and route-tlm=1 use only FullAttr.
dump-dmi-cache	bool	0x0	Dumps the content of the DMI cache into a file
dump-dmi-file-name	string	""	Prefix of the file name to dump the content of the DMI when requested
force-dmi-size	bool	0x1	Force DMI start and end address to be 4kB-aligned
min-range-to-cache	int	0x10000	Min DMI range size to cache in the bridge

Table 3-20 Parameters for PVBus2AMBAPVACE (continued)

Name	Type	Default value	Description
route-tlm	bool	0x1	Route all the PVBus traffic explicitly to the TLM bus. Allows to monitor transactions on the TLM bus but slows down the emulation. The routing must always be to TLM if there is not a corresponding AMBAPVACE2PVBus bridge downstream.
set-ace-lite	bool	0x0	Set bridge mode when connecting to ace-lite ports. If true, the bridge will not deal with SNOOPs.
size	int	0x1000000000000	Maximum size of memory region, i.e. the first unsupported address.

3.1.18 PVBusBridge

A PVBusBridge bridges incoming transactions to a PVDevice port. This model is written in C++.

PVBusBridge contains the following MTI components:

- *4.101 PVBusBridge - trace* on page 4-2751

Table 3-21 Ports

Name	Protocol	Type	Description
control	PVBusBridgeControl	Slave	Control signal.
device	*PVDevice* on page 2-77	Master	Optimised connection out to devices.
dump_dmi	*Signal* on page 2-85	Slave	On the assert of this signal the bridge will dump dmi cache content into a csv file
pvbus_s	PVBus	Slave	Connection in from bus master.
reset	*Signal* on page 2-85	Slave	On the assert of this signal, a reset of the bus slave will be latched this is used by the bus deadlock detection logic.

3.1.19 SGSignal2AMBAPVSignal

SystemGenerator Signal to AMBA-PV Signal protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Table 3-22 Ports

Name	Protocol	Type	Description
amba_pv_signal_m	*AMBAPVSignal* on page 2-63	Master	Output master port for connection to top-level AMBAPVSignal master port. Converted signal state changes are sent out through this port.
sg_signal_s	*Signal* on page 2-85	Slave	Handles incoming signal state changes.

3.1.20 SGStateSignal2AMBAPVSignalState

SystemGenerator StateSignal to AMBA-PV SignalState protocol converter. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Note

Variants of this component also exist with multiple input and output ports.

Table 3-23 Ports

Name	Protocol	Type	Description
amba_pv_signal_m	*AMBAPVSignalState* on page 2-63	Master	Output master port for connection to top-level AMBAPVValue64 master port. Converted value changes are sent out through this port.
sg_signal_s	*StateSignal* on page 2-85	Slave	Handles incoming value changes.

3.1.21 SGValue2AMBAPVValue

SystemGenerator Value to AMBA-PV Value protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Table 3-24 Ports

Name	Protocol	Type	Description
amba_pv_value_m	*AMBAPVValue* on page 2-63	Master	Output master port for connection to top-level AMBAPVValue master port. Converted value changes are sent out through this port.
sg_value_s	*Value* on page 2-85	Slave	Handles incoming value changes.

3.1.22 SGValue2AMBAPVValue64

SystemGenerator Value_64 to AMBA-PV Value64 protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Table 3-25 Ports

Name	Protocol	Type	Description
amba_pv_value_m	*AMBAPVValue64* on page 2-63	Master	Output master port for connection to top-level AMBAPVValue master port. Converted value changes are sent out through this port.
sg_value_s	*Value_64* on page 2-85	Slave	Handles incoming value changes.

3.1.23 SGValueState2AMBAPVValueState

SystemGenerator ValueState to AMBA-PV ValueState protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-26 Ports

Name	Protocol	Type	Description
amba_pv_value_m	*AMBAPVValueState on page 2-64*	Master	Output master port for connection to top-level AMBAPVValue master port. Converted value changes are sent out through this port.
sg_value_s	*ValueState on page 2-85*	Slave	Handles incoming value changes.

3.1.24 SGValueState2AMBAPVValueState64

SystemGenerator ValueState_64 to AMBA-PV ValueState64 protocol converter. This model is written in LISA+.

Note

Variants of this component also exist with multiple input and output ports.

Table 3-27 Ports

Name	Protocol	Type	Description
amba_pv_value_m	*AMBAPVValueState64 on page 2-64*	Master	Output master port for connection to top-level AMBAPVValue64 master port. Converted value changes are sent out through this port.
sg_value_s	ValueState_64	Slave	Handles incoming value changes.

3.1.25 SMMUv3AEMIdentify2AMBAPVValue64

SMMUv3AEMIdentify to AMBA-PV Value64 protocol converter. This model is written in LISA+.

Table 3-28 Ports

Name	Protocol	Type	Description
identify	*SMMUv3AEMIdentifyProtocol on page 2-78*	Slave	SMMUv3AEMIdentifyProtocol input.
identify_reply	*AMBAPVValue64 on page 2-63*	Slave	From SystemC.
identify_request	*AMBAPVValue64 on page 2-63*	Master	To SystemC.

3.1.26 SystemC2Clock

Clock to SystemC Converter. This model is written in LISA+.

SystemC2Clock contains the following CADI targets:

- SystemC2Clock

Table 3-29 Ports

Name	Protocol	Type	Description
clk_out	ClockSignal	Master	ClockSignal ouput
current_ticks_m	*AMBAPVValueState64 on page 2-64*	Master	To SystemC.
get_clock_m	*AMBAPVValueState64 on page 2-64*	Master	To SystemC.
rate_in_Hz_m	*AMBAPVValueState64 on page 2-64*	Master	To SystemC.
set_clock_s	*AMBAPVValue64 on page 2-63*	Slave	From SystemC.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

3.1.27 SystemC2InstructionCount

SystemC to InstructionCount Converter. This model is written in LISA+.

SystemC2InstructionCount contains the following CADI targets:

- SystemC2InstructionCount

Note

Variants of this component also exist with multiple input and output ports.

Table 3-30 Ports

Name	Protocol	Type	Description
inst_count	*AMBAPVValueState64* on page 2-64	Master	To SystemC to request instruction count.
run_state	*AMBAPVValueState* on page 2-64	Master	To SystemC to request run state.
ticks	*InstructionCount* on page 2-84	Master	InstructionCount input.

3.1.28 SystemC2LCD

Converts SystemC to LCD protocol. This model is written in LISA+.

SystemC2LCD contains the following CADI targets:

- SystemC2LCD

Table 3-31 Ports

Name	Protocol	Type	Description
all_received_sPL	*AMBAPVSignal* on page 2-63	Slave	From SystemC.
all_received_u	*AMBAPVSignal* on page 2-63	Slave	From SystemC.
lcd_m	*LCD* on page 2-72	Master	LCD output.
lock_s	*AMBAPVValueState64* on page 2-64	Slave	From SystemC.
setPreferredLayout_d	*AMBAPVValue* on page 2-63	Slave	From SystemC.
setPreferredLayout_h	*AMBAPVValue* on page 2-63	Slave	From SystemC.
setPreferredLayout_w	*AMBAPVValue* on page 2-63	Slave	From SystemC.
unlock_s	*AMBAPVSignal* on page 2-63	Slave	From SystemC.
update_h	*AMBAPVValue* on page 2-63	Slave	From SystemC.
update_w	*AMBAPVValue* on page 2-63	Slave	From SystemC.
update_x	*AMBAPVValue* on page 2-63	Slave	From SystemC.
update_y	*AMBAPVValue* on page 2-63	Slave	From SystemC.

3.1.29 SystemC2PChannel

SystemC to PChannel Converter. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SystemC2PChannel contains the following CADI targets:

- SystemC2PChannel

Table 3-32 Ports

Name	Protocol	Type	Description
pchannel	*PChannel* on page 2-80	Master	-
sc_pchannel	SystemCPChannel	Slave	-

3.1.30 SystemC2VirtualEthernet

SystemC to VirtualEthernet Converter. This model is written in LISA+.

SystemC2VirtualEthernet contains the following CADI targets:

- SystemC2VirtualEthernet

Table 3-33 Ports

Name	Protocol	Type	Description
virtualethernet_m	*VirtualEthernet* on page 2-79	Master	-
virtualethernet_s	SC_VirtualEthernet	Slave	-

3.1.31 SystemC2v7VGICConfig

Converts SystemC to v7_vgic_configuration_protocol. This model is written in LISA+.

SystemC2v7VGICConfig contains the following CADI targets:

- SystemC2v7VGICConfig

Table 3-34 Ports

Name	Protocol	Type	Description
all_received_s	*AMBAPVSignal* on page 2-63	Slave	From SystemC.
cpu_interface_number_s	*AMBAPVValue64* on page 2-63	Slave	From SystemC.
inout_cluster_number_s	*AMBAPVValue64* on page 2-63	Slave	From SystemC.
inout_cpu_number_in_cluster_s	*AMBAPVValue64* on page 2-63	Slave	From SystemC.
master_id_mask_s	*AMBAPVValue* on page 2-63	Slave	From SystemC.
master_id_s	*AMBAPVValue* on page 2-63	Slave	From SystemC.
number_of_cores_s	*AMBAPVValueState* on page 2-64	Slave	From SystemC.
response_m	*AMBAPVSignal* on page 2-63	Master	To SystemC.
v7_vgic_config_m	v7_VGIC_Configuration_Protocol	Master	v7_VGIC_Configuration_Protocol output.

3.1.32 VirtualEthernet2SystemC

VirtualEthernet to SystemC Converter. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VirtualEthernet2SystemC contains the following CADI targets:
- VirtualEthernet2SystemC

Table 3-35 Ports

Name	Protocol	Type	Description
virtualethernet_m	SC_VirtualEthernet	Master	-
virtualethernet_s	*VirtualEthernet* on page 2-79	Slave	-

3.1.33 v7VGICConfig2SystemC

Converts v7_vgic_configuration_protocol to SystemC. This model is written in LISA+.

v7VGICConfig2SystemC contains the following CADI targets:
- v7VGICConfig2SystemC

Table 3-36 Ports

Name	Protocol	Type	Description
all_received	*AMBAPVSignal* on page 2-63	Master	Called when all other values have been set in opposite bridge.
cpu_interface_number_m	*AMBAPVValue64* on page 2-63	Master	To SystemC.
inout_cluster_number_m	*AMBAPVValue64* on page 2-63	Master	To SystemC.
inout_cpu_number_in_cluster_m	*AMBAPVValue64* on page 2-63	Master	To SystemC.
master_id_m	*AMBAPVValue* on page 2-63	Master	To SystemC.
master_id_mask_m	*AMBAPVValue* on page 2-63	Master	To SystemC.
number_of_cores_m	*AMBAPVValueState* on page 2-64	Master	To SystemC.
response_s	*AMBAPVSignal* on page 2-63	Slave	From SystemC.
v7_vgic_config_s	v7_VGIC_Configuration_Protocol	Slave	v7_VGIC_Configuration_Protocol input.

3.2 Bus components

This section describes the Bus components.

PVBus components and protocols provide functionally-accurate communication between bus masters and slaves. They are not software implementations of specific hardware, but instead are abstract components that are required by the software model environment.

There is no modeling of handshaking or cycle counts. By removing this level of detail, and by using efficient internal communication mechanisms, PVBus components can provide very fast modeling of bus accesses. A number of components, which abstract the internal details, access the PVBus API. You must use these components correctly to achieve high simulation speeds.

This section contains the following subsections:

- *3.2.1 Labeller* on page 3-102.
- *3.2.2 LabellerForDMA330* on page 3-103.
- *3.2.3 LabellerForGPUProtMode* on page 3-103.
- *3.2.4 MSIRewriter* on page 3-104.
- *3.2.5 PVBusCache* on page 3-105.
- *3.2.6 PVBusDecoder* on page 3-106.
- *3.2.7 PVBusExclusiveMonitor* on page 3-106.
- *3.2.8 PVBusExclusiveSquasher* on page 3-107.
- *3.2.9 PVBusLogger* on page 3-107.
- *3.2.10 PVBusMapper* on page 3-108.
- *3.2.11 PVBusMaster* on page 3-108.
- *3.2.12 PVBusModifier* on page 3-109.
- *3.2.13 PVBusRouter* on page 3-109.

3.2.1 Labeller

This model is written in LISA+.

Labeller contains the following CADI targets:

- Labeller

Labeller contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758

About Labeller

Labeller and LabellerForDMA330 are utility components that allow the system designer to embed values into the Label field for transactions generated by a Bus Master. They go between PVBus Master and Slave ports.

The following example creates a labeller to add an ID for an HDLCD controller that is upstream of a TZC_400. The system designer specifies a unique set of IDs for use as *Non-Secure Access IDs* (NSAIDs) in the TZC_400. The labeller can insert these IDs directly into the transaction.

```
pl370_hdlcd : PL370_HDLCD();
hdlcd_labeller : Labeller( "label" = 2 );
pl370_hdlcd.pvbus_m => hdlcd_labeller.pvbus_s;
hdlcd_labeller.pvbus_m => output_bus.pvbus_s;
```

Table 3-37 Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output with modified MasterID.
pvbus_s	PVBus	Slave	Unmodified input.

Table 3-38 Parameters for Labeller

Name	Type	Default value	Description
label	int	0x0	The label to apply to all transactions flowing through the labeller

3.2.2 LabellerForDMA330

This model is written in LISA+.

LabellerForDMA330 contains the following CADI targets:

- LabellerForDMA330

LabellerForDMA330 contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758

About LabellerForDMA330

Labeller and LabellerForDMA330 are utility components that allow the system designer to embed values into the Label field for transactions generated by a Bus Master. They go between PVBus Master and Slave ports.

Table 3-39 Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output with modified MasterID.
pvbus_s	PVBus	Slave	Unmodified input.

Table 3-40 Parameters for LabellerForDMA330

Name	Type	Default value	Description
dma330_data_label	int	0x0	The label to apply to all _data_ transactions flowing through the labeller. Used as a base value in conjunction with the channel ID if data-channel discrimination is enabled.
dma330_discriminate_data_channels	bool	0x0	Discriminate between DMA-330 data channels. Channel ID is added to the data label.
dma330_ns_instruction_label	int	0x0	The label to apply to all non-secure _instructions_ transactions flowing through the labeller
dma330_s_instruction_label	int	0x0	The label to apply to all secure _instructions_ transactions flowing through the labeller

3.2.3 LabellerForGPUProtMode

This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

LabellerForGPUProtMode contains the following CADI targets:

- LabellerForGPUProtMode

LabellerForGPUProtMode contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758

About LabellerForGPUProtMode

This component adds Non-Secure Access IDs (NSAIDs) to the transactions generated by the GPU. The NSAID is a four-bit number. It allows other components, such as a TrustZone Controller (TZC) or a Dynamic Memory Controller (DMC) to filter transactions and control access to memory regions that are designated as protected.

Table 3-41 Ports

Name	Protocol	Type	Description
prot_mode	*Signal* on page 2-85	Slave	Input to determine whether output is supposed to be protected or not
pvbus_m	PVBus	Master	Output with modified MasterID.
pvbus_s	PVBus	Slave	Unmodified input.

Table 3-42 Parameters for LabellerForGPUProtMode

Name	Type	Default value	Description
gpu_id_normal	int	0x0	NSAID to apply to all transactions flowing through the labeller when prot_mode is low.
gpu_id_protected	int	0x0	NSAID to apply to all transactions flowing through the labeller when prot_mode is high.

3.2.4 MSIRewriter

Recognise writes to the GITS_TRANSLATER register and rewrite them to go to the GITS_TRANSLATE64R register. The DeviceID is expected to be in the bottom 32 bits of ExtendedID of the transaction. Debug transactions and reads are not rewritten. This component can also, optionally, apply a 16 bit 'label' to the top 16 bits of the MasterID in the same way that the Labeller component does. This model is written in LISA+.

MSIRewriter contains the following CADI targets:

- MSIRewriter

MSIRewriter contains the following MTI components:

- *4.86 MSIRewriter - trace* on page 4-2723
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

MasterID, ExtendedID, and UserFlags

These tables show how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-43 pvbus_s port

PVBus attribute	Bits used	Property encoded	Notes
MasterID	-	-	Not used.
ExtendedID	Bits[63:32]	Stream ID	-
	Bits[31:0]	Device ID	-
UserFlags	-	-	Not used.

Table 3-44 pvbus_m port

PVBus attribute	Bits used	Property encoded	Notes
MasterID	Bits[31:16]	Optional 16-bit label.	For usage, see the label parameter.
ExtendedID	-	-	Not used.
UserFlags	-	-	Not used.

Table 3-45 Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-

Table 3-46 Parameters for MSIRewriter

Name	Type	Default value	Description
GITS_TRANSLATE64R_OFFSET	int	0x10048	It is an offset from ITS0-Base.
ITS0-base	int	0x0	Register base address for ITS0. This base address is used to recognise writes to the GITS_TRANSLATER register within the ITS0's register frame.
enable_rewriting	bool	0x1	Enable rewriting.
label	int	0xffffffff	If < 2**16 then this is a label that is put in the top 16 bits of MasterID in the same way that the component Labeller does. This labelling is not controlled by enable_rewriting and is performed on all transactions (even rewritten ones)
log	int	0x0	Log level, 0 is off.

3.2.5 PVBusCache

A PVBusCache manages cache-line data and supports forwarding of transactions. This model is written in C++.

Table 3-47 Ports

Name	Protocol	Type	Description
bus_in[4]	PVBus	Slave	Connections in from bus master.
bus_out[4]	PVBus	Master	Connections out to bus slaves.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-47 Ports (continued)

Name	Protocol	Type	Description
control	PVBusCacheControl	Slave	Configuration/control port.
device	PVBusCacheDevice	Master	Connection out to cache device.

3.2.6 PVBusDecoder

A PVBusDecoder allows bus transactions to be routed to one of many slaves, based on the address given in the transaction. This model is written in C++.

About PVBusDecoder

Each slave connection is associated with a specific address range on the pvbus_m_range port. In LISA+, the syntax for this is:

```
decoder.pvbus_m_range[start..end] = slave.pvbus
```

The values for start (inclusive) and end (inclusive) must specify a 4KB-aligned region of a multiple of 4K bytes. You can specify an address range for the slave, where the decoder remaps addresses into the appropriate range. The default address range for a slave is [0-(*sizeOfMasterRange* – 1)].

Table 3-48 Ports

Name	Protocol	Type	Description
pvbus_m_range	PVBus	Master	Specifies the address range for the bus master. The range must be 4KB aligned and a multiple of 4KB in size. If the address range is larger than the size of the slave device, the slave is aliased.
pvbus_s	PVBus	Slave	Accepts incoming transactions. Connect this port to a bus master, or to the output of another bus decoder.

3.2.7 PVBusExclusiveMonitor

Global exclusive monitor. This model is written in C++.

PVBusExclusiveMonitor contains the following CADI targets:

- PVBusExclusiveMonitor

PVBusExclusiveMonitor contains the following MTI components:

- *4.102 PVBusExclusiveMonitor - trace* on page 4-2752
- *4.105 PVBusMapper - trace* on page 4-2758

Table 3-49 Ports

Name	Protocol	Type	Description
excl_cleared	*Signal* on page 2-85	Master	Exclusive monitor clear signal port.
pvbus_m	PVBus	Master	Bus master port.
pvbus_s	PVBus	Slave	Bus slave port.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-50 Parameters for PVBusExclusiveMonitor

Name	Type	Default value	Description
apply_access_width_criteria_to_non_excl_stores	bool	0x1	Apply the given exclusive store width matching criteria to non-exclusive stores
clear_on_strex_address_mismatch	bool	0x1	Whether monitor is cleared when strex fails due to address mismatch
enable_component	bool	0x1	Enable component
log2_granule_size	int	0x0	log2 of address granule size
match_access_width	bool	0x0	Fail STREX if not the same access width as LDREX
match_secure_state	bool	0x1	Treat the secure state like an address bit
monitor_access_level	int	0x0	0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device
monitor_non_excl_stores	bool	0x0	Monitor non-exclusive stores from the same master
number_of_monitors	int	0x8	Number of monitors
shareability_domain	int	0x3	Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system)

3.2.8 PVBusExclusiveSquasher

Squashes the exclusive attribute on bus transactions. This model is written in LISA+.

PVBusExclusiveSquasher contains the following CADI targets:

- PVBusExclusiveSquasher

PVBusExclusiveSquasher contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758

Table 3-51 Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Bus master port.
pvbus_s	PVBus	Slave	Bus slave port.

3.2.9 PVBusLogger

A PVBusLogger has a slave and a master port and traffic is passed straight through. All traffic is logged using an MTI trace event. This model is written in C++.

PVBusLogger contains the following CADI targets:

- PVBusLogger

PVBusLogger contains the following MTI components:

- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-52 Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Bus master port.
pvbus_s	PVBus	Slave	Bus slave port.

Table 3-53 Parameters for PVBusLogger

Name	Type	Default value	Description
trace_debug	bool	0x0	Enable tracing of debug transactions
trace_snoops	bool	0x0	Enable tracing of ACE snoop requests

3.2.10 PVBusMapper

Allow transactions to be remapped arbitrarily. This model is written in C++.

PVBusMapper contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758

About PVBusMapper

This component performs like PVBusModifier, but in addition:

- It has multiple downstream ports
- It allows routing of transactions to any one of these ports
- It allows arbitrary remapping of transaction addresses and attributes

As a generic modeling component, it does not have a hardware revision code.

For an example of how to use PVBusMapper, see $PVLIB_HOME/examples/LISAPlus/RemappingWithPVBusMapper/.

Table 3-54 Ports

Name	Protocol	Type	Description
control	PVBusMapperControl	Master	Configuration port to determine mappings.
pvbus_m[64]	PVBus	Master	Bus master ports.
pvbus_s	PVBus	Slave	Bus slave port.
reset	*Signal* on page 2-85	Slave	Reset signal.

3.2.11 PVBusMaster

The PVBusMaster subcomponent allows a device to generate PVBus transactions. This model is written in C++.

PVBusMaster contains the following MTI components:

- *4.106 PVBusMaster - trace* on page 4-2759

About PVBusMaster

If you want a component to act as a bus master, instantiate a PVBusMaster subcomponent and then use its control port to create one or more transaction generators to generate transactions on the bus. $PVLIB_HOME/examples/LISA/BusComponents/DmaTransfer.lisa is an example component that shows this.

Table 3-55 Ports

Name	Protocol	Type	Description
control	*PVTransactionMaster* on page 2-77	Slave	Enables the owning component to instantiate pv::TransactionGenerator objects.
pvbus_m	PVBus	Master	Sends out generated transactions to the bus.
reset	*Signal* on page 2-85	Slave	On the de-assert of this signal, a reset of the bus master will be latched this is used by the bus deadlock detection logic.

Related concepts

1.15.2 TransactionGenerator efficiency considerations on page 1-50

3.2.12 PVBusModifier

Allow transactions to be remapped arbitrarily. This model is written in C++.

PVBusModifier contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758

Note

PVBusModifierx2 is an identical component, except it has two downstream ports.

Table 3-56 Ports

Name	Protocol	Type	Description
control	PVBusMapperControl	Master	Configuration port to determine mappings.
pvbus_m	PVBus	Master	Bus master port.
pvbus_s	PVBus	Slave	Bus slave port.
reset	*Signal* on page 2-85	Slave	Reset signal.

3.2.13 PVBusRouter

Allow transactions to be routed arbitrarily. This model is written in LISA+.

PVBusRouter contains the following CADI targets:

- PVBusRouter

PVBusRouter contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758

Table 3-57 Ports

Name	Protocol	Type	Description
control	PVBusRouterControl	Master	Configuration port to determine filters.
pvbus_m[64]	PVBus	Master	Bus master ports.
pvbus_s	PVBus	Slave	Bus slave port.

3.2.14 PVBusSlave

A PVBusSlave handles incoming transactions, and handles support for mapping regions of device address space to work as RAM/ROM/device memory. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PVBusSlave contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About PVBusSlave

Any component that acts as a bus slave must:

- Provide a PVBus slave port.
- Instantiate a PVBusSlave subcomponent, with the size parameter configured for the address range covered by the device.
- Connect the slave port to the `pvbus_s` port on the PVBusSlave.

By default, the PVBusSlave translates all transactions into `read()` and `write()` requests on the device port.

The control port enables you to configure the PVBusSlave for a device. This lets you define the behavior of the different regions of the address space on the device. You can configure regions separately for read and write, at a 4KB granularity. This permits you to set memory-like, device-like, abort, or ignore access address regions.

Transactions to memory-like regions are handled internally by the PVBusSlave subcomponent. Abort and ignore regions are also handled by the PVBusSlave.

Transactions to device-like regions are forwarded to the device port. Your device must implement the `read()` and `write()` methods on the device port if any regions are configured as device-like.

This component typically does not significantly affect the performance of a PV system. However, correct implementation of the PVBusSlave component is critical to the performance of the overall PV system. For example, routing a request to a PVDevice port is slower than letting the PVBusSlave component handle the request internally. Arm recommends using the internal support for memory-like regions where possible.

Table 3-58 Ports

Name	Protocol	Type	Description
`control`	*`PVBusSlaveControl` on page 2-75*	Slave	Enables the owning component to control which regions of the device memory are to be handled as RAM/ROM/Device. These settings can be changed dynamically. For example, when a Flash component is being programmed, it can switch to treating reads as Device requests instead of ROM requests.
`device`	*`PVDevice` on page 2-77*	Master	Passes on requests for peripheral register accesses to permit the owning component to handle the request.
`pvbus_s`	`PVBus`	Slave	Handles incoming requests from bus masters.
`reset`	*`Signal` on page 2-85*	Slave	On the assert of this signal, a reset of the bus slave will be latched this is used by the bus deadlock detection logic.

3.2.15 PVWriteBuffer

The PVWriteBuffer subcomponent buffers PVBus transactions. This model is written in C++.

PVWriteBuffer contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758
- *4.109 PVWriteBuffer - trace* on page 4-2767

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-59 Ports

Name	Protocol	Type	Description
barrier_notify_s	PVWriteBuffer_BarrierPort	Slave	Barrier notification input.
clk_in	ClockSignal	Slave	Clock input.
pvbus_m	PVBus	Master	Master connection to memory bus.
pvbus_s	PVBus	Slave	Slave connection for transactions to be buffered.
reset_in	*Signal* on page 2-85	Slave	Reset input.
serror_notify_m	PVWriteBuffer_SErrorPort	Master	SError output generation.

3.2.16 SimplePVBusMaster

Component to generate PVTransactions with configurable attributes and address. This model is written in LISA+.

SimplePVBusMaster contains the following CADI targets:

- ClockTimerThread64
- SchedulerThread
- SchedulerThreadEvent
- SimplePVBusMaster

SimplePVBusMaster contains the following MTI components:

- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-60 Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output of generated transactions.
pvbus_s	PVBus	Slave	-

Table 3-61 Parameters for SimplePVBusMaster

Name	Type	Default value	Description
verbose	bool	0x0	verbose

3.2.17 TZSwitch

Allow TrustZone secure/normal bus signals to be routed separately. This model is written in LISA+.

TZSwitch contains the following CADI targets:

- TZSwitch

TZSwitch contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758

About TZSwitch

The default behavior is to forward secure transactions to pvbus_port_a, and normal transactions to pvbus_port_b.

You must only use TZSwitches if the routing decisions change infrequently, for example as part of a memory remap.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The `secure` and `normal` parameters control the initial state of this component:

0 Ignore these transactions.

1 Forward the transactions to `pvbus_port_a`.

2 Forward the transactions to `pvbus_port_b`.

3 Generate an abort for these transactions.

The numbers used for initial configuration are not the same as the enumeration constants used to control routing at runtime.

Table 3-62 Ports

Name	Protocol	Type	Description
`control`	`TZSwitchControl`	Slave	Controls routing of transactions.
`pvbus_input`	`PVBus`	Slave	Slave port for connection to PVBus master/decoder.
`pvbus_port_a`	`PVBus`	Master	Output port a.
`pvbus_port_b`	`PVBus`	Master	Output port b.

Table 3-63 Parameters for TZSwitch

Name	Type	Default value	Description
`normal`	`int`	`0x2`	Normal Port
`secure`	`int`	`0x1`	Secure Port

3.3 Clocking components

This section describes the Clocking components.

The clocking components and protocols provide a mechanism for systems to regulate the execution rate of components. Clocking includes the concept of clock rates, dividers to change clock rates, and timers to generate callbacks based on those clock rates.

If the MasterClock component is instantiated in a system, it provides a consistent master clock rate. Although this rate is not defined, you can consider this to be 1Hz, even for non-SystemC systems. ClockDivider components are able to convert this clock rate into a new rate using a multiplier and divider, although the clock rate cannot be divided to be less than 1Hz. You can cascade ClockDivider components to produce many different clock rates within a system. The maximum ratio of any two clocks in the system must be less than 2^{32}.

ClockTimer components can be instantiated by a component and connected to any MasterClock or ClockDivider output. ClockTimers can generate callbacks after a given number of ticks of that clock. ClockTimers can invoke a behavior on the component to permit the component to perform work. The component can then request the ClockTimer to repeat its count.

This section contains the following subsections:

- *3.3.1 ClockDivider* on page 3-113.
- *3.3.2 ClockTimer* on page 3-114.
- *3.3.3 ClockTimer64* on page 3-114.
- *3.3.4 ClockTimerThread* on page 3-115.
- *3.3.5 ClockTimerThread64* on page 3-115.
- *3.3.6 MasterClock* on page 3-116.

3.3.1 ClockDivider

A ClockDivider is a library component that takes a ClockSignal on its input port (which could come from the output of a MasterClock, or from another ClockDivider), and generates a new ClockSignal on its output port, representing a clock frequency that is related to the input clock by the ratio of the multiply and divide parameters. This model is written in C++.

ClockDivider contains the following CADI targets:

- ClockDivider

ClockDivider contains the following MTI components:

- *4.60 ClockDivider - trace* on page 4-2438

About ClockDivider

This component uses a configurable ratio to convert the ClockSignal rate at its input to a new ClockSignal rate at its output. Changes to the input rate or ratio take effect immediately and clocking components dependent on the output rate continue counting at the new rate.

This component does not normally incur a runtime performance cost. However, reprogramming the clock rate causes all related clocks and timers to be recalculated.

For an example of the use of ClockDividers, see the `VEMotherBoard.lisa` component in the `$PVLIB_HOME/examples/LISA/FVP_VE/LISA/` directory of your Fast Models distribution.

Non-Confidential

Table 3-64 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Input clock signal, coming from a MasterClock or another ClockDivider.
clk_out	ClockSignal	Master	Clock signal generated by this ClockDivider.
rate	*ClockRateControl* on page 2-65	Slave	Permits you to dynamically change the clock divider ratio.

3.3.2 ClockTimer

A ClockTimer provides support for counting a number of ticks at the rate determined by the input clock. When the countdown reaches zero, the timer can send a signal to another component. That component can return a value that will cause the timer to start counting down again. Setting up a timer is very efficient, and no host processing time is used while a counter is counting down: when a timer is started, the scheduler precomputes the finish time. To use a ClockTimer connect the ClockTimer's 'timer_callback' port to a slave port that implements the 'signal()' behaviour and connect a clock signal to the clk_in port. Use the 'timer_control' port to start the timer counting down for a given number of ticks. This model is written in C++.

About ClockTimer

This component provides a mechanism for other components to schedule a callback after a number of ticks at a given ClockSignal rate.

An active ClockTimer component incurs no simulation overhead. For best performance, avoid having your performance-critical code frequently cancel timers or query the number of remaining ticks.

Table 3-65 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Determines the tick rate of the timer.
timer_callback	*TimerCallback* on page 2-65	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
timer_control	*TimerControl* on page 2-65	Slave	Permits the timer to be set, canceled and queried.

3.3.3 ClockTimer64

A ClockTimer64 provides support for counting a number of ticks at the rate determined by the input clock. When the countdown reaches zero, the timer can send a signal to another component. That component can return a value that will cause the timer to start counting down again. Setting up a timer is very efficient, and no host processing time is used while a counter is counting down: when a timer is started, the scheduler precomputes the finish time. This version of the timer provides 64 bit resolution. This model is written in C++.

About ClockTimer64

This component provides a mechanism for other components to schedule a callback after a number of ticks at a given ClockSignal rate.

An active ClockTimer64 component incurs no simulation overhead. For best performance, avoid having your performance-critical code frequently cancel timers or query the number of remaining ticks.

Non-Confidential

Table 3-66 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Determines the tick rate of the timer.
timer_callback	*TimerCallback64 on page 2-65*	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
timer_control	*TimerControl64 on page 2-66*	Slave	Permits the timer to be set, canceled and queried.

3.3.4 ClockTimerThread

A ClockTimerThread(64) is a drop-in replacement for a ClockTimer(64) component. The main difference to the ClockTimer component is that the ClockTimerThread runs the signal() callback from a proper scheduler thread. This mean that the signal() function may directly or indirectly invoke wait() functions to wait for time or events. This is not allowed for the ClockTimer component which does not use a thread. Components which issue bus transactions from within the timer signal() callback must use ClockTimerThread(64) rather than ClockTimer(64). This model is written in LISA+.

ClockTimerThread contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- SchedulerThread
- SchedulerThreadEvent

Table 3-67 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Determines the tick rate of the timer.
timer_callback	*TimerCallback on page 2-65*	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
timer_control	*TimerControl on page 2-65*	Slave	Permits the timer to be set, canceled and queried.

3.3.5 ClockTimerThread64

A ClockTimerThread64 is a drop-in replacement for ClockTimer64. The main difference to the ClockTimer component is that the ClockTimerThread runs the signal() callback from a proper scheduler thread. This mean that the signal() function may directly or indirectly invoke wait() functions to wait for time or events. This is not allowed for the ClockTimer component which does not use a thread. Components which issue bus transactions from within the timer signal() callback must use ClockTimerThread(64) rather than ClockTimer(64). This model is written in LISA+.

ClockTimerThread64 contains the following CADI targets:

- ClockTimerThread64
- SchedulerThread
- SchedulerThreadEvent

Table 3-68 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Determines the tick rate of the timer.
timer_callback	*TimerCallback64 on page 2-65*	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
timer_control	*TimerControl64 on page 2-66*	Slave	Permits the timer to be set, canceled and queried.

3.3.6 MasterClock

A source of a clock signal representing the base clock rate of the simulation (nominally 1Hz). The signal from the output port can be connected to a ClockDivider, to generate clock signals at a different clock rate. The output can also be connected to a ClockTimer in order to generate scheduled events, or to any other components that accept a ClockSignal input. See ClockSignal.lisa for more information. This model is written in C++.

About MasterClock

This component provides a single ClockSignal output that can be used to drive the ClockSignal input of ClockDividers, ClockTimers and other clocking components.

The rate of the MasterClock is not defined because all clocking is relative, but can be considered to be 1Hz.

A system might contain more than one MasterClock, all of which generate the same ClockSignal rate.

Table 3-69 Ports

Name	Protocol	Type	Description
clk_out	ClockSignal	Master	Master clock rate.

3.4 Core components

This section describes the Core components.

Code Translation (CT) components translate instructions on the fly and cache the translations to enable fast execution of code, but sacrifice timing accuracy. They also use efficient PV bus models to enable fast access to memory and devices.

CT components implement most of the processor features but differ in some ways:

- They do not model cycle timing. In aggregate, all instructions execute in one processor master clock cycle, except for Wait For Interrupt.
- Write buffers are not modeled on all processors.
- Most aspects of TLB behavior are implemented in the models. In Armv7 models and later, the TLB memory attribute settings are used when stateful cache is enabled.
- No device-accurate MicroTLB is implemented.
- Device-accurate modeling of multiple TLBs is off by default.
- A single memory access port is implemented. The port combines accesses for instruction, data, DMA, and peripherals. Configuration of the peripheral port memory map register is ignored.
- All memory accesses are atomic and are performed in *Programmer's View* (PV) order. Unaligned accesses are always performed as byte transfers.
- Some instruction sequences are executed atomically so that system time does not advance during their execution. This difference in behavior can affect sequential accesses of device registers where devices are expecting time to move on between each access.
- Interrupts are not taken at every instruction boundary.
- Integration and test registers are not implemented.
- Models do not support running Software Test Libraries (STLs).
- Not all CP14 debug registers are implemented on all processors.
- Breakpoint types that the models support directly are:
  - Single address unconditional instruction breakpoints.
  - Single address unconditional data breakpoints.
  - Unconditional instruction address range breakpoints.
- Pseudoregisters in the debugger support processor exception breakpoints. Setting an exception register to a nonzero value stops execution on entry to the associated exception vector.
- Cluster models do not simulate all cores at the same time. They execute a number of instructions on each core in turn. There can be a bias in the order in which cores run after a restart (for example, core 0 always runs first), so the simulation might hit breakpoints on the favored core more often.
- Performance counters are not implemented on all models.
- Some models implement caches, although all processor models implement cache control registers.
- ECC and parity schemes are hardware-specific so are not modeled.
- Models use a simplified view of the external buses.

About AEMvACT

This component is an AEM that implements all architectural features in Armv8-A and in addition implements the following Future Architecture Technologies:

- Scalable Vector Extension version 2 (SVE2)
- Transactional Memory Extension (TME)
- Call Stack Recorder Extension (CSRE)
- Branch Record Buffer Extension (BRBE)

Mapping architectural features to Fast Models releases

The following table shows which Fast Models releases the key architectural features are implemented in, from Armv8.3-A onwards. Support is at EAC quality unless otherwise stated.

Table 3-70 Architectural features and Fast Models releases

Architecture version	Feature	Fast Models version									
		11.13	11.12	11.11	11.10	11.9	11.8	11.7	11.6	11.5	11.4
Armv8.3-A	All [b]	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.4-A	All [c]	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.5-A	Memory Tagging Extension (MTE) functionality	✓	✓	✓	✓	✓	✓	✓	✓ (Beta)	-	-
	MTE performance	✓	✓	✓	✓	✓	✓ (Beta)	-	-	-	-
	All except MTE [d].	✓	✓	✓	✓	✓	✓	✓	✓	✓	-
Armv8.6-A	All [e]	✓	✓	✓	✓	✓	-	-	-	-	-
Armv8.7-A	Limited TLBI maintenance	✓ (Alpha)	-	-	-	-	-	-	-	-	-
	All except TLBI maintenance [f]	✓	-	-	-	-	-	-	-	-	-
Future Architecture Technologies	SVE2, TME, CSRE, BRBE. [g]	✓	✓	✓	✓	✓	✓	-	-	-	-

[b] Armv8.3-A includes pointer authentication, nested virtualization, Advanced SIMD complex number support, improved Javascript data type conversion support, memory consistency model changes, support for larger system-visible caches, debug over powerdown.

[c] Armv8.4-A includes Secure EL2, additional cryptographic hashes, activity monitors, enhanced support for nested virtualization, Memory Partitioning and Monitoring (MPAM), stage 2 forced write-back, dot product instructions, data independent timing instructions, Large System Extensions (LSE), support for TLB maintenance instructions and for TLB range instructions, Translation Table Level (TTL), enhancements to weaker release consistency, debug relaxations and extensions, flag manipulation instructions.

[d] Armv8.5-A includes Branch Target Indicators (BTI), Enhanced Virtualization Traps (EVT), Random Number Generator (RNG), Flag Manipulation instructions, Floating-point round to integer, DC CVADP.

[e] Armv8.6-A includes General Matrix Multiply (GEMM), EnhancedPAC2, FPAC, Data Gathering Hint, Additional PMU events, Enhanced Counter Virtualization.

[f] Armv8.7-A includes WFE and WFI with timeouts, Larger physical address for 4KB and 16KB translation granules, MTE Asymmetric Fault Handling, Enhancements to Privilege Access Never (PAN), Enhancements to PMU and SPE.

[g] Implemented by AEMvA only.

broadcastinner	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
cfgend[8]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	*Signal* on page 2-85	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	*Signal* on page 2-85	Slave	Signals the clearing of an external global exclusive monitor
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[8]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.

Non-Confidential

Table 3-71 Ports (continued)

Name	Protocol	Type	Description
config64[8]	*Signal* on page 2-85	Slave	Register width after reset.
cp15sdisable[8]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[8]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
cti0extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 0.
cti0extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 0.
cti1extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 1.
cti1extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 1.
cti2extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 2.
cti2extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 2.
cti3extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 3.
cti3extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 3.
cti4extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 4.
cti4extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 4.
cti5extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 5.
cti5extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 5.
cti6extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 6.
cti6extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 6.
cti7extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 7.
cti7extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 7.
ctidbgirq[8]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[8]	*Signal* on page 2-85	Slave	External debug interface.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-71 Ports (continued)

Name	Protocol	Type	Description
dbgnopwrdwn[8]	*Signal* on page 2-85	Master	Debug no power down request.
dbgpwrdwnack[8]	*Signal* on page 2-85	Master	Debug power down acknowledge.
dbgpwrdwnreq[8]	*Signal* on page 2-85	Slave	Debug power down request.
dbgpwrupreq[8]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
etm[8]	PVBus	Master	Embedded trace macrocell port.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
external_trace_reset[8]	*Signal* on page 2-85	Slave	ETMv4 External Trace Reset signal.
fiq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	*GICv3Comms* on page 2-84	Slave	GICv3 cpu interface ports.
irq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
irqs[224]	*Signal* on page 2-85	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	*Signal* on page 2-85	Slave	This signal resets timer and interrupt controller.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[8]	*Signal* on page 2-85	Slave	External debug interface.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of private peripheral region.
pmbirq[8]	*Signal* on page 2-85	Master	Interrupt signal from the statistical profiling unit.
pmuirq[8]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg[8]	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-71 Ports (continued)

Name	Protocol	Type	Description
rei[8]	*Signal* on page 2-85	Slave	Individual processor RAM Error Interrupt signal input.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
romaddr	*Value_64* on page 2-85	Slave	Debug ROM base address.
romaddrv	*Signal* on page 2-85	Slave	Debug ROM base address valid.
rvbar[8]	*Value_64* on page 2-85	Slave	Reset vector base address.
sei[8]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
smpnamp[8]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each core.
spiden[8]	*Signal* on page 2-85	Slave	External debug interface.
spniden[8]	*Signal* on page 2-85	Slave	External debug interface.
standbywfe[8]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[8]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
standbywfil2	*Signal* on page 2-85	Master	This signal indicated all cores and L2 are in a power down state
teinit[8]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
ticks[8]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trace_unit_reset[8]	*Signal* on page 2-85	Slave	ETMv4 Trace Unit Reset signal.
trbirq[8]	*Signal* on page 2-85	Master	-
vcpumntirq[8]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	*Signal* on page 2-85	Slave	Virtual FIQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[8]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-71 Ports (continued)

Name	Protocol	Type	Description
virq[8]	*Signal* on page 2-85	Slave	Virtual IRQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	*Signal* on page 2-85	Slave	Processor Virtual System Error Interrupt request.

Table 3-72 Parameters for ARM_AEM-A_MP

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CONFIG64	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CP15SDISABLE2	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.DCZID-log2-block-size	int	0x8	Log2 of the block size cleared by DC ZVA instruction (as read from DCZID_EL0).
cpu0.DCZVA_single_write	bool	0x0	Execute the DCZVA as a single write
cpu0.MPIDR-override	int	0x0	Override of MPIDR value. If nonzero will override the MT, cluster and CPU ID bits in MPIDR.
cpu0.RVBAR	int	0x0	Value of RVBAR_ELx register.
cpu0.RVBAR32	int	0x0	Reset vector address in AARCH32 when VINITHI is not set and ignore_rvbar_in_aarch32 is set
cpu0.SMPnAMP	bool	0x1	Enable broadcast messages necessary for correct SMP operation at reset.
cpu0.TEINIT	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.ase-present	bool	0x1	Set whether the model has been built with NEON support
cpu0.clock_divider	int	0x1	Clock divider ratio for asymmetric MP clocking.
cpu0.clock_multiplier	int	0x1	Clock divider ratio for asymmetric MP clocking.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-72 Parameters for ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
cpu0.crypto_aes	int	0x2	AES instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, AES instructions implemented. 2, AES and PMULL instructions implemented.
cpu0.crypto_sha1	int	0x1	SHA-1 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA1 instructions implemented.
cpu0.crypto_sha256	int	0x1	SHA-256 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA256 instructions implemented.
cpu0.crypto_sha3	int	0x0	Implement ARMv8.4 SHA-3 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.crypto_sha512	int	0x0	Implement ARMv8.4 SHA-512 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.crypto_sm3	int	0x0	Implement ARMv8.4 SM-3 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.crypto_sm4	int	0x0	Implement ARMv8.4 SM-4 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.cti-intack_mask	int	0x1	Set bits represent that the corresponding trigger requires software acknowledge via CTIINTACK
cpu0.cti-number_of_claim_bits	int	0x0	Number of implemented bits in CTICLAIMSET
cpu0.cti-number_of_triggers	int	0x8	Number of cti event triggers (default: 8, valid values: {3, 8-32})
cpu0.enable_crc32	int	0x0	CRC32 instructions supported. 0, not implemented. 1, CRC32 instructions implemented.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.etm-present	bool	0x1	Set whether the model has ETM support
cpu0.force-fpsid	bool	0x0	Override the FPSID value
cpu0.force-fpsid-value	int	0x0	Value to override the FPSID value to
cpu0.has_hcptr_tase	bool	0x1	If false, HCPTR.TASE is RES0

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-72 Parameters for ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.number-of-breakpoints	int	0x10	Number of breakpoints.
cpu0.number-of-context-breakpoints	int	0x10	Number of breakpoints that are context aware.
cpu0.number-of-watchpoints	int	0x10	Number of watchpoints.
cpu0.operation_bandwidth	int	0x1	Operation width for ARMv8.4 PMU extension
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.semihosting-stderr_istty	bool	0x1	Result for semihost istty call when argument is stderr
cpu0.semihosting-stdin_istty	bool	0x1	Result for semihost istty call when argument is stdin
cpu0.semihosting-stdout_istty	bool	0x1	Result for semihost istty call when argument is stdout
cpu0.semihosting-use_stderr	bool	0x0	Send stderr from the simulated process to host stderr
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.unpredictable_WPMASKANDBAS	int	0x1	Constrained unpredictable handling of watchpoints when mask and BAS fields specified. 0, IGNOREMASK. 1, IGNOREBAS (default). 2, REPEATBAS8. 3, REPEATBAS.
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support
cpu0.vfp-traps	bool	0x1	Implement support for trapping floating-point exceptions

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-72 Parameters for ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
cpu0.vfp-traps-show-all	bool	0x0	Report all trapped floating-point exceptions in the syndrome when a combination occurs.
cpu0.wfet_early_or_delayed_timeout	int	0x0	WFET early or delayed timeout beyond the threshold value of CNTVCT_EL0 in percentage.
cpu0.wfit_early_or_delayed_timeout	int	0x0	WFIT early or delayed timeout beyond the threshold value of CNTVCT_EL0 in percentage.

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP

Name	Type	Default value	Description
AIDR	int	0x0	Value of AIDR_EL1 register.
AMPIDR	int	0x400bbb000	Value of AMU Peripheral Identification Register
BPIMVA_causes_translation_lookup	bool	0x0	Do a translation when BPIMVA instruction is executed (which may cause a translation fault).
CCSIDR-L1D_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).
CCSIDR-L1I_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).
CCSIDR-L2_override	int	0x0	If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).
CCSIDR-L3_override	int	0x0	If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).
CPUCFR	int	0x0	Value of CPU Configuration Register
CTIPIDR	int	0x0	If non-zero, override the CTI Peripheral Identification Register
DBGPIDR	int	0x0	If non-zero, override the Debug Peripheral Identification Register
ERXMISC0_mask	int	0x0	Write Mask for ERXMISC0 RAS Register
GMID-log2-block-size	int	0x4	Log2 of the block size accessed by STGM/LDGM/STZGM instructions
ISV_set_to_0_for_stage2_synch_external_abort	bool	0x0	Whether ESR_EL2.ISV is set to 0 on stage 2 synchronous external aborts
MIDR	int	0x410fd0f0	Value of MIDR_EL1 register.
NUM_CORES	int	0x1	Number of cores per cluster
PA_SIZE	int	0x28	Physical address range supported. For ARMv8.0 and ARMv8.1 this is limited to 48 bits.
PMUPIDR	int	0x0	If non-zero, override the PMU Peripheral Identification Register
abort_execution_from_device_memory	bool	0x0	Execution from device memory generates a prefetch abort.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
advsimd_bf16_support_level	int	0x0	Implement BFloat16 operations from ARMv8.6. AArch64 Advanced SIMD and FP BFloat16 instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP BFloat16 instructions only. - 2, AArch32 Advanced SIMD and VFP BFloat16 instructions only. - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP BFloat16 instructions.
advsimd_i8mm_support_level	int	0x0	Implement Int8 matrix multiply operations from ARMv8.6. AArch64 Advanced SIMD and FP Int8 matrix multiply instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP Int8 matrix multiply instructions only. - 2, AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions only. - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions.
amair_reg_rw_mask	int	0x0	RW mask for implementation-defined registers.
amu_aux_voffset_mask	int	0x0	If ARMv8.6 is implemented, each bit of the field, 0 to 15, when 1 indicates that the corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2, is implemented
amu_has_external_interface	int	0x0	Implement external memory-mapped access to system register of activity monitor unit from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
amu_has_sysreg_interface	bool	0x1	Implement system register access to activity monitor unit from ARMv8.4.
amu_reset_domain	int	0x0	Reset domain for activity monitor unit. 0, COLD_RESET. 1, WARM_RESET. 2, NONE.
amu_version	int	0x1	Selects the activity monitor version implemented - 1, AMUv1 for Armv8.4 is implemented. - 2, AMUv1 for Armv8.6 is implemented.
apsr_read_restrict	bool	0x0	At EL0, unknown bits of APSR are RAZ.
arm_v8_7_accelerator_support_level	int	0x0	Implements Armv8.7 accelerator support instructions LD/ST64B, ST64BV, ST64BV0, etc.
auxilliary_feature_register0	int	0x0	Value of AFR0 ID register.
cache-log2linelen	int	0x6	Log2 of the cache line length in bytes.
cache_maintenance_hits_watchpoints	bool	0x0	DCIMVA operations executed in AArch32 modes hit watchpoints.
changing_block_size_without_bbm_support	int	0x0	Level of support for changing block size without break-before-make.
clear_IT_when_IL_set	bool	0x0	Clear IT bits when performing a *legal* exception return to AArch32 when IL is set

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
clear_IT_when_IL_set_explicitly	bool	0x0	Apart from clear_IT_when_IL_set, also clear IT bits when loading CPSR from SPSR/memory and IL == 1 in the value being loaded.
clear_reg_top_eret	int	0x1	Behaviour of the upper 32-bits of the Xn registers when changing between AArch32 state and AArch64 state. 0, upper 32-bits preserved for all registers. 1, upper 32-bits set to 0 for all accessible registers. 2, upper 32-bits set to 0 for a random selection of accessible registers. 3, upper-32-bits set to 0 for registers touched in AArch32
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dc_fault_unaligned_s1_device_s2_fwb	bool	0x0	Whether takes an Alignment Fault caused by the memory type on a DC {ZVA,GZVA,GVA} if the stage 1 memory type is any Device memory type
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_bus_width_in_bytes	int	0x8	L1 D-Cache read bus width in bytes used to calculate per-access timing annotations
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x8000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
dcache-ways	int	0x2	L1 D-Cache number of ways (sets are implicit from size).
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_bus_width_in_bytes	int	0x8	L1 D-Cache write bus width in bytes used to calculate per-access timing annotations
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
dcimva_requires_s2_write_permissions	bool	0x0	Data-cache invalidate by MVA operations require stage 2 write permission (virtualised AArch32 guest).
dczva_reports_lowest_addr_on_tag_check_fail	bool	0x0	Whether DC ZVA reports lowest address in FAR on tag check fail
delayed_dbgreg_between_secure_views	int	0x1	If delayed_dbgreg is enabled, whether the secure and nonsecure external views require explicit synchronization. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
dic-spi_count	int	0x40	Number of shared peripheral interrupts implemented
disable_sve_plugin	bool	0x0	If true, SVE will not be implemented in this processor even if the plugin is loaded
disable_unknown_update_event_on_reset	bool	0x0	Disables SYSREG_UPDATE event notification on reset for the registers whose bitfields are all reserverd or resets to architecturally unknown value
ecv_support_level	int	0x0	Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF.
el0_can_access_imp_def_functionality	bool	0x0	If not made UNDEF by imp_def_functionality_behaviour, EL0 can access IMPLEMENTATION DEFINED registers and system instructions.
el0_el1_only_non_secure	bool	0x0	Secure/non-secure state if EL2 and EL3 are not implemented. 0, secure. 1, non-secure.
enable_tlb_contig_check	bool	0x0	Perform extra pagetable walks to check translation table entries that have the contiguous hint bit set.
enhanced_pac2_level	int	0x0	Implements Enhanced PAC2 from ARMv8.6. This feature is mandatory for ARMv8.6 but can be cherrypicked to a ARMv8.3(or greater) implementation. 0: No EnhancedPAC2, 1: EnhancedPAC2 Only, 2: EnhancedPAC2 with FPAC, 3: EnhancedPAC2 with FPACCombined.

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
error_record_feature_register	string	""	RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0,"IMPDEF_3_2":0x0,"UI":0x0,"FI":0x0,"UE":0x0,"CFI":0x0,"CEC":0x0,"RP":0x0,"DUI":0x0,"CEO":0x0,"CI":0x0,"TS":0x0,"INJ":0x0,"FRX":0x0,"UC":0x0,"UEU":0x0,"UER":0x0,"UEO":0x0,"DE":0x0,"CE":0x0,"Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values betwn 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster"
error_record_feature_register_json_file	string	""	File path to the RAS feature register values as JSON. The file uses the same format as the error_record_feature_register parameter value
exercise_stxr_fail	bool	0x0	Reject a pseudo-random majority of exclusive store instructions
ext_abort_device_GRE_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_GRE_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_GRE_read_is_critical	bool	0x0	Critical reporting of device-GRE read external aborts.
ext_abort_device_GRE_read_is_sync	int	0x2	Synchronous reporting of device-GRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.
ext_abort_device_GRE_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_GRE_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_GRE_write_is_critical	bool	0x0	Critical reporting of device-GRE write external aborts
ext_abort_device_GRE_write_is_sync	int	0x2	Synchronous reporting of device-GRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.
ext_abort_device_GRE_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_GRE_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
ext_abort_device_nGRE_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_nGRE_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_nGRE_read_is_critical	bool	0x0	Critical reporting of device-nGRE read external aborts.
ext_abort_device_nGRE_read_is_sync	int	0x2	Synchronous reporting of device-nGRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.
ext_abort_device_nGRE_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_nGRE_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_nGRE_write_is_critical	bool	0x0	Critical reporting of device-nGRE write external aborts
ext_abort_device_nGRE_write_is_sync	int	0x2	Synchronous reporting of device-nGRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.
ext_abort_device_nGRE_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_nGRE_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_read_is_critical	bool	0x0	Critical reporting of device-nGnRE read external aborts
ext_abort_device_read_is_sync	bool	0x1	Synchronous reporting of device-nGnRE read external aborts
ext_abort_device_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_device_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
ext_abort_prefetch_wt_cacheable_read_is_sync	int	0x2	Behaviour of external aborts generated by normal writethrough cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_so_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_so_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_so_read_is_critical	bool	0x0	Critical reporting of device-nGnRnE read external aborts
ext_abort_so_read_is_sync	bool	0x1	Synchronous reporting of device-nGnRnE read external aborts
ext_abort_so_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_so_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_so_write_is_critical	bool	0x0	Critical reporting of device-nGnRnE write external aborts
ext_abort_so_write_is_sync	bool	0x1	Synchronous reporting of device-nGnRnE write external aborts
ext_abort_so_write_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_so_write_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_ttw_cacheable_read_is_critical	bool	0x0	Critical reporting of TTW cacheable read external aborts
ext_abort_ttw_cacheable_read_is_sync	bool	0x1	Synchronous reporting of TTW cacheable read external aborts
ext_abort_ttw_cacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_ttw_cacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_ttw_noncacheable_read_is_critical	bool	0x0	Critical reporting of TTW noncacheable read external aborts
ext_abort_ttw_noncacheable_read_is_sync	bool	0x1	Synchronous reporting of TTW noncacheable read external aborts
ext_abort_ttw_noncacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
ext_abort_ttw_noncacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_ttw_wt_cacheable_read_is_critical	bool	0x0	Critical reporting of TTW write-through cacheable read external aborts
ext_abort_ttw_wt_cacheable_read_is_sync	int	0x2	Synchronous reporting of TTW write-through cacheable read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_ttw_cacheable_read_is_sync.
ext_abort_ttw_wt_cacheable_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_ttw_wt_cacheable_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
fault_on_nT_bit_set	bool	0x1	Whether block translation table entries with the nT bit set should always fault. Only applies when changing_block_size_without_bbm_support_level is 1 or higher.
fault_unalign_to_unsupported_mem	int	0x0	If has_unaligned_single_copy_atomicity is true, whether unaligned A64 atomic, exclusive and acquire/release instructions to non iWB-oWB generate fault. This parameter is a bitmap. Bits 0,1,2 should be set accordingly to enable the fault behaviour. bit 0(LSB): atomic access should fault, bit 1: exclusive access should fault, bit 2: acquire/release should fault.
fault_unaligned_s1_device_s2_fwb	bool	0x0	Whether unaligned access with stage1 Device memory and final memory attribute forced to normal by FWB can generate alignment fault
force_deterministic_irg_tag_generation	bool	0x0	Force the random tag generated by the IRG instruction when GCR_EL1.RRND=1 to equal RGSR_EL1.SEED[3:0] rather than a non-deterministic value
fsr_ext_bit_update_kind	int	0x3	Set/Clear DFSR/IFSR EA bit on Synchronous/Async External Aborts. 0: Never Set, 1: Set on Synchronous Ext Aborts 2: Set on Asynchronous Ext Aborts 3: Set on both Sync and Async Ext Aborts.
global_debug_rom.ROMDEVID	int	0x0	Value of Debug Rom Device Identification Register
global_debug_rom.ROMPIDR	int	0x4000bb000	Value of Debug Rom Peripheral Identification Register
hardware_translation_table_update_implemented	int	0x1	Implement hardware translation table updates from ARMv8.1. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
has_16bit_asids	bool	0x1	Enable 16-bit ASIDs.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
has_16bit_vmids	int	0x1	Implement support for 16-bit VMIDs from ARMv8.1. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
has_16k_granule	bool	0x0	Implement the 16k LPAE translation granule.
has_4k_granule	bool	0x1	Implement the 4k LPAE translation granule.
has_52bit_address_with_16k	int	0x0	Implements Armv8.7 52-bit IPA/PA support for 16k Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_52bit_address_with_4k	int	0x0	Implements Armv8.7 52-bit IPA/PA support for 4k Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_64k_granule	bool	0x1	Implement the 64k LPAE translation granule.
has_aarch32_hpd	bool	0x0	If true then hierarchical permission disable is supported in AArch32
has_aarch64	bool	0x1	All implemented exception levels can run in AArch64
has_actlr2	bool	0x0	If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32]
has_amu	int	0x0	Implement activity monitor functionality from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_arm_v8-1	bool	0x0	Implement the ARMv8.1 Extension.
has_arm_v8-2	bool	0x0	Implement the ARMv8.2 Extension.
has_arm_v8-3	bool	0x0	Implement the ARMv8.3 Extension.
has_arm_v8-4	bool	0x0	Implement the ARMv8.4 Extension.
has_arm_v8-5	bool	0x0	Implement the ARMv8.5 Extension.
has_arm_v8-6	bool	0x0	Implement the ARMv8.6 Extension.
has_arm_v8-7	bool	0x0	Implement the Armv8.7 Extension. This feature is incomplete and under development.
has_at_with_pan	int	0x1	Implement new AT instructions with PAN support. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_axflag_xaflag	int	0x1	Implement flag manipulation instructions (AXFlag, XAFlag) from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
has_axflag_xaflag_frint	int	0x1	Implement flag manipulation instructions (AXFlag, XAFlag) and floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. If this parameter is enabled, it also enables both has_axflag_xaflag and has_frint. If support for only one of the features is needed, please use the individual parameters and do not enable this one. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_branch_target_exception	int	0x0	Implement Branch target identification mechanism from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_ccidx	bool	0x0	Implement the ARMv8.3 CCSIDR Extension. Extending the ccsidr number of sets.
has_cfinv_rmif_setf	int	0x1	Implement flag manipulation (CFINV, RMIF, SETF8, SETF16) instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_coherent_icache	bool	0x0	Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
has_common_not_private_translations	int	0x1	Implement the TTBRn_ELx.CnP (Common not Private) controls from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_complex_number	int	0x1	Implement ARMv8.3 complex number support, Multiply Accumulate and Add instructions. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_cvadp_support	int	0x0	Implement instruction to support cache clean by deep persistence (DC CVADP) from ARMv8.5, can be selected for core implemented on any arch version starting ARMv8.2 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_data_alignment_flag	int	0x0	Implement non-optimal misalignment flag for PMU/SPE from ARMv8.5 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_delayed_ctireg	bool	0x0	Delay the functional effect of CTI register writes until ISB or implicit barrier.
has_delayed_dbgreg	bool	0x0	Delay the functional effect of external debug register writes until ISB or implicit barrier.
has_delayed_sysreg	bool	0x0	Delay the functional effect of system register writes until ISB or implicit barrier.

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
has_delayed_wfe_trap	int	0x0	Implements Configurable Delayed WFE trapping from ARMv8.6 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_dgh	int	0x1	Implements Data Gathering Hint instruction from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_dot_product	int	0x1	Implement the dot product (UDOT, SDOT) instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_e0pd	int	0x1	Implement ARMv8.5 feature to prevent unprivileged access to one half of the memory Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_el2	bool	0x1	Implements EL2
has_el3	bool	0x1	Implements EL3
has_enhanced_pac	bool	0x0	If pointer authentication is enabled then implement enhanced PAC.
has_enhanced_pan	int	0x1	Implements Armv8.7 Enhanced PAN feature Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_ets	bool	0x0	Whether Enhanced Translation Synchronization is supported
has_extended_recp_estimate	int	0x0	Implements increased precision of reciprocal instructions.) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_fgt	int	0x1	Implements Fine-grained Virtualization Traps extension from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_fp16	int	0x1	Implement the half-precision floating-point data processing instructions from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_fp16_fmlal	int	0x1	Implement the New Floating Point Multiplication Variant (FP16 FMLAL, FMLSL) instructions from ARMv8.4. Only supported if has_fp16=0x1. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_frint	int	0x1	Implement floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_generic_authentication	int	0x1	Implement ARMv8.3 generic authentication. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
has_guest_translation_granule	int	0x1	Implement mechanism for guest translation granule identification from ARMv8.5, ID values determined by stage1 granule configuration parameters Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_hardware_translation_table_update	int	0x2	Type of hardware translation table supported (when enabled by hardware_translation_table_update_implemented). 0, not implemented. 1, access bit updates implemented. 2, access bit updates and dirty bit mechanism implemented.
has_hcrx_el2	int	0x1	Implements new HCRX_EL2 id register from Armv8.7 Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_id_reg_read	int	0x1	Implement read access to the ID registers (ESR_ELx.EC=0x18) Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_iesb	int	0x1	Implement support for implicit error sync event from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_jscvt	int	0x1	Implement ARMv8.3 javascript Floating-point to Integer conversion instruction. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_large_system_ext	bool	0x0	Implement the ARMv8 Large System Extensions.
has_large_va	int	0x0	Implement support for the extended 52-bit virtual addresses from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_ldapur_stlur	int	0x1	Implement support for LDAPR and STLR instructions with immediate offsets from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_ldm_stm_ordering_control	int	0x0	Implement the SCTLR_ELx.LSMAOE (Load/Store Multiple Atomicity and Ordering Enable) and SCTLR_ELx,nTLSMD (no Trap Load/Store Multiple to Device) controls from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_lrcpc	bool	0x0	If true then it support the RCpc feature (ARMv8.3)
has_mpam	int	0x0	Implement ARMv8.4 MPAM Registers and associated functionality. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
has_mt_pmu_disable_feature	int	0x0	Implements Multi-threading PMU disable extension from ARMv8.6 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_mte_ctrl_bits_stateful	bool	0x0	if memory_tagging_support_level == 1, Whether mte specific control bits in system registers are stateful
has_nested_virtualization	int	0x1	Implement ARMv8.3 nested virtualization. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_no_os_double_lock	int	0x0	Do not implement the OS double-lock. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_non_context_synchronizing_exception_controls	int	0x1	Implement cosmetic controls for whether exception entry and exit are context synchronizing events (SCTLR_ELx.{EIS,EOS}) from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_par_bit10_razwi	bool	0x0	Whether PAR_EL1[10] is RAZ/WI
has_pointer_authentication	int	0x1	Implement ARMv8.3 pointer authentication. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_prediction_invalidation_instructions	int	0x1	Implement execution and data prediction invalidation from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_pstate_dit	int	0x1	Implement timing insensitivity of data processing instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_pstate_pan	int	0x1	Implement the PSTATE.PAN (Privileged Access Never) control from ARMv8.1 Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
has_pstate_uao	int	0x1	Implement the PSTATE.UAO (User Access Override) control from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_ras_armv84_extension	int	0x1	Implement ARMv8.4 RAS Extension. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_ras_critical_error	int	0x0	[DEPRECATED: Set CI field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Critical Error is implemented or not. 0 - Feature Not Supported, 1 - Feature always enabled, 2 - Feature is controllable.

Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
has_ras_double_fault	int	0x1	Implement ARMv8.4 RAS Doublt Fault Extension. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_ras_fault_injection	int	0x0	[DEPRECATED: Set INJ field on first register in error_record_feature_register JSON instead] Implement ARMv8.4 Standard Fault Injection mechanism. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_ras_timestamp	int	0x0	[DEPRECATED: Set TS field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Timestamp register is implemented or not. 0 - No Timestamp is recorded, 1 - Generic Timer timestamp is recorded, 2 - IMP DEF timestamp is recorded.
has_restriction_on_speculative_data_loaded	int	0x1	Implements the ARMv8.5 security feature (Restrictions on the effects of speculation) Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_rndr	int	0x0	Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_rounding_doubling_multiply_add_subtract	int	0x1	Implement the rounding doubling multiply add and subtract instructions from ARMv8.1 Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
has_secure_el2	int	0x1	Implement support for Secure EL2 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_self_hosted_trace_extension	int	0x1	Implement support for the Self-hosted Trace Extensions from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_small_page_table	int	0x1	Implement small page table support which increases the maximum value of TxSZ field from ARMv8.4. Note: will be unimplemented only if both has_small_page_table=0x0 and has_secure_el2=0x0. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_speculation_barrier_inst	int	0x1	Implement speculation barrier instruction (SB) from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_stage2_fwb	int	0x1	Implement HCR_EL2.FWB, stage 2 control of memory types and cacheability Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
has_stage2_xnx	int	0x1	Implement the extended XN[1:0] stage 2 control from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_stage2_xnx_in_aarch32	bool	0x1	Implement the extended XN[1:0] stage 2 control from ARMv8.2 for Aarch32.
has_statistical_profiling	bool	0x1	Whether Statistical Based Profiling is implemented
has_supersections	bool	0x1	Whether VMSAv8-32 supersection to support more than 32-bit PA using short descriptor is implemented.
has_tlb_conflict_abort	bool	0x0	Detected inconsistent TLB content generate aborts.
has_tlbi_range	int	0x1	Implement support for TLB Range Maintenance instructions (TLBI RVAE1, etc) from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_tlbi_to_outer_shareable	int	0x1	Implement support for TLB Maintenance instructions that extend to the Outer Shareable domain (TLBI VAE1OS, etc) from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_tlbi_ttl	int	0x1	Implement support for the TTL level hint in by-address TLB Maintenance instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_unaligned_single_copy_atomicity	int	0x1	Implement support for SCTLR_ELx.nAA from ARMv8.4, and A64 atomic, exclusive and acquire/release instructions accessing unaligned bytes inside a 16byte window will not generate alignment fault. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_v8_4_debug_extension	int	0x1	Implement ARMv8.4 debug extensions Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_v8_4_pmu_extension	int	0x1	Implement PMU extension from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_v8_5_debug_over_power_down	int	0x0	Implement ARMv8.5 Debug over powerdown Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_v8_5_pmu_extension	int	0x1	Implement PMU extension from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_v8_5_spe_extension	int	0x1	Implement SPE extension from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
has_v8_6_pmu_events	int	0x1	Implements PMU events from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_v8_7_fp_enhancements	int	0x1	Implements the Floating Point enhancements from Armv8.7 (introduces FPCR.FIZ/AH/NEP, etc.) Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_v8_7_pmu_events	int	0x1	Implement PMU events from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_v8_7_pmu_extension	int	0x1	Implement PMU extension from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_v8_7_spe_extension	int	0x1	Implement SPE extension from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_vncr_el2	int	0x1	Implement support for nested virtualization enhancements from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_wfet_and_wfit	int	0x1	Implements WFE and WFI with Timeout from Armv8.7 Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_writebuffer	bool	0x0	Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.
has_xs	int	0x1	Implements Armv8.7 XS, TLBInXS, DSBnXS instruction Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-log2linelen	int	0x0	If nonzero, Log2 of the instruction cache line length in bytes (valid values in range 4-8). Otherwise the value of cache-log2linelen is used.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-nprefetch	int	0x1	Number of next sequential instruction cache lines to prefetch. This is only used when icache-prefetch_enabled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
icache-prefetch_level	int	0x0	0 based cache level at which instructions are pre-fetched. This is only used when icache-prefetch_enabled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_bus_width_in_bytes	int	0x8	L1 I-Cache read bus width in bytes used to calculate per-access timing annotations
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x8000	L1 I-Cache size in bytes.
icache-ways	int	0x2	L1 I-Cache number of ways (sets are implicit from size).
ignore_DBGPRCR_CWRR	bool	0x0	Ignore writes to the deprecated DBGPRCR.CWRR bit.
ignore_access_flag_update_by_at_ops	bool	0x0	If true, AT operations do not update access flag
ignore_large_address_top_bits_in_page_walk	bool	0x0	Whether page table bits [15:12] are ignored if PA_SIZE < 52 and output address is configured < 52 with large page
imp_def_functionality_behaviour	int	0x0	Behaviour of IMPLEMENTATION DEFINED registers and system instructions. 0, UNDEF. 1, RAZ/WI.
impdef_regs_and_unpred_from_implementation	string	""	Configure implementation defined registers and unpredictable behaviour to match the specified implementation. Requires a license for the selected implementation model. Use ARM_Cortex-A<num> or ARM_<codename> for licensed pre-release cores.
independent_cache_control_traps	int	0x0	Implement Independent Cache Control traps from ARMv8.5. 0, NO_SUPPORT. 1, SUPPORTED_BUT_NOT_FOR_TLB_MAINTENANCE_INSTRUCTIONS. 2, FULL_SUPPORT.
insert_iesb_before_exception	bool	0x0	If true then inserts an IESB before taking with Exception otherwise has no effect and IESB is taken after PState is changed due to the Exception.
instruction_tlb_size	int	0x0	Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB)
is_mt_res0	bool	0x0	If ARMv8.6 is not implemented, and PMUv3 is implemented, this parameter controls whether PMEVTYPER<n>.MT bit is RES0 or RW. For other implementations, this parameter has no effect
is_uniprocessor	bool	0x0	Value for the U bit in MPIDR. true disables L1 cache coherency protocols

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l2cache-read_bus_width_in_bytes	int	0x8	L2 Cache read bus width in bytes used to calculate per-access timing annotations
l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l2cache-size	int	0x80000	L2 Cache size in bytes.
l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l2cache-ways	int	0x10	L2 Cache number of ways (sets are implicit from size).
l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
l2cache-write_bus_width_in_bytes	int	0x8	L2 Cache write bus width in bytes used to calculate per-access timing annotations
l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
l3cache-mpamf.bwa_width_ns	int	0x10	L3 Cache width of MPAM bandwidth allocation fields for non-secure accesses.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
l3cache-mpamf.bwa_width_s	int	0x10	L3 Cache width of MPAM bandwidth allocation fields for secure accesses.
l3cache-mpamf.cmax_width_ns	int	0x0	L3 Cache number of fractional bits in MPAM cache capacity partition control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
l3cache-mpamf.cmax_width_s	int	0x0	L3 Cache number of fractional bits in MPAM cache capacity partition control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
l3cache-mpamf.cpbm_width_ns	int	0x0	L3 Cache width of MPAM cache portion bitmap for non-secure accesses. If 0, the feature is not implemented, and all ways are available.
l3cache-mpamf.cpbm_width_s	int	0x0	L3 Cache width of MPAM cache portion bitmap for secure accesses. If 0, the feature is not implemented, and all ways are available.
l3cache-mpamf.csu_num_mon_ns	int	0x0	L3 Cache number of MPAM cache storage usage monitors for non-secure accesses.
l3cache-mpamf.csu_num_mon_s	int	0x0	L3 Cache number of MPAM cache storage usage monitors for secure accesses.
l3cache-mpamf.has_prop_ns	bool	0x0	Enable memory bandwidth proportional stride control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
l3cache-mpamf.has_prop_s	bool	0x0	Enable memory bandwidth proportional stride control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
max_32bit_el	int	0x3	Maximum exception level supporting AArch32 modes.
memory.acp.AxCACHE_mask	int	0x0	Used with memory.acp.AxCACHE_pattern to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.
memory.acp.AxCACHE_pattern	int	0x0	Used with memory.acp.AxCACHE_mask to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.
memory.l2_cache.is_inner_cacheable	bool	0x1	L2 cache obeys inner cacheable attributes (rather than outer cacheable attributes)
memory.l2_cache.is_inner_shareable	bool	0x1	L2 cache obeys inner shareable attributes (rather than outer sharaable attributes)
memory_tagging_support_level	int	0x0	Specify the memory tagging extension support level: 0, not implemented. 1, instructions and registers only are implemented. 2, implemented. 3, implemented with asymmetric handling of exceptions
mixed_endian	int	0x1	Implement support for mixed endianness. 0, not supported. 1, supported at all exception levels. 2, supported at EL0 only.
mpam_force_ns_rao	bool	0x0	Whether MPAM3_EL3.FORCE_NS bit is RAO/WI.

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
mpam_frac	int	0x0	MPAM fractional revision number in ID_AA64PFR1_EL1.MPAM_frac field
mpam_has_hcr	bool	0x0	MPAM Whether MPAMIDR_EL1 HAS_HCR bit is set or clear
mpam_max_partid	int	0xffff	MPAM Maximum PARTID Supported
mpam_max_pmg	int	0xff	MPAM Maximum PMG Supported
mpam_max_vpmr	int	0x0	MPAM Maximum VPMR Supported
mpamidr_has_force_ns	int	0x0	Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
mpamidr_has_sdeflt	int	0x0	Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
mpamidr_has_tidr	int	0x0	Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
mvbar_reset_is_rvbar	bool	0x1	If true then the reset value of MVBAR is RVBAR, if false the reset value is UNKNOWN.
non_secure_vgic_alias_when_ns_only	int	0x0	If ! has_el3 and only non-secure side exists, then the normal position of the VGIC is a secure alias. If this parameter is non-zero then in addition a non-secure alias of the VGIC will be placed at this position (aligned to 32 KB).
num_loregion_descriptors	int	0x0	Number of Limited Ordering Region descriptors implemented (if ARM v8.1 extensions are implemented)
num_loregions	int	0x0	Number of Limited Ordering Regions implemented excluding background region (if ARM v8.1 extensions are implemented)
number_of_error_records	int	0x0	Cores Number of Error records supported for RAS
optimal_alignment_size	int	0x1	Alignment boundary which does not incur additional performance penalty from ARMv8.5. - 1, architectural misalignment is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] - 2, access crossing 4 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] - 3, access crossing 8 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] ... - 12, access crossing 4 Kbyte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
output_attributes	string	"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS"	User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.
page_based_hardware_attributes	int	0x0	Implement the page based hardware attributes from ARMv8.2. This parameter indicates which page table bits are available for hardware, where bits[3:0] correspond to PTE[62:59] and to TCR_ELx.HWUnyy.
pmmir_el1_bus_slots	int	0x0	Largest value by which BUS_ACCESS can increment over BUS_CYCLES cycles. From v8.7 PMU extension
pmmir_el1_bus_width	int	0x0	Width, in bytes, of accesses counted by BUS_ACCESS. From v8.7 PMU extension
pseudo_fault_generation_feature_register	string	""	ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false,"UC":false,"UEU":false,"UER":false,"UEO":false,"DE":false,"CE":0x0,"CI":false,"ER":false,"PN":false,"AV":false,"MV":false,"SYN":false,"R":false},other_psuedo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.
pstate_ssbs_type	int	0x0	Implement speculative store bypass safe feature from ARMv8.5. 0, Not supported. 1, Supported without MSR/MRS access to SSBS. 2, fully supported.
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
randomize_unknowns_at_reset	bool	0x0	Will fill in unknown bits in registers at reset with random value using register_reset_data as seed, it overrides scramble_unknowns_at_reset
ras_errselr_undef_if_no_error_records	bool	0x0	If true, ERRSELR_EL1 will be undefined if ERRIDR_EL1 indicates that zero error records are implemented.

Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
ras_frac	int	0x0	0, No additional feature implemented. 1, Additional ERXMISC*, ERXPFG* registers and FaultInjection trap from RAS v1.1. implemented
register_reset_data	int	0x0	Data used to fill register bits when they become UNKNOWN at reset.
restriction_on_speculative_execution	int	0x0	Implements the ARMv8.5 security feature (Restrictions on the effects of speculation): 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx not supported), 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx supported)
rmr_always_implemented	bool	0x0	Always implement RMR_ELx, RMR, or HRMR at the highest implemented exception level, even if that exception level cannot use both AArch32 and AArch64.
rndr_rndrrs_seed	int	0x0	Initial seed for random engine used in RNDR register
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions.
scramble_unknowns_at_reset	bool	0x1	Will fill in unknown bits in registers at reset with register_reset_data
set_rasv10_for_armv84_and_higher	bool	0x0	ARMv8.4 mandates RAS System Architecture v1.1, but when there are no error records and ARMv8.4-DFE is not implemented then there is no functional difference between the RAS System Architecture v1.0 (that is, the RAS extension as in pre-ARMv8.4 implementations) and the RAS System Architecture v1.1 (also known as ARMv8.4-RAS). This flag if true will set the RAS ID to declare RAS v1.0 rather than RAS v1.1 for ARMv8.4 and higher implementations. If this is set and the core does not conform to the restrictions then this parameter is ignored.
spsr_el3_is_mapped_to_spsr_mon	bool	0x1	Whether SPSR_EL3 is mapped to AArch32 register SPSR_mon
spsr_m4_res0	bool	0x0	Whether SPSR_ELx.M[4] bit should be RES0 for AARCH64 only implementations
stage12_tlb_size	int	0x80	Number of stage1+2 tlb entries.
stage1_tlb_size	int	0x0	Number of stage1 only tlb entries.
stage1_walkcache_size	int	0x0	Number of stage1 only walk cache entries.
stage2_tlb_size	int	0x0	Number of stage2 only tlb entries.
stage2_walkcache_size	int	0x0	Number of stage2 only walk cache entries.
statistical_profiling_buffer_alignment	int	0x1	Statistical profiling alignment constraint for sample buffer

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
statistical_profiling_random_interval_is_separate	bool	0x0	Statistical profiling random interval gets added to the main timer interval(false) or (true) runs as separate timer
statistical_profiling_recommended_min_sampling	int	0x100	Statistical profiling recommended minimum sampling interval
take_ccfail_tsc_trap	bool	0x0	When take_ccfail_undef=1 this prameter controls whether or not an SMC instruction that is trapped by HCR_EL2.TSC but fails its condition code check generates a trap to EL2.
take_ccfail_undef	bool	0x1	UNDEF exception is taken even if condition code check fails
tcr_ps_reserved_value_size	int	0x0	Physical size treated when TCR.(I)PS is programmed with a reserved value. 0, 48 bits. 1, 52 bits. The parameter value is treated 0 if LPA is not supported.
tcr_txsz_undersize_should_fault	bool	0x1	If large VA is not supported, Whether undersized TxSZ value should generate translation fault
tdosa_traps_osdlr_if_no_os_double_lock	bool	0x1	MDCR_EL*.TDOSA enables trap on OSDLR_EL1 and DBGOSDLR when OS double-lock is not implemented.
tidcp_traps_el0_undef_imp_def	bool	0x1	TIDCP has priority over UNDEF for accesses to IMPLEMENTATION DEFINED functionality from EL0
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
trace_physical_registers_when_host_virtualisation_enabled	int	0x0	When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers
treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
treat-dcache-invalidate-as-clean-invalidate	bool	0x0	Treat data cache invalidate operations as clean and invalidate.
undef_ccsidr2_access_for_unimplemented_aarch32	bool	0x0	Whether access to CCSIDR2 is undef if AArch32 is implemented or not
unification-level	int	0x1	Level of Unification Inner Shareable for the cache hierarchy
unification-uniprocessor-level	int	0x1	Level of Unification Uniprocessor for the cache hierarchy
unpred_nested_virtualization_nv_behaviour	int	0x0	Constrained unpredictable choices for HCR_EL2.NV=0 and HCR_EL2.NV1=1 with respect to nested virtualization - 0, Behave as defined in the sepcification as per bit values - 1, Behave as if HCR_EL2.NV=1 and HCR_EL2.NV1=1 for all purpose other than reading back HCR_EL2.NV - 2, Behave as if HCR_EL2.NV=0 and HCR_EL2.NV1=0 for all purpose other than reading back HCR_EL2.NV1

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-73 Parameters for Cluster_ARM_AEM-A_MP (continued)

Name	Type	Default value	Description
unpred_vncr_el2_ress_mismatch	int	0x0	Constrained unpredictable choices when bits marked as RESS do not all have the same value for VNCR_EL2 - 0, Generating an EL2 translation regime translation abort on use of the VNCR_EL2 register - 1, Reserved sign exteneded bits of VNCR_EL2 are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes other than reading back the register
unpred_zero_spsr_btype	bool	0x1	Constrained unpredictable control to make SPSR_ELx.BTYPE 0 instead of PSTATE.BTYPE on synchronous exceptions other than Software Step, PC alignment fault, Instruction Abort, Breakpoint or Address Matching Vector Catch, Illegal Execution State, BRK instruction, Branch Target
unpredictable_exclusive_abort_memtype	int	0x0	Cause MMU abort if exclusive access is not supported in certain memory type (0=exclusives allowed in all memory types, 1=exclusives abort in Device memory types, 2=exclusives abort in any type other than WB inner cacheable)
unpredictable_hvc_behaviour	int	0x0	HVC unpredictable behaviour. 0, UNDEF. 1, NOP.
unpredictable_smc_behaviour	int	0x0	SMC unpredictable behaviour. 0, UNDEF. 1, NOP.
use_Xt_as_LDG_STG_input	bool	0x1	Use new MTE Intructions formats for LDG/ST(Z)(2)G, which use Xt as an input
use_mte_eac_02_instructions_encoding	bool	0x1	Use new MTE Intructions encoding since MTE spec EAC 0.2 in ARMv8.5.
use_mte_eac_08_tfsr_encoding	bool	0x1	Use new MTE TFSR_ELx encodings since MTE spec EAC 0.8 in ARMv8.5.
use_rosetta_disass	int	0x1	Use Rosetta disassembly library. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
use_tlb_contig_hint	bool	0x0	Translation table entries with the contiguous hint bit set generate large TLB entries.
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks
warn_unpredictable_in_v7	bool	0x1	If true, behaviour which is unpredictable in V7 yet is predictable in V8 will produce a warning
watchpoint-log2secondary_restriction	int	0x0	log2 size of secondary restriction of FAR/EDWAR possible values on watchpoint hit for load/store operations.
wnr_is_read_for_s2f_on_s1_atomic_instr_fault	bool	0x0	Whether WnR is 0 for stage2 fault on stage1 for atomic instructions
wnr_is_read_for_s2f_on_s1_dbm_update	bool	0x0	Whether WnR is 0 for stage2 fault on stage1 descriptor dbm update

3.4.2 ARMAEMv8AMPCT

ARM AEM v8-A(MP) CPU component - number of core configurable at runtime. This model is written in C++.

ARMAEMv8AMPCT contains the following CADI targets:

- ARMAEMv8-A_MP
- Cluster_ARMAEMv8-A_MP
- PVCache
- TlbCadi

ARMAEMv8AMPCT contains the following MTI components:

- *4.4 ARM_AEMv8-A_MP - trace* on page 4-908
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMAEMv8AMPCT

- AEMv8-A is deprecated and will be replaced by AEMvA, which enables both the existing Armv8-A architecture and Future Architecture Technologies. Support for architectural features is selectable through parameters. For additional information, contact *support@arm.com*.
- This component supports multiple versions of the Armv8-A architecture and provides parameters to enable or disable particular architectural features. Some of these parameters allow you to enable features in versions of the architecture earlier than the one in which they were introduced. These parameters have the possible values:

  0 Feature is not enabled.

  1 Feature is enabled, but only if the model is set to implement a version of the architecture in which the feature is supported.

  2 Feature is enabled, regardless of which architecture version the model implements.
- The number of cores is configured using the `NUM_CORES` parameter. The per-core parameters are preceded by `cpun`, where *n* identifies the core (0-7).

AEMv8A core personalities

The AEM core personalities feature allows you to configure AEM instances in a platform to use the IMPLEMENTATION DEFINED registers and UNPREDICTABLE behavior for a specific implementation of your choice at model startup.

Configuring an AEM with a core personality requires a license for both the AEM and the selected implementation.

Set the personality using the environment variable `FASTSIM_AEMV8_PROFILE`, or the parameter `impdef_regs_and_unpred_from_implementation`.

The parameter allows you to configure different instances in the same platform with different personalities, including subclusters in a heterogeneous AEM. The environment variable takes precedence over the parameter and affects all instances of the AEM in the platform. Otherwise the two options function identically.

To see the available values for the environment variable or parameter, set either of them to the special value `list`. The model prints the list of available values and exits. An example value is `ARM_Cortex-A57`. Then set the parameter or environment variable to the required value.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Configuring a core personality only affects IMPLEMENTATION DEFINED registers and UNPREDICTABLE behavior. In other respects, the cluster or subcluster still behaves like the AEM. For example, all parameters default to the AEM default values. Therefore, parameters have to be manually configured to valid values for the configured personality, as many of the defaults are incompatible with any given implementation.

To assist with this configuration, the AEM prints warnings for any parameter with an invalid value for the configured personality. The warning lists the parameter name and the valid value or range of values it can be set to for the selected personality.

Running the model with invalid parameter configurations for the selected personality can lead to unexpected behavior.

Mapping architectural features to Fast Models releases

The following table shows which Fast Models releases the key architectural features are implemented in, from Armv8.3-A onwards. Support is at EAC quality unless otherwise stated.

Table 3-74 Architectural features and Fast Models releases

Architecture version	Feature	Fast Models version									
		11.13	11.12	11.11	11.10	11.9	11.8	11.7	11.6	11.5	11.4
Armv8.3-A	All [h]	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.4-A	All [i]	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.5-A	Memory Tagging Extension (MTE) functionality	✓	✓	✓	✓	✓	✓	✓	✓ (Beta)	-	-
	MTE performance	✓	✓	✓	✓	✓	✓ (Beta)	-	-	-	-
	All except MTE [j].	✓	✓	✓	✓	✓	✓	✓	✓	✓	-
Armv8.6-A	All [k]	✓	✓	✓	✓	✓	-	-	-	-	-
Armv8.7-A	Limited TLBI maintenance	✓ (Alpha)	-	-	-	-	-	-	-	-	-
	All except TLBI maintenance [l]	✓	-	-	-	-	-	-	-	-	-
Future Architecture Technologies	SVE2, TME, CSRE, BRBE. [m]	✓	✓	✓	✓	✓	✓	-	-	-	-

[h] Armv8.3-A includes pointer authentication, nested virtualization, Advanced SIMD complex number support, improved Javascript data type conversion support, memory consistency model changes, support for larger system-visible caches, debug over powerdown.

[i] Armv8.4-A includes Secure EL2, additional cryptographic hashes, activity monitors, enhanced support for nested virtualization, Memory Partitioning and Monitoring (MPAM), stage 2 forced write-back, dot product instructions, data independent timing instructions, Large System Extensions (LSE), support for TLB maintenance instructions and for TLB range instructions, Translation Table Level (TTL), enhancements to weaker release consistency, debug relaxations and extensions, flag manipulation instructions.

[j] Armv8.5-A includes Branch Target Indicators (BTI), Enhanced Virtualization Traps (EVT), Random Number Generator (RNG), Flag Manipulation instructions, Floating-point round to integer, DC CVADP.

[k] Armv8.6-A includes General Matrix Multiply (GEMM), EnhancedPAC2, FPAC, Data Gathering Hint, Additional PMU events, Enhanced Counter Virtualization.

[l] Armv8.7-A includes WFE and WFI with timeouts, Larger physical address for 4KB and 16KB translation granules, MTE Asymmetric Fault Handling, Enhancements to Privilege Access Never (PAN), Enhancements to PMU and SPE.

[m] Implemented by AEMvA only.

Table 3-75 Ports

Name	Protocol	Type	Description
CNTHPIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHPSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CRITICALIRQ[8]	*Signal* on page 2-85	Master	RAS Critical Error Interrupt.
ERRORIRQ[8]	*Signal* on page 2-85	Master	RAS Error Recovery Interrupt.
FAULTIRQ[8]	*Signal* on page 2-85	Master	RAS Fault Handling Interrupt
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastinner	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
cfgend[8]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	*Signal* on page 2-85	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	*Signal* on page 2-85	Slave	Signals the clearing of an external global exclusive monitor
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[8]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.

Table 3-75 Ports (continued)

Name	Protocol	Type	Description
config64[8]	*Signal* on page 2-85	Slave	Register width after reset.
cp15sdisable[8]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[8]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
cti0extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 0.
cti0extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 0.
cti1extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 1.
cti1extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 1.
cti2extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 2.
cti2extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 2.
cti3extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 3.
cti3extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 3.
cti4extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 4.
cti4extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 4.
cti5extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 5.
cti5extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 5.
cti6extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 6.
cti6extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 6.
cti7extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 7.
cti7extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 7.
ctidbgirq[8]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[8]	*Signal* on page 2-85	Slave	External debug interface.

Table 3-75 Ports (continued)

Name	Protocol	Type	Description
dbgnopwrdwn[8]	*Signal* on page 2-85	Master	Debug no power down request.
dbgpwrdwnack[8]	*Signal* on page 2-85	Master	Debug power down acknowledge.
dbgpwrdwnreq[8]	*Signal* on page 2-85	Slave	Debug power down request.
dbgpwrupreq[8]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
etm[8]	PVBus	Master	Embedded trace macrocell port.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
external_trace_reset[8]	*Signal* on page 2-85	Slave	ETMv4 External Trace Reset signal.
fiq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	*GICv3Comms* on page 2-84	Slave	GICv3 cpu interface ports.
irq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
irqs[224]	*Signal* on page 2-85	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	*Signal* on page 2-85	Slave	This signal resets timer and interrupt controller.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[8]	*Signal* on page 2-85	Slave	External debug interface.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of private peripheral region.
pmbirq[8]	*Signal* on page 2-85	Master	Interrupt signal from the statistical profiling unit.
pmuirq[8]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg[8]	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.

Table 3-75 Ports (continued)

Name	Protocol	Type	Description
rei[8]	*Signal* on page 2-85	Slave	Individual processor RAM Error Interrupt signal input.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
romaddr	*Value_64* on page 2-85	Slave	Debug ROM base address.
romaddrv	*Signal* on page 2-85	Slave	Debug ROM base address valid.
rvbar[8]	*Value_64* on page 2-85	Slave	Reset vector base address.
sei[8]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
smpnamp[8]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each core.
spiden[8]	*Signal* on page 2-85	Slave	External debug interface.
spniden[8]	*Signal* on page 2-85	Slave	External debug interface.
standbywfe[8]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[8]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
standbywfil2	*Signal* on page 2-85	Master	This signal indicated all cores and L2 are in a power down state
teinit[8]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
ticks[8]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trace_unit_reset[8]	*Signal* on page 2-85	Slave	ETMv4 Trace Unit Reset signal.
vcpumntirq[8]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	*Signal* on page 2-85	Slave	Virtual FIQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[8]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.

Table 3-75 Ports (continued)

Name	Protocol	Type	Description
virq[8]	*Signal* on page 2-85	Slave	Virtual IRQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	*Signal* on page 2-85	Slave	Processor Virtual System Error Interrupt request.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP

Name	Type	Default value	Description
AIDR	int	0x0	Value of AIDR_EL1 register.
AMPIDR	int	0x400bbb000	Value of AMU Peripheral Identification Register
BPIMVA_causes_translation_lookup	bool	0x0	Do a translation when BPIMVA instruction is executed (which may cause a translation fault).
CCSIDR-L1D_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).
CCSIDR-L1I_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).
CCSIDR-L2_override	int	0x0	If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).
CCSIDR-L3_override	int	0x0	If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).
CPUCFR	int	0x0	Value of CPU Configuration Register
CTIPIDR	int	0x0	If non-zero, override the CTI Peripheral Identification Register
DBGPIDR	int	0x0	If non-zero, override the Debug Peripheral Identification Register
ERXMISC0_mask	int	0x0	Write Mask for ERXMISC0 RAS Register
GMID-log2-block-size	int	0x4	Log2 of the block size accessed by STGM/LDGM/STZGM instructions
ISV_set_to_0_for_stage2_synch_external_abort	bool	0x0	Whether ESR_EL2.ISV is set to 0 on stage 2 synchronous external aborts
MIDR	int	0x410fd0f0	Value of MIDR_EL1 register.
NUM_CORES	int	0x1	Number of cores per cluster

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
PA_SIZE	int	0x28	Physical address range supported. For ARMv8.0 and ARMv8.1 this is limited to 48 bits.
PMUPIDR	int	0x0	If non-zero, override the PMU Peripheral Identification Register
abort_execution_from_device_memory	bool	0x0	Execution from device memory generates a prefetch abort.
advsimd_bf16_support_level	int	0x0	Implement BFloat16 operations from ARMv8.6. AArch64 Advanced SIMD and FP BFloat16 instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP BFloat16 instructions only. - 2, AArch32 Advanced SIMD and VFP BFloat16 instructions only. - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP BFloat16 instructions.
advsimd_i8mm_support_level	int	0x0	Implement Int8 matrix multiply operations from ARMv8.6. AArch64 Advanced SIMD and FP Int8 matrix multiply instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP Int8 matrix multiply instructions only. - 2, AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions only. - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions.
amair_reg_rw_mask	int	0x0	RW mask for implementation-defined registers.
amu_aux_voffset_mask	int	0x0	If ARMv8.6 is implemented, each bit of the field, 0 to 15, when 1 indicates that the corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2, is implemented
amu_has_external_interface	int	0x0	Implement external memory-mapped access to system register of activity monitor unit from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
amu_has_sysreg_interface	bool	0x1	Implement system register access to activity monitor unit from ARMv8.4.
amu_reset_domain	int	0x0	Reset domain for activity monitor unit. 0, COLD_RESET. 1, WARM_RESET. 2, NONE.
amu_version	int	0x1	Selects the activity monitor version implemented - 1, AMUv1 for Armv8.4 is implemented. - 2, AMUv1 for Armv8.6 is implemented.
apsr_read_restrict	bool	0x0	At EL0, unknown bits of APSR are RAZ.
arm_v8_7_accelerator_support_level	int	0x0	Implements Armv8.7 accelerator support instructions LD/ST64B, ST64BV, ST64BV0, etc.
auxilliary_feature_register0	int	0x0	Value of AFR0 ID register.
cache-log2linelen	int	0x6	Log2 of the cache line length in bytes.
cache_maintenance_hits_watchpoints	bool	0x0	DCIMVA operations executed in AArch32 modes hit watchpoints.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
changing_block_size_without_bbm_support	int	0x0	Level of support for changing block size without break-before-make.
clear_IT_when_IL_set	bool	0x0	Clear IT bits when performing a *legal* exception return to AArch32 when IL is set
clear_IT_when_IL_set_explicitly	bool	0x0	Apart from clear_IT_when_IL_set, also clear IT bits when loading CPSR from SPSR/memory and IL == 1 in the value being loaded.
clear_reg_top_eret	int	0x1	Behaviour of the upper 32-bits of the Xn registers when changing between AArch32 state and AArch64 state. 0, upper 32-bits preserved for all registers. 1, upper 32-bits set to 0 for all accessible registers. 2, upper 32-bits set to 0 for a random selection of accessible registers. 3, upper-32-bits set to 0 for registers touched in AArch32
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dc_fault_unaligned_s1_device_s2_fwb	bool	0x0	Whether takes an Alignment Fault caused by the memory type on a DC {ZVA,GZVA,GVA} if the stage 1 memory type is any Device memory type
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_bus_width_in_bytes	int	0x8	L1 D-Cache read bus width in bytes used to calculate per-access timing annotations
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
dcache-size	int	0x8000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-ways	int	0x2	L1 D-Cache number of ways (sets are implicit from size).
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_bus_width_in_bytes	int	0x8	L1 D-Cache write bus width in bytes used to calculate per-access timing annotations
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
dcimva_requires_s2_write_permissions	bool	0x0	Data-cache invalidate by MVA operations require stage 2 write permission (virtualised AArch32 guest).
dczva_reports_lowest_addr_on_tag_check_fail	bool	0x0	Whether DC ZVA reports lowest address in FAR on tag check fail
delayed_dbgreg_between_secure_views	int	0x1	If delayed_dbgreg is enabled, whether the secure and nonsecure external views require explicit synchronization. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
dic-spi_count	int	0x40	Number of shared peripheral interrupts implemented
disable_sve_plugin	bool	0x0	If true, SVE will not be implemented in this processor even if the plugin is loaded
disable_unknown_update_event_on_reset	bool	0x0	Disables SYSREG_UPDATE event notification on reset for the registers whose bitfields are all reserverd or resets to architecturally unknown value
ecv_support_level	int	0x0	Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF.
el0_can_access_imp_def_functionality	bool	0x0	If not made UNDEF by imp_def_functionality_behaviour, EL0 can access IMPLEMENTATION DEFINED registers and system instructions.
el0_el1_only_non_secure	bool	0x0	Secure/non-secure state if EL2 and EL3 are not implemented. 0, secure. 1, non-secure.
enable_tlb_contig_check	bool	0x0	Perform extra pagetable walks to check translation table entries that have the contiguous hint bit set.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
enhanced_pac2_level	int	0x0	Implements Enhanced PAC2 from ARMv8.6. This feature is mandatory for ARMv8.6 but can be cherrypicked to a ARMv8.3(or greater) implementation. 0: No EnhancedPAC2, 1: EnhancedPAC2 Only, 2: EnhancedPAC2 with FPAC, 3: EnhancedPAC2 with FPACCombined.
error_record_feature_register	string	""	RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0,"IMPDEF_3_2":0x0,"UI":0x0,"FI":0x0,"UE":0x0,"CFI":0x0,"CEC":0x0,"RP":0x0,"DUI":0x0,"CEO":0x0,"CI":0x0,"TS":0x0,"INJ":0x0,"FRX":0x0,"UC":0x0,"UEU":0x0,"UER":0x0,"UEO":0x0,"DE":0x0,"CE":0x0,"Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values betwn 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster"
error_record_feature_register_json_file	string	""	File path to the RAS feature register values as JSON. The file uses the same format as the error_record_feature_register parameter value
exercise_stxr_fail	bool	0x0	Reject a pseudo-random majority of exclusive store instructions
ext_abort_device_GRE_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_GRE_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_GRE_read_is_critical	bool	0x0	Critical reporting of device-GRE read external aborts.
ext_abort_device_GRE_read_is_sync	int	0x2	Synchronous reporting of device-GRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.
ext_abort_device_GRE_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_GRE_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_GRE_write_is_critical	bool	0x0	Critical reporting of device-GRE write external aborts
ext_abort_device_GRE_write_is_sync	int	0x2	Synchronous reporting of device-GRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_device_GRE_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_GRE_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_nGRE_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_nGRE_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_nGRE_read_is_critical	bool	0x0	Critical reporting of device-nGRE read external aborts.
ext_abort_device_nGRE_read_is_sync	int	0x2	Synchronous reporting of device-nGRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.
ext_abort_device_nGRE_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_nGRE_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_nGRE_write_is_critical	bool	0x0	Critical reporting of device-nGRE write external aborts
ext_abort_device_nGRE_write_is_sync	int	0x2	Synchronous reporting of device-nGRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.
ext_abort_device_nGRE_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_nGRE_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_read_is_critical	bool	0x0	Critical reporting of device-nGnRE read external aborts
ext_abort_device_read_is_sync	bool	0x1	Synchronous reporting of device-nGnRE read external aborts

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_device_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_device_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_write_is_critical	bool	0x0	Critical reporting of device-nGnRE write external aborts
ext_abort_device_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRE write external aborts
ext_abort_device_write_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_device_write_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_fill_data	int	-0x202020303020203	Returned data, if external aborts are asynchronous
ext_abort_normal_cacheable_read_is_critical	bool	0x0	Critical reporting of normal write-back cacheable-read external aborts
ext_abort_normal_cacheable_read_is_sync	bool	0x1	Synchronous reporting of normal write-back cacheable-read external aborts
ext_abort_normal_cacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_normal_cacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_normal_cacheable_write_is_critical	bool	0x0	Critical reporting of normal write-back cacheable write external aborts
ext_abort_normal_cacheable_write_is_sync	bool	0x0	Synchronous reporting of normal write-back cacheable write external aborts
ext_abort_normal_cacheable_write_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_normal_cacheable_write_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_normal_noncacheable_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_normal_wt_cacheable_write_is_critical	bool	0x0	Critical reporting of normal write-through write external aborts
ext_abort_normal_wt_cacheable_write_is_sync	int	0x2	Synchronous reporting of normal write-through write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_write_is_sync.
ext_abort_normal_wt_cacheable_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_normal_wt_cacheable_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_prefetch_device_GRE_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-GRE instruction fetches
ext_abort_prefetch_device_GRE_read_is_sync	int	0x2	Behaviour of external aborts generated by device-GRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_prefetch_device_nGRE_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-nGRE instruction fetches
ext_abort_prefetch_device_nGRE_read_is_sync	int	0x2	Behaviour of external aborts generated by device-nGRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_prefetch_device_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-nGnRE instruction fetches
ext_abort_prefetch_device_read_is_sync	int	0x2	Behaviour of external aborts generated by device-nGnRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_prefetch_is_critical	bool	0x0	Critical reporting of external aborts generated by normal writeback cacheable instruction fetches
ext_abort_prefetch_is_sync	bool	0x1	Behaviour of external aborts generated by normal writeback cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort.
ext_abort_prefetch_noncacheable_read_is_critical	bool	0x0	Critical reporting of external aborts generated by normal noncacheable instruction fetches
ext_abort_prefetch_noncacheable_read_is_sync	int	0x2	Behaviour of external aborts generated by normal noncacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_prefetch_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_prefetch_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_prefetch_so_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-nGnRnE instruction fetches
ext_abort_prefetch_so_read_is_sync	int	0x2	Behaviour of external aborts generated by device=nGnRnE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_prefetch_wt_cacheable_read_is_critical	bool	0x0	Critical reporting of external aborts generated by normal writethrough cacheable instruction fetches
ext_abort_prefetch_wt_cacheable_read_is_sync	int	0x2	Behaviour of external aborts generated by normal writethrough cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_so_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_so_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_so_read_is_critical	bool	0x0	Critical reporting of device-nGnRnE read external aborts
ext_abort_so_read_is_sync	bool	0x1	Synchronous reporting of device-nGnRnE read external aborts
ext_abort_so_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_so_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_so_write_is_critical	bool	0x0	Critical reporting of device-nGnRnE write external aborts
ext_abort_so_write_is_sync	bool	0x1	Synchronous reporting of device-nGnRnE write external aborts
ext_abort_so_write_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_so_write_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_ttw_cacheable_read_is_critical	bool	0x0	Critical reporting of TTW cacheable read external aborts
ext_abort_ttw_cacheable_read_is_sync	bool	0x1	Synchronous reporting of TTW cacheable read external aborts
ext_abort_ttw_cacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_ttw_cacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_ttw_noncacheable_read_is_critical	bool	0x0	Critical reporting of TTW noncacheable read external aborts
ext_abort_ttw_noncacheable_read_is_sync	bool	0x1	Synchronous reporting of TTW noncacheable read external aborts
ext_abort_ttw_noncacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_ttw_noncacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_ttw_wt_cacheable_read_is_critical	bool	0x0	Critical reporting of TTW write-through cacheable read external aborts
ext_abort_ttw_wt_cacheable_read_is_sync	int	0x2	Synchronous reporting of TTW write-through cacheable read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_ttw_cacheable_read_is_sync.
ext_abort_ttw_wt_cacheable_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_ttw_wt_cacheable_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
fault_on_nT_bit_set	bool	0x1	Whether block translation table entries with the nT bit set should always fault. Only applies when changing_block_size_without_bbm_support_level is 1 or higher.
fault_unalign_to_unsupported_mem	int	0x0	If has_unaligned_single_copy_atomicity is true, whether unaligned A64 atomic, exclusive and acquire/release instructions to non iWB-oWB generate fault. This parameter is a bitmap. Bits 0,1,2 should be set accordingly to enable the fault behaviour. bit 0(LSB): atomic access should fault, bit 1: exclusive access should fault, bit 2: acquire/release should fault.
fault_unaligned_s1_device_s2_fwb	bool	0x0	Whether unaligned access with stage1 Device memory and final memory attribute forced to normal by FWB can generate alignment fault
force_deterministic_irg_tag_generation	bool	0x0	Force the random tag generated by the IRG instruction when GCR_EL1.RRND=1 to equal RGSR_EL1.SEED[3:0] rather than a non-deterministic value

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
fsr_ext_bit_update_kind	int	0x3	Set/Clear DFSR/IFSR EA bit on Synchronous/Async External Aborts. 0: Never Set, 1: Set on Synchronous Ext Aborts 2: Set on Asynchronous Ext Aborts 3: Set on both Sync and Async Ext Aborts.
global_debug_rom.ROMDEVID	int	0x0	Value of Debug Rom Device Identification Register
global_debug_rom.ROMPIDR	int	0x4000 bb000	Value of Debug Rom Peripheral Identification Register
hardware_translation_table_update_implemented	int	0x1	Implement hardware translation table updates from ARMv8.1. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
has_16bit_asids	bool	0x1	Enable 16-bit ASIDs.
has_16bit_vmids	int	0x1	Implement support for 16-bit VMIDs from ARMv8.1. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
has_16k_granule	bool	0x0	Implement the 16k LPAE translation granule.
has_4k_granule	bool	0x1	Implement the 4k LPAE translation granule.
has_52bit_address_with_16k	int	0x0	Implements Armv8.7 52-bit IPA/PA support for 16k Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_52bit_address_with_4k	int	0x0	Implements Armv8.7 52-bit IPA/PA support for 4k Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_64k_granule	bool	0x1	Implement the 64k LPAE translation granule.
has_aarch32_hpd	bool	0x0	If true then hierarchical permission disable is supported in AArch32
has_aarch64	bool	0x1	All implemented exception levels can run in AArch64
has_actlr2	bool	0x0	If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32]
has_amu	int	0x0	Implement activity monitor functionality from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_arm_v8-1	bool	0x0	Implement the ARMv8.1 Extension.
has_arm_v8-2	bool	0x0	Implement the ARMv8.2 Extension.
has_arm_v8-3	bool	0x0	Implement the ARMv8.3 Extension.
has_arm_v8-4	bool	0x0	Implement the ARMv8.4 Extension.
has_arm_v8-5	bool	0x0	Implement the ARMv8.5 Extension.
has_arm_v8-6	bool	0x0	Implement the ARMv8.6 Extension.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_arm_v8-7	bool	0x0	Implement the Armv8.7 Extension. This feature is incomplete and under development.
has_at_with_pan	int	0x1	Implement new AT instructions with PAN support. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_axflag_xaflag	int	0x1	Implement flag manipulation instructions (AXFlag, XAFlag) from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_axflag_xaflag_frint	int	0x1	Implement flag manipulation instructions (AXFlag, XAFlag) and floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. If this parameter is enabled, it also enables both has_axflag_xaflag and has_frint. If support for only one of the features is needed, please use the individual parameters and do not enable this one. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_branch_target_exception	int	0x0	Implement Branch target identification mechanism from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_ccidx	bool	0x0	Implement the ARMv8.3 CCSIDR Extension. Extending the ccsidr number of sets.
has_cfinv_rmif_setf	int	0x1	Implement flag manipulation (CFINV, RMIF, SETF8, SETF16) instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_coherent_icache	bool	0x0	Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
has_common_not_private_translations	int	0x1	Implement the TTBRn_ELx.CnP (Common not Private) controls from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_complex_number	int	0x1	Implement ARMv8.3 complex number support, Multiply Accumulate and Add instructions. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_cvadp_support	int	0x0	Implement instruction to support cache clean by deep persistence (DC CVADP) from ARMv8.5, can be selected for core implemented on any arch version starting ARMv8.2 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_data_alignment_flag	int	0x0	Implement non-optimal misalignment flag for PMU/SPE from ARMv8.5 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_delayed_ctireg	bool	0x0	Delay the functional effect of CTI register writes until ISB or implicit barrier.
has_delayed_dbgreg	bool	0x0	Delay the functional effect of external debug register writes until ISB or implicit barrier.
has_delayed_sysreg	bool	0x0	Delay the functional effect of system register writes until ISB or implicit barrier.
has_delayed_wfe_trap	int	0x0	Implements Configurable Delayed WFE trapping from ARMv8.6 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_dgh	int	0x1	Implements Data Gathering Hint instruction from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_dot_product	int	0x1	Implement the dot product (UDOT, SDOT) instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_e0pd	int	0x1	Implement ARMv8.5 feature to prevent unprivileged access to one half of the memory Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_el2	bool	0x1	Implements EL2
has_el3	bool	0x1	Implements EL3
has_enhanced_pac	bool	0x0	If pointer authentication is enabled then implement enhanced PAC.
has_enhanced_pan	int	0x1	Implements Armv8.7 Enhanced PAN feature Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_ets	bool	0x0	Whether Enhanced Translation Synchronization is supported
has_extended_recp_estimate	int	0x0	Implements increased precision of reciprocal instructions.) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_fgt	int	0x1	Implements Fine-grained Virtualization Traps extension from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_fp16	int	0x1	Implement the half-precision floating-point data processing instructions from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_fp16_fmlal	int	0x1	Implement the New Floating Point Multiplication Variant (FP16 FMLAL, FMLSL) instructions from ARMv8.4. Only supported if has_fp16=0x1. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_frint	int	0x1	Implement floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_generic_authentication	int	0x1	Implement ARMv8.3 generic authentication. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_guest_translation_granule	int	0x1	Implement mechanism for guest translation granule identification from ARMv8.5, ID values determined by stage1 granule configuration parameters Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_hardware_translation_table_update	int	0x2	Type of hardware translation table supported (when enabled by hardware_translation_table_update_implemented). 0, not implemented. 1, access bit updates implemented. 2, access bit updates and dirty bit mechanism implemented.
has_hcrx_el2	int	0x1	Implements new HCRX_EL2 id register from Armv8.7 Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_id_reg_read	int	0x1	Implement read access to the ID registers (ESR_ELx.EC=0x18) Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_iesb	int	0x1	Implement support for implicit error sync event from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_jscvt	int	0x1	Implement ARMv8.3 javascript Floating-point to Integer conversion instruction. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_large_system_ext	bool	0x0	Implement the ARMv8 Large System Extensions.
has_large_va	int	0x0	Implement support for the extended 52-bit virtual addresses from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_ldapur_stlur	int	0x1	Implement support for LDAPR and STLR instructions with immediate offsets from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_ldm_stm_ordering_control	int	0x0	Implement the SCTLR_ELx.LSMAOE (Load/Store Multiple Atomicity and Ordering Enable) and SCTLR_ELx,nTLSMD (no Trap Load/Store Multiple to Device) controls from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_lrcpc	bool	0x0	If true then it support the RCpc feature (ARMv8.3)
has_mpam	int	0x0	Implement ARMv8.4 MPAM Registers and associated functionality. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_mt_pmu_disable_feature	int	0x0	Implements Multi-threading PMU disable extension from ARMv8.6 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_mte_ctrl_bits_stateful	bool	0x0	if memory_tagging_support_level == 1, Whether mte specific control bits in system registers are stateful
has_nested_virtualization	int	0x1	Implement ARMv8.3 nested virtualization. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_no_os_double_lock	int	0x0	Do not implement the OS double-lock. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_non_context_synchronizing_exception_controls	int	0x1	Implement cosmetic controls for whether exception entry and exit are context synchronizing events (SCTLR_ELx.{EIS,EOS}) from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_par_bit10_razwi	bool	0x0	Whether PAR_EL1[10] is RAZ/WI
has_pointer_authentication	int	0x1	Implement ARMv8.3 pointer authentication. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_prediction_invalidation_instructions	int	0x1	Implement execution and data prediction invalidation from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_pstate_dit	int	0x1	Implement timing insensitivity of data processing instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_pstate_pan	int	0x1	Implement the PSTATE.PAN (Privileged Access Never) control from ARMv8.1 Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_pstate_uao	int	0x1	Implement the PSTATE.UAO (User Access Override) control from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_ras_armv84_extension	int	0x1	Implement ARMv8.4 RAS Extension. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_ras_critical_error	int	0x0	[DEPRECATED: Set CI field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Critical Error is implemented or not. 0 - Feature Not Supported, 1 - Feature always enabled, 2 - Feature is controllable.
has_ras_double_fault	int	0x1	Implement ARMv8.4 RAS Doublt Fault Extension. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_ras_fault_injection	int	0x0	[DEPRECATED: Set INJ field on first register in error_record_feature_register JSON instead] Implement ARMv8.4 Standard Fault Injection mechanism. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_ras_timestamp	int	0x0	[DEPRECATED: Set TS field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Timestamp register is implemented or not. 0 - No Timestamp is recorded, 1 - Generic Timer timestamp is recorded, 2 - IMP DEF timestamp is recorded.
has_restriction_on_speculative_data_loaded	int	0x1	Implements the ARMv8.5 security feature (Restrictions on the effects of speculation) Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_rndr	int	0x0	Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_rounding_doubling_multiply_add_subtract	int	0x1	Implement the rounding doubling multiply add and subtract instructions from ARMv8.1 Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
has_secure_el2	int	0x1	Implement support for Secure EL2 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_self_hosted_trace_extension	int	0x1	Implement support for the Self-hosted Trace Extensions from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_small_page_table	int	0x1	Implement small page table support which increases the maximum value of TxSZ field from ARMv8.4. Note: will be unimplemented only if both has_small_page_table=0x0 and has_secure_el2=0x0. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_speculation_barrier_inst	int	0x1	Implement speculation barrier instruction (SB) from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_stage2_fwb	int	0x1	Implement HCR_EL2.FWB, stage 2 control of memory types and cacheability Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_stage2_xnx	int	0x1	Implement the extended XN[1:0] stage 2 control from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_stage2_xnx_in_aarch32	bool	0x1	Implement the extended XN[1:0] stage 2 control from ARMv8.2 for Aarch32.
has_statistical_profiling	bool	0x1	Whether Statistical Based Profiling is implemented
has_supersections	bool	0x1	Whether VMSAv8-32 supersection to support more than 32-bit PA using short descriptor is implemented.
has_tlb_conflict_abort	bool	0x0	Detected inconsistent TLB content generate aborts.
has_tlbi_range	int	0x1	Implement support for TLB Range Maintenance instructions (TLBI RVAE1, etc) from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_tlbi_to_outer_shareable	int	0x1	Implement support for TLB Maintenance instructions that extend to the Outer Shareable domain (TLBI VAE1OS, etc) from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_tlbi_ttl	int	0x1	Implement support for the TTL level hint in by-address TLB Maintenance instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_unaligned_single_copy_atomicity	int	0x1	Implement support for SCTLR_ELx.nAA from ARMv8.4, and A64 atomic, exclusive and acquire/release instructions accessing unaligned bytes inside a 16byte window will not generate alignment fault. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_v8_4_debug_extension	int	0x1	Implement ARMv8.4 debug extensions Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_v8_4_pmu_extension	int	0x1	Implement PMU extension from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_v8_5_debug_over_power_down	int	0x0	Implement ARMv8.5 Debug over powerdown Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_v8_5_pmu_extension	int	0x1	Implement PMU extension from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_v8_5_spe_extension	int	0x1	Implement SPE extension from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_v8_6_pmu_events	int	0x1	Implements PMU events from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_v8_7_fp_enhancements	int	0x1	Implements the Floating Point enhancements from Armv8.7 (introduces FPCR.FIZ/AH/NEP, etc.) Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_v8_7_pmu_events	int	0x1	Implement PMU events from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_v8_7_pmu_extension	int	0x1	Implement PMU extension from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_v8_7_spe_extension	int	0x1	Implement SPE extension from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_vncr_el2	int	0x1	Implement support for nested virtualization enhancements from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_wfet_and_wfit	int	0x1	Implements WFE and WFI with Timeout from Armv8.7 Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_writebuffer	bool	0x0	Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.
has_xs	int	0x1	Implements Armv8.7 XS, TLBInXS, DSBnXS instruction Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
icache-log2linelen	int	0x0	If nonzero, Log2 of the instruction cache line length in bytes (valid values in range 4-8). Otherwise the value of cache-log2linelen is used.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-nprefetch	int	0x1	Number of next sequential instruction cache lines to prefetch. This is only used when icache-prefetch_enabled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-prefetch_level	int	0x0	0 based cache level at which instructions are pre-fetched. This is only used when icache-prefetch_enabled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_bus_width_in_bytes	int	0x8	L1 I-Cache read bus width in bytes used to calculate per-access timing annotations
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x8000	L1 I-Cache size in bytes.
icache-ways	int	0x2	L1 I-Cache number of ways (sets are implicit from size).
ignore_DBGPRCR_CWRR	bool	0x0	Ignore writes to the deprecated DBGPRCR.CWRR bit.
ignore_access_flag_update_by_at_ops	bool	0x0	If true, AT operations do not update access flag
ignore_large_address_top_bits_in_page_walk	bool	0x0	Whether page table bits [15:12] are ignored if PA_SIZE < 52 and output address is configured < 52 with large page
imp_def_functionality_behaviour	int	0x0	Behaviour of IMPLEMENTATION DEFINED registers and system instructions. 0, UNDEF. 1, RAZ/WI.
impdef_regs_and_unpred_from_implementation	string	""	Configure implementation defined registers and unpredictable behaviour to match the specified implementation. Requires a license for the selected implementation model. Use ARM_Cortex-A<num> or ARM_<codename> for licensed pre-release cores.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
independent_cache_control_traps	int	0x0	Implement Independent Cache Control traps from ARMv8.5. 0, NO_SUPPORT. 1, SUPPORTED_BUT_NOT_FOR_TLB_MAINTENANCE_INSTRUCTIONS. 2, FULL_SUPPORT.
insert_iesb_before_exception	bool	0x0	If true then inserts an IESB before taking with Exception otherwise has no effect and IESB is taken after PState is changed due to the Exception.
instruction_tlb_size	int	0x0	Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB)
is_mt_res0	bool	0x0	If ARMv8.6 is not implemented, and PMUv3 is implemented, this parameter controls whether PMEVTYPER<n>.MT bit is RES0 or RW. For other implementations, this parameter has no effect
is_uniprocessor	bool	0x0	Value for the U bit in MPIDR. true disables L1 cache coherency protocols
l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l2cache-read_bus_width_in_bytes	int	0x8	L2 Cache read bus width in bytes used to calculate per-access timing annotations
l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l2cache-size	int	0x80000	L2 Cache size in bytes.
l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
l2cache-ways	int	0x10	L2 Cache number of ways (sets are implicit from size).
l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
l2cache-write_bus_width_in_bytes	int	0x8	L2 Cache write bus width in bytes used to calculate per-access timing annotations
l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
l3cache-mpamf.bwa_width_ns	int	0x10	L3 Cache width of MPAM bandwidth allocation fields for non-secure accesses.
l3cache-mpamf.bwa_width_s	int	0x10	L3 Cache width of MPAM bandwidth allocation fields for secure accesses.
l3cache-mpamf.cmax_width_ns	int	0x0	L3 Cache number of fractional bits in MPAM cache capacity partition control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
l3cache-mpamf.cmax_width_s	int	0x0	L3 Cache number of fractional bits in MPAM cache capacity partition control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
l3cache-mpamf.cpbm_width_ns	int	0x0	L3 Cache width of MPAM cache portion bitmap for non-secure accesses. If 0, the feature is not implemented, and all ways are available.
l3cache-mpamf.cpbm_width_s	int	0x0	L3 Cache width of MPAM cache portion bitmap for secure accesses. If 0, the feature is not implemented, and all ways are available.
l3cache-mpamf.csu_num_mon_ns	int	0x0	L3 Cache number of MPAM cache storage usage monitors for non-secure accesses.
l3cache-mpamf.csu_num_mon_s	int	0x0	L3 Cache number of MPAM cache storage usage monitors for secure accesses.
l3cache-mpamf.has_prop_ns	bool	0x0	Enable memory bandwidth proportional stride control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
l3cache-mpamf.has_prop_s	bool	0x0	Enable memory bandwidth proportional stride control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
max_32bit_el	int	0x3	Maximum exception level supporting AArch32 modes.
memory.acp.AxCACHE_mask	int	0x0	Used with memory.acp.AxCACHE_pattern to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
memory.acp.AxCACHE_pattern	int	0x0	Used with memory.acp.AxCACHE_mask to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.
memory.l2_cache.is_inner_cacheable	bool	0x1	L2 cache obeys inner cacheable attributes (rather than outer cacheable attributes)
memory.l2_cache.is_inner_shareable	bool	0x1	L2 cache obeys inner shareable attributes (rather than outer sharaable attributes)
memory_tagging_support_level	int	0x0	Specify the memory tagging extension support level: 0, not implemented. 1, instructions and registers only are implemented. 2, implemented. 3, implemented with asymmetric handling of exceptions
mixed_endian	int	0x1	Implement support for mixed endianness. 0, not supported. 1, supported at all exception levels. 2, supported at EL0 only.
mpam_force_ns_rao	bool	0x0	Whether MPAM3_EL3.FORCE_NS bit is RAO/WI.
mpam_frac	int	0x0	MPAM fractional revision number in ID_AA64PFR1_EL1.MPAM_frac field
mpam_has_hcr	bool	0x0	MPAM Whether MPAMIDR_EL1 HAS_HCR bit is set or clear
mpam_max_partid	int	0xffff	MPAM Maximum PARTID Supported
mpam_max_pmg	int	0xff	MPAM Maximum PMG Supported
mpam_max_vpmr	int	0x0	MPAM Maximum VPMR Supported
mpamidr_has_force_ns	int	0x0	Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
mpamidr_has_sdeflt	int	0x0	Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
mpamidr_has_tidr	int	0x0	Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
mvbar_reset_is_rvbar	bool	0x1	If true then the reset value of MVBAR is RVBAR, if false the reset value is UNKNOWN.
non_secure_vgic_alias_when_ns_only	int	0x0	If ! has_el3 and only non-secure side exists, then the normal position of the VGIC is a secure alias. If this parameter is non-zero then in addition a non-secure alias of the VGIC will be placed at this position (aligned to 32 KB).
num_loregion_descriptors	int	0x0	Number of Limited Ordering Region descriptors implemented (if ARM v8.1 extensions are implemented)
num_loregions	int	0x0	Number of Limited Ordering Regions implemented excluding background region (if ARM v8.1 extensions are implemented)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
number_of_error_records	int	0x0	Cores Number of Error records supported for RAS
optimal_alignment_size	int	0x1	Alignment boundary which does not incur additional performance penalty from ARMv8.5. - 1, architectural misalignment is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] - 2, access crossing 4 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] - 3, access crossing 8 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] ... - 12, access crossing 4 Kbyte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]
output_attributes	string	"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS"	User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.
page_based_hardware_attributes	int	0x0	Implement the page based hardware attributes from ARMv8.2. This parameter indicates which page table bits are available for hardware, where bits[3:0] correspond to PTE[62:59] and to TCR_ELx.HWUnyy.
pmmir_el1_bus_slots	int	0x0	Largest value by which BUS_ACCESS can increment over BUS_CYCLES cycles. From v8.7 PMU extension
pmmir_el1_bus_width	int	0x0	Width, in bytes, of accesses counted by BUS_ACCESS. From v8.7 PMU extension
pseudo_fault_generation_feature_register	string	""	ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false,"UC":false,"UEU":false,"UER":false,"UEO":false,"DE":false,"CE":0x0,"CI":false,"ER":false,"PN":false,"AV":false,"MV":false,"SYN":false,"R":false},other_psuedo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.
pstate_ssbs_type	int	0x0	Implement speculative store bypass safe feature from ARMv8.5. 0, Not supported. 1, Supported without MSR/MRS access to SSBS. 2, fully supported.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
randomize_unknowns_at_reset	bool	0x0	Will fill in unknown bits in registers at reset with random value using register_reset_data as seed, it overrides scramble_unknowns_at_reset
ras_errselr_undef_if_no_error_records	bool	0x0	If true, ERRSELR_EL1 will be undefined if ERRIDR_EL1 indicates that zero error records are implemented.
ras_frac	int	0x0	0, No additional feature implemented. 1, Additional ERXMISC*, ERXPFG* registers and FaultInjection trap from RAS v1.1. implemented
register_reset_data	int	0x0	Data used to fill register bits when they become UNKNOWN at reset.
restriction_on_speculative_execution	int	0x0	Implements the ARMv8.5 security feature (Restrictions on the effects of speculation): 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx not supported), 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx supported)
rmr_always_implemented	bool	0x0	Always implement RMR_ELx, RMR, or HRMR at the highest implemented exception level, even if that exception level cannot use both AArch32 and AArch64.
rndr_rndrrs_seed	int	0x0	Initial seed for random engine used in RNDR register
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions.
scramble_unknowns_at_reset	bool	0x1	Will fill in unknown bits in registers at reset with register_reset_data
set_rasv10_for_armv84_and_higher	bool	0x0	ARMv8.4 mandates RAS System Architecture v1.1, but when there are no error records and ARMv8.4-DFE is not implemented then there is no functional difference between the RAS System Architecture v1.0 (that is, the RAS extension as in pre-ARMv8.4 implementations) and the RAS System Architecture v1.1 (also known as ARMv8.4-RAS). This flag if true will set the RAS ID to declare RAS v1.0 rather than RAS v1.1 for ARMv8.4 and higher implementations. If this is set and the core does not conform to the restrictions then this parameter is ignored.
spsr_el3_is_mapped_to_spsr_mon	bool	0x1	Whether SPSR_EL3 is mapped to AArch32 register SPSR_mon
spsr_m4_res0	bool	0x0	Whether SPSR_ELx.M[4] bit should be RES0 for AARCH64 only implementations
stage12_tlb_size	int	0x80	Number of stage1+2 tlb entries.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
stage1_tlb_size	int	0x0	Number of stage1 only tlb entries.
stage1_walkcache_size	int	0x0	Number of stage1 only walk cache entries.
stage2_tlb_size	int	0x0	Number of stage2 only tlb entries.
stage2_walkcache_size	int	0x0	Number of stage2 only walk cache entries.
statistical_profiling_buffer_alignment	int	0x1	Statistical profiling alignment constraint for sample buffer
statistical_profiling_random_interval_is_separate	bool	0x0	Statistical profiling random interval gets added to the main timer interval(false) or (true) runs as separate timer
statistical_profiling_recommended_min_sampling	int	0x100	Statistical profiling recommended minimum sampling interval
take_ccfail_tsc_trap	bool	0x0	When take_ccfail_undef=1 this prameter controls whether or not an SMC instruction that is trapped by HCR_EL2.TSC but fails its condition code check generates a trap to EL2.
take_ccfail_undef	bool	0x1	UNDEF exception is taken even if condition code check fails
tcr_ps_reserved_value_size	int	0x0	Physical size treated when TCR.(I)PS is programmed with a reserved value. 0, 48 bits. 1, 52 bits. The parameter value is treated 0 if LPA is not supported.
tcr_txsz_undersize_should_fault	bool	0x1	If large VA is not supported, Whether undersized TxSZ value should generate translation fault
tdosa_traps_osdlr_if_no_os_double_lock	bool	0x1	MDCR_EL*.TDOSA enables trap on OSDLR_EL1 and DBGOSDLR when OS double-lock is not implemented.
tidcp_traps_el0_undef_imp_def	bool	0x1	TIDCP has priority over UNDEF for accesses to IMPLEMENTATION DEFINED functionality from EL0
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
trace_physical_registers_when_host_virtualisation_enabled	int	0x0	When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers
treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
treat-dcache-invalidate-as-clean-invalidate	bool	0x0	Treat data cache invalidate operations as clean and invalidate.
undef_ccsidr2_access_for_unimplemented_aarch32	bool	0x0	Whether access to CCSIDR2 is undef if AArch32 is implemented or not
unification-level	int	0x1	Level of Unification Inner Shareable for the cache hierarchy
unification-uniprocessor-level	int	0x1	Level of Unification Uniprocessor for the cache hierarchy

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
unpred_nested_virtualization_nv_behaviour	int	0x0	Constrained unpredictable choices for HCR_EL2.NV=0 and HCR_EL2.NV1=1 with respect to nested virtualization - 0, Behave as defined in the sepcification as per bit values - 1, Behave as if HCR_EL2.NV=1 and HCR_EL2.NV1=1 for all purpose other than reading back HCR_EL2.NV - 2, Behave as if HCR_EL2.NV=0 and HCR_EL2.NV1=0 for all purpose other than reading back HCR_EL2.NV1
unpred_vncr_el2_ress_mismatch	int	0x0	Constrained unpredictable choices when bits marked as RESS do not all have the same value for VNCR_EL2 - 0, Generating an EL2 translation regime translation abort on use of the VNCR_EL2 register - 1, Reserved sign exteneded bits of VNCR_EL2 are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes other than reading back the register
unpred_zero_spsr_btype	bool	0x1	Constrained unpredictable control to make SPSR_ELx.BTYPE 0 instead of PSTATE.BTYPE on synchronous exceptions other than Software Step, PC alignment fault, Instruction Abort, Breakpoint or Address Matching Vector Catch, Illegal Execution State, BRK instruction, Branch Target
unpredictable_exclusive_abort_memtype	int	0x0	Cause MMU abort if exclusive access is not supported in certain memory type (0=exclusives allowed in all memory types, 1=exclusives abort in Device memory types, 2=exclusives abort in any type other than WB inner cacheable)
unpredictable_hvc_behaviour	int	0x0	HVC unpredictable behaviour. 0, UNDEF. 1, NOP.
unpredictable_smc_behaviour	int	0x0	SMC unpredictable behaviour. 0, UNDEF. 1, NOP.
use_Xt_as_LDG_STG_input	bool	0x1	Use new MTE Intructions formats for LDG/ST(Z)(2)G, which use Xt as an input
use_mte_eac_02_instructions_encoding	bool	0x1	Use new MTE Intructions encoding since MTE spec EAC 0.2 in ARMv8.5.
use_mte_eac_08_tfsr_encoding	bool	0x1	Use new MTE TFSR_ELx encodings since MTE spec EAC 0.8 in ARMv8.5.
use_rosetta_disass	int	0x1	Use Rosetta disassembly library. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
use_tlb_contig_hint	bool	0x0	Translation table entries with the contiguous hint bit set generate large TLB entries.
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks
warn_unpredictable_in_v7	bool	0x1	If true, behaviour which is unpredictable in V7 yet is predictable in V8 will produce a warning
watchpoint-log2secondary_restriction	int	0x0	log2 size of secondary restriction of FAR/EDWAR possible values on watchpoint hit for load/store operations.

Table 3-76 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
wnr_is_read_for_s2f_on_s1_atomic_instr_fault	bool	0x0	Whether WnR is 0 for stage2 fault on stage1 for atomic instructions
wnr_is_read_for_s2f_on_s1_dbm_update	bool	0x0	Whether WnR is 0 for stage2 fault on stage1 descriptor dbm update

Table 3-77 Parameters for ARMAEMv8-A_MP

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CONFIG64	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CP15SDISABLE2	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.DCZID-log2-block-size	int	0x8	Log2 of the block size cleared by DC ZVA instruction (as read from DCZID_EL0).
cpu0.DCZVA_single_write	bool	0x0	Execute the DCZVA as a single write
cpu0.MPIDR-override	int	0x0	Override of MPIDR value. If nonzero will override the MT, cluster and CPU ID bits in MPIDR.
cpu0.RVBAR	int	0x0	Value of RVBAR_ELx register.
cpu0.RVBAR32	int	0x0	Reset vector address in AARCH32 when VINITHI is not set and ignore_rvbar_in_aarch32 is set
cpu0.SMPnAMP	bool	0x1	Enable broadcast messages necessary for correct SMP operation at reset.
cpu0.TEINIT	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.ase-present	bool	0x1	Set whether the model has been built with NEON support
cpu0.clock_divider	int	0x1	Clock divider ratio for asymmetric MP clocking.
cpu0.clock_multiplier	int	0x1	Clock divider ratio for asymmetric MP clocking.
cpu0.crypto_aes	int	0x2	AES instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, AES instructions implemented. 2, AES and PMULL instructions implemented.
cpu0.crypto_sha1	int	0x1	SHA-1 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA1 instructions implemented.
cpu0.crypto_sha256	int	0x1	SHA-256 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA256 instructions implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-77 Parameters for ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
cpu0.crypto_sha3	int	0x0	Implement ARMv8.4 SHA-3 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.crypto_sha512	int	0x0	Implement ARMv8.4 SHA-512 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.crypto_sm3	int	0x0	Implement ARMv8.4 SM-3 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.crypto_sm4	int	0x0	Implement ARMv8.4 SM-4 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.cti-intack_mask	int	0x1	Set bits represent that the corresponding trigger requires software acknowledge via CTIINTACK
cpu0.cti-number_of_claim_bits	int	0x0	Number of implemented bits in CTICLAIMSET
cpu0.cti-number_of_triggers	int	0x8	Number of cti event triggers (default: 8, valid values: {3, 8-32})
cpu0.enable_crc32	int	0x0	CRC32 instructions supported. 0, not implemented. 1, CRC32 instructions implemented.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.etm-present	bool	0x1	Set whether the model has ETM support
cpu0.force-fpsid	bool	0x0	Override the FPSID value
cpu0.force-fpsid-value	int	0x0	Value to override the FPSID value to
cpu0.has_hcptr_tase	bool	0x1	If false, HCPTR.TASE is RES0
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.number-of-breakpoints	int	0x10	Number of breakpoints.
cpu0.number-of-context-breakpoints	int	0x10	Number of breakpoints that are context aware.
cpu0.number-of-watchpoints	int	0x10	Number of watchpoints.
cpu0.operation_bandwidth	int	0x1	Operation width for ARMv8.4 PMU extension
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-77 Parameters for ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.semihosting-stderr_istty	bool	0x1	Result for semihost istty call when argument is stderr
cpu0.semihosting-stdin_istty	bool	0x1	Result for semihost istty call when argument is stdin
cpu0.semihosting-stdout_istty	bool	0x1	Result for semihost istty call when argument is stdout
cpu0.semihosting-use_stderr	bool	0x0	Send stderr from the simulated process to host stderr
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.unpredictable_WPMASKANDBAS	int	0x1	Constrained unpredictable handling of watchpoints when mask and BAS fields specified. 0, IGNOREMASK. 1, IGNOREBAS (default). 2, REPEATBAS8. 3, REPEATBAS.
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support
cpu0.vfp-traps	bool	0x1	Implement support for trapping floating-point exceptions
cpu0.vfp-traps-show-all	bool	0x0	Report all trapped floating-point exceptions in the syndrome when a combination occurs.
cpu0.wfet_early_or_delayed_timeout	int	0x0	WFET early or delayed timeout beyond the threshold value of CNTVCT_EL0 in percentage.
cpu0.wfit_early_or_delayed_timeout	int	0x0	WFIT early or delayed timeout beyond the threshold value of CNTVCT_EL0 in percentage.

3.4.3 ARMAEMv8A_AEMv8AMPCT

ARM AEM v8-A+v8-A (MP) CPU component - number of core configurable at runtime. This model is written in C++.

ARMAEMv8A_AEMv8AMPCT contains the following CADI targets:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- ARMAEMv8-A_MP
- Cluster_ARMAEMv8-A_MP
- Subcluster_ARMAEMv8-A_MP

ARMAEMv8A_AEMv8AMPCT contains the following MTI components:

- *4.4 ARM_AEMv8-A_MP - trace* on page 4-908
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.68 DSU - trace* on page 4-2463
- *4.71 GICv2 - trace* on page 4-2470
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMAEMv8A_AEMv8AMPCT

- AEMv8-A is deprecated and will be replaced by AEMvA, which enables both the existing Armv8-A architecture and Future Architecture Technologies. Support for architectural features is selectable through parameters. For additional information, contact *support@arm.com*.
- This component supports multiple versions of the Armv8-A architecture and provides parameters to enable or disable particular architectural features. Some of these parameters allow you to enable features in versions of the architecture earlier than the one in which they were introduced. These parameters have the possible values:

  0 Feature is not enabled.

  1 Feature is enabled, but only if the model is set to implement a version of the architecture in which the feature is supported.

  2 Feature is enabled, regardless of which architecture version the model implements.
- Each subcluster can be configured independently by using the parameters prefixed with `subcluster`*X* where *X* is 0-3.
- The number of cores is configured using the `NUM_CORES` parameter. The per-core parameters are preceded by `cpu`*n*, where *n* identifies the core (0-7).

AEMv8A core personalities

The AEM core personalities feature allows you to configure AEM instances in a platform to use the IMPLEMENTATION DEFINED registers and UNPREDICTABLE behavior for a specific implementation of your choice at model startup.

Configuring an AEM with a core personality requires a license for both the AEM and the selected implementation.

Set the personality using the environment variable `FASTSIM_AEMV8_PROFILE`, or the parameter `impdef_regs_and_unpred_from_implementation`.

The parameter allows you to configure different instances in the same platform with different personalities, including subclusters in a heterogeneous AEM. The environment variable takes precedence over the parameter and affects all instances of the AEM in the platform. Otherwise the two options function identically.

To see the available values for the environment variable or parameter, set either of them to the special value `list`. The model prints the list of available values and exits. An example value is `ARM_Cortex-A57`. Then set the parameter or environment variable to the required value.

Configuring a core personality only affects IMPLEMENTATION DEFINED registers and UNPREDICTABLE behavior. In other respects, the cluster or subcluster still behaves like the AEM. For example, all parameters default to the AEM default values. Therefore, parameters have to be manually

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

configured to valid values for the configured personality, as many of the defaults are incompatible with any given implementation.

To assist with this configuration, the AEM prints warnings for any parameter with an invalid value for the configured personality. The warning lists the parameter name and the valid value or range of values it can be set to for the selected personality.

Running the model with invalid parameter configurations for the selected personality can lead to unexpected behavior.

Mapping architectural features to Fast Models releases

The following table shows which Fast Models releases the key architectural features are implemented in, from Armv8.3-A onwards. Support is at EAC quality unless otherwise stated.

Table 3-78 Architectural features and Fast Models releases

Architecture version	Feature	Fast Models version									
		11.13	11.12	11.11	11.10	11.9	11.8	11.7	11.6	11.5	11.4
Armv8.3-A	All [n]	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.4-A	All [o]	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.5-A	Memory Tagging Extension (MTE) functionality	✓	✓	✓	✓	✓	✓	✓	✓ (Beta)	-	-
	MTE performance	✓	✓	✓	✓	✓	✓ (Beta)	-	-	-	-
	All except MTE [p].	✓	✓	✓	✓	✓	✓	✓	✓	✓	-
Armv8.6-A	All [q]	✓	✓	✓	✓	✓	-	-	-	-	-
Armv8.7-A	Limited TLBI maintenance	✓ (Alpha)	-	-	-	-	-	-	-	-	-
	All except TLBI maintenance [r]	✓	-	-	-	-	-	-	-	-	-
Future Architecture Technologies	SVE2, TME, CSRE, BRBE. [s]	✓	✓	✓	✓	✓	✓	-	-	-	-

[n] Armv8.3-A includes pointer authentication, nested virtualization, Advanced SIMD complex number support, improved Javascript data type conversion support, memory consistency model changes, support for larger system-visible caches, debug over powerdown.

[o] Armv8.4-A includes Secure EL2, additional cryptographic hashes, activity monitors, enhanced support for nested virtualization, Memory Partitioning and Monitoring (MPAM), stage 2 forced write-back, dot product instructions, data independent timing instructions, Large System Extensions (LSE), support for TLB maintenance instructions and for TLB range instructions, Translation Table Level (TTL), enhancements to weaker release consistency, debug relaxations and extensions, flag manipulation instructions.

[p] Armv8.5-A includes Branch Target Indicators (BTI), Enhanced Virtualization Traps (EVT), Random Number Generator (RNG), Flag Manipulation instructions, Floating-point round to integer, DC CVADP.

[q] Armv8.6-A includes General Matrix Multiply (GEMM), EnhancedPAC2, FPAC, Data Gathering Hint, Additional PMU events, Enhanced Counter Virtualization.

[r] Armv8.7-A includes WFE and WFI with timeouts, Larger physical address for 4KB and 16KB translation granules, MTE Asymmetric Fault Handling, Enhancements to Privilege Access Never (PAN), Enhancements to PMU and SPE.

[s] Implemented by AEMvA only.

Table 3-79 Ports

Name	Protocol	Type	Description
CNTHPIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHPSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CRITICALIRQ[8]	*Signal* on page 2-85	Master	RAS Critical Error Interrupt.
ERRORIRQ[8]	*Signal* on page 2-85	Master	RAS Error Recovery Interrupt.
FAULTIRQ[8]	*Signal* on page 2-85	Master	RAS Fault Handling Interrupt
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastinner	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[8]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clrexmonack	*Signal* on page 2-85	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	*Signal* on page 2-85	Slave	Signals the clearing of an external global exclusive monitor
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.

Non-Confidential

Table 3-79 Ports (continued)

Name	Protocol	Type	Description
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[8]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
config64[8]	*Signal* on page 2-85	Slave	Register width after reset.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[8]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[8]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
cti0extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 0.
cti0extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 0.
cti1extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 1.
cti1extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 1.
cti2extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 2.
cti2extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 2.
cti3extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 3.
cti3extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 3.
cti4extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 4.
cti4extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 4.
cti5extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 5.
cti5extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 5.
cti6extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 6.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-79 Ports (continued)

Name	Protocol	Type	Description
cti6extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 6.
cti7extin[4]	*Signal* on page 2-85	Slave	CTI trace inputs for core 7.
cti7extout[4]	*Signal* on page 2-85	Master	CTI trace outputs for core 7.
ctidbgirq[8]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[8]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[8]	*Signal* on page 2-85	Master	Debug no power down request.
dbgpwrdwnack[8]	*Signal* on page 2-85	Master	Debug power down acknowledge.
dbgpwrdwnreq[8]	*Signal* on page 2-85	Slave	Debug power down request.
dbgpwrupreq[8]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
etm[8]	PVBus	Master	Embedded trace macrocell port.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
external_trace_reset[8]	*Signal* on page 2-85	Slave	ETMv4 External Trace Reset signal.
fiq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	*GICv3Comms* on page 2-84	Slave	GICv3 cpu interface ports.
irq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
irqs[224]	*Signal* on page 2-85	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	*Signal* on page 2-85	Slave	This signal resets timer and interrupt controller.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[8]	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[8]	*PChannel* on page 2-80	Slave	PChannels for cores
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of private peripheral region.

Table 3-79 Ports (continued)

Name	Protocol	Type	Description
pmbirq[8]	*Signal* on page 2-85	Master	Interrupt signal from the statistical profiling unit.
pmuirq[8]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg[8]	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[8]	*Signal* on page 2-85	Slave	Individual processor RAM Error Interrupt signal input.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
romaddr	*Value_64* on page 2-85	Slave	Debug ROM base address.
romaddrv	*Signal* on page 2-85	Slave	Debug ROM base address valid.
rvbar[8]	*Value_64* on page 2-85	Slave	Reset vector base address.
sei[8]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
smpnamp[8]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each core.
spiden[8]	*Signal* on page 2-85	Slave	External debug interface.
spniden[8]	*Signal* on page 2-85	Slave	External debug interface.
standbywfe[8]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[8]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
standbywfil2	*Signal* on page 2-85	Master	This signal indicated all cores and L2 are in a power down state
teinit[8]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
ticks[8]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trace_unit_reset[8]	*Signal* on page 2-85	Slave	ETMv4 Trace Unit Reset signal.

Non-Confidential

Table 3-79 Ports (continued)

Name	Protocol	Type	Description
vcpumntirq[8]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	*Signal* on page 2-85	Slave	Virtual FIQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[8]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	*Signal* on page 2-85	Slave	Virtual IRQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	*Signal* on page 2-85	Slave	Processor Virtual System Error Interrupt request.

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP

Name	Type	Default value	Description
subcluster0.ADFSR-AIFSR-implemented	bool	0x0	ADFSR and AIFSR are implemented
subcluster0.AIDR	int	0x0	Value of AIDR_EL1 register.
subcluster0.AMPIDR	int	0x400bbb000	Value of AMU Peripheral Identification Register
subcluster0.BPIMVA_causes_translation_lookup	bool	0x0	Do a translation when BPIMVA instruction is executed (which may cause a translation fault).
subcluster0.CCSIDR-L1D_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).
subcluster0.CCSIDR-L1I_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).
subcluster0.CCSIDR-L2_override	int	0x0	If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).
subcluster0.CCSIDR-L3_override	int	0x0	If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).
subcluster0.CPUCFR	int	0x0	Value of CPU Configuration Register

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.CTIPIDR	int	0x0	If non-zero, override the CTI Peripheral Identification Register
subcluster0.DBGPIDR	int	0x0	If non-zero, override the Debug Peripheral Identification Register
subcluster0.ERXMISC0_mask	int	0x0	Write Mask for ERXMISC0 RAS Register
subcluster0.GMID-log2-block-size	int	0x4	Log2 of the block size accessed by STGM/LDGM/STZGM instructions
subcluster0.ISV_set_to_0_for_stage2_synch_external_abort	bool	0x0	Whether ESR_EL2.ISV is set to 0 on stage 2 synchronous external aborts
subcluster0.MIDR	int	0x410fd0f0	Value of MIDR_EL1 register.
subcluster0.NUM_CORES	int	0x1	Number of cores per cluster
subcluster0.PA_SIZE	int	0x28	Physical address range supported. For ARMv8.0 and ARMv8.1 this is limited to 48 bits.
subcluster0.PMCEID0	int	0xffffffff	Performance Monitor Common Event ID Reg 0 value - 64 bit
subcluster0.PMCEID1	int	0xffffffff	Performance Monitor Common Event ID Reg 1 value - 64 bit
subcluster0.PMUPIDR	int	0x0	If non-zero, override the PMU Peripheral Identification Register
subcluster0.abort_execution_from_device_memory	bool	0x0	Execution from device memory generates a prefetch abort.
subcluster0.advsimd_bf16_support_level	int	0x0	Implement BFloat16 operations from ARMv8.6. AArch64 Advanced SIMD and FP BFloat16 instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP BFloat16 instructions only. - 2, AArch32 Advanced SIMD and VFP BFloat16 instructions only. - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP BFloat16 instructions.
subcluster0.advsimd_i8mm_support_level	int	0x0	Implement Int8 matrix multiply operations from ARMv8.6. AArch64 Advanced SIMD and FP Int8 matrix multiply instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP Int8 matrix multiply instructions only. - 2, AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions only. - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions.
subcluster0.amair_reg_rw_mask	int	0x0	RW mask for implementation-defined registers.
subcluster0.amu_aux_type_fixed	string	""	Lists which AMU auxiliary registers that are fixed and to which event type. The JSON schema is: {fixed_aux_reg:evt_type, ...}. For example {"0":0x300} would make auxiliary register 0 fixed to event type 0x300
subcluster0.amu_aux_voffset_mask	int	0x0	If ARMv8.6 is implemented, each bit of the field, 0 to 15, when 1 indicates that the corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2, is implemented

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.amu_has_external_interface	int	0x0	Implement external memory-mapped access to system register of activity monitor unit from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.amu_has_sysreg_interface	bool	0x1	Implement system register access to activity monitor unit from ARMv8.4.
subcluster0.amu_num_auxiliary_counters	int	0x0	Number of AMU auxiliary counters implemented
subcluster0.amu_reset_domain	int	0x0	Reset domain for activity monitor unit. 0, COLD_RESET. 1, WARM_RESET. 2, NONE.
subcluster0.amu_version	int	0x1	Selects the activity monitor version implemented - 1, AMUv1 for Armv8.4 is implemented. - 2, AMUv1 for Armv8.6 is implemented.
subcluster0.apsr_read_restrict	bool	0x0	At EL0, unknown bits of APSR are RAZ.
subcluster0.arm_v8_7_accelerator_support_level	int	0x0	Implements Armv8.7 accelerator support instructions LD/ST64B, ST64BV, ST64BV0, etc.
subcluster0.auxilliary_feature_register0	int	0x0	Value of AFR0 ID register.
subcluster0.branch-predictor-clear-policy	int	0x2	Set branch prediction policy as defined for MMFR1[31:28]. This does not change the behaviour of the branch predictor, only what is reported in MMFR1.BPred.
subcluster0.branch-predictor-supported-ops	int	0x1	Set branch prediction policy as defined for MMFR3[11:8]. This does not change the behaviour of the branch predictor, only what is reported in MMFR3.BPMaint.
subcluster0.cache-log2linelen	int	0x6	Log2 of the cache line length in bytes.
subcluster0.cache_maintenance_hits_watchpoints	bool	0x0	DCIMVA operations executed in AArch32 modes hit watchpoints.
subcluster0.changing_block_size_without_bbm_support	int	0x0	Level of support for changing block size without break-before-make.
subcluster0.clear_IT_when_IL_set	bool	0x0	Clear IT bits when performing a *legal* exception return to AArch32 when IL is set
subcluster0.clear_IT_when_IL_set_explicitly	bool	0x0	Apart from clear_IT_when_IL_set, also clear IT bits when loading CPSR from SPSR/memory and IL == 1 in the value being loaded.
subcluster0.clear_reg_top_eret	int	0x1	Behaviour of the upper 32-bits of the Xn registers when changing between AArch32 state and AArch64 state. 0, upper 32-bits preserved for all registers. 1, upper 32-bits set to 0 for all accessible registers. 2, upper 32-bits set to 0 for a random selection of accessible registers. 3, upper-32-bits set to 0 for registers touched in AArch32
subcluster0.cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
subcluster0.cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.dc_fault_unaligned_s1_device_s2_fwb	bool	0x0	Whether takes an Alignment Fault caused by the memory type on a DC {ZVA,GZVA,GVA} if the stage 1 memory type is any Device memory type
subcluster0.dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
subcluster0.dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
subcluster0.dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
subcluster0.dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
subcluster0.dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
subcluster0.dcache-read_bus_width_in_bytes	int	0x8	L1 D-Cache read bus width in bytes used to calculate per-access timing annotations
subcluster0.dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
subcluster0.dcache-size	int	0x8000	L1 D-Cache size in bytes.
subcluster0.dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
subcluster0.dcache-ways	int	0x2	L1 D-Cache number of ways (sets are implicit from size).
subcluster0.dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
subcluster0.dcache-write_bus_width_in_bytes	int	0x8	L1 D-Cache write bus width in bytes used to calculate per-access timing annotations

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
subcluster0.dcimva_requires_s2_write_permissions	bool	0x0	Data-cache invalidate by MVA operations require stage 2 write permission (virtualised AArch32 guest).
subcluster0.dczva_reports_lowest_addr_on_tag_check_fail	bool	0x0	Whether DC ZVA reports lowest address in FAR on tag check fail
subcluster0.delay_serror	int	0x0	Add a propagation delay of serror signal into the core
subcluster0.delayed_dbgreg_between_secure_views	int	0x1	If delayed_dbgreg is enabled, whether the secure and nonsecure external views require explicit synchronization. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.dic-spi_count	int	0x40	Number of shared peripheral interrupts implemented
subcluster0.disable_sve_plugin	bool	0x0	If true, SVE will not be implemented in this processor even if the plugin is loaded
subcluster0.disable_unknown_update_event_on_reset	bool	0x0	Disables SYSREG_UPDATE event notification on reset for the registers whose bitfields are all reserverd or resets to architecturally unknown value
subcluster0.ecv_support_level	int	0x0	Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF.
subcluster0.el0_can_access_imp_def_functionality	bool	0x0	If not made UNDEF by imp_def_functionality_behaviour, EL0 can access IMPLEMENTATION DEFINED registers and system instructions.
subcluster0.el0_el1_only_non_secure	bool	0x0	Secure/non-secure state if EL2 and EL3 are not implemented. 0, secure. 1, non-secure.
subcluster0.enable_tlb_contig_check	bool	0x0	Perform extra pagetable walks to check translation table entries that have the contiguous hint bit set.
subcluster0.enhanced_pac2_level	int	0x0	Implements Enhanced PAC2 from ARMv8.6. This feature is mandatory for ARMv8.6 but can be cherrypicked to a ARMv8.3(or greater) implementation. 0: No EnhancedPAC2, 1: EnhancedPAC2 Only, 2: EnhancedPAC2 with FPAC, 3: EnhancedPAC2 with FPACCombined.

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.error_record_feature_register	string	""	RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0,"IMPDEF_3_2":0x0,"UI":0x0,"FI":0x0,"UE":0x0,"CFI":0x0,"CEC":0x0,"RP":0x0,"DUI":0x0,"CEO":0x0,"CI":0x0,"TS":0x0,"INJ":0x0,"FRX":0x0,"UC":0x0,"UEU":0x0,"UER":0x0,"UEO":0x0,"DE":0x0,"CE":0x0,"Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values betwn 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster"
subcluster0.error_record_feature_register_json_file	string	""	File path to the RAS feature register values as JSON. The file uses the same format as the error_record_feature_register parameter value
subcluster0.exercise_stxr_fail	bool	0x0	Reject a pseudo-random majority of exclusive store instructions
subcluster0.ext_abort_device_GRE_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_device_GRE_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_device_GRE_read_is_critical	bool	0x0	Critical reporting of device-GRE read external aborts.
subcluster0.ext_abort_device_GRE_read_is_sync	int	0x2	Synchronous reporting of device-GRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.
subcluster0.ext_abort_device_GRE_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_device_GRE_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_device_GRE_write_is_critical	bool	0x0	Critical reporting of device-GRE write external aborts
subcluster0.ext_abort_device_GRE_write_is_sync	int	0x2	Synchronous reporting of device-GRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.
subcluster0.ext_abort_device_GRE_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_device_GRE_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.ext_abort_device_nGRE_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_device_nGRE_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_device_nGRE_read_is_critical	bool	0x0	Critical reporting of device-nGRE read external aborts.
subcluster0.ext_abort_device_nGRE_read_is_sync	int	0x2	Synchronous reporting of device-nGRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.
subcluster0.ext_abort_device_nGRE_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_device_nGRE_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_device_nGRE_write_is_critical	bool	0x0	Critical reporting of device-nGRE write external aborts
subcluster0.ext_abort_device_nGRE_write_is_sync	int	0x2	Synchronous reporting of device-nGRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.
subcluster0.ext_abort_device_nGRE_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_device_nGRE_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_device_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_device_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_device_read_is_critical	bool	0x0	Critical reporting of device-nGnRE read external aborts
subcluster0.ext_abort_device_read_is_sync	bool	0x1	Synchronous reporting of device-nGnRE read external aborts
subcluster0.ext_abort_device_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.ext_abort_normal_wt_cacheable_write_is_sync	int	0x2	Synchronous reporting of normal write-through write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_write_is_sync.
subcluster0.ext_abort_normal_wt_cacheable_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_index, Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_normal_wt_cacheable_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_prefetch_device_GRE_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-GRE instruction fetches
subcluster0.ext_abort_prefetch_device_GRE_read_is_sync	int	0x2	Behaviour of external aborts generated by device-GRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
subcluster0.ext_abort_prefetch_device_nGRE_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-nGRE instruction fetches
subcluster0.ext_abort_prefetch_device_nGRE_read_is_sync	int	0x2	Behaviour of external aborts generated by device-nGRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
subcluster0.ext_abort_prefetch_device_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-nGnRE instruction fetches
subcluster0.ext_abort_prefetch_device_read_is_sync	int	0x2	Behaviour of external aborts generated by device-nGnRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
subcluster0.ext_abort_prefetch_is_critical	bool	0x0	Critical reporting of external aborts generated by normal writeback cacheable instruction fetches
subcluster0.ext_abort_prefetch_is_sync	bool	0x1	Behaviour of external aborts generated by normal writeback cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort.
subcluster0.ext_abort_prefetch_noncacheable_read_is_critical	bool	0x0	Critical reporting of external aborts generated by normal noncacheable instruction fetches
subcluster0.ext_abort_prefetch_noncacheable_read_is_sync	int	0x2	Behaviour of external aborts generated by normal noncacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
subcluster0.ext_abort_prefetch_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_prefetch_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.ext_abort_prefetch_so_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-nGnRnE instruction fetches
subcluster0.ext_abort_prefetch_so_read_is_sync	int	0x2	Behaviour of external aborts generated by device=nGnRnE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
subcluster0.ext_abort_prefetch_wt_cacheable_read_is_critical	bool	0x0	Critical reporting of external aborts generated by normal writethrough cacheable instruction fetches
subcluster0.ext_abort_prefetch_wt_cacheable_read_is_sync	int	0x2	Behaviour of external aborts generated by normal writethrough cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
subcluster0.ext_abort_so_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_so_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_so_read_is_critical	bool	0x0	Critical reporting of device-nGnRnE read external aborts
subcluster0.ext_abort_so_read_is_sync	bool	0x1	Synchronous reporting of device-nGnRnE read external aborts
subcluster0.ext_abort_so_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_so_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_so_write_is_critical	bool	0x0	Critical reporting of device-nGnRnE write external aborts
subcluster0.ext_abort_so_write_is_sync	bool	0x1	Synchronous reporting of device-nGnRnE write external aborts
subcluster0.ext_abort_so_write_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_so_write_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_ttw_cacheable_read_is_critical	bool	0x0	Critical reporting of TTW cacheable read external aborts
subcluster0.ext_abort_ttw_cacheable_read_is_sync	bool	0x1	Synchronous reporting of TTW cacheable read external aborts
subcluster0.ext_abort_ttw_cacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.ext_abort_ttw_cacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_ttw_noncacheable_read_is_critical	bool	0x0	Critical reporting of TTW noncacheable read external aborts
subcluster0.ext_abort_ttw_noncacheable_read_is_sync	bool	0x1	Synchronous reporting of TTW noncacheable read external aborts
subcluster0.ext_abort_ttw_noncacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_ttw_noncacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.ext_abort_ttw_wt_cacheable_read_is_critical	bool	0x0	Critical reporting of TTW write-through cacheable read external aborts
subcluster0.ext_abort_ttw_wt_cacheable_read_is_sync	int	0x2	Synchronous reporting of TTW write-through cacheable read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_ttw_cacheable_read_is_sync.
subcluster0.ext_abort_ttw_wt_cacheable_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records).
subcluster0.ext_abort_ttw_wt_cacheable_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
subcluster0.fault_on_nT_bit_set	bool	0x1	Whether block translation table entries with the nT bit set should always fault. Only applies when changing_block_size_without_bbm_support_level is 1 or higher.
subcluster0.fault_unalign_to_unsupported_mem	int	0x0	If has_unaligned_single_copy_atomicity is true, whether unaligned A64 atomic, exclusive and acquire/release instructions to non iWB-oWB generate fault. This parameter is a bitmap. Bits 0,1,2 should be set accordingly to enable the fault behaviour. bit 0(LSB): atomic access should fault, bit 1: exclusive access should fault, bit 2: acquire/release should fault.
subcluster0.fault_unaligned_s1_device_s2_fwb	bool	0x0	Whether unaligned access with stage1 Device memory and final memory attribute forced to normal by FWB can generate alignment fault
subcluster0.force_deterministic_irg_tag_generation	bool	0x0	Force the random tag generated by the IRG instruction when GCR_EL1.RRND=1 to equal RGSR_EL1.SEED[3:0] rather than a non-deterministic value
subcluster0.fpcr_short_vector_raz	bool	0x0	FPSCR and FPCR fields LEN and STRIDE are hardwired to 0

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.fsr_ext_bit_update_kind	int	0x3	Set/Clear DFSR/IFSR EA bit on Synchronous/Async External Aborts. 0: Never Set, 1: Set on Synchronous Ext Aborts 2: Set on Asynchronous Ext Aborts 3: Set on both Sync and Async Ext Aborts.
subcluster0.global_debug_rom.ROMDEVID	int	0x0	Value of Debug Rom Device Identification Register
subcluster0.global_debug_rom.ROMPIDR	int	0x4000bb000	Value of Debug Rom Peripheral Identification Register
subcluster0.hardware_translation_table_update_implemented	int	0x1	Implement hardware translation table updates from ARMv8.1. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
subcluster0.has_16bit_asids	bool	0x1	Enable 16-bit ASIDs.
subcluster0.has_16bit_vmids	int	0x1	Implement support for 16-bit VMIDs from ARMv8.1. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
subcluster0.has_16k_granule	bool	0x0	Implement the 16k LPAE translation granule.
subcluster0.has_4k_granule	bool	0x1	Implement the 4k LPAE translation granule.
subcluster0.has_52bit_address_with_16k	int	0x0	Implements Armv8.7 52-bit IPA/PA support for 16k Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.has_52bit_address_with_4k	int	0x0	Implements Armv8.7 52-bit IPA/PA support for 4k Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.has_64k_granule	bool	0x1	Implement the 64k LPAE translation granule.
subcluster0.has_aarch32_hpd	bool	0x0	If true then hierarchical permission disable is supported in AArch32
subcluster0.has_aarch64	bool	0x1	All implemented exception levels can run in AArch64
subcluster0.has_actlr2	bool	0x0	If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32]
subcluster0.has_amu	int	0x0	Implement activity monitor functionality from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_arm_v8-1	bool	0x0	Implement the ARMv8.1 Extension.
subcluster0.has_arm_v8-2	bool	0x0	Implement the ARMv8.2 Extension.
subcluster0.has_arm_v8-3	bool	0x0	Implement the ARMv8.3 Extension.
subcluster0.has_arm_v8-4	bool	0x0	Implement the ARMv8.4 Extension.
subcluster0.has_arm_v8-5	bool	0x0	Implement the ARMv8.5 Extension.
subcluster0.has_arm_v8-6	bool	0x0	Implement the ARMv8.6 Extension.

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.has_arm_v8-7	bool	0x0	Implement the Armv8.7 Extension. This feature is incomplete and under development.
subcluster0.has_at_with_pan	int	0x1	Implement new AT instructions with PAN support. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
subcluster0.has_axflag_xaflag	int	0x1	Implement flag manipulation instructions (AXFlag, XAFlag) from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_axflag_xaflag_frint	int	0x1	Implement flag manipulation instructions (AXFlag, XAFlag) and floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. If this parameter is enabled, it also enables both has_axflag_xaflag and has_frint. If support for only one of the features is needed, please use the individual parameters and do not enable this one. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_branch_target_exception	int	0x0	Implement Branch target identification mechanism from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_ccidx	bool	0x0	Implement the ARMv8.3 CCSIDR Extension. Extending the ccsidr number of sets.
subcluster0.has_cfinv_rmif_setf	int	0x1	Implement flag manipulation (CFINV, RMIF, SETF8, SETF16) instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_coherent_icache	bool	0x0	Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
subcluster0.has_common_not_private_translations	int	0x1	Implement the TTBRn_ELx.CnP (Common not Private) controls from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
subcluster0.has_complex_number	int	0x1	Implement ARMv8.3 complex number support, Multiply Accumulate and Add instructions. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
subcluster0.has_cvadp_support	int	0x0	Implement instruction to support cache clean by deep persistence (DC CVADP) from ARMv8.5, can be selected for core implemented on any arch version starting ARMv8.2 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.has_data_alignment_flag	int	0x0	Implement non-optimal misalignment flag for PMU/SPE from ARMv8.5 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_delayed_ctireg	bool	0x0	Delay the functional effect of CTI register writes until ISB or implicit barrier.
subcluster0.has_delayed_dbgreg	bool	0x0	Delay the functional effect of external debug register writes until ISB or implicit barrier.
subcluster0.has_delayed_sysreg	bool	0x0	Delay the functional effect of system register writes until ISB or implicit barrier.
subcluster0.has_delayed_wfe_trap	int	0x0	Implements Configurable Delayed WFE trapping from ARMv8.6 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
subcluster0.has_dgh	int	0x1	Implements Data Gathering Hint instruction from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
subcluster0.has_dot_product	int	0x1	Implement the dot product (UDOT, SDOT) instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_e0pd	int	0x1	Implement ARMv8.5 feature to prevent unprivileged access to one half of the memory Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_el2	bool	0x1	Implements EL2
subcluster0.has_el3	bool	0x1	Implements EL3
subcluster0.has_enhanced_pac	bool	0x0	If pointer authentication is enabled then implement enhanced PAC.
subcluster0.has_enhanced_pan	int	0x1	Implements Armv8.7 Enhanced PAN feature Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.has_ets	bool	0x0	Whether Enhanced Translation Synchronization is supported
subcluster0.has_extended_recp_estimate	int	0x0	Implements increased precision of reciprocal instructions.) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.has_fgt	int	0x1	Implements Fine-grained Virtualization Traps extension from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
subcluster0.has_fp16	int	0x1	Implement the half-precision floating-point data processing instructions from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.has_fp16_fmlal	int	0x1	Implement the New Floating Point Multiplication Variant (FP16 FMLAL, FMLSL) instructions from ARMv8.4. Only supported if has_fp16=0x1. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_frint	int	0x1	Implement floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_generic_authentication	int	0x1	Implement ARMv8.3 generic authentication. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
subcluster0.has_guest_translation_granule	int	0x1	Implement mechanism for guest translation granule identification from ARMv8.5, ID values determined by stage1 granule configuration parameters Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_hardware_translation_table_update	int	0x2	Type of hardware translation table supported (when enabled by hardware_translation_table_update_implemented). 0, not implemented. 1, access bit updates implemented. 2, access bit updates and dirty bit mechanism implemented.
subcluster0.has_hcrx_el2	int	0x1	Implements new HCRX_EL2 id register from Armv8.7 Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.has_id_reg_read	int	0x1	Implement read access to the ID registers (ESR_ELx.EC=0x18) Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_iesb	int	0x1	Implement support for implicit error sync event from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
subcluster0.has_jscvt	int	0x1	Implement ARMv8.3 javascript Floating-point to Integer conversion instruction. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
subcluster0.has_large_system_ext	bool	0x0	Implement the ARMv8 Large System Extensions.
subcluster0.has_large_va	int	0x0	Implement support for the extended 52-bit virtual addresses from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
subcluster0.has_ldapur_stlur	int	0x1	Implement support for LDAPR and STLR instructions with immediate offsets from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.has_ldm_stm_ordering_control	int	0x0	Implement the SCTLR_ELx.LSMAOE (Load/Store Multiple Atomicity and Ordering Enable) and SCTLR_ELx,nTLSMD (no Trap Load/Store Multiple to Device) controls from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
subcluster0.has_lrcpc	bool	0x0	If true then it support the RCpc feature (ARMv8.3)
subcluster0.has_mpam	int	0x0	Implement ARMv8.4 MPAM Registers and associated functionality. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_mt_pmu_disable_feature	int	0x0	Implements Multi-threading PMU disable extension from ARMv8.6 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
subcluster0.has_mte_ctrl_bits_stateful	bool	0x0	if memory_tagging_support_level == 1, Whether mte specific control bits in system registers are stateful
subcluster0.has_nested_virtualization	int	0x1	Implement ARMv8.3 nested virtualization. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
subcluster0.has_no_os_double_lock	int	0x0	Do not implement the OS double-lock. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_non_context_synchronizing_exception_controls	int	0x1	Implement cosmetic controls for whether exception entry and exit are context synchronizing events (SCTLR_ELx.{EIS,EOS}) from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_par_bit10_razwi	bool	0x0	Whether PAR_EL1[10] is RAZ/WI
subcluster0.has_pointer_authentication	int	0x1	Implement ARMv8.3 pointer authentication. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
subcluster0.has_prediction_invalidation_instructions	int	0x1	Implement execution and data prediction invalidation from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_pstate_dit	int	0x1	Implement timing insensitivity of data processing instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_pstate_pan	int	0x1	Implement the PSTATE.PAN (Privileged Access Never) control from ARMv8.1 Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.has_pstate_uao	int	0x1	Implement the PSTATE.UAO (User Access Override) control from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
subcluster0.has_ras_armv84_extension	int	0x1	Implement ARMv8.4 RAS Extension. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_ras_critical_error	int	0x0	[DEPRECATED: Set CI field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Critical Error is implemented or not. 0 - Feature Not Supported, 1 - Feature always enabled, 2 - Feature is controllable.
subcluster0.has_ras_double_fault	int	0x1	Implement ARMv8.4 RAS Doublt Fault Extension. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_ras_fault_injection	int	0x0	[DEPRECATED: Set INJ field on first register in error_record_feature_register JSON instead] Implement ARMv8.4 Standard Fault Injection mechanism. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_ras_timestamp	int	0x0	[DEPRECATED: Set TS field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Timestamp register is implemented or not. 0 - No Timestamp is recorded, 1 - Generic Timer timestamp is recorded, 2 - IMP DEF timestamp is recorded.
subcluster0.has_restriction_on_speculative_data_loaded	int	0x1	Implements the ARMv8.5 security feature (Restrictions on the effects of speculation) Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_rndr	int	0x0	Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_rounding_doubling_multiply_add_subtract	int	0x1	Implement the rounding doubling multiply add and subtract instructions from ARMv8.1 Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
subcluster0.has_secure_el2	int	0x1	Implement support for Secure EL2 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_self_hosted_trace_extension	int	0x1	Implement support for the Self-hosted Trace Extensions from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.has_small_page_table	int	0x1	Implement small page table support which increases the maximum value of TxSZ field from ARMv8.4. Note: will be unimplemented only if both has_small_page_table=0x0 and has_secure_el2=0x0. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_speculation_barrier_inst	int	0x1	Implement speculation barrier instruction (SB) from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_stage2_fwb	int	0x1	Implement HCR_EL2.FWB, stage 2 control of memory types and cacheability Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_stage2_xnx	int	0x1	Implement the extended XN[1:0] stage 2 control from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
subcluster0.has_stage2_xnx_in_aarch32	bool	0x1	Implement the extended XN[1:0] stage 2 control from ARMv8.2 for Aarch32.
subcluster0.has_statistical_profiling	bool	0x1	Whether Statistical Based Profiling is implemented
subcluster0.has_supersections	bool	0x1	Whether VMSAv8-32 supersection to support more than 32-bit PA using short descriptor is implemented.
subcluster0.has_synchronous_load_atomics	bool	0x1	Report asynchronous abort due to unsupported load atomics as synchronous
subcluster0.has_synchronous_store_atomics	bool	0x0	Report asynchronous abort due to unsupported store atomics as synchronous
subcluster0.has_tlb_conflict_abort	bool	0x0	Detected inconsistent TLB content generate aborts.
subcluster0.has_tlbi_range	int	0x1	Implement support for TLB Range Maintenance instructions (TLBI RVAE1, etc) from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_tlbi_to_outer_shareable	int	0x1	Implement support for TLB Maintenance instructions that extend to the Outer Shareable domain (TLBI VAE1OS, etc) from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_tlbi_ttl	int	0x1	Implement support for the TTL level hint in by-address TLB Maintenance instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.has_unaligned_single_copy_atomicity	int	0x1	Implement support for SCTLR_ELx.nAA from ARMv8.4, and A64 atomic, exclusive and acquire/release instructions accessing unaligned bytes inside a 16byte window will not generate alignment fault. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_unsupported_exclusive_fault	bool	0x1	Report unsupported exclusive access with Unsupported Exclusive fault status (otherwise use external abort)
subcluster0.has_v8_4_debug_extension	int	0x1	Implement ARMv8.4 debug extensions Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_v8_4_pmu_extension	int	0x1	Implement PMU extension from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.has_v8_5_debug_over_power_down	int	0x0	Implement ARMv8.5 Debug over powerdown Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_v8_5_pmu_extension	int	0x1	Implement PMU extension from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_v8_5_spe_extension	int	0x1	Implement SPE extension from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
subcluster0.has_v8_6_pmu_events	int	0x1	Implements PMU events from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
subcluster0.has_v8_7_fp_enhancements	int	0x1	Implements the Floating Point enhancements from Armv8.7 (introduces FPCR.FIZ/AH/NEP, etc.) Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.has_v8_7_pmu_events	int	0x1	Implement PMU events from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.has_v8_7_pmu_extension	int	0x1	Implement PMU extension from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.has_v8_7_spe_extension	int	0x1	Implement SPE extension from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.has_vncr_el2	int	0x1	Implement support for nested virtualization enhancements from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.has_wfet_and_wfit	int	0x1	Implements WFE and WFI with Timeout from Armv8.7 Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.has_writebuffer	bool	0x0	Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.
subcluster0.has_xs	int	0x1	Implements Armv8.7 XS, TLBInXS, DSBnXS instruction Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
subcluster0.hsr_uncond_cc	bool	0x0	Condition codes reported in HSR as AL if it passes
subcluster0.icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
subcluster0.icache-log2linelen	int	0x0	If nonzero, Log2 of the instruction cache line length in bytes (valid values in range 4-8). Otherwise the value of cache-log2linelen is used.
subcluster0.icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
subcluster0.icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
subcluster0.icache-nprefetch	int	0x1	Number of next sequential instruction cache lines to prefetch. This is only used when icache-prefetch_enabled=true.
subcluster0.icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
subcluster0.icache-prefetch_level	int	0x0	0 based cache level at which instructions are pre-fetched. This is only used when icache-prefetch_enabled=true.
subcluster0.icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
subcluster0.icache-read_bus_width_in_bytes	int	0x8	L1 I-Cache read bus width in bytes used to calculate per-access timing annotations
subcluster0.icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
subcluster0.icache-size	int	0x8000	L1 I-Cache size in bytes.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.icache-ways	int	0x2	L1 I-Cache number of ways (sets are implicit from size).
subcluster0.ignore_DBGPRCR_CWRR	bool	0x0	Ignore writes to the deprecated DBGPRCR.CWRR bit.
subcluster0.ignore_access_flag_update_by_at_ops	bool	0x0	If true, AT operations do not update access flag
subcluster0.ignore_large_address_top_bits_in_page_walk	bool	0x0	Whether page table bits [15:12] are ignored if PA_SIZE < 52 and output address is configured < 52 with large page
subcluster0.imp_def_functionality_behaviour	int	0x0	Behaviour of IMPLEMENTATION DEFINED registers and system instructions. 0, UNDEF. 1, RAZ/WI.
subcluster0.impdef_regs_and_unpred_from_implementation	string	""	Configure implementation defined registers and unpredictable behaviour to match the specified implementation. Requires a license for the selected implementation model. Use ARM_Cortex-A<num> or ARM_<codename> for licensed pre-release cores.
subcluster0.independent_cache_control_traps	int	0x0	Implement Independent Cache Control traps from ARMv8.5. 0, NO_SUPPORT. 1, SUPPORTED_BUT_NOT_FOR_TLB_MAINTENANCE_INSTRUCTIONS. 2, FULL_SUPPORT.
subcluster0.insert_iesb_before_exception	bool	0x0	If true then inserts an IESB before taking with Exception otherwise has no effect and IESB is taken after PState is changed due to the Exception.
subcluster0.instruction_tlb_size	int	0x0	Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB)
subcluster0.is_mt_res0	bool	0x0	If ARMv8.6 is not implemented, and PMUv3 is implemented, this parameter controls whether PMEVTYPER<n>.MT bit is RES0 or RW. For other implementations, this parameter has no effect
subcluster0.is_uniprocessor	bool	0x0	Value for the U bit in MPIDR. true disables L1 cache coherency protocols
subcluster0.max_32bit_el	int	0x3	Maximum exception level supporting AArch32 modes.
subcluster0.memory.acp.AxCACHE_mask	int	0x0	Used with memory.acp.AxCACHE_pattern to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.
subcluster0.memory.acp.AxCACHE_pattern	int	0x0	Used with memory.acp.AxCACHE_mask to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.
subcluster0.memory.l2_cache.is_inner_cacheable	bool	0x1	L2 cache obeys inner cacheable attributes (rather than outer cacheable attributes)
subcluster0.memory.l2_cache.is_inner_shareable	bool	0x1	L2 cache obeys inner shareable attributes (rather than outer sharaable attributes)
subcluster0.memory_tagging_support_level	int	0x0	Specify the memory tagging extension support level: 0, not implemented. 1, instructions and registers only are implemented. 2, implemented. 3, implemented with asymmetric handling of exceptions

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.mixed_endian	int	0x1	Implement support for mixed endianness. 0, not supported. 1, supported at all exception levels. 2, supported at EL0 only.
subcluster0.mpam_force_ns_rao	bool	0x0	Whether MPAM3_EL3.FORCE_NS bit is RAO/WI.
subcluster0.mpam_frac	int	0x0	MPAM fractional revision number in ID_AA64PFR1_EL1.MPAM_frac field
subcluster0.mpam_has_hcr	bool	0x0	MPAM Whether MPAMIDR_EL1 HAS_HCR bit is set or clear
subcluster0.mpam_max_partid	int	0xffff	MPAM Maximum PARTID Supported
subcluster0.mpam_max_pmg	int	0xff	MPAM Maximum PMG Supported
subcluster0.mpam_max_vpmr	int	0x0	MPAM Maximum VPMR Supported
subcluster0.mpamidr_has_force_ns	int	0x0	Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
subcluster0.mpamidr_has_sdeflt	int	0x0	Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
subcluster0.mpamidr_has_tidr	int	0x0	Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
subcluster0.mvbar_reset_is_rvbar	bool	0x1	If true then the reset value of MVBAR is RVBAR, if false the reset value is UNKNOWN.
subcluster0.non_secure_vgic_alias_when_ns_only	int	0x0	If ! has_el3 and only non-secure side exists, then the normal position of the VGIC is a secure alias. If this parameter is non-zero then in addition a non-secure alias of the VGIC will be placed at this position (aligned to 32 KB).
subcluster0.num_loregion_descriptors	int	0x0	Number of Limited Ordering Region descriptors implemented (if ARM v8.1 extensions are implemented)
subcluster0.num_loregions	int	0x0	Number of Limited Ordering Regions implemented excluding background region (if ARM v8.1 extensions are implemented)
subcluster0.number_of_error_records	int	0x0	Cores Number of Error records supported for RAS
subcluster0.optimal_alignment_size	int	0x1	Alignment boundary which does not incur additional performance penalty from ARMv8.5. - 1, architectural misalignment is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] - 2, access crossing 4 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] - 3, access crossing 8 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] ... - 12, access crossing 4 Kbyte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.output_attributes	string	"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS"	User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.
subcluster0.page_based_hardware_attributes	int	0x0	Implement the page based hardware attributes from ARMv8.2. This parameter indicates which page table bits are available for hardware, where bits[3:0] correspond to PTE[62:59] and to TCR_ELx.HWUnyy.
subcluster0.pmmir_el1_bus_slots	int	0x0	Largest value by which BUS_ACCESS can increment over BUS_CYCLES cycles. From v8.7 PMU extension
subcluster0.pmmir_el1_bus_width	int	0x0	Width, in bytes, of accesses counted by BUS_ACCESS. From v8.7 PMU extension
subcluster0.pmu-num_counters	int	0x8	Number of PMU counters implemented
subcluster0.pseudo_fault_generation_feature_register	string	""	ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false,"UC":false,"UEU":false,"UER":false,"UEO":false,"DE":false,"CE":0x0,"CI":false,"ER":false,"PN":false,"AV":false,"MV":false,"SYN":false,"R":false},other_psuedo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.
subcluster0.pstate_ssbs_type	int	0x0	Implement speculative store bypass safe feature from ARMv8.5. 0, Not supported. 1, Supported without MSR/MRS access to SSBS. 2, fully supported.
subcluster0.ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
subcluster0.randomize_unknowns_at_reset	bool	0x0	Will fill in unknown bits in registers at reset with random value using register_reset_data as seed, it overrides scramble_unknowns_at_reset
subcluster0.ras_errselr_undef_if_no_error_records	bool	0x0	If true, ERRSELR_EL1 will be undefined if ERRIDR_EL1 indicates that zero error records are implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.ras_frac	int	0x0	0, No additional feature implemented. 1, Additional ERXMISC*, ERXPFG* registers and FaultInjection trap from RAS v1.1. implemented
subcluster0.register_reset_data	int	0x0	Data used to fill register bits when they become UNKNOWN at reset.
subcluster0.report_iside_cmo_ifsr	bool	0x1	fault info for an iside cache maintenance operation is reported in the IFSR
subcluster0.reserved_HMC_SSC_PAC_treated_disabled	bool	0x0	When DBG[B|W]CR.{HMC,SSC,PAC} bits configuration is reserved, this parameter controls whether breakpoints/watchpoints are treated as Disabled or not
subcluster0.restriction_on_speculative_execution	int	0x0	Implements the ARMv8.5 security feature (Restrictions on the effects of speculation): 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx not supported), 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx supported)
subcluster0.rmr_always_implemented	bool	0x0	Always implement RMR_ELx, RMR, or HRMR at the highest implemented exception level, even if that exception level cannot use both AArch32 and AArch64.
subcluster0.rndr_rndrrs_seed	int	0x0	Initial seed for random engine used in RNDR register
subcluster0.scheduler_mode	int	0x0	Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions.
subcluster0.scramble_unknowns_at_reset	bool	0x1	Will fill in unknown bits in registers at reset with register_reset_data
subcluster0.set_rasv10_for_armv84_and_higher	bool	0x0	ARMv8.4 mandates RAS System Architecture v1.1, but when there are no error records and ARMv8.4-DFE is not implemented then there is no functional difference between the RAS System Architecture v1.0 (that is, the RAS extension as in pre-ARMv8.4 implementations) and the RAS System Architecture v1.1 (also known as ARMv8.4-RAS). This flag if true will set the RAS ID to declare RAS v1.0 rather than RAS v1.1 for ARMv8.4 and higher implementations. If this is set and the core does not conform to the restrictions then this parameter is ignored.
subcluster0.spsr_el3_is_mapped_to_spsr_mon	bool	0x1	Whether SPSR_EL3 is mapped to AArch32 register SPSR_mon
subcluster0.spsr_m4_res0	bool	0x0	Whether SPSR_ELx.M[4] bit should be RES0 for AARCH64 only implementations
subcluster0.stage12_tlb_size	int	0x80	Number of stage1+2 tlb entries.
subcluster0.stage1_tlb_size	int	0x0	Number of stage1 only tlb entries.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.stage1_walkcache_size	int	0x0	Number of stage1 only walk cache entries.
subcluster0.stage2_tlb_size	int	0x0	Number of stage2 only tlb entries.
subcluster0.stage2_walkcache_size	int	0x0	Number of stage2 only walk cache entries.
subcluster0.statistical_profiling_buffer_alignment	int	0x1	Statistical profiling alignment constraint for sample buffer
subcluster0.statistical_profiling_random_interval_is_separate	bool	0x0	Statistical profiling random interval gets added to the main timer interval(false) or (true) runs as separate timer
subcluster0.statistical_profiling_recommended_min_sampling	int	0x100	Statistical profiling recommended minimum sampling interval
subcluster0.take_ccfail_tsc_trap	bool	0x0	When take_ccfail_undef=1 this prameter controls whether or not an SMC instruction that is trapped by HCR_EL2.TSC but fails its condition code check generates a trap to EL2.
subcluster0.take_ccfail_undef	bool	0x1	UNDEF exception is taken even if condition code check fails
subcluster0.tcr_ps_reserved_value_size	int	0x0	Physical size treated when TCR.(I)PS is programmed with a reserved value. 0, 48 bits. 1, 52 bits. The parameter value is treated 0 if LPA is not supported.
subcluster0.tcr_txsz_undersize_should_fault	bool	0x1	If large VA is not supported, Whether undersized TxSZ value should generate translation fault
subcluster0.tdosa_traps_osdlr_if_no_os_double_lock	bool	0x1	MDCR_EL*.TDOSA enables trap on OSDLR_EL1 and DBGOSDLR when OS double-lock is not implemented.
subcluster0.tidcp_traps_el0_undef_imp_def	bool	0x1	TIDCP has priority over UNDEF for accesses to IMPLEMENTATION DEFINED functionality from EL0
subcluster0.tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
subcluster0.trace_physical_registers_when_host_virtualisation_enabled	int	0x0	When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers
subcluster0.trap_reserved_group3_id_regs	bool	0x0	Whether setting HCR_EL2.TID3 traps reserved group3 id registers.
subcluster0.treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
subcluster0.treat-dcache-invalidate-as-clean-invalidate	bool	0x0	Treat data cache invalidate operations as clean and invalidate.
subcluster0.treat_pld_as_nop	bool	0x0	If true, treat PLD as NOP.
subcluster0.treat_wfi_wfe_as_nop	bool	0x0	If true, never go into wait state for WFI or WFE instructions.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.truncate_pc_on_illegal_exception_return_to_aarch32	bool	0x1	On Illegal ERET to AArch32, truncate PC to 32-bits
subcluster0.undef_ccsidr2_access_for_unimplemented_aarch32	bool	0x0	Whether access to CCSIDR2 is undef if AArch32 is implemented or not
subcluster0.unification-level	int	0x1	Level of Unification Inner Shareable for the cache hierarchy
subcluster0.unification-uniprocessor-level	int	0x1	Level of Unification Uniprocessor for the cache hierarchy
subcluster0.unpred_nested_virtualization_nv_behaviour	int	0x0	Constrained unpredictable choices for HCR_EL2.NV=0 and HCR_EL2.NV1=1 with respect to nested virtualization - 0, Behave as defined in the sepcification as per bit values - 1, Behave as if HCR_EL2.NV=1 and HCR_EL2.NV1=1 for all purpose other than reading back HCR_EL2.NV - 2, Behave as if HCR_EL2.NV=0 and HCR_EL2.NV1=0 for all purpose other than reading back HCR_EL2.NV1
subcluster0.unpred_vncr_el2_ress_mismatch	int	0x0	Constrained unpredictable choices when bits marked as RESS do not all have the same value for VNCR_EL2 - 0, Generating an EL2 translation regime translation abort on use of the VNCR_EL2 register - 1, Reserved sign exteneded bits of VNCR_EL2 are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes other than reading back the register
subcluster0.unpred_zero_spsr_btype	bool	0x1	Constrained unpredictable control to make SPSR_ELx.BTYPE 0 instead of PSTATE.BTYPE on synchronous exceptions other than Software Step, PC alignment fault, Instruction Abort, Breakpoint or Address Matching Vector Catch, Illegal Execution State, BRK instruction, Branch Target
subcluster0.unpredictable_exclusive_abort_memtype	int	0x0	Cause MMU abort if exclusive access is not supported in certain memory type (0=exclusives allowed in all memory types, 1=exclusives abort in Device memory types, 2=exclusives abort in any type other than WB inner cacheable)
subcluster0.unpredictable_hvc_behaviour	int	0x0	HVC unpredictable behaviour. 0, UNDEF. 1, NOP.
subcluster0.unpredictable_smc_behaviour	int	0x0	SMC unpredictable behaviour. 0, UNDEF. 1, NOP.
subcluster0.unsupported_atomic_fault_type	int	0x0	Type of fault reported on unsupported atomic access. 0 = external abort if any reported by interconnect, 1 = precise unsupported atomic fault, 2 = precise external abort, 3 = imprecise external abort.
subcluster0.use_Xt_as_LDG_STG_input	bool	0x1	Use new MTE Intructions formats for LDG/ST(Z)(2)G, which use Xt as an input
subcluster0.use_mte_eac_02_instructions_encoding	bool	0x1	Use new MTE Intructions encoding since MTE spec EAC 0.2 in ARMv8.5.
subcluster0.use_mte_eac_08_tfsr_encoding	bool	0x1	Use new MTE TFSR_ELx encodings since MTE spec EAC 0.8 in ARMv8.5.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-80 Parameters for Subcluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
subcluster0.use_rosetta_disass	int	0x1	Use Rosetta disassembly library. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
subcluster0.use_tlb_contig_hint	bool	0x0	Translation table entries with the contiguous hint bit set generate large TLB entries.
subcluster0.walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks
subcluster0.warn_unpredictable_in_v7	bool	0x1	If true, behaviour which is unpredictable in V7 yet is predictable in V8 will produce a warning
subcluster0.watchpoint-log2secondary_restriction	int	0x0	log2 size of secondary restriction of FAR/EDWAR possible values on watchpoint hit for load/store operations.
subcluster0.wfe_wakeup_delay	int	0x0	Configure WFE wakeup delay in CPU cycles
subcluster0.wfi_wakeup_delay	int	0x0	Configure WFI wakeup delay in CPU cycles
subcluster0.wnr_is_read_for_s2f_on_s1_atomic_instr_fault	bool	0x0	Whether WnR is 0 for stage2 fault on stage1 for atomic instructions
subcluster0.wnr_is_read_for_s2f_on_s1_dbm_update	bool	0x0	Whether WnR is 0 for stage2 fault on stage1 descriptor dbm update

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP

Name	Type	Default value	Description
AIDR	int	0x0	Value of AIDR_EL1 register.
AMPIDR	int	0x400bbb000	Value of AMU Peripheral Identification Register
BPIMVA_causes_translation_lookup	bool	0x0	Do a translation when BPIMVA instruction is executed (which may cause a translation fault).
CCSIDR-L1D_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).
CCSIDR-L1I_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).
CCSIDR-L2_override	int	0x0	If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).
CCSIDR-L3_override	int	0x0	If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).
CPUCFR	int	0x0	Value of CPU Configuration Register
CTIPIDR	int	0x0	If non-zero, override the CTI Peripheral Identification Register
DBGPIDR	int	0x0	If non-zero, override the Debug Peripheral Identification Register
ERXMISC0_mask	int	0x0	Write Mask for ERXMISC0 RAS Register
GMID-log2-block-size	int	0x4	Log2 of the block size accessed by STGM/LDGM/STZGM instructions

Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ISV_set_to_0_for_stage2_synch_external_abort	bool	0x0	Whether ESR_EL2.ISV is set to 0 on stage 2 synchronous external aborts
MIDR	int	0x410fd0f0	Value of MIDR_EL1 register.
NUM_CORES	int	0x1	Number of cores per cluster
PA_SIZE	int	0x28	Physical address range supported. For ARMv8.0 and ARMv8.1 this is limited to 48 bits.
PMUPIDR	int	0x0	If non-zero, override the PMU Peripheral Identification Register
abort_execution_from_device_memory	bool	0x0	Execution from device memory generates a prefetch abort.
advsimd_bf16_support_level	int	0x0	Implement BFloat16 operations from ARMv8.6. AArch64 Advanced SIMD and FP BFloat16 instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP BFloat16 instructions only. - 2, AArch32 Advanced SIMD and VFP BFloat16 instructions only. - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP BFloat16 instructions.
advsimd_i8mm_support_level	int	0x0	Implement Int8 matrix multiply operations from ARMv8.6. AArch64 Advanced SIMD and FP Int8 matrix multiply instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP Int8 matrix multiply instructions only. - 2, AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions only. - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions.
amair_reg_rw_mask	int	0x0	RW mask for implementation-defined registers.
amu_aux_voffset_mask	int	0x0	If ARMv8.6 is implemented, each bit of the field, 0 to 15, when 1 indicates that the corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2, is implemented
amu_has_external_interface	int	0x0	Implement external memory-mapped access to system register of activity monitor unit from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
amu_has_sysreg_interface	bool	0x1	Implement system register access to activity monitor unit from ARMv8.4.
amu_reset_domain	int	0x0	Reset domain for activity monitor unit. 0, COLD_RESET. 1, WARM_RESET. 2, NONE.
amu_version	int	0x1	Selects the activity monitor version implemented - 1, AMUv1 for Armv8.4 is implemented. - 2, AMUv1 for Armv8.6 is implemented.
apsr_read_restrict	bool	0x0	At EL0, unknown bits of APSR are RAZ.
arm_v8_7_accelerator_support_level	int	0x0	Implements Armv8.7 accelerator support instructions LD/ST64B, ST64BV, ST64BV0, etc.

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
auxilliary_feature_register0	int	0x0	Value of AFR0 ID register.
cache-log2linelen	int	0x6	Log2 of the cache line length in bytes.
cache_maintenance_hits_watchpoints	bool	0x0	DCIMVA operations executed in AArch32 modes hit watchpoints.
changing_block_size_without_bbm_support	int	0x0	Level of support for changing block size without break-before-make.
clear_IT_when_IL_set	bool	0x0	Clear IT bits when performing a *legal* exception return to AArch32 when IL is set
clear_IT_when_IL_set_explicitly	bool	0x0	Apart from clear_IT_when_IL_set, also clear IT bits when loading CPSR from SPSR/memory and IL == 1 in the value being loaded.
clear_reg_top_eret	int	0x1	Behaviour of the upper 32-bits of the Xn registers when changing between AArch32 state and AArch64 state. 0, upper 32-bits preserved for all registers. 1, upper 32-bits set to 0 for all accessible registers. 2, upper 32-bits set to 0 for a random selection of accessible registers. 3, upper-32-bits set to 0 for registers touched in AArch32
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dc_fault_unaligned_s1_device_s2_fwb	bool	0x0	Whether takes an Alignment Fault caused by the memory type on a DC {ZVA,GZVA,GVA} if the stage 1 memory type is any Device memory type
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_bus_width_in_bytes	int	0x8	L1 D-Cache read bus width in bytes used to calculate per-access timing annotations

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x8000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-ways	int	0x2	L1 D-Cache number of ways (sets are implicit from size).
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_bus_width_in_bytes	int	0x8	L1 D-Cache write bus width in bytes used to calculate per-access timing annotations
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
dcimva_requires_s2_write_permissions	bool	0x0	Data-cache invalidate by MVA operations require stage 2 write permission (virtualised AArch32 guest).
dczva_reports_lowest_addr_on_tag_check_fail	bool	0x0	Whether DC ZVA reports lowest address in FAR on tag check fail
delayed_dbgreg_between_secure_views	int	0x1	If delayed_dbgreg is enabled, whether the secure and nonsecure external views require explicit synchronization. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
dic-spi_count	int	0x40	Number of shared peripheral interrupts implemented
disable_sve_plugin	bool	0x0	If true, SVE will not be implemented in this processor even if the plugin is loaded
disable_unknown_update_event_on_reset	bool	0x0	Disables SYSREG_UPDATE event notification on reset for the registers whose bitfields are all reserverd or resets to architecturally unknown value
ecv_support_level	int	0x0	Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF.
el0_can_access_imp_def_functionality	bool	0x0	If not made UNDEF by imp_def_functionality_behaviour, EL0 can access IMPLEMENTATION DEFINED registers and system instructions.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
el0_el1_only_non_secure	bool	0x0	Secure/non-secure state if EL2 and EL3 are not implemented. 0, secure. 1, non-secure.
enable_tlb_contig_check	bool	0x0	Perform extra pagetable walks to check translation table entries that have the contiguous hint bit set.
enhanced_pac2_level	int	0x0	Implements Enhanced PAC2 from ARMv8.6. This feature is mandatory for ARMv8.6 but can be cherrypicked to a ARMv8.3(or greater) implementation. 0: No EnhancedPAC2, 1: EnhancedPAC2 Only, 2: EnhancedPAC2 with FPAC, 3: EnhancedPAC2 with FPACCombined.
error_record_feature_register	string	""	RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0,"IMPDEF_3_2":0x0,"UI":0x0,"FI":0x0,"UE":0x0,"CFI":0x0,"CEC":0x0,"RP":0x0,"DUI":0x0,"CEO":0x0,"CI":0x0,"TS":0x0,"INJ":0x0,"FRX":0x0,"UC":0x0,"UEU":0x0,"UER":0x0,"UEO":0x0,"DE":0x0,"CE":0x0,"Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values betwn 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster"
error_record_feature_register_json_file	string	""	File path to the RAS feature register values as JSON. The file uses the same format as the error_record_feature_register parameter value
exercise_stxr_fail	bool	0x0	Reject a pseudo-random majority of exclusive store instructions
ext_abort_device_GRE_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_GRE_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_GRE_read_is_critical	bool	0x0	Critical reporting of device-GRE read external aborts.
ext_abort_device_GRE_read_is_sync	int	0x2	Synchronous reporting of device-GRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.
ext_abort_device_GRE_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_GRE_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_GRE_write_is_critical	bool	0x0	Critical reporting of device-GRE write external aborts

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_device_GRE_write_is_sync	int	0x2	Synchronous reporting of device-GRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.
ext_abort_device_GRE_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_GRE_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_nGRE_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_nGRE_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_nGRE_read_is_critical	bool	0x0	Critical reporting of device-nGRE read external aborts.
ext_abort_device_nGRE_read_is_sync	int	0x2	Synchronous reporting of device-nGRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.
ext_abort_device_nGRE_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_nGRE_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_nGRE_write_is_critical	bool	0x0	Critical reporting of device-nGRE write external aborts
ext_abort_device_nGRE_write_is_sync	int	0x2	Synchronous reporting of device-nGRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.
ext_abort_device_nGRE_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_nGRE_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_device_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_device_read_is_critical	bool	0x0	Critical reporting of device-nGnRE read external aborts
ext_abort_device_read_is_sync	bool	0x1	Synchronous reporting of device-nGnRE read external aborts
ext_abort_device_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_device_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_device_write_is_critical	bool	0x0	Critical reporting of device-nGnRE write external aborts
ext_abort_device_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRE write external aborts
ext_abort_device_write_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_device_write_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_fill_data	int	-0x202020303020203	Returned data, if external aborts are asynchronous
ext_abort_normal_cacheable_read_is_critical	bool	0x0	Critical reporting of normal write-back cacheable-read external aborts
ext_abort_normal_cacheable_read_is_sync	bool	0x1	Synchronous reporting of normal write-back cacheable-read external aborts
ext_abort_normal_cacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_normal_cacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_normal_cacheable_write_is_critical	bool	0x0	Critical reporting of normal write-back cacheable write external aborts
ext_abort_normal_cacheable_write_is_sync	bool	0x0	Synchronous reporting of normal write-back cacheable write external aborts
ext_abort_normal_cacheable_write_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_normal_cacheable_write_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_normal_noncacheable_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_normal_noncacheable_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_normal_noncacheable_read_is_critical	bool	0x0	Critical reporting of normal noncacheable-read external aborts
ext_abort_normal_noncacheable_read_is_sync	bool	0x1	Synchronous reporting of normal noncacheable-read external aborts
ext_abort_normal_noncacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_normal_noncacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_normal_noncacheable_write_is_critical	bool	0x0	Critical reporting of normal noncacheable write external aborts
ext_abort_normal_noncacheable_write_is_sync	bool	0x0	Synchronous reporting of normal noncacheable write external aborts
ext_abort_normal_noncacheable_write_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_normal_noncacheable_write_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_normal_wt_cacheable_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_normal_wt_cacheable_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_normal_wt_cacheable_read_is_critical	bool	0x0	Critical reporting of normal write-through cacheable-read external aborts
ext_abort_normal_wt_cacheable_read_is_sync	int	0x2	Synchronous reporting of normal write-through read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_read_is_sync.
ext_abort_normal_wt_cacheable_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records).

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_normal_wt_cacheable_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_normal_wt_cacheable_write_is_critical	bool	0x0	Critical reporting of normal write-through write external aborts
ext_abort_normal_wt_cacheable_write_is_sync	int	0x2	Synchronous reporting of normal write-through write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_write_is_sync.
ext_abort_normal_wt_cacheable_write_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_normal_wt_cacheable_write_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_prefetch_device_GRE_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-GRE instruction fetches
ext_abort_prefetch_device_GRE_read_is_sync	int	0x2	Behaviour of external aborts generated by device-GRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_prefetch_device_nGRE_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-nGRE instruction fetches
ext_abort_prefetch_device_nGRE_read_is_sync	int	0x2	Behaviour of external aborts generated by device-nGRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_prefetch_device_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-nGnRE instruction fetches
ext_abort_prefetch_device_read_is_sync	int	0x2	Behaviour of external aborts generated by device-nGnRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_prefetch_is_critical	bool	0x0	Critical reporting of external aborts generated by normal writeback cacheable instruction fetches
ext_abort_prefetch_is_sync	bool	0x1	Behaviour of external aborts generated by normal writeback cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort.
ext_abort_prefetch_noncacheable_read_is_critical	bool	0x0	Critical reporting of external aborts generated by normal noncacheable instruction fetches
ext_abort_prefetch_noncacheable_read_is_sync	int	0x2	Behaviour of external aborts generated by normal noncacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_prefetch_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_prefetch_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_prefetch_so_read_is_critical	bool	0x0	Critical reporting of external aborts generated by device-nGnRnE instruction fetches
ext_abort_prefetch_so_read_is_sync	int	0x2	Behaviour of external aborts generated by device=nGnRnE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_prefetch_wt_cacheable_read_is_critical	bool	0x0	Critical reporting of external aborts generated by normal writethrough cacheable instruction fetches
ext_abort_prefetch_wt_cacheable_read_is_sync	int	0x2	Behaviour of external aborts generated by normal writethrough cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.
ext_abort_so_prefetch_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_so_prefetch_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_so_read_is_critical	bool	0x0	Critical reporting of device-nGnRnE read external aborts
ext_abort_so_read_is_sync	bool	0x1	Synchronous reporting of device-nGnRnE read external aborts
ext_abort_so_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_so_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_so_write_is_critical	bool	0x0	Critical reporting of device-nGnRnE write external aborts
ext_abort_so_write_is_sync	bool	0x1	Synchronous reporting of device-nGnRnE write external aborts
ext_abort_so_write_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_so_write_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_ttw_cacheable_read_is_critical	bool	0x0	Critical reporting of TTW cacheable read external aborts
ext_abort_ttw_cacheable_read_is_sync	bool	0x1	Synchronous reporting of TTW cacheable read external aborts

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ext_abort_ttw_cacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_ttw_cacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_ttw_noncacheable_read_is_critical	bool	0x0	Critical reporting of TTW noncacheable read external aborts
ext_abort_ttw_noncacheable_read_is_sync	bool	0x1	Synchronous reporting of TTW noncacheable read external aborts
ext_abort_ttw_noncacheable_read_ras_index	int	0x0	External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).
ext_abort_ttw_noncacheable_read_ras_type	int	0x0	External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
ext_abort_ttw_wt_cacheable_read_is_critical	bool	0x0	Critical reporting of TTW write-through cacheable read external aborts
ext_abort_ttw_wt_cacheable_read_is_sync	int	0x2	Synchronous reporting of TTW write-through cacheable read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_ttw_cacheable_read_is_sync.
ext_abort_ttw_wt_cacheable_read_ras_index	int	-0x1	External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records).
ext_abort_ttw_wt_cacheable_read_ras_type	int	-0x1	External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.
fault_on_nT_bit_set	bool	0x1	Whether block translation table entries with the nT bit set should always fault. Only applies when changing_block_size_without_bbm_support_level is 1 or higher.
fault_unalign_to_unsupported_mem	int	0x0	If has_unaligned_single_copy_atomicity is true, whether unaligned A64 atomic, exclusive and acquire/release instructions to non iWB-oWB generate fault. This parameter is a bitmap. Bits 0,1,2 should be set accordingly to enable the fault behaviour. bit 0(LSB): atomic access should fault, bit 1: exclusive access should fault, bit 2: acquire/release should fault.
fault_unaligned_s1_device_s2_fwb	bool	0x0	Whether unaligned access with stage1 Device memory and final memory attribute forced to normal by FWB can generate alignment fault
force_deterministic_irg_tag_generation	bool	0x0	Force the random tag generated by the IRG instruction when GCR_EL1.RRND=1 to equal RGSR_EL1.SEED[3:0] rather than a non-deterministic value

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
fsr_ext_bit_update_kind	int	0x3	Set/Clear DFSR/IFSR EA bit on Synchronous/Async External Aborts. 0: Never Set, 1: Set on Synchronous Ext Aborts 2: Set on Asynchronous Ext Aborts 3: Set on both Sync and Async Ext Aborts.
global_debug_rom.ROMDEVID	int	0x0	Value of Debug Rom Device Identification Register
global_debug_rom.ROMPIDR	int	0x4000 bb000	Value of Debug Rom Peripheral Identification Register
hardware_translation_table_update_implemented	int	0x1	Implement hardware translation table updates from ARMv8.1. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
has_16bit_asids	bool	0x1	Enable 16-bit ASIDs.
has_16bit_vmids	int	0x1	Implement support for 16-bit VMIDs from ARMv8.1. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
has_16k_granule	bool	0x0	Implement the 16k LPAE translation granule.
has_4k_granule	bool	0x1	Implement the 4k LPAE translation granule.
has_52bit_address_with_16k	int	0x0	Implements Armv8.7 52-bit IPA/PA support for 16k Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_52bit_address_with_4k	int	0x0	Implements Armv8.7 52-bit IPA/PA support for 4k Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_64k_granule	bool	0x1	Implement the 64k LPAE translation granule.
has_aarch32_hpd	bool	0x0	If true then hierarchical permission disable is supported in AArch32
has_aarch64	bool	0x1	All implemented exception levels can run in AArch64
has_actlr2	bool	0x0	If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32]
has_amu	int	0x0	Implement activity monitor functionality from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_arm_v8-1	bool	0x0	Implement the ARMv8.1 Extension.
has_arm_v8-2	bool	0x0	Implement the ARMv8.2 Extension.
has_arm_v8-3	bool	0x0	Implement the ARMv8.3 Extension.
has_arm_v8-4	bool	0x0	Implement the ARMv8.4 Extension.
has_arm_v8-5	bool	0x0	Implement the ARMv8.5 Extension.
has_arm_v8-6	bool	0x0	Implement the ARMv8.6 Extension.

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_arm_v8-7	bool	0x0	Implement the Armv8.7 Extension. This feature is incomplete and under development.
has_at_with_pan	int	0x1	Implement new AT instructions with PAN support. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_axflag_xaflag	int	0x1	Implement flag manipulation instructions (AXFlag, XAFlag) from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_axflag_xaflag_frint	int	0x1	Implement flag manipulation instructions (AXFlag, XAFlag) and floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. If this parameter is enabled, it also enables both has_axflag_xaflag and has_frint. If support for only one of the features is needed, please use the individual parameters and do not enable this one. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_branch_target_exception	int	0x0	Implement Branch target identification mechanism from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_ccidx	bool	0x0	Implement the ARMv8.3 CCSIDR Extension. Extending the ccsidr number of sets.
has_cfinv_rmif_setf	int	0x1	Implement flag manipulation (CFINV, RMIF, SETF8, SETF16) instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_coherent_icache	bool	0x0	Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
has_common_not_private_translations	int	0x1	Implement the TTBRn_ELx.CnP (Common not Private) controls from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_complex_number	int	0x1	Implement ARMv8.3 complex number support, Multiply Accumulate and Add instructions. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_cvadp_support	int	0x0	Implement instruction to support cache clean by deep persistence (DC CVADP) from ARMv8.5, can be selected for core implemented on any arch version starting ARMv8.2 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_data_alignment_flag	int	0x0	Implement non-optimal misalignment flag for PMU/SPE from ARMv8.5 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_delayed_ctireg	bool	0x0	Delay the functional effect of CTI register writes until ISB or implicit barrier.
has_delayed_dbgreg	bool	0x0	Delay the functional effect of external debug register writes until ISB or implicit barrier.
has_delayed_sysreg	bool	0x0	Delay the functional effect of system register writes until ISB or implicit barrier.
has_delayed_wfe_trap	int	0x0	Implements Configurable Delayed WFE trapping from ARMv8.6 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_dgh	int	0x1	Implements Data Gathering Hint instruction from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_dot_product	int	0x1	Implement the dot product (UDOT, SDOT) instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_e0pd	int	0x1	Implement ARMv8.5 feature to prevent unprivileged access to one half of the memory Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_el2	bool	0x1	Implements EL2
has_el3	bool	0x1	Implements EL3
has_enhanced_pac	bool	0x0	If pointer authentication is enabled then implement enhanced PAC.
has_enhanced_pan	int	0x1	Implements Armv8.7 Enhanced PAN feature Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_ets	bool	0x0	Whether Enhanced Translation Synchronization is supported
has_extended_recp_estimate	int	0x0	Implements increased precision of reciprocal instructions.) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_fgt	int	0x1	Implements Fine-grained Virtualization Traps extension from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_fp16	int	0x1	Implement the half-precision floating-point data processing instructions from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_fp16_fmlal	int	0x1	Implement the New Floating Point Multiplication Variant (FP16 FMLAL, FMLSL) instructions from ARMv8.4. Only supported if has_fp16=0x1. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_frint	int	0x1	Implement floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_generic_authentication	int	0x1	Implement ARMv8.3 generic authentication. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_guest_translation_granule	int	0x1	Implement mechanism for guest translation granule identification from ARMv8.5, ID values determined by stage1 granule configuration parameters Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_hardware_translation_table_update	int	0x2	Type of hardware translation table supported (when enabled by hardware_translation_table_update_implemented). 0, not implemented. 1, access bit updates implemented. 2, access bit updates and dirty bit mechanism implemented.
has_hcrx_el2	int	0x1	Implements new HCRX_EL2 id register from Armv8.7 Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_id_reg_read	int	0x1	Implement read access to the ID registers (ESR_ELx.EC=0x18) Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_iesb	int	0x1	Implement support for implicit error sync event from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_jscvt	int	0x1	Implement ARMv8.3 javascript Floating-point to Integer conversion instruction. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_large_system_ext	bool	0x0	Implement the ARMv8 Large System Extensions.
has_large_va	int	0x0	Implement support for the extended 52-bit virtual addresses from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_ldapur_stlur	int	0x1	Implement support for LDAPR and STLR instructions with immediate offsets from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_ldm_stm_ordering_control	int	0x0	Implement the SCTLR_ELx.LSMAOE (Load/Store Multiple Atomicity and Ordering Enable) and SCTLR_ELx,nTLSMD (no Trap Load/Store Multiple to Device) controls from ARMv8.2. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_lrcpc	bool	0x0	If true then it support the RCpc feature (ARMv8.3)
has_mpam	int	0x0	Implement ARMv8.4 MPAM Registers and associated functionality. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_mt_pmu_disable_feature	int	0x0	Implements Multi-threading PMU disable extension from ARMv8.6 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_mte_ctrl_bits_stateful	bool	0x0	if memory_tagging_support_level == 1, Whether mte specific control bits in system registers are stateful
has_nested_virtualization	int	0x1	Implement ARMv8.3 nested virtualization. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_no_os_double_lock	int	0x0	Do not implement the OS double-lock. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_non_context_synchronizing_exception_controls	int	0x1	Implement cosmetic controls for whether exception entry and exit are context synchronizing events (SCTLR_ELx.{EIS,EOS}) from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_par_bit10_razwi	bool	0x0	Whether PAR_EL1[10] is RAZ/WI
has_pointer_authentication	int	0x1	Implement ARMv8.3 pointer authentication. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.
has_prediction_invalidation_instructions	int	0x1	Implement execution and data prediction invalidation from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_pstate_dit	int	0x1	Implement timing insensitivity of data processing instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_pstate_pan	int	0x1	Implement the PSTATE.PAN (Privileged Access Never) control from ARMv8.1 Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_pstate_uao	int	0x1	Implement the PSTATE.UAO (User Access Override) control from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_ras_armv84_extension	int	0x1	Implement ARMv8.4 RAS Extension. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_ras_critical_error	int	0x0	[DEPRECATED: Set CI field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Critical Error is implemented or not. 0 - Feature Not Supported, 1 - Feature always enabled, 2 - Feature is controllable.
has_ras_double_fault	int	0x1	Implement ARMv8.4 RAS Doublt Fault Extension. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_ras_fault_injection	int	0x0	[DEPRECATED: Set INJ field on first register in error_record_feature_register JSON instead] Implement ARMv8.4 Standard Fault Injection mechanism. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_ras_timestamp	int	0x0	[DEPRECATED: Set TS field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Timestamp register is implemented or not. 0 - No Timestamp is recorded, 1 - Generic Timer timestamp is recorded, 2 - IMP DEF timestamp is recorded.
has_restriction_on_speculative_data_loaded	int	0x1	Implements the ARMv8.5 security feature (Restrictions on the effects of speculation) Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_rndr	int	0x0	Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_rounding_doubling_multiply_add_subtract	int	0x1	Implement the rounding doubling multiply add and subtract instructions from ARMv8.1 Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.
has_secure_el2	int	0x1	Implement support for Secure EL2 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_self_hosted_trace_extension	int	0x1	Implement support for the Self-hosted Trace Extensions from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_small_page_table	int	0x1	Implement small page table support which increases the maximum value of TxSZ field from ARMv8.4. Note: will be unimplemented only if both has_small_page_table=0x0 and has_secure_el2=0x0. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_speculation_barrier_inst	int	0x1	Implement speculation barrier instruction (SB) from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_stage2_fwb	int	0x1	Implement HCR_EL2.FWB, stage 2 control of memory types and cacheability Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_stage2_xnx	int	0x1	Implement the extended XN[1:0] stage 2 control from ARMv8.2. Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.
has_stage2_xnx_in_aarch32	bool	0x1	Implement the extended XN[1:0] stage 2 control from ARMv8.2 for Aarch32.
has_statistical_profiling	bool	0x1	Whether Statistical Based Profiling is implemented
has_supersections	bool	0x1	Whether VMSAv8-32 supersection to support more than 32-bit PA using short descriptor is implemented.
has_tlb_conflict_abort	bool	0x0	Detected inconsistent TLB content generate aborts.
has_tlbi_range	int	0x1	Implement support for TLB Range Maintenance instructions (TLBI RVAE1, etc) from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_tlbi_to_outer_shareable	int	0x1	Implement support for TLB Maintenance instructions that extend to the Outer Shareable domain (TLBI VAE1OS, etc) from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_tlbi_ttl	int	0x1	Implement support for the TTL level hint in by-address TLB Maintenance instructions from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_unaligned_single_copy_atomicity	int	0x1	Implement support for SCTLR_ELx.nAA from ARMv8.4, and A64 atomic, exclusive and acquire/release instructions accessing unaligned bytes inside a 16byte window will not generate alignment fault. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_v8_4_debug_extension	int	0x1	Implement ARMv8.4 debug extensions Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
has_v8_4_pmu_extension	int	0x1	Implement PMU extension from ARMv8.4. Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_v8_5_debug_over_power_down	int	0x0	Implement ARMv8.5 Debug over powerdown Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_v8_5_pmu_extension	int	0x1	Implement PMU extension from ARMv8.5. Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_v8_5_spe_extension	int	0x1	Implement SPE extension from ARMv8.5 Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.
has_v8_6_pmu_events	int	0x1	Implements PMU events from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
has_v8_7_fp_enhancements	int	0x1	Implements the Floating Point enhancements from Armv8.7 (introduces FPCR.FIZ/AH/NEP, etc.) Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_v8_7_pmu_events	int	0x1	Implement PMU events from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_v8_7_pmu_extension	int	0x1	Implement PMU extension from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_v8_7_spe_extension	int	0x1	Implement SPE extension from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_vncr_el2	int	0x1	Implement support for nested virtualization enhancements from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
has_wfet_and_wfit	int	0x1	Implements WFE and WFI with Timeout from Armv8.7 Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
has_writebuffer	bool	0x0	Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.
has_xs	int	0x1	Implements Armv8.7 XS, TLBInXS, DSBnXS instruction Possible values of this parameter are: - 1, feature is implemented if Armv8.7 is enabled. - 2, feature is implemented.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
icache-log2linelen	int	0x0	If nonzero, Log2 of the instruction cache line length in bytes (valid values in range 4-8). Otherwise the value of cache-log2linelen is used.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-nprefetch	int	0x1	Number of next sequential instruction cache lines to prefetch. This is only used when icache-prefetch_enabled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-prefetch_level	int	0x0	0 based cache level at which instructions are pre-fetched. This is only used when icache-prefetch_enabled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_bus_width_in_bytes	int	0x8	L1 I-Cache read bus width in bytes used to calculate per-access timing annotations
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x8000	L1 I-Cache size in bytes.
icache-ways	int	0x2	L1 I-Cache number of ways (sets are implicit from size).
ignore_DBGPRCR_CWRR	bool	0x0	Ignore writes to the deprecated DBGPRCR.CWRR bit.
ignore_access_flag_update_by_at_ops	bool	0x0	If true, AT operations do not update access flag
ignore_large_address_top_bits_in_page_walk	bool	0x0	Whether page table bits [15:12] are ignored if PA_SIZE < 52 and output address is configured < 52 with large page
imp_def_functionality_behaviour	int	0x0	Behaviour of IMPLEMENTATION DEFINED registers and system instructions. 0, UNDEF. 1, RAZ/WI.
impdef_regs_and_unpred_from_implementation	string	""	Configure implementation defined registers and unpredictable behaviour to match the specified implementation. Requires a license for the selected implementation model. Use ARM_Cortex-A<num> or ARM_<codename> for licensed pre-release cores.

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
independent_cache_control_traps	int	0x0	Implement Independent Cache Control traps from ARMv8.5. 0, NO_SUPPORT. 1, SUPPORTED_BUT_NOT_FOR_TLB_MAINTENANCE_INSTRUCTIONS. 2, FULL_SUPPORT.
insert_iesb_before_exception	bool	0x0	If true then inserts an IESB before taking with Exception otherwise has no effect and IESB is taken after PState is changed due to the Exception.
instruction_tlb_size	int	0x0	Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB)
is_mt_res0	bool	0x0	If ARMv8.6 is not implemented, and PMUv3 is implemented, this parameter controls whether PMEVTYPER<n>.MT bit is RES0 or RW. For other implementations, this parameter has no effect
is_uniprocessor	bool	0x0	Value for the U bit in MPIDR. true disables L1 cache coherency protocols
l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l2cache-read_bus_width_in_bytes	int	0x8	L2 Cache read bus width in bytes used to calculate per-access timing annotations
l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l2cache-size	int	0x80000	L2 Cache size in bytes.
l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
l2cache-ways	int	0x10	L2 Cache number of ways (sets are implicit from size).
l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
l2cache-write_bus_width_in_bytes	int	0x8	L2 Cache write bus width in bytes used to calculate per-access timing annotations
l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
l3cache-mpamf.bwa_width_ns	int	0x10	L3 Cache width of MPAM bandwidth allocation fields for non-secure accesses.
l3cache-mpamf.bwa_width_s	int	0x10	L3 Cache width of MPAM bandwidth allocation fields for secure accesses.
l3cache-mpamf.cmax_width_ns	int	0x0	L3 Cache number of fractional bits in MPAM cache capacity partition control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
l3cache-mpamf.cmax_width_s	int	0x0	L3 Cache number of fractional bits in MPAM cache capacity partition control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
l3cache-mpamf.cpbm_width_ns	int	0x0	L3 Cache width of MPAM cache portion bitmap for non-secure accesses. If 0, the feature is not implemented, and all ways are available.
l3cache-mpamf.cpbm_width_s	int	0x0	L3 Cache width of MPAM cache portion bitmap for secure accesses. If 0, the feature is not implemented, and all ways are available.
l3cache-mpamf.csu_num_mon_ns	int	0x0	L3 Cache number of MPAM cache storage usage monitors for non-secure accesses.
l3cache-mpamf.csu_num_mon_s	int	0x0	L3 Cache number of MPAM cache storage usage monitors for secure accesses.
l3cache-mpamf.has_prop_ns	bool	0x0	Enable memory bandwidth proportional stride control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
l3cache-mpamf.has_prop_s	bool	0x0	Enable memory bandwidth proportional stride control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.
max_32bit_el	int	0x3	Maximum exception level supporting AArch32 modes.
memory.acp.AxCACHE_mask	int	0x0	Used with memory.acp.AxCACHE_pattern to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
memory.acp.AxCACHE_pattern	int	0x0	Used with memory.acp.AxCACHE_mask to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.
memory.l2_cache.is_inner_cacheable	bool	0x1	L2 cache obeys inner cacheable attributes (rather than outer cacheable attributes)
memory.l2_cache.is_inner_shareable	bool	0x1	L2 cache obeys inner shareable attributes (rather than outer sharaable attributes)
memory_tagging_support_level	int	0x0	Specify the memory tagging extension support level: 0, not implemented. 1, instructions and registers only are implemented. 2, implemented. 3, implemented with asymmetric handling of exceptions
mixed_endian	int	0x1	Implement support for mixed endianness. 0, not supported. 1, supported at all exception levels. 2, supported at EL0 only.
mpam_force_ns_rao	bool	0x0	Whether MPAM3_EL3.FORCE_NS bit is RAO/WI.
mpam_frac	int	0x0	MPAM fractional revision number in ID_AA64PFR1_EL1.MPAM_frac field
mpam_has_hcr	bool	0x0	MPAM Whether MPAMIDR_EL1 HAS_HCR bit is set or clear
mpam_max_partid	int	0xffff	MPAM Maximum PARTID Supported
mpam_max_pmg	int	0xff	MPAM Maximum PMG Supported
mpam_max_vpmr	int	0x0	MPAM Maximum VPMR Supported
mpamidr_has_force_ns	int	0x0	Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
mpamidr_has_sdeflt	int	0x0	Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
mpamidr_has_tidr	int	0x0	Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.
mvbar_reset_is_rvbar	bool	0x1	If true then the reset value of MVBAR is RVBAR, if false the reset value is UNKNOWN.
non_secure_vgic_alias_when_ns_only	int	0x0	If ! has_el3 and only non-secure side exists, then the normal position of the VGIC is a secure alias. If this parameter is non-zero then in addition a non-secure alias of the VGIC will be placed at this position (aligned to 32 KB).
num_loregion_descriptors	int	0x0	Number of Limited Ordering Region descriptors implemented (if ARM v8.1 extensions are implemented)
num_loregions	int	0x0	Number of Limited Ordering Regions implemented excluding background region (if ARM v8.1 extensions are implemented)

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
number_of_error_records	int	0x0	Cores Number of Error records supported for RAS
optimal_alignment_size	int	0x1	Alignment boundary which does not incur additional performance penalty from ARMv8.5. - 1, architectural misalignment is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] - 2, access crossing 4 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] - 3, access crossing 8 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] ... - 12, access crossing 4 Kbyte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]
output_attributes	string	"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS"	User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.
page_based_hardware_attributes	int	0x0	Implement the page based hardware attributes from ARMv8.2. This parameter indicates which page table bits are available for hardware, where bits[3:0] correspond to PTE[62:59] and to TCR_ELx.HWUnyy.
pmmir_el1_bus_slots	int	0x0	Largest value by which BUS_ACCESS can increment over BUS_CYCLES cycles. From v8.7 PMU extension
pmmir_el1_bus_width	int	0x0	Width, in bytes, of accesses counted by BUS_ACCESS. From v8.7 PMU extension
pseudo_fault_generation_feature_register	string	""	ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false,"UC":false,"UEU":false,"UER":false,"UEO":false,"DE":false,"CE":0x0,"CI":false,"ER":false,"PN":false,"AV":false,"MV":false,"SYN":false,"R":false},other_psuedo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.
pstate_ssbs_type	int	0x0	Implement speculative store bypass safe feature from ARMv8.5. 0, Not supported. 1, Supported without MSR/MRS access to SSBS. 2, fully supported.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
randomize_unknowns_at_reset	bool	0x0	Will fill in unknown bits in registers at reset with random value using register_reset_data as seed, it overrides scramble_unknowns_at_reset
ras_errselr_undef_if_no_error_records	bool	0x0	If true, ERRSELR_EL1 will be undefined if ERRIDR_EL1 indicates that zero error records are implemented.
ras_frac	int	0x0	0, No additional feature implemented. 1, Additional ERXMISC*, ERXPFG* registers and FaultInjection trap from RAS v1.1. implemented
register_reset_data	int	0x0	Data used to fill register bits when they become UNKNOWN at reset.
restriction_on_speculative_execution	int	0x0	Implements the ARMv8.5 security feature (Restrictions on the effects of speculation): 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx not supported), 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx supported)
rmr_always_implemented	bool	0x0	Always implement RMR_ELx, RMR, or HRMR at the highest implemented exception level, even if that exception level cannot use both AArch32 and AArch64.
rndr_rndrrs_seed	int	0x0	Initial seed for random engine used in RNDR register
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions.
scramble_unknowns_at_reset	bool	0x1	Will fill in unknown bits in registers at reset with register_reset_data
set_rasv10_for_armv84_and_higher	bool	0x0	ARMv8.4 mandates RAS System Architecture v1.1, but when there are no error records and ARMv8.4-DFE is not implemented then there is no functional difference between the RAS System Architecture v1.0 (that is, the RAS extension as in pre-ARMv8.4 implementations) and the RAS System Architecture v1.1 (also known as ARMv8.4-RAS). This flag if true will set the RAS ID to declare RAS v1.0 rather than RAS v1.1 for ARMv8.4 and higher implementations. If this is set and the core does not conform to the restrictions then this parameter is ignored.
spsr_el3_is_mapped_to_spsr_mon	bool	0x1	Whether SPSR_EL3 is mapped to AArch32 register SPSR_mon
spsr_m4_res0	bool	0x0	Whether SPSR_ELx.M[4] bit should be RES0 for AARCH64 only implementations
stage12_tlb_size	int	0x80	Number of stage1+2 tlb entries.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
stage1_tlb_size	int	0x0	Number of stage1 only tlb entries.
stage1_walkcache_size	int	0x0	Number of stage1 only walk cache entries.
stage2_tlb_size	int	0x0	Number of stage2 only tlb entries.
stage2_walkcache_size	int	0x0	Number of stage2 only walk cache entries.
statistical_profiling_buffer_alignment	int	0x1	Statistical profiling alignment constraint for sample buffer
statistical_profiling_random_interval_is_separate	bool	0x0	Statistical profiling random interval gets added to the main timer interval(false) or (true) runs as separate timer
statistical_profiling_recommended_min_sampling	int	0x100	Statistical profiling recommended minimum sampling interval
take_ccfail_tsc_trap	bool	0x0	When take_ccfail_undef=1 this prameter controls whether or not an SMC instruction that is trapped by HCR_EL2.TSC but fails its condition code check generates a trap to EL2.
take_ccfail_undef	bool	0x1	UNDEF exception is taken even if condition code check fails
tcr_ps_reserved_value_size	int	0x0	Physical size treated when TCR.(I)PS is programmed with a reserved value. 0, 48 bits. 1, 52 bits. The parameter value is treated 0 if LPA is not supported.
tcr_txsz_undersize_should_fault	bool	0x1	If large VA is not supported, Whether undersized TxSZ value should generate translation fault
tdosa_traps_osdlr_if_no_os_double_lock	bool	0x1	MDCR_EL*.TDOSA enables trap on OSDLR_EL1 and DBGOSDLR when OS double-lock is not implemented.
tidcp_traps_el0_undef_imp_def	bool	0x1	TIDCP has priority over UNDEF for accesses to IMPLEMENTATION DEFINED functionality from EL0
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
trace_physical_registers_when_host_virtualisation_enabled	int	0x0	When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers
treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
treat-dcache-invalidate-as-clean-invalidate	bool	0x0	Treat data cache invalidate operations as clean and invalidate.
undef_ccsidr2_access_for_unimplemented_aarch32	bool	0x0	Whether access to CCSIDR2 is undef if AArch32 is implemented or not
unification-level	int	0x1	Level of Unification Inner Shareable for the cache hierarchy
unification-uniprocessor-level	int	0x1	Level of Unification Uniprocessor for the cache hierarchy

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
unpred_nested_virtualization_nv_behaviour	int	0x0	Constrained unpredictable choices for HCR_EL2.NV=0 and HCR_EL2.NV1=1 with respect to nested virtualization - 0, Behave as defined in the sepcification as per bit values - 1, Behave as if HCR_EL2.NV=1 and HCR_EL2.NV1=1 for all purpose other than reading back HCR_EL2.NV - 2, Behave as if HCR_EL2.NV=0 and HCR_EL2.NV1=0 for all purpose other than reading back HCR_EL2.NV1
unpred_vncr_el2_ress_mismatch	int	0x0	Constrained unpredictable choices when bits marked as RESS do not all have the same value for VNCR_EL2 - 0, Generating an EL2 translation regime translation abort on use of the VNCR_EL2 register - 1, Reserved sign exteneded bits of VNCR_EL2 are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes other than reading back the register
unpred_zero_spsr_btype	bool	0x1	Constrained unpredictable control to make SPSR_ELx.BTYPE 0 instead of PSTATE.BTYPE on synchronous exceptions other than Software Step, PC alignment fault, Instruction Abort, Breakpoint or Address Matching Vector Catch, Illegal Execution State, BRK instruction, Branch Target
unpredictable_exclusive_abort_memtype	int	0x0	Cause MMU abort if exclusive access is not supported in certain memory type (0=exclusives allowed in all memory types, 1=exclusives abort in Device memory types, 2=exclusives abort in any type other than WB inner cacheable)
unpredictable_hvc_behaviour	int	0x0	HVC unpredictable behaviour. 0, UNDEF. 1, NOP.
unpredictable_smc_behaviour	int	0x0	SMC unpredictable behaviour. 0, UNDEF. 1, NOP.
use_Xt_as_LDG_STG_input	bool	0x1	Use new MTE Intructions formats for LDG/ST(Z)(2)G, which use Xt as an input
use_mte_eac_02_instructions_encoding	bool	0x1	Use new MTE Intructions encoding since MTE spec EAC 0.2 in ARMv8.5.
use_mte_eac_08_tfsr_encoding	bool	0x1	Use new MTE TFSR_ELx encodings since MTE spec EAC 0.8 in ARMv8.5.
use_rosetta_disass	int	0x1	Use Rosetta disassembly library. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
use_tlb_contig_hint	bool	0x0	Translation table entries with the contiguous hint bit set generate large TLB entries.
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks
warn_unpredictable_in_v7	bool	0x1	If true, behaviour which is unpredictable in V7 yet is predictable in V8 will produce a warning
watchpoint-log2secondary_restriction	int	0x0	log2 size of secondary restriction of FAR/EDWAR possible values on watchpoint hit for load/store operations.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-81 Parameters for Cluster_ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
wnr_is_read_for_s2f_on_s1_atomic_instr_fault	bool	0x0	Whether WnR is 0 for stage2 fault on stage1 for atomic instructions
wnr_is_read_for_s2f_on_s1_dbm_update	bool	0x0	Whether WnR is 0 for stage2 fault on stage1 descriptor dbm update

Table 3-82 Parameters for ARMAEMv8-A_MP

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CONFIG64	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CP15SDISABLE2	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.DCZID-log2-block-size	int	0x8	Log2 of the block size cleared by DC ZVA instruction (as read from DCZID_EL0).
cpu0.DCZVA_single_write	bool	0x0	Execute the DCZVA as a single write
cpu0.MPIDR-override	int	0x0	Override of MPIDR value. If nonzero will override the MT, cluster and CPU ID bits in MPIDR.
cpu0.RVBAR	int	0x0	Value of RVBAR_ELx register.
cpu0.RVBAR32	int	0x0	Reset vector address in AARCH32 when VINITHI is not set and ignore_rvbar_in_aarch32 is set
cpu0.SMPnAMP	bool	0x1	Enable broadcast messages necessary for correct SMP operation at reset.
cpu0.TEINIT	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.ase-present	bool	0x1	Set whether the model has been built with NEON support
cpu0.clock_divider	int	0x1	Clock divider ratio for asymmetric MP clocking.
cpu0.clock_multiplier	int	0x1	Clock divider ratio for asymmetric MP clocking.
cpu0.crypto_aes	int	0x2	AES instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, AES instructions implemented. 2, AES and PMULL instructions implemented.
cpu0.crypto_sha1	int	0x1	SHA-1 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA1 instructions implemented.
cpu0.crypto_sha256	int	0x1	SHA-256 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA256 instructions implemented.

Table 3-82 Parameters for ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
cpu0.crypto_sha3	int	0x0	Implement ARMv8.4 SHA-3 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.crypto_sha512	int	0x0	Implement ARMv8.4 SHA-512 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.crypto_sm3	int	0x0	Implement ARMv8.4 SM-3 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.crypto_sm4	int	0x0	Implement ARMv8.4 SM-4 instructions (requires CryptoPlugin to be loaded). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.
cpu0.cti-intack_mask	int	0x1	Set bits represent that the corresponding trigger requires software acknowledge via CTIINTACK
cpu0.cti-number_of_claim_bits	int	0x0	Number of implemented bits in CTICLAIMSET
cpu0.cti-number_of_triggers	int	0x8	Number of cti event triggers (default: 8, valid values: {3, 8-32})
cpu0.enable_crc32	int	0x0	CRC32 instructions supported. 0, not implemented. 1, CRC32 instructions implemented.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.etm-present	bool	0x1	Set whether the model has ETM support
cpu0.force-fpsid	bool	0x0	Override the FPSID value
cpu0.force-fpsid-value	int	0x0	Value to override the FPSID value to
cpu0.has_hcptr_tase	bool	0x1	If false, HCPTR.TASE is RES0
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.number-of-breakpoints	int	0x10	Number of breakpoints.
cpu0.number-of-context-breakpoints	int	0x10	Number of breakpoints that are context aware.
cpu0.number-of-watchpoints	int	0x10	Number of watchpoints.
cpu0.operation_bandwidth	int	0x1	Operation width for ARMv8.4 PMU extension
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-82 Parameters for ARMAEMv8-A_MP (continued)

Name	Type	Default value	Description
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.semihosting-stderr_istty	bool	0x1	Result for semihost istty call when argument is stderr
cpu0.semihosting-stdin_istty	bool	0x1	Result for semihost istty call when argument is stdin
cpu0.semihosting-stdout_istty	bool	0x1	Result for semihost istty call when argument is stdout
cpu0.semihosting-use_stderr	bool	0x0	Send stderr from the simulated process to host stderr
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.unpredictable_WPMASKANDBAS	int	0x1	Constrained unpredictable handling of watchpoints when mask and BAS fields specified. 0, IGNOREMASK. 1, IGNOREBAS (default). 2, REPEATBAS8. 3, REPEATBAS.
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support
cpu0.vfp-traps	bool	0x1	Implement support for trapping floating-point exceptions
cpu0.vfp-traps-show-all	bool	0x0	Report all trapped floating-point exceptions in the syndrome when a combination occurs.
cpu0.wfet_early_or_delayed_timeout	int	0x0	WFET early or delayed timeout beyond the threshold value of CNTVCT_EL0 in percentage.
cpu0.wfit_early_or_delayed_timeout	int	0x0	WFIT early or delayed timeout beyond the threshold value of CNTVCT_EL0 in percentage.

3.4.4 ARMAEMv8MCT

ARMAEMv8MCT CPU component. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARMAEMv8MCT contains the following CADI targets:

- ARM_AEMv8M

ARMAEMv8MCT contains the following MTI components:

- *4.5 ARM_AEMv8M - trace* on page 4-946
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761

Table 3-83 Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
ahbp_m	PVBus	Master	The core will generate Vendor System data accesses on this port.
ahbs	PVBus	Slave	External master (e.g. DMA) can write TCMs (whether or not enabled in xTCMCR).
auxfault	*Value* on page 2-85	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
coproc_bus	*CoprocBusProtocol* on page 2-81	Slave	Co-Processor Interface
cpuwait	*Signal* on page 2-85	Slave	When this signal is HIGH out of reset, it forces the processor into a quiescent state that delays its boot-up sequence and instruction execution until this signal is driven LOW.
currpri	*Value* on page 2-85	Master	Current execution priority.
dap_s	PVBus	Slave	Debug Access Port (DAP).
dbgen	*Signal* on page 2-85	Slave	Invasive debug enable.
dbgrestart	*Signal* on page 2-85	Slave	External debug request.
dbgrestarted	*Signal* on page 2-85	Master	External debug request.
edbgrq	*Signal* on page 2-85	Slave	External debug request.
etm_reset	*Signal* on page 2-85	Slave	Separate reset for ETM, if param "has_etm_reset" is true.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	*Value* on page 2-85	Master	Port which sends the value of the FPXXC cumulative exception flags.
halted	*Signal* on page 2-85	Master	External debug request.
idau	PVBus	Master	The core will generate IDAU Bus request.

Non-Confidential

Table 3-83 Ports (continued)

Name	Protocol	Type	Description
idau_invalidate_region	*Value_64* on page 2-85	Slave	64 bit number to invalid IDAU memory ranage (start_address<<32|end_address)
initpahben	*Signal* on page 2-85	Slave	Enable P-AHB on the next reset
initvtor_ns	*Value* on page 2-85	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initvtor_s	*Value* on page 2-85	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
intisr[496]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
intnmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
intnum	*Value* on page 2-85	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
io_port_in	PVBus	Slave	I/O port pair. See the documentation for the io_port_out port.
io_port_out	PVBus	Master	I/O port pair. Used if IOP is true. Transactions from io_port_out which do not "match" should be returned via io_port_in. For performance reasons, the I/O port interface is not modelled directly. Instead, a simple PVBus gasket is inserted at the point in the memory system where the I/O port would be. In hardware, a device would be attached to the port which would tell the CPU whether it would like to intercept each transaction, given its address. This can be modelled in a performant manner by connecting a PVBusMapper-based device to io_port_out which intercepts transactions of interest and passes other transactions back to the CPU via io_port_in. Your I/O port device model is also responsible for aborting transactions which would be aborted on hardware (e.g. exclusives) if necessary.
lockdcaic	*Signal* on page 2-85	Slave	-
locknsmpu	*Signal* on page 2-85	Slave	Disable writes to the Non-Secure MPU_*_NS registers
locknsvtor	*Signal* on page 2-85	Slave	Disable writes to VTOR_NS
lockpahb	*Signal* on page 2-85	Slave	P-AHB related ports Disable writes to PAHBCR
locksau	*Signal* on page 2-85	Slave	Disable writes to the SAU_* registers
locksmpu	*Signal* on page 2-85	Slave	Disable writes to the Secure MPU_* registers

Table 3-83 Ports (continued)

Name	Protocol	Type	Description
locksvtaircr	*Signal* on page 2-85	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
niden	*Signal* on page 2-85	Slave	Non-invasive debug enable.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
spiden	*Signal* on page 2-85	Slave	Secure invasive debug enable.
spniden	*Signal* on page 2-85	Slave	Secure non-invasive debug enable.
stcalib[2]	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.

Table 3-84 Parameters for ARM_AEMv8M

Name	Type	Default value	Description
AIRCR.ENDIANNESS	bool	0x0	Initialize processor to big endian mode
BB_PRESENT	bool	0x0	Enable bitbanding
CFGMEMALIAS	int	0x0	Memory address alias bit for the ITCM, DTCM and P-AHB regions. 0=No alias, 1=Alias bit 24, 2=Alias bit 25, 4=Alias bit 26, 8=Alias bit 27, 16=Alias bit 28
CFGPAHBSZ	int	0x0	Size of the P-AHB peripheral port memory region. 0=P-AHB disabled, 1=64MB, 2=128MB, 3=256MB, 4=512MB
DTGU	bool	0x0	DTCM Security Gate Unit included
DTGUBLKSZ	int	0x3	DTCM gate unit block size. Size=pow(2, DTGUBLKSZ + 5) bytes

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
DTGUMAXBLKS	int	0x0	Maxiumum number of DTCM gate unit blocks. Number of blocks=pow(2, DTGUMAXBLKS)
DWT_CTRL.NOCYCCNT	bool	0x0	DWT cycle-counter not present (v8M_bl/v6M never have one).
DWT_CTRL.NOPRFCNT	bool	0x0	DWT performance-counters not present (v8M_bl/v6M never have them).
DWT_CTRL.NUMCOMP	int	0x4	Number of watchpoint unit comparators implemented
DWT_DEVARCH.REVISION	int	0x1	0: V2, 1: V2.1.
DWT_FUNCTION0.ID	int	0xb	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION0. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION1.ID	int	0x1e	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION1. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION10.ID	int	0xb	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION10. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION11.ID	int	0x1e	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION11. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION12.ID	int	0xb	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION12. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION13.ID	int	0x1e	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION13. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION14.ID	int	0xb	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION14. If 'baseline' is set, invalid ID bits are cleared

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
DWT_FUNCTION15.ID	int	0x1e	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION15. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION2.ID	int	0xb	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION2. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION3.ID	int	0x1e	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION3. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION4.ID	int	0xb	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION4. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION5.ID	int	0x1e	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION5. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION6.ID	int	0xb	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION6. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION7.ID	int	0x1e	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION7. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION8.ID	int	0xb	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION8. If 'baseline' is set, invalid ID bits are cleared
DWT_FUNCTION9.ID	int	0x1e	Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION9. If 'baseline' is set, invalid ID bits are cleared

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
DWT_TRACE	bool	0x1	Support for DWT trace, controls the DWT_CTRL.NOTRCPKT bit. false : No DWT trace included, true: DWT trace included
FP_CTRL.NUM_CODE	int	0x8	Number of breakpoint unit comparators implemented (limited to 15 in V6M or baseline)
FP_CTRL.NUM_LIT	int	0x0	How many Literals FPB supports remapping (ignored if baseline or TZM)
FP_REMAP.RMPSPT	bool	0x1	FPB supports remapping (ignored if baseline or SECEXT)
ID_DFR0.Debug_Model_M_profile	bool	0x1	Set whether debug extensions are implemented
INITPAHBEN	bool	0x0	The P-AHB enable state at reset
INITVTOR_NS	int	0x0	Non-Secure vector-table offset at reset
INITVTOR_S	int	0x0	Secure vector-table offset at reset
ITGU	bool	0x0	ITCM Security Gate Unit included
ITGUBLKSZ	int	0x3	ITCM gate unit block size. Size=pow(2, ITGUBLKSZ + 5) bytes
ITGUMAXBLKS	int	0x0	Maxiumum number of ITCM gate unit blocks. Number of blocks=pow(2, ITGUMAXBLKS)
ITM	bool	0x1	Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included (unless baseline)
ITM_HAS_LSR	bool	0x1	ITM support LAR and LSR for software lock
LOCKDTGU	bool	0x0	Lock down of Data TGU registers write
LOCKITGU	bool	0x0	Lock down of Instruction TGU registers write
LOCKTCM	bool	0x0	Lock down of TCM registers write
LVL_WIDTH	int	0x3	Number of bits of interrupt priority (baseline has 2)
MPU_TYPE_NS.DREGION	int	0x10	Number of regions in the Non-Secure MPU. If Security Extentions are absent, this is the total number of MPU regions

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
MPU_TYPE_S.DREGION	int	0x10	Number of regions in the Secure MPU. If Security Extentions are absent, this is ignored
MVFR0.Double-precision	bool	0x1	Support 8-byte floats
NUM_IRQ	int	0x10	Number of user interrupts
REGISTER_POP_ORDER	string	"R0-R3,R12,R14,RETURN_ADDR,CPSR,S0-S15,FPSCR,PADDING,S16-S31"	Order in which the registers are popped off the stack during exception return. A comma separated list of register names and ranges.
REGISTER_PUSH_ORDER	string	"R0-R3,R12,R14,RETURN_ADDR,CPSR,S0-S15,FPSCR,PADDING,S16-S31"	Order in which the registers are pushed on to the stack during exception handling. A comma separated list of register names and ranges.
SAU_CTRL.ALLNS	bool	0x0	At reset, the SAU treats entire memory space as NS when the SAU is disabled if this is set
SAU_CTRL.ENABLE	bool	0x0	Enable SAU at reset
SAU_REGION0.BADDR	int	0x0	Base address of SAU region0 at reset
SAU_REGION0.ENABLE	bool	0x0	Enable SAU region0 at reset
SAU_REGION0.LADDR	int	0x0	Limit address of SAU region0 at reset
SAU_REGION0.NSC	bool	0x0	Set NSC for SAU region0 at reset
SAU_REGION1.BADDR	int	0x0	Base address of SAU region1 at reset
SAU_REGION1.ENABLE	bool	0x0	Enable SAU region1 at reset
SAU_REGION1.LADDR	int	0x0	Limit address of SAU region1 at reset
SAU_REGION1.NSC	bool	0x0	Set NSC for SAU region1 at reset
SAU_REGION10.BADDR	int	0x0	Base address of SAU region10 at reset
SAU_REGION10.ENABLE	bool	0x0	Enable SAU region10 at reset
SAU_REGION10.LADDR	int	0x0	Limit address of SAU region10 at reset
SAU_REGION10.NSC	bool	0x0	Set NSC for SAU region10 at reset
SAU_REGION11.BADDR	int	0x0	Base address of SAU region11 at reset
SAU_REGION11.ENABLE	bool	0x0	Enable SAU region11 at reset
SAU_REGION11.LADDR	int	0x0	Limit address of SAU region11 at reset
SAU_REGION11.NSC	bool	0x0	Set NSC for SAU region11 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION12.BADDR	int	0x0	Base address of SAU region12 at reset
SAU_REGION12.ENABLE	bool	0x0	Enable SAU region12 at reset
SAU_REGION12.LADDR	int	0x0	Limit address of SAU region12 at reset
SAU_REGION12.NSC	bool	0x0	Set NSC for SAU region12 at reset
SAU_REGION13.BADDR	int	0x0	Base address of SAU region13 at reset
SAU_REGION13.ENABLE	bool	0x0	Enable SAU region13 at reset
SAU_REGION13.LADDR	int	0x0	Limit address of SAU region13 at reset
SAU_REGION13.NSC	bool	0x0	Set NSC for SAU region13 at reset
SAU_REGION14.BADDR	int	0x0	Base address of SAU region14 at reset
SAU_REGION14.ENABLE	bool	0x0	Enable SAU region14 at reset
SAU_REGION14.LADDR	int	0x0	Limit address of SAU region14 at reset
SAU_REGION14.NSC	bool	0x0	Set NSC for SAU region14 at reset
SAU_REGION15.BADDR	int	0x0	Base address of SAU region15 at reset
SAU_REGION15.ENABLE	bool	0x0	Enable SAU region15 at reset
SAU_REGION15.LADDR	int	0x0	Limit address of SAU region15 at reset
SAU_REGION15.NSC	bool	0x0	Set NSC for SAU region15 at reset
SAU_REGION16.BADDR	int	0x0	Base address of SAU region16 at reset
SAU_REGION16.ENABLE	bool	0x0	Enable SAU region16 at reset
SAU_REGION16.LADDR	int	0x0	Limit address of SAU region16 at reset
SAU_REGION16.NSC	bool	0x0	Set NSC for SAU region16 at reset
SAU_REGION17.BADDR	int	0x0	Base address of SAU region17 at reset
SAU_REGION17.ENABLE	bool	0x0	Enable SAU region17 at reset
SAU_REGION17.LADDR	int	0x0	Limit address of SAU region17 at reset
SAU_REGION17.NSC	bool	0x0	Set NSC for SAU region17 at reset
SAU_REGION18.BADDR	int	0x0	Base address of SAU region18 at reset
SAU_REGION18.ENABLE	bool	0x0	Enable SAU region18 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION18.LADDR	int	0x0	Limit address of SAU region18 at reset
SAU_REGION18.NSC	bool	0x0	Set NSC for SAU region18 at reset
SAU_REGION19.BADDR	int	0x0	Base address of SAU region19 at reset
SAU_REGION19.ENABLE	bool	0x0	Enable SAU region19 at reset
SAU_REGION19.LADDR	int	0x0	Limit address of SAU region19 at reset
SAU_REGION19.NSC	bool	0x0	Set NSC for SAU region19 at reset
SAU_REGION2.BADDR	int	0x0	Base address of SAU region2 at reset
SAU_REGION2.ENABLE	bool	0x0	Enable SAU region2 at reset
SAU_REGION2.LADDR	int	0x0	Limit address of SAU region2 at reset
SAU_REGION2.NSC	bool	0x0	Set NSC for SAU region2 at reset
SAU_REGION20.BADDR	int	0x0	Base address of SAU region20 at reset
SAU_REGION20.ENABLE	bool	0x0	Enable SAU region20 at reset
SAU_REGION20.LADDR	int	0x0	Limit address of SAU region20 at reset
SAU_REGION20.NSC	bool	0x0	Set NSC for SAU region20 at reset
SAU_REGION21.BADDR	int	0x0	Base address of SAU region21 at reset
SAU_REGION21.ENABLE	bool	0x0	Enable SAU region21 at reset
SAU_REGION21.LADDR	int	0x0	Limit address of SAU region21 at reset
SAU_REGION21.NSC	bool	0x0	Set NSC for SAU region21 at reset
SAU_REGION22.BADDR	int	0x0	Base address of SAU region22 at reset
SAU_REGION22.ENABLE	bool	0x0	Enable SAU region22 at reset
SAU_REGION22.LADDR	int	0x0	Limit address of SAU region22 at reset
SAU_REGION22.NSC	bool	0x0	Set NSC for SAU region22 at reset
SAU_REGION23.BADDR	int	0x0	Base address of SAU region23 at reset
SAU_REGION23.ENABLE	bool	0x0	Enable SAU region23 at reset
SAU_REGION23.LADDR	int	0x0	Limit address of SAU region23 at reset
SAU_REGION23.NSC	bool	0x0	Set NSC for SAU region23 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION24.BADDR	int	0x0	Base address of SAU region24 at reset
SAU_REGION24.ENABLE	bool	0x0	Enable SAU region24 at reset
SAU_REGION24.LADDR	int	0x0	Limit address of SAU region24 at reset
SAU_REGION24.NSC	bool	0x0	Set NSC for SAU region24 at reset
SAU_REGION25.BADDR	int	0x0	Base address of SAU region25 at reset
SAU_REGION25.ENABLE	bool	0x0	Enable SAU region25 at reset
SAU_REGION25.LADDR	int	0x0	Limit address of SAU region25 at reset
SAU_REGION25.NSC	bool	0x0	Set NSC for SAU region25 at reset
SAU_REGION26.BADDR	int	0x0	Base address of SAU region26 at reset
SAU_REGION26.ENABLE	bool	0x0	Enable SAU region26 at reset
SAU_REGION26.LADDR	int	0x0	Limit address of SAU region26 at reset
SAU_REGION26.NSC	bool	0x0	Set NSC for SAU region26 at reset
SAU_REGION27.BADDR	int	0x0	Base address of SAU region27 at reset
SAU_REGION27.ENABLE	bool	0x0	Enable SAU region27 at reset
SAU_REGION27.LADDR	int	0x0	Limit address of SAU region27 at reset
SAU_REGION27.NSC	bool	0x0	Set NSC for SAU region27 at reset
SAU_REGION28.BADDR	int	0x0	Base address of SAU region28 at reset
SAU_REGION28.ENABLE	bool	0x0	Enable SAU region28 at reset
SAU_REGION28.LADDR	int	0x0	Limit address of SAU region28 at reset
SAU_REGION28.NSC	bool	0x0	Set NSC for SAU region28 at reset
SAU_REGION29.BADDR	int	0x0	Base address of SAU region29 at reset
SAU_REGION29.ENABLE	bool	0x0	Enable SAU region29 at reset
SAU_REGION29.LADDR	int	0x0	Limit address of SAU region29 at reset
SAU_REGION29.NSC	bool	0x0	Set NSC for SAU region29 at reset
SAU_REGION3.BADDR	int	0x0	Base address of SAU region3 at reset
SAU_REGION3.ENABLE	bool	0x0	Enable SAU region3 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION3.LADDR	int	0x0	Limit address of SAU region3 at reset
SAU_REGION3.NSC	bool	0x0	Set NSC for SAU region3 at reset
SAU_REGION30.BADDR	int	0x0	Base address of SAU region30 at reset
SAU_REGION30.ENABLE	bool	0x0	Enable SAU region30 at reset
SAU_REGION30.LADDR	int	0x0	Limit address of SAU region30 at reset
SAU_REGION30.NSC	bool	0x0	Set NSC for SAU region30 at reset
SAU_REGION31.BADDR	int	0x0	Base address of SAU region31 at reset
SAU_REGION31.ENABLE	bool	0x0	Enable SAU region31 at reset
SAU_REGION31.LADDR	int	0x0	Limit address of SAU region31 at reset
SAU_REGION31.NSC	bool	0x0	Set NSC for SAU region31 at reset
SAU_REGION32.BADDR	int	0x0	Base address of SAU region32 at reset
SAU_REGION32.ENABLE	bool	0x0	Enable SAU region32 at reset
SAU_REGION32.LADDR	int	0x0	Limit address of SAU region32 at reset
SAU_REGION32.NSC	bool	0x0	Set NSC for SAU region32 at reset
SAU_REGION33.BADDR	int	0x0	Base address of SAU region33 at reset
SAU_REGION33.ENABLE	bool	0x0	Enable SAU region33 at reset
SAU_REGION33.LADDR	int	0x0	Limit address of SAU region33 at reset
SAU_REGION33.NSC	bool	0x0	Set NSC for SAU region33 at reset
SAU_REGION34.BADDR	int	0x0	Base address of SAU region34 at reset
SAU_REGION34.ENABLE	bool	0x0	Enable SAU region34 at reset
SAU_REGION34.LADDR	int	0x0	Limit address of SAU region34 at reset
SAU_REGION34.NSC	bool	0x0	Set NSC for SAU region34 at reset
SAU_REGION35.BADDR	int	0x0	Base address of SAU region35 at reset
SAU_REGION35.ENABLE	bool	0x0	Enable SAU region35 at reset
SAU_REGION35.LADDR	int	0x0	Limit address of SAU region35 at reset
SAU_REGION35.NSC	bool	0x0	Set NSC for SAU region35 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION36.BADDR	int	0x0	Base address of SAU region36 at reset
SAU_REGION36.ENABLE	bool	0x0	Enable SAU region36 at reset
SAU_REGION36.LADDR	int	0x0	Limit address of SAU region36 at reset
SAU_REGION36.NSC	bool	0x0	Set NSC for SAU region36 at reset
SAU_REGION37.BADDR	int	0x0	Base address of SAU region37 at reset
SAU_REGION37.ENABLE	bool	0x0	Enable SAU region37 at reset
SAU_REGION37.LADDR	int	0x0	Limit address of SAU region37 at reset
SAU_REGION37.NSC	bool	0x0	Set NSC for SAU region37 at reset
SAU_REGION38.BADDR	int	0x0	Base address of SAU region38 at reset
SAU_REGION38.ENABLE	bool	0x0	Enable SAU region38 at reset
SAU_REGION38.LADDR	int	0x0	Limit address of SAU region38 at reset
SAU_REGION38.NSC	bool	0x0	Set NSC for SAU region38 at reset
SAU_REGION39.BADDR	int	0x0	Base address of SAU region39 at reset
SAU_REGION39.ENABLE	bool	0x0	Enable SAU region39 at reset
SAU_REGION39.LADDR	int	0x0	Limit address of SAU region39 at reset
SAU_REGION39.NSC	bool	0x0	Set NSC for SAU region39 at reset
SAU_REGION4.BADDR	int	0x0	Base address of SAU region4 at reset
SAU_REGION4.ENABLE	bool	0x0	Enable SAU region4 at reset
SAU_REGION4.LADDR	int	0x0	Limit address of SAU region4 at reset
SAU_REGION4.NSC	bool	0x0	Set NSC for SAU region4 at reset
SAU_REGION40.BADDR	int	0x0	Base address of SAU region40 at reset
SAU_REGION40.ENABLE	bool	0x0	Enable SAU region40 at reset
SAU_REGION40.LADDR	int	0x0	Limit address of SAU region40 at reset
SAU_REGION40.NSC	bool	0x0	Set NSC for SAU region40 at reset
SAU_REGION41.BADDR	int	0x0	Base address of SAU region41 at reset
SAU_REGION41.ENABLE	bool	0x0	Enable SAU region41 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION41.LADDR	int	0x0	Limit address of SAU region41 at reset
SAU_REGION41.NSC	bool	0x0	Set NSC for SAU region41 at reset
SAU_REGION42.BADDR	int	0x0	Base address of SAU region42 at reset
SAU_REGION42.ENABLE	bool	0x0	Enable SAU region42 at reset
SAU_REGION42.LADDR	int	0x0	Limit address of SAU region42 at reset
SAU_REGION42.NSC	bool	0x0	Set NSC for SAU region42 at reset
SAU_REGION43.BADDR	int	0x0	Base address of SAU region43 at reset
SAU_REGION43.ENABLE	bool	0x0	Enable SAU region43 at reset
SAU_REGION43.LADDR	int	0x0	Limit address of SAU region43 at reset
SAU_REGION43.NSC	bool	0x0	Set NSC for SAU region43 at reset
SAU_REGION44.BADDR	int	0x0	Base address of SAU region44 at reset
SAU_REGION44.ENABLE	bool	0x0	Enable SAU region44 at reset
SAU_REGION44.LADDR	int	0x0	Limit address of SAU region44 at reset
SAU_REGION44.NSC	bool	0x0	Set NSC for SAU region44 at reset
SAU_REGION45.BADDR	int	0x0	Base address of SAU region45 at reset
SAU_REGION45.ENABLE	bool	0x0	Enable SAU region45 at reset
SAU_REGION45.LADDR	int	0x0	Limit address of SAU region45 at reset
SAU_REGION45.NSC	bool	0x0	Set NSC for SAU region45 at reset
SAU_REGION46.BADDR	int	0x0	Base address of SAU region46 at reset
SAU_REGION46.ENABLE	bool	0x0	Enable SAU region46 at reset
SAU_REGION46.LADDR	int	0x0	Limit address of SAU region46 at reset
SAU_REGION46.NSC	bool	0x0	Set NSC for SAU region46 at reset
SAU_REGION47.BADDR	int	0x0	Base address of SAU region47 at reset
SAU_REGION47.ENABLE	bool	0x0	Enable SAU region47 at reset
SAU_REGION47.LADDR	int	0x0	Limit address of SAU region47 at reset
SAU_REGION47.NSC	bool	0x0	Set NSC for SAU region47 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION48.BADDR	int	0x0	Base address of SAU region48 at reset
SAU_REGION48.ENABLE	bool	0x0	Enable SAU region48 at reset
SAU_REGION48.LADDR	int	0x0	Limit address of SAU region48 at reset
SAU_REGION48.NSC	bool	0x0	Set NSC for SAU region48 at reset
SAU_REGION49.BADDR	int	0x0	Base address of SAU region49 at reset
SAU_REGION49.ENABLE	bool	0x0	Enable SAU region49 at reset
SAU_REGION49.LADDR	int	0x0	Limit address of SAU region49 at reset
SAU_REGION49.NSC	bool	0x0	Set NSC for SAU region49 at reset
SAU_REGION5.BADDR	int	0x0	Base address of SAU region5 at reset
SAU_REGION5.ENABLE	bool	0x0	Enable SAU region5 at reset
SAU_REGION5.LADDR	int	0x0	Limit address of SAU region5 at reset
SAU_REGION5.NSC	bool	0x0	Set NSC for SAU region5 at reset
SAU_REGION50.BADDR	int	0x0	Base address of SAU region50 at reset
SAU_REGION50.ENABLE	bool	0x0	Enable SAU region50 at reset
SAU_REGION50.LADDR	int	0x0	Limit address of SAU region50 at reset
SAU_REGION50.NSC	bool	0x0	Set NSC for SAU region50 at reset
SAU_REGION51.BADDR	int	0x0	Base address of SAU region51 at reset
SAU_REGION51.ENABLE	bool	0x0	Enable SAU region51 at reset
SAU_REGION51.LADDR	int	0x0	Limit address of SAU region51 at reset
SAU_REGION51.NSC	bool	0x0	Set NSC for SAU region51 at reset
SAU_REGION52.BADDR	int	0x0	Base address of SAU region52 at reset
SAU_REGION52.ENABLE	bool	0x0	Enable SAU region52 at reset
SAU_REGION52.LADDR	int	0x0	Limit address of SAU region52 at reset
SAU_REGION52.NSC	bool	0x0	Set NSC for SAU region52 at reset
SAU_REGION53.BADDR	int	0x0	Base address of SAU region53 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION53.LADDR	int	0x0	Limit address of SAU region53 at reset
SAU_REGION53.NSC	bool	0x0	Set NSC for SAU region53 at reset
SAU_REGION54.BADDR	int	0x0	Base address of SAU region54 at reset
SAU_REGION54.ENABLE	bool	0x0	Enable SAU region54 at reset
SAU_REGION54.LADDR	int	0x0	Limit address of SAU region54 at reset
SAU_REGION54.NSC	bool	0x0	Set NSC for SAU region54 at reset
SAU_REGION55.BADDR	int	0x0	Base address of SAU region55 at reset
SAU_REGION55.ENABLE	bool	0x0	Enable SAU region55 at reset
SAU_REGION55.LADDR	int	0x0	Limit address of SAU region55 at reset
SAU_REGION55.NSC	bool	0x0	Set NSC for SAU region55 at reset
SAU_REGION56.BADDR	int	0x0	Base address of SAU region56 at reset
SAU_REGION56.ENABLE	bool	0x0	Enable SAU region56 at reset
SAU_REGION56.LADDR	int	0x0	Limit address of SAU region56 at reset
SAU_REGION56.NSC	bool	0x0	Set NSC for SAU region56 at reset
SAU_REGION57.BADDR	int	0x0	Base address of SAU region57 at reset
SAU_REGION57.ENABLE	bool	0x0	Enable SAU region57 at reset
SAU_REGION57.LADDR	int	0x0	Limit address of SAU region57 at reset
SAU_REGION57.NSC	bool	0x0	Set NSC for SAU region57 at reset
SAU_REGION58.BADDR	int	0x0	Base address of SAU region58 at reset
SAU_REGION58.ENABLE	bool	0x0	Enable SAU region58 at reset
SAU_REGION58.LADDR	int	0x0	Limit address of SAU region58 at reset
SAU_REGION58.NSC	bool	0x0	Set NSC for SAU region58 at reset
SAU_REGION59.BADDR	int	0x0	Base address of SAU region59 at reset
SAU_REGION59.ENABLE	bool	0x0	Enable SAU region59 at reset
SAU_REGION59.LADDR	int	0x0	Limit address of SAU region59 at reset
SAU_REGION59.NSC	bool	0x0	Set NSC for SAU region59 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION6.BADDR	int	0x0	Base address of SAU region6 at reset
SAU_REGION6.ENABLE	bool	0x0	Enable SAU region6 at reset
SAU_REGION6.LADDR	int	0x0	Limit address of SAU region6 at reset
SAU_REGION6.NSC	bool	0x0	Set NSC for SAU region6 at reset
SAU_REGION60.BADDR	int	0x0	Base address of SAU region60 at reset
SAU_REGION60.ENABLE	bool	0x0	Enable SAU region60 at reset
SAU_REGION60.LADDR	int	0x0	Limit address of SAU region60 at reset
SAU_REGION60.NSC	bool	0x0	Set NSC for SAU region60 at reset
SAU_REGION61.BADDR	int	0x0	Base address of SAU region61 at reset
SAU_REGION61.ENABLE	bool	0x0	Enable SAU region61 at reset
SAU_REGION61.LADDR	int	0x0	Limit address of SAU region61 at reset
SAU_REGION61.NSC	bool	0x0	Set NSC for SAU region61 at reset
SAU_REGION62.BADDR	int	0x0	Base address of SAU region62 at reset
SAU_REGION62.ENABLE	bool	0x0	Enable SAU region62 at reset
SAU_REGION62.LADDR	int	0x0	Limit address of SAU region62 at reset
SAU_REGION62.NSC	bool	0x0	Set NSC for SAU region62 at reset
SAU_REGION63.BADDR	int	0x0	Base address of SAU region63 at reset
SAU_REGION63.ENABLE	bool	0x0	Enable SAU region63 at reset
SAU_REGION63.LADDR	int	0x0	Limit address of SAU region63 at reset
SAU_REGION63.NSC	bool	0x0	Set NSC for SAU region63 at reset
SAU_REGION64.BADDR	int	0x0	Base address of SAU region64 at reset
SAU_REGION64.ENABLE	bool	0x0	Enable SAU region64 at reset
SAU_REGION64.LADDR	int	0x0	Limit address of SAU region64 at reset
SAU_REGION64.NSC	bool	0x0	Set NSC for SAU region64 at reset
SAU_REGION65.BADDR	int	0x0	Base address of SAU region65 at reset
SAU_REGION65.ENABLE	bool	0x0	Enable SAU region65 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION65.LADDR	int	0x0	Limit address of SAU region65 at reset
SAU_REGION65.NSC	bool	0x0	Set NSC for SAU region65 at reset
SAU_REGION66.BADDR	int	0x0	Base address of SAU region66 at reset
SAU_REGION66.ENABLE	bool	0x0	Enable SAU region66 at reset
SAU_REGION66.LADDR	int	0x0	Limit address of SAU region66 at reset
SAU_REGION66.NSC	bool	0x0	Set NSC for SAU region66 at reset
SAU_REGION67.BADDR	int	0x0	Base address of SAU region67 at reset
SAU_REGION67.ENABLE	bool	0x0	Enable SAU region67 at reset
SAU_REGION67.LADDR	int	0x0	Limit address of SAU region67 at reset
SAU_REGION67.NSC	bool	0x0	Set NSC for SAU region67 at reset
SAU_REGION68.BADDR	int	0x0	Base address of SAU region68 at reset
SAU_REGION68.ENABLE	bool	0x0	Enable SAU region68 at reset
SAU_REGION68.LADDR	int	0x0	Limit address of SAU region68 at reset
SAU_REGION68.NSC	bool	0x0	Set NSC for SAU region68 at reset
SAU_REGION69.BADDR	int	0x0	Base address of SAU region69 at reset
SAU_REGION69.ENABLE	bool	0x0	Enable SAU region69 at reset
SAU_REGION69.LADDR	int	0x0	Limit address of SAU region69 at reset
SAU_REGION69.NSC	bool	0x0	Set NSC for SAU region69 at reset
SAU_REGION7.BADDR	int	0x0	Base address of SAU region7 at reset
SAU_REGION7.ENABLE	bool	0x0	Enable SAU region7 at reset
SAU_REGION7.LADDR	int	0x0	Limit address of SAU region7 at reset
SAU_REGION7.NSC	bool	0x0	Set NSC for SAU region7 at reset
SAU_REGION70.BADDR	int	0x0	Base address of SAU region70 at reset
SAU_REGION70.ENABLE	bool	0x0	Enable SAU region70 at reset
SAU_REGION70.LADDR	int	0x0	Limit address of SAU region70 at reset
SAU_REGION70.NSC	bool	0x0	Set NSC for SAU region70 at reset

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
SAU_REGION71.BADDR	int	0x0	Base address of SAU region71 at reset
SAU_REGION71.ENABLE	bool	0x0	Enable SAU region71 at reset
SAU_REGION71.LADDR	int	0x0	Limit address of SAU region71 at reset
SAU_REGION71.NSC	bool	0x0	Set NSC for SAU region71 at reset
SAU_REGION72.BADDR	int	0x0	Base address of SAU region72 at reset
SAU_REGION72.ENABLE	bool	0x0	Enable SAU region72 at reset
SAU_REGION72.LADDR	int	0x0	Limit address of SAU region72 at reset
SAU_REGION72.NSC	bool	0x0	Set NSC for SAU region72 at reset
SAU_REGION73.BADDR	int	0x0	Base address of SAU region73 at reset
SAU_REGION73.ENABLE	bool	0x0	Enable SAU region73 at reset
SAU_REGION73.NSC	bool	0x0	Set NSC for SAU region73 at reset
SAU_REGION8.BADDR	int	0x0	Base address of SAU region8 at reset
SAU_REGION8.ENABLE	bool	0x0	Enable SAU region8 at reset
SAU_REGION8.LADDR	int	0x0	Limit address of SAU region8 at reset
SAU_REGION8.NSC	bool	0x0	Set NSC for SAU region8 at reset
SAU_REGION9.BADDR	int	0x0	Base address of SAU region9 at reset
SAU_REGION9.ENABLE	bool	0x0	Enable SAU region9 at reset
SAU_REGION9.LADDR	int	0x0	Limit address of SAU region9 at reset
SAU_REGION9.NSC	bool	0x0	Set NSC for SAU region9 at reset
SAU_TYPE.SREGION	int	0x10	Number of SAU regions (0 => no SAU)
VTOR_NS	bool	0x1	NonSecure Vector Table Offset Register is writeable
VTOR_NS_MASK	int	0xffffff80	Non-Secure VTOR write mask
VTOR_S	bool	0x1	Secure Vector Table Offset Register is writeable
VTOR_S_MASK	int	0xffffff80	Secure VTOR write mask
allow_debug_monitor_with_in_flight_inst	bool	0x0	Allow handling Debug Monitor exception with in-flight instructions
allow_stack_accesses_to_ppb_space	bool	0x0	Allow stack accesses to PPB space

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
callee_register_push_low_to_high	bool	0x1	If true, push callee registers in order from R4 to R11. If false, push R11 to R4
cde_impl_name	string	""	Name of the CDE implementation for this core (implementation contributed by MTI plugin).
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
dcache-invalidate-ns-cleans-s	bool	0x0	Whether V8M DCI* in non-secure should clean-and-invalidate secure cache contents.
dcache-size	int	0x8000	L1 D-cache size in bytes
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-ways	int	0x4	L1 D-cache ways (sets are implicit from size)
delay_faultmask_update	bool	0x0	Delay FAULTMASK update to context sync
delay_sysreg_update	bool	0x0	Delay some system register updates (e.g. SHCSR) to context sync
dtcm_enable	bool	0x0	Enable DTCM at reset
dtcm_size	int	0x100	DTCM size in KB
duplicate_CADI_TCM_writes	bool	0x0	CADI writes to TCMs are also sent to downstream memory at same addresses (for validation platforms)
dwt_unaligned_word_access_as_half_word	bool	0x1	DWT Treat unaligned word access as half word or bytes.
exercise_strex_fail	bool	0x0	Reject a pseudo-random majority of exclusive store instructions
has_cde	bool	0x0	Enables Custom Datapath Extensions
has_global_monitor	bool	0x0	Enable global monitor, with granule set to 16 words / 64 bytes
has_writebuffer	bool	0x0	Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.
icache-size	int	0x8000	L1 I-cache size in bytes
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
icache-ways	int	0x2	L1 I-cache ways (sets are implicit from size)

Non-Confidential

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
ignore_RNR_top_nibble	bool	0x0	If set, only the bottom four bits of MPU_RNR.REGION are used
ignore_out_of_range_RNR_write	bool	0x0	If an MPU_RNR.REGION write is out of range, ignore it ; if false, MPU_RNR values wrap
itcm_enable	bool	0x0	Enable ITCM at reset
itcm_size	int	0x100	ITCM size in KB
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
mve_has_atomic_ticks	bool	0x0	Enable atomic ticks behaviour for vector instructions flagged as such (e.g. VLDR)
number_of_itm_stimulus_ports	int	0x20	The number of ITM stimulus ports
rd_ns_bus_err_behave	int	0x1	External read aborts in nonsecure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.
rd_s_bus_err_behave	int	0x1	External read aborts in secure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor (0=default long quantum, 1=low latency mode, short quantum and signal checking, 2=lock-breaking mode, long quantum with additional context switches near load-exclusive instructions, 3=ISSCompare)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-84 Parameters for ARM_AEMv8M (continued)

Name	Type	Default value	Description
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit
vector_fetch_busfault_sets_HFSR_FORCED	bool	0x0	Only v8.0M. Set HFSR.FORCED when a vector table read generates a HardFault
vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
vfp-present	bool	0x1	Set whether the model has VFP support
wr_ns_bus_err_behave	int	0x3	External write aborts in nonsecure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.
wr_s_bus_err_behave	int	0x3	External write aborts in secure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

3.4.5 ARMCortexA5CT

ARMCortexA5CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA5CT contains the following CADI targets:

- ARM_Cortex-A5UP
- Cluster_ARM_Cortex-A5UP
- PVCache
- TlbCadi

ARMCortexA5CT contains the following MTI components:

- *4.10 ARM_Cortex-A5 - trace* on page 4-1127
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

About ARMCortexA5CT

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

  vfp present and ase present
  Neon™ and VFPv3-D32 are supported.

  vfp present and ase not present
  VFPv3-D16 is supported.

  vfp not present and ase present
  Illegal. Forces `vfp-present` to true so model has Neon and VFPv3-D32 support.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

vfp not present and ase not present
Model has neither Neon nor VFPv3-D32 support.

- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require an L2 cache you can add a PL310 Level 2 Cache Controller component.

Table 3-85 Ports

Name	Protocol	Type	Description
`cfgend[1]`	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
`cfgnmfi[1]`	*Signal* on page 2-85	Slave	This signal disables FIQ mask in CPSR.
`clk_in`	`ClockSignal`	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
`clusterid`	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
`cp15sdisable[1]`	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
`event`	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
`fiq[1]`	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
`irq[1]`	*Signal* on page 2-85	Slave	This signal drives the CPU's interrupt handling.
`pmuirq[1]`	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
`pvbus_m0`	`PVBus`	Master	The core will generate bus requests on this port.
`reset[1]`	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
`standbywfe[1]`	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
`standbywfi[1]`	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
`teinit[1]`	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
`ticks[1]`	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
`vinithi[1]`	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.

Table 3-86 Parameters for ARM_Cortex-A5UP

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Initialize to BE8 endianness
cpu0.CFGNMFI	bool	0x0	Enable nonmaskable FIQ interrupts on startup
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.POWERCTLI	int	0x0	Default power control state for processor
cpu0.TEINIT	bool	0x0	T32 exception enable. The default has exceptions including reset handled in A32 state
cpu0.VINITHI	bool	0x0	Initialize with high vectors enabled
cpu0.ase-present	bool	0x1	Set whether model has NEON support
cpu0.dcache-size	int	0x8000	Set D-cache size in bytes
cpu0.icache-size	int	0x8000	Set I-cache size in bytes
cpu0.min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-ARM_HLT	int	0xf000	ARM HLT number for semihosting
cpu0.semihosting-ARM_SVC	int	0x123456	ARM SVC number for semihosting
cpu0.semihosting-Thumb_HLT	int	0x3c	Thumb HLT number for semihosting
cpu0.semihosting-Thumb_SVC	int	0xab	Thumb SVC number for semihosting
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
cpu0.semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
cpu0.vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support

Table 3-87 Parameters for Cluster_ARM_Cortex-A5UP

Name	Type	Default value	Description
CLUSTER_ID	int	0x0	Processor cluster ID value
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-87 Parameters for Cluster_ARM_Cortex-A5UP (continued)

Name	Type	Default value	Description
dcache-hit_latency	int	0x0	D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-read_access_latency	int	0x0	D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
device-accurate-tlb	bool	0x0	Specify whether all TLBs are modeled
icache-hit_latency	int	0x0	I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation

3.4.6 ARMCortexA5MPx1CT

ARMCortexA5MPx1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA5MPx1CT contains the following CADI targets:

- ARM_Cortex-A5MP
- Cluster_ARM_Cortex-A5MP
- PVCache
- TlbCadi

ARMCortexA5MPx1CT contains the following MTI components:

- *4.14 ARM_Cortex-A5MP - trace* on page 4-1266
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA5MPx1CT

- The following components also exist:
  - ARMCortexA5MPx2CT.
  - ARMCortexA5MPx4CT.

  The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).
- The `ase-present` and `vfp-present` parameters configure the synthesis options:

  vfp present and ase present
  Neon and VFPv3-D32 are supported.

  vfp present and ase not present
  VFPv3-D16 is supported.

  vfp not present and ase present
  Illegal. Forces `vfp-present` to true so model has Neon and VFPv3-D32 support.

  vfp not present and ase not present
  Model has neither Neon nor VFPv3-D32 support.
- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- If you are using the ARMCortexA5MPx*n*CT component in a VE platform model, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- There is a single memory port combining instruction, data, DMA and peripheral access.
- The GIC does not respect the CFGSDISABLE signal. This leads to some registers being accessible when they must not be.
- The SCU enable bit is ignored. The SCU is always enabled.
- The SCU ignores the invalidate all register.
- The Broadcast TLB or cache operations in this model do not cause other cores in the cluster that are asleep because of *Wait For Interrupt* (WFI) to wake up.
- The RR bit in the SCTLR is ignored.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- When modeling the SCU, coherency operations are represented by a memory write followed by a read to refill from memory, rather than using cache-to-cache transfers.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require an L2 cache you can add a PL310 Level 2 Cache Controller component.

Table 3-88 Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
cfgend[1]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgnmfi[1]	*Signal* on page 2-85	Slave	This signal disables FIQ mask in CPSR.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cp15sdisable[1]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
filteren	*Signal* on page 2-85	Slave	This signal enables filtering of address ranges between master bus ports.
filterend	*Value* on page 2-85	Slave	This port sets end of region mapped to pvbus_m1.
filterstart	*Value* on page 2-85	Slave	This port sets start of region mapped to pvbus_m1.
fiq[1]	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[1]	*Signal* on page 2-85	Master	This signal exports internal VGIC FIQ signal to the CPU.
ints[224]	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
irq[1]	*Signal* on page 2-85	Slave	This signal drives the CPU's interrupt handling.
irqout[1]	*Signal* on page 2-85	Master	This signal exports internal VGIC IRQ signal to the CPU.
periphbase	*Value* on page 2-85	Slave	This port sets the base address of private peripheral region.
periphclk_in	ClockSignal	Slave	The timer and the watchdog take need a clk that is scaled down atleast by factor of two.
periphreset	*Signal* on page 2-85	Slave	This signal resets timer and interrupt controller.
pmuirq[1]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	AXI master 0 bus master channel.
pvbus_m1	PVBus	Master	AXI master 1 bus master channel.
pwrctli[1]	*Value* on page 2-85	Slave	This port sets reset value for scu CPU status register.
pwrctlo[1]	*Value* on page 2-85	Master	This port sends scu CPU status register bits.
reset[1]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
scureset	*Signal* on page 2-85	Slave	This signal resets SCU.

Non-Confidential

Table 3-88 Ports (continued)

Name	Protocol	Type	Description
smpnamp[1]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each Cortex-A5 processor.
standbywfe[1]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
teinit[1]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
ticks[1]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
wdreset[1]	*Signal* on page 2-85	Slave	This signal resets individual watchdog.
wdresetreq[1]	*Signal* on page 2-85	Master	This signal resets rest of the CA5MP system.

Table 3-89 Parameters for ARM_Cortex-A5MP

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Initialize to BE8 endianness
cpu0.CFGNMFI	bool	0x0	Enable nonmaskable FIQ interrupts on startup
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.POWERCTLI	int	0x0	Default power control state for processor
cpu0.SMPnAMP	bool	0x0	Set whether the processor is part of a coherent domain
cpu0.TEINIT	bool	0x0	T32 exception enable. The default has exceptions including reset handled in A32 state
cpu0.VINITHI	bool	0x0	Initialize with high vectors enabled
cpu0.ase-present	bool	0x1	Set whether model has NEON support
cpu0.dcache-size	int	0x8000	Set D-cache size in bytes
cpu0.icache-size	int	0x8000	Set I-cache size in bytes
cpu0.min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-ARM_HLT	int	0xf000	ARM HLT number for semihosting
cpu0.semihosting-ARM_SVC	int	0x123456	ARM SVC number for semihosting
cpu0.semihosting-Thumb_HLT	int	0x3c	Thumb HLT number for semihosting
cpu0.semihosting-Thumb_SVC	int	0xab	Thumb SVC number for semihosting
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false

Table 3-89 Parameters for ARM_Cortex-A5MP (continued)

Name	Type	Default value	Description
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
cpu0.semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
cpu0.vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support

Table 3-90 Parameters for Cluster_ARM_Cortex-A5MP

Name	Type	Default value	Description
CFGSDISABLE	bool	0x0	Disable some accesses to GIC registers
CLUSTER_ID	int	0x0	Processor cluster ID value
FILTEREN	bool	0x0	Enable filtering of accesses through pvbus_m0
FILTEREND	int	0x0	End of region filtered to pvbus_m0
FILTERSTART	int	0x0	Base of region filtered to pvbus_m0
PERIPHBASE	int	0x13080000	Base address of peripheral memory space
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-read_access_latency	int	0x0	D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Table 3-90 Parameters for Cluster_ARM_Cortex-A5MP (continued)

Name	Type	Default value	Description
dcache-read_latency	int	0x0	D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-snoop_data_transfer_latency	int	0x0	D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
device-accurate-tlb	bool	0x0	Specify whether all TLBs are modeled
dic-spi_count	int	0x40	Number of shared peripheral interrupts implemented
icache-hit_latency	int	0x0	I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation

3.4.7 ARMCortexA7x1CT

ARMCortexA7x1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARMCortexA7x1CT contains the following CADI targets:

- ARM_Cortex-A7
- Cluster_ARM_Cortex-A7
- PVCache
- TlbCadi

ARMCortexA7x1CT contains the following MTI components:

- *4.17 ARM_Cortex-A7 - trace* on page 4-1367
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.71 GICv2 - trace* on page 4-2470
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA7x1CT

- The following components also exist:
  - ARMCortexA7x2CT.
  - ARMCortexA7x3CT.
  - ARMCortexA7x4CT.

  The per-core parameters are preceded by `cpu`*`n`*`.`, where *n* identifies the core (0-3).
- The `ase-present` and `vfp-present` parameters configure the synthesis options:

  vfp present and ase present
  Neon and VFPv4-D32 are supported.

  vfp present and ase not present
  VFPv4-D16 is supported.

  vfp not present and ase present
  Illegal. Forces `vfp-present` to true so model has Neon and VFPv4-D32 support.

  vfp not present and ase not present
  Model has neither Neon nor VFPv4-D32 support.
- If you are using the ARMCortexA7x*n*CT component in a VE platform model, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

ACE limitation

AXI Coherency Extensions (ACE) are extensions to AXI4 that support system-level cache-coherency between multiple clusters. The ACE cache models in the Cortex-A15 and the Cortex-A7, and the ACE support in the CCI-400 have the limitation that they only process one transaction at a time. Normally, the simulation processes each transaction to completion before allowing any master to generate another transaction. However, in the following situation the simulation might fail. If a SystemC bus slave calls `wait()` while it is processing a transaction, this call might allow another master to issue another transaction that passes through the CCI-400 or the Cortex-A15/Cortex-A7 caches. This situation could happen if a SystemC bus master running in another thread is connected to one of the ACE-lite ports on the CCI-400.

Differences between the CT model and RTL implementations

This model has the following differences from the corresponding revision of the RTL implementation:

- The GIC does not respect the CFGSDISABLE signal. This leads to some registers wrongly being accessible.
- The Broadcast *Translation Lookaside Buffer* (TLB) or cache operations in this model do not cause other cores in the cluster that are asleep because of *Wait For Interrupt* (WFI) to wake up.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- The model ignores the RR bit in the SCTLR.
- The model implements the Power Control Register in the system control coprocessor but writing to it does not change the behavior of the model.
- The model does not implement ETM registers.
- The model does not support the Cortex-A7 mechanism to read the internal memory that the Cache and TLB structures use through the implementation defined region of the system coprocessor interface.
- The model does not upgrade DCIMVAC operations to DCCIMVAC.

Table 3-91 Ports

Name	Protocol	Type	Description
CNTHPIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
CNTVIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
axierrirq	*Signal* on page 2-85	Master	Imprecise aborts from the L2 are signaled by pulsing this pin, typically they are connect to an interrupt controller.
broadcastcachemaint	*Signal* on page 2-85	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	*Signal* on page 2-85	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	*Signal* on page 2-85	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	*Signal* on page 2-85	Slave	This signal controls the SCTLR.EE bit.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	*Value* on page 2-85	Slave	This port sets the value in the CLUSTERID field (bits[11:8]) of the MPIDR.
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some secure system control processor registers.
cpuporeset[4]	*Signal* on page 2-85	Slave	Signal initializes all processor logic including NEON, VFP, Debug, PTM, breakpoint and watchpoint.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[4]	*Signal* on page 2-85	Master	This signal exports internal VGIC FIQ signal to the CPU..
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPU's interrupt handling.
irqout[4]	*Signal* on page 2-85	Master	This signal exports internal VGIC IRQ signal to the CPU.

Table 3-91 Ports (continued)

Name	Protocol	Type	Description
irqs[480]	*Signal* on page 2-85	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	*Signal* on page 2-85	Slave	This signal resets the shared L2 memory system, interrupt controller and timer logic.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of the private peripheral region.
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Signal initializes the shared Debug APB, CTI and CTM logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
standbywfe[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
standbywfil2	*Signal* on page 2-85	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.
teinit[4]	*Signal* on page 2-85	Slave	This signal enables Thumb exceptions (controls the SCTLR.TE bit).
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vfiq[4]	*Signal* on page 2-85	Slave	Virtual FIQ inputs. Note that the fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtual IRQ inputs. Note that the irq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Table 3-92 Parameters for Cluster_ARM_Cortex-A7

Name	Type	Default value	Description
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTINNER	bool	0x1	Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Table 3-92 Parameters for Cluster_ARM_Cortex-A7 (continued)

Name	Type	Default value	Description
CFGSDISABLE	bool	0x0	Disable some accesses to GIC registers
CLUSTER_ID	int	0x0	Processor cluster ID value
PERIPHBASE	int	0x13080000	Base address of peripheral memory space
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dic-spi_count	int	0x40	Number of shared peripheral interrupts implemented
disable_periph_decoder	bool	0x0	Disable memory mapped access to gic system registers
internal_vgic	bool	0x1	Configures whether the model of the processor contains a VGIC
l1_dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l1_dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l1_dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l1_dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l1_dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.l1_dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l1_dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l1_dcache-state_modelled	bool	0x0	Set whether L1 D-cache has stateful implementation
l1_dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-write_latency is set. This is only used when dcache-state_modelled=true.
l1_dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. l1_dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Table 3-92 Parameters for Cluster_ARM_Cortex-A7 (continued)

Name	Type	Default value	Description
l2_cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l2_cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l2_cache-state_modelled	bool	0x0	Set whether L2 cache has stateful implementation
l2_cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-write_latency is set. This is only used when dcache-state_modelled=true.
l2_cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2_cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Table 3-93 Parameters for ARM_Cortex-A7

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Initialize to BE8 endianness
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.DBGROMADDR	int	0x12000003	This value is used to initialize the CP15 DBGDRAR register. Bits[39:12] of this register specify the ROM table physical address
cpu0.DBGROMADDRV	bool	0x1	If true this sets bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid
cpu0.DBGSELFADDR	int	0x10003	This value is used to initialize the CP15 DBGDSAR register. Bits[39:17] of this register specify the ROM table physical address
cpu0.DBGSELFADDRV	bool	0x1	If true this sets bits[1:0] of the CP15 DBGDSAR to indicate that the address is valid
cpu0.TEINIT	bool	0x0	T32 exception enable. The default has exceptions including reset handled in A32 state
cpu0.VINITHI	bool	0x0	Initialize with high vectors enabled
cpu0.ase-present	bool	0x1	Set whether CT model has been built with NEON support
cpu0.l1_dcache-size	int	0x8000	Size of L1 D-cache
cpu0.l1_icache-size	int	0x8000	Size of L1 I-cache
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-ARM_HLT	int	0xf000	ARM HLT number for semihosting
cpu0.semihosting-ARM_SVC	int	0x123456	ARM SVC number for semihosting
cpu0.semihosting-Thumb_HLT	int	0x3c	Thumb HLT number for semihosting
cpu0.semihosting-Thumb_SVC	int	0xab	Thumb SVC number for semihosting

Table 3-93 Parameters for ARM_Cortex-A7 (continued)

Name	Type	Default value	Description
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
cpu0.semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
cpu0.vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset
cpu0.vfp-present	bool	0x1	Set whether CT model has been built with VFP support

3.4.8 ARMCortexA8CT

ARMCortexA8CT CPU component. This model is written in C++ and models version r2p1 of the RTL.

ARMCortexA8CT contains the following CADI targets:

- ARM_Cortex-A8
- PVCache
- TlbCadi

ARMCortexA8CT contains the following MTI components:

- *4.26 ARM_Cortex-A8 - trace* on page 4-1712
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA8CT

- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- If the `l1_dcache-state_modelled` parameter is true, then `l2_cache-state_modelled` must also be true.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.
- This component provides the registers that the *Technical Reference Manual* (TRM) specifies except for the coprocessor 14 registers, the integration and test registers, and the PLE model, which is register based and has no implemented behavior.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

These TLB registers do not have working implementations:
— D-TLB ATTR read/write.
— D-TLB CAM read/write.
— D-TLB PA read/write.
— Normal memory remap register.
— Primary memory remap register.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- There is a single memory port combining instruction, data, DMA and peripheral access.
- The L2 cache write allocate policy is not configurable. It defaults to write-allocate. Writes to the configuration register succeed but are ignored, meaning that data can be unexpectedly stored in the L2 cache.
- Unaligned accesses with the MMU disabled on the processor do not cause data aborts.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Table 3-94 Ports

Name	Protocol	Type	Description
`cfgend0`	*Signal* on page 2-85	Slave	Configure BE8 mode after a reset.
`cfgnmfi`	*Signal* on page 2-85	Slave	Configure FIQs as non-maskable after a reset.
`cfgte`	*Signal* on page 2-85	Slave	Configure exceptions to be taken in thumb mode after a reset.
`clk_in`	`ClockSignal`	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
`dmaexterrirq`	*Signal* on page 2-85	Master	L1 PLE error interrupt.
`dmairq`	*Signal* on page 2-85	Master	Interrupt signal from L1 PLE.
`dmasirq`	*Signal* on page 2-85	Master	Secure interrupt signal from L1 PLE.
`fiq`	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
`irq`	*Signal* on page 2-85	Slave	This signal drives the CPU's interrupt handling.
`pmuirq`	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
`pvbus_m`	`PVBus`	Master	The core will generate bus requests on this port.
`reset`	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
`ticks`	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.
`vinithi`	*Signal* on page 2-85	Slave	Configure high vectors after a reset.

Table 3-95 Parameters for ARM_Cortex-A8

Name	Type	Default value	Description
`CFGEND0`	`bool`	`0x0`	Initialize to BE8 endianness
`CFGNMFI`	`bool`	`0x0`	Enable nonmaskable FIQ interrupts on startup
`CFGTE`	`bool`	`0x0`	Initialize to take exceptions in T32 state. Model starts in T32 state

semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
siliconID	int	0x41000000	Value as read by the system coprocessor siliconID register
vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset

3.4.9 ARMCortexA9MPx1CT

ARMCortexA9MPx1CT CPU component. This model is written in C++ and models version r3p0 of the RTL.

ARMCortexA9MPx1CT contains the following CADI targets:

- ARM_Cortex-A9MP
- Cluster_ARM_Cortex-A9MP
- PVCache
- TlbCadi

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARMCortexA9MPx1CT contains the following MTI components:

- *4.27 ARM_Cortex-A9MP - trace* on page 4-1736
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA9MPx1CT

- The following components also exist:
  - ARMCortexA9MPx2CT.
  - ARMCortexA9MPx4CT.

  The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).
- The `ase-present` and `vfp-present` parameters configure the synthesis options:

  vfp present and ase present
  Neon and VFPv3-D32 are supported.

  vfp present and ase not present
  VFPv3-D16 is supported.

  vfp not present and ase present
  Illegal. Forces `vfp-present` to true so model has Neon and VFPv3-D32 support.

  vfp not present and ase not present
  Model has neither Neon nor VFPv3-D32 support.
- If you are using the ARMCortexA9MPx*n*CT component in a VE platform model, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.
- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require L2 cache, you can add a PL310 Level 2 Cache Controller component.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The GIC does not respect the CFGSDISABLE signal. This leads to some registers being accessible when they must not be.
- The SCU enable bit is ignored. The SCU is always enabled.
- The SCU ignores the invalidate all register.
- The Broadcast TLB or cache operations in this model do not cause other cores in the cluster that are asleep because of WFI to wake up.
- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- The model cannot be configured with a 128-entry TLB.
- When modeling the SCU, coherency operations are represented by a memory write followed by a read to refill from memory, rather than using cache-to-cache transfers.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

- The following TLB registers do not have working implementations:
  — Main TLB Attr.
  — Main TLB PA.
  — Main TLB VA.
  — Normal memory remap register.
  — Primary memory remap register.
  — Read Main TLB Entry.
  — Write Main TLB Entry.

  In addition, the simulation does not distinguish peripheral accesses from data accesses, so it ignores configuration of the peripheral port memory remap register.
- Parity error support is hardware-specific so is not modeled.

Table 3-96 Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
cfgend[4]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgnmfi[4]	*Signal* on page 2-85	Slave	This signal disables FIQ mask in CPSR.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
filteren	*Signal* on page 2-85	Slave	This signal enables filtering of address ranges between master bus ports.
filterend	*Value* on page 2-85	Slave	This port sets end of region mapped to pvbus_m1.
filterstart	*Value* on page 2-85	Slave	This port sets start of region mapped to pvbus_m1.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[4]	*Signal* on page 2-85	Master	This signal exports internal VGIC FIQ signal to the CPU..
ints[224]	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPU's interrupt handling.
irqout[4]	*Signal* on page 2-85	Master	This signal exports internal VGIC IRQ signal to the CPU.
periphbase	*Value* on page 2-85	Slave	This port sets the base address of private peripheral region.
periphclk_in	ClockSignal	Slave	The timer and the watchdog take need a clk that is scaled down atleast by factor of two.
periphreset	*Signal* on page 2-85	Slave	This signal resets timer and interrupt controller.
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	AXI master 0 bus master channel.
pvbus_m1	PVBus	Master	AXI master 1 bus master channel.

Table 3-96 Ports (continued)

Name	Protocol	Type	Description
pwrctli[4]	*Value* on page 2-85	Slave	This port sets reset value for scu CPU status register.
pwrctlo[4]	*Value* on page 2-85	Master	This port sends scu CPU status register bits.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
scureset	*Signal* on page 2-85	Slave	This signal resets SCU.
smpnamp[4]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each Cortex-A9 processor.
standbywfe[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
teinit[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
wdreset[4]	*Signal* on page 2-85	Slave	This signal resets individual watchdog.
wdresetreq[4]	*Signal* on page 2-85	Master	This signal resets rest of the CA9MP system.

Table 3-97 Parameters for ARM_Cortex-A9MP

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Initialize to BE8 endianness
cpu0.CFGNMFI	bool	0x0	Enable nonmaskable FIQ interrupts on startup
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.POWERCTLI	int	0x0	Default power control state for processor
cpu0.SMPnAMP	bool	0x0	Set whether the processor is part of a coherent domain
cpu0.TEINIT	bool	0x0	T32 exception enable. The default has exceptions including reset handled in A32 state
cpu0.VINITHI	bool	0x0	Initialize with high vectors enabled
cpu0.ase-present	bool	0x1	Set whether model has NEON support
cpu0.dcache-size	int	0x8000	Set D-cache size in bytes
cpu0.icache-size	int	0x8000	Set I-cache size in bytes
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-ARM_HLT	int	0xf000	ARM HLT number for semihosting
cpu0.semihosting-ARM_SVC	int	0x123456	ARM SVC number for semihosting
cpu0.semihosting-Thumb_HLT	int	0x3c	Thumb HLT number for semihosting

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-97 Parameters for ARM_Cortex-A9MP (continued)

Name	Type	Default value	Description
cpu0.semihosting-Thumb_SVC	int	0xab	Thumb SVC number for semihosting
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
cpu0.semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
cpu0.vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support

Table 3-98 Parameters for Cluster_ARM_Cortex-A9MP

Name	Type	Default value	Description
CFGSDISABLE	bool	0x0	Disable some accesses to GIC registers
CLUSTER_ID	int	0x0	Processor cluster ID value
FILTEREN	bool	0x0	Enable filtering of accesses through pvbus_m0
FILTEREND	int	0x0	End of region filtered to pvbus_m0
FILTERSTART	int	0x0	Base of region filtered to pvbus_m0
PERIPHBASE	int	0x13080000	Base address of peripheral memory space
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	D-cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	D-cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	D-cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Non-Confidential

Table 3-98 Parameters for Cluster_ARM_Cortex-A9MP (continued)

Name	Type	Default value	Description
dcache-read_access_latency	int	0x0	D-cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	D-cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-snoop_data_transfer_latency	int	0x0	D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	D-cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	D-cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
device-accurate-tlb	bool	0x0	Specify whether all TLBs are modeled
dic-spi_count	int	0x40	Number of shared peripheral interrupts implemented
icache-hit_latency	int	0x0	I-cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	I-cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	I-cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	I-cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

3.4.10 ARMCortexA9UPCT

ARMCortexA9UPCT CPU component. This model is written in C++ and models version r3p0 of the RTL.

ARMCortexA9UPCT contains the following CADI targets:

- ARM_Cortex-A9UP
- Cluster_ARM_Cortex-A9UP
- PVCache
- TlbCadi

ARMCortexA9UPCT contains the following MTI components:

- *4.28 ARM_Cortex-A9UP - trace* on page 4-1772
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA9UPCT

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

  vfp present and ase present
  Neon and VFPv3-D32 are supported.

  vfp present and ase not present
  VFPv3-D16 is supported.

  vfp not present and ase present
  Illegal. Forces `vfp-present` to `true` so model has Neon and VFPv3-D32 support.

  vfp not present and ase not present
  Model has neither Neon nor VFPv3-D32 support.
- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- The model cannot be configured with a 128-entry TLB.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require L2 cache you can add a PL310 Level 2 Cache Controller component.
- Parity error support is hardware-specific so is not modeled.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

These TLB registers do not have working implementations:

- Normal memory remap register.
- Primary memory remap register.
- Read Main TLB Entry.
- Write Main TLB Entry.
- Main TLB VA.
- Main TLB PA.
- Main TLB Attr.

In addition, the simulation does not distinguish peripheral accesses from data accesses, so it ignores configuration of the peripheral port memory remap register.

Table 3-99 Ports

Name	Protocol	Type	Description
`cfgend[1]`	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
`cfgnmfi[1]`	*Signal* on page 2-85	Slave	This signal disables FIQ mask in CPSR.
`clk_in`	`ClockSignal`	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
`clusterid`	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
`cp15sdisable[1]`	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
`event`	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
`fiq[1]`	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
`irq[1]`	*Signal* on page 2-85	Slave	This signal drives the CPU's interrupt handling.
`pmuirq[1]`	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
`pvbus_m0`	`PVBus`	Master	The core will generate bus requests on this port.
`reset[1]`	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
`standbywfe[1]`	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
`standbywfi[1]`	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
`teinit[1]`	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
`ticks[1]`	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
`vinithi[1]`	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.

3.4.11 ARMCortexA15x1CT

ARMCortexA15x1CT CPU component. This model is written in C++ and models version r2p0 of the RTL.

ARMCortexA15x1CT contains the following CADI targets:

- ARM_Cortex-A15
- Cluster_ARM_Cortex-A15
- PVCache
- TlbCadi

ARMCortexA15x1CT contains the following MTI components:

- *4.6 ARM_Cortex-A15 - trace* on page 4-979
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.71 GICv2 - trace* on page 4-2470
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA15x1CT

- The following components also exist:
  - ARMCortexA15x2CT.
  - ARMCortexA15x3CT.
  - ARMCortexA15x4CT.

  The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).
- The `ase-present` and `vfp-present` parameters configure the synthesis options:

  vfp present and ase present
  Neon and VFPv4-D32 are supported.

  vfp present and ase not present
  VFPv4-D16 is supported.

  vfp not present and ase present
  Illegal. Forces `vfp-present` to `true` so model has Neon and VFPv4-D32 support.

  vfp not present and ase not present
  Model has neither Neon nor VFPv4-D32 support.
- If you are using the ARMCortexA15x*n*CT component on a VE model platform, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.

ACE limitation

AXI Coherency Extensions (ACE) are extensions to AXI4 that support system-level cache-coherency between multiple clusters. The ACE cache models in the Cortex-A15 and the Cortex-A7, and the ACE support in the CCI-400 have the limitation that they only process one transaction at a time. Normally, the simulation processes each transaction to completion before allowing any master to generate another transaction. However, in the following situation the simulation might fail. If a SystemC bus slave calls `wait()` while it is processing a transaction, this call might allow another master to issue another transaction that passes through the CCI-400 or the Cortex-A15/Cortex-A7 caches. This situation could happen if a SystemC bus master running in another thread is connected to one of the ACE-lite ports on the CCI-400.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The GIC does not respect the CFGSDISABLE signal. This leads to some registers wrongly being accessible.
- The Broadcast *Translation Lookaside Buffer* (TLB) or cache operations in the model do not cause other cores in the cluster that are asleep because of *Wait For Interrupt* (WFI) to wake up.
- It ignores the RR bit in the SCTLR.
- It implements the Power Control Register in the system control coprocessor but writing to it does not change the behavior of the model.
- When modeling the SCU, coherency operations are by memory writes then reads to refill from memory, rather than cache-to-cache transfers.
- It does not implement ETM registers.
- It implements TLB bitmap registers as RAZ/WI.
- It does not support the Cortex-A15 mechanism to read the internal memory that the Cache and TLB structures use through the implementation defined region of the system coprocessor interface. This includes the RAM Index Register, IL1DATA Registers, DL1DATA Registers, and associated functionality.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Table 3-102 Ports

Name	Protocol	Type	Description
CNTHPIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
CNTVIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	*Signal* on page 2-85	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	*Signal* on page 2-85	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	*Signal* on page 2-85	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	*Signal* on page 2-85	Slave	This signal controls the SCTLR.EE bit.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	*Value* on page 2-85	Slave	This port sets the value in the CLUSTERID field (bits[11:8]) of the MPIDR.
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some secure system control processor registers.
cpuporeset[4]	*Signal* on page 2-85	Slave	Signal initializes all processor logic including NEON, VFP, Debug, PTM, breakpoint and watchpoint.

Table 3-102 Ports (continued)

Name	Protocol	Type	Description
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[4]	*Signal* on page 2-85	Master	This signal exports internal VGIC FIQ signal to the CPU..
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPU's interrupt handling.
irqout[4]	*Signal* on page 2-85	Master	This signal exports internal VGIC IRQ signal to the CPU.
irqs[224]	*Signal* on page 2-85	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	*Signal* on page 2-85	Slave	This signal resets the shared L2 memory system, interrupt controller and timer logic.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of the private peripheral region.
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Signal initializes the shared Debug APB, CTI and CTM logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
standbywfe[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
standbywfil2	*Signal* on page 2-85	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.
teinit[4]	*Signal* on page 2-85	Slave	This signal enables Thumb exceptions (controls the SCTLR.TE bit).
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vfiq[4]	*Signal* on page 2-85	Slave	Virtual FIQ inputs. Note that the fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtual IRQ inputs. Note that the irq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Table 3-103 Parameters for Cluster_ARM_Cortex-A15

Name	Type	Default value	Description
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTINNER	bool	0x1	Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
CFGSDISABLE	bool	0x0	Disable some accesses to GIC registers
CLUSTER_ID	int	0x0	Processor cluster ID value
IMINLN	bool	0x1	Instruction cache minimum line size: false=32 bytes, true=64 bytes
PERIPHBASE	int	0x13080000	Base address of peripheral memory space
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dic-spi_count	int	0x40	Number of shared peripheral interrupts implemented
disable_periph_decoder	bool	0x0	Disable memory mapped access to gic system registers
internal_vgic	bool	0x1	Configures whether the model of the processor contains a Virtualized Generic Interrupt Controller (VGIC)
l1_dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l1_dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l1_dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l1_dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l1_dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.l1_dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l1_dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l1_dcache-state_modelled	bool	0x0	Set whether L1 D-cache has stateful implementation

Table 3-103 Parameters for Cluster_ARM_Cortex-A15 (continued)

Name	Type	Default value	Description
l1_dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-write_latency is set. This is only used when dcache-state_modelled=true.
l1_dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. l1_dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
l1_icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l1_icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l1_icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l1_icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l1_icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.l1_icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l1_icache-state_modelled	bool	0x0	Set whether L1 I-cache has stateful implementation
l2-data-slice	int	0x0	L2 data RAM slice
l2-tag-slice	int	0x0	L2 tag RAM slice
l2_cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l2_cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l2_cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l2_cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2_cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l2_cache-size	int	0x80000	Set L2 cache size in bytes
l2_cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l2_cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l2_cache-state_modelled	bool	0x0	Set whether L2 cache has stateful implementation
l2_cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-write_latency is set. This is only used when dcache-state_modelled=true.
l2_cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2_cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Table 3-104 Parameters for ARM_Cortex-A15

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Initialize to BE8 endianness
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.DBGROMADDR	int	0x12000003	This value is used to initialize the CP15 DBGDRAR register. Bits[39:12] of this register specify the ROM table physical address
cpu0.DBGROMADDRV	bool	0x1	If true, this sets bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid
cpu0.DBGSELFADDR	int	0x10003	This value is used to initialize the CP15 DBGDSAR register. Bits[39:17] of this register specify the ROM table physical address
cpu0.DBGSELFADDRV	bool	0x1	If true, this sets bits[1:0] of the CP15 DBGDSAR to indicate that the address is valid
cpu0.TEINIT	bool	0x0	T32 exception enable. The default has exceptions including reset handled in A32 state

Table 3-104 Parameters for ARM_Cortex-A15 (continued)

Name	Type	Default value	Description
cpu0.VINITHI	bool	0x0	Initialize with high vectors enabled
cpu0.ase-present	bool	0x1	Set whether CT model has been built with NEON support
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-ARM_HLT	int	0xf000	ARM HLT number for semihosting
cpu0.semihosting-ARM_SVC	int	0x123456	ARM SVC number for semihosting
cpu0.semihosting-Thumb_HLT	int	0x3c	Thumb HLT number for semihosting
cpu0.semihosting-Thumb_SVC	int	0xab	Thumb SVC number for semihosting
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
cpu0.semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
cpu0.vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset
cpu0.vfp-present	bool	0x1	Set whether CT model has been built with VFP support

3.4.12 ARMCortexA17x1CT

ARMCortexA17x1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA17x1CT contains the following CADI targets:

- ARM_Cortex-A17
- Cluster_ARM_Cortex-A17
- PVCache
- TlbCadi

ARMCortexA17x1CT contains the following MTI components:

- *4.7 ARM_Cortex-A17 - trace* on page 4-1015
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA17x1CT

- The following components also exist:
  — ARMCortexA17x2CT.
  — ARMCortexA17x3CT.
  — ARMCortexA17x4CT.

  The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).
- The `ase-present` and `vfp-present` parameters configure the synthesis options:

  vfp present and ase present
  NEON and VFPv4-D32 are supported.

  vfp present and ase not present
  VFPv4-D16 is supported.

  vfp not present and ase present
  Illegal. Forces `vfp-present` to `true` so model has NEON and VFPv4-D32 support.

  vfp not present and ase not present
  Model has neither NEON nor VFPv4-D32 support.
- This model exposes the `BROADCASTCACHEMAINT`, `BROADCASTINNER`, and `BROADCASTOUTER` parameters at the CPU level, rather than at the cluster level. To achieve correct behavior, set the same value for all CPUs in the cluster.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC support is hardware-specific so is not modeled.

Table 3-105 Ports

Name	Protocol	Type	Description
CFGADDRFILTENDNS	*Value_64* on page 2-85	Slave	NS end address (only bits 39:20 are used).
CFGADDRFILTENDS	*Value_64* on page 2-85	Slave	S end address (only bits 39:20 are used).
CFGADDRFILTENNS	*Signal* on page 2-85	Slave	Enable periph port filtering for NS accesses.
CFGADDRFILTENS	*Signal* on page 2-85	Slave	Enable periph port filtering for S accesses.
CFGADDRFILTSTARTNS	*Value_64* on page 2-85	Slave	NS start address (only bits 39:20 are used).
CFGADDRFILTSTARTS	*Value_64* on page 2-85	Slave	S start address (only bits 39:20 are used).
CNTHPIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
CNTVIRQ[4]	*Signal* on page 2-85	Master	Outputs of the generic timers.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	*Signal* on page 2-85	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	*Signal* on page 2-85	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	*Signal* on page 2-85	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	*Signal* on page 2-85	Slave	This signal controls the SCTLR.EE bit.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.

Table 3-105 Ports (continued)

Name	Protocol	Type	Description
clusterid	*Value* on page 2-85	Slave	This port sets the value in the CLUSTERID field (bits[11:8]) of the MPIDR.
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some secure system control processor registers.
cpuporeset[4]	*Signal* on page 2-85	Slave	Signal initializes all processor logic including NEON, VFP, Debug, PTM, breakpoint and watchpoint.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPU's interrupt handling.
l2flushdone	*Signal* on page 2-85	Master	Flush of L2 memory system complete.
l2flushreq	*Signal* on page 2-85	Slave	Request flush of L2 memory system.
l2reset	*Signal* on page 2-85	Slave	This signal resets the shared L2 memory system and timer logic.
peripheral_m	PVBus	Master	The core's peripheral port. Controlled by filter registers.
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Signal initializes the shared Debug APB, CTI and CTM logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
standbywfe[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
standbywfil2	*Signal* on page 2-85	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.
teinit[4]	*Signal* on page 2-85	Slave	This signal enables Thumb exceptions (controls the SCTLR.TE bit).
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vfiq[4]	*Signal* on page 2-85	Slave	Virtual FIQ inputs.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtual IRQ inputs.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Table 3-106 Parameters for Cluster_ARM_Cortex-A17

Name	Type	Default value	Description
CFGADDRFILTENDNS	int	0x0	Peripheral port NS end address
CFGADDRFILTENDS	int	0x0	Peripheral port S end address
CFGADDRFILTENNS	bool	0x0	Peripheral port NS address filtering enabled
CFGADDRFILTENS	bool	0x0	Peripheral port S address filtering enabled
CFGADDRFILTSTARTNS	int	0x0	Peripheral port NS start address
CFGADDRFILTSTARTS	int	0x0	Peripheral port S start address
CLUSTER_ID	int	0x0	Processor cluster ID value
IMINLN	bool	0x1	Instruction cache minimum line size: false=32 bytes, true=64 bytes
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
l1_dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l1_dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l1_dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l1_dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l1_dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.l1_dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l1_dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l1_dcache-state_modelled	bool	0x0	Set whether L1 D-cache has stateful implementation
l1_dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-write_latency is set. This is only used when dcache-state_modelled=true.
l1_dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. l1_dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Table 3-106 Parameters for Cluster_ARM_Cortex-A17 (continued)

Name	Type	Default value	Description
l1_icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l1_icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l1_icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l1_icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l1_icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.l1_icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l1_icache-state_modelled	bool	0x0	Set whether L1 I-cache has stateful implementation
l2-data-slice	int	0x0	L2 data RAM slice
l2-tag-slice	int	0x0	L2 tag RAM slice
l2_cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l2_cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l2_cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l2_cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l2_cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2_cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l2_cache-size	int	0x40000	Set L2 cache size in bytes

Table 3-106 Parameters for Cluster_ARM_Cortex-A17 (continued)

Name	Type	Default value	Description
l2_cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l2_cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l2_cache-state_modelled	bool	0x0	Set whether L2 cache has stateful implementation
l2_cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-write_latency is set. This is only used when dcache-state_modelled=true.
l2_cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2_cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Table 3-107 Parameters for ARM_Cortex-A17

Name	Type	Default value	Description
cpu0.BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
cpu0.BROADCASTINNER	bool	0x1	Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.
cpu0.BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
cpu0.CFGEND	bool	0x0	Initialize to BE8 endianness
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.DBGROMADDR	int	0x12000003	This value is used to initialize the CP15 DBGDRAR register. Bits[39:12] of this register specify the ROM table physical address
cpu0.DBGROMADDRV	bool	0x1	If true, this sets bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid
cpu0.DBGSELFADDR	int	0x10003	This value is used to initialize the CP15 DBGDSAR register. Bits[39:17] of this register specify the ROM table physical address
cpu0.DBGSELFADDRV	bool	0x1	If true, this sets bits[1:0] of the CP15 DBGDSAR to indicate that the address is valid
cpu0.TEINIT	bool	0x0	T32 exception enable. The default has exceptions including reset handled in A32 state
cpu0.VINITHI	bool	0x0	Initialize with high vectors enabled
cpu0.ase-present	bool	0x1	Set whether CT model has been built with NEON support
cpu0.l1_icache-size	int	0x8000	Size of L1 I-cache

Table 3-107 Parameters for ARM_Cortex-A17 (continued)

Name	Type	Default value	Description
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-ARM_HLT	int	0xf000	ARM HLT number for semihosting
cpu0.semihosting-ARM_SVC	int	0x123456	ARM SVC number for semihosting
cpu0.semihosting-Thumb_HLT	int	0x3c	Thumb HLT number for semihosting
cpu0.semihosting-Thumb_SVC	int	0xab	Thumb SVC number for semihosting
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
cpu0.semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
cpu0.vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset
cpu0.vfp-present	bool	0x1	Set whether CT model has been built with VFP support

3.4.13 ARMCortexA32x1CT

ARMCortexA32x1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA32x1CT contains the following CADI targets:

- ARM_Cortex-A32
- Cluster_ARM_Cortex-A32
- PVCache
- TlbCadi

ARMCortexA32x1CT contains the following MTI components:

- *4.8 ARM_Cortex-A32 - trace* on page 4-1051
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA32x1CT

- The following components also exist:
  — ARMCortexA32x2CT.
  — ARMCortexA32x3CT.
  — ARMCortexA32x4CT.

  The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).
- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for the Cortex-A32 processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Armv8-A Cryptography Extensions, which requires the Crypto plug-in to be loaded. See *Crypto plug-in* on page 5-2909 for details.
- The `semihosting-cwd` parameter sets the CWD that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Table 3-108 Ports

Name	Protocol	Type	Description
`CNTHPIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTPNSIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTPSIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTVIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`acp_s`	`PVBus`	Slave	AXI ACP slave port.
`broadcastcachemaint`	*Signal* on page 2-85	Slave	ACE defined pins.
`broadcastinner`	*Signal* on page 2-85	Slave	ACE defined pins.
`broadcastouter`	*Signal* on page 2-85	Slave	ACE defined pins.
`cfgend[4]`	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
`cfgsdisable`	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
`cfgte[4]`	*Signal* on page 2-85	Slave	This signal provides default exception handling state.

Table 3-108 Ports (continued)

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	*Signal* on page 2-85	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	*Signal* on page 2-85	Slave	Signals the clearing of an external global exclusive monitor
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
commrx[4]	*Signal* on page 2-85	Master	Receive portion of Data Transfer Register full.
commtx[4]	*Signal* on page 2-85	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cp15sdisable2[4]	*Signal* on page 2-85	Slave	-
cpuporeset[4]	*Signal* on page 2-85	Slave	CPU power on reset.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross trigger matrix port.
dbgack[4]	*Signal* on page 2-85	Master	External debug interface.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	Processor powerup request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	*Signal* on page 2-85	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.

Table 3-108 Ports (continued)

Name	Protocol	Type	Description
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	*Signal* on page 2-85	Master	Flush of L2 memory system complete.
l2flushreq	*Signal* on page 2-85	Slave	Request flush of L2 memory system.
l2reset	*Signal* on page 2-85	Slave	Level2 reset.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Debug reset.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt
reset[4]	*Signal* on page 2-85	Slave	Reset.
romaddr	*Value_64* on page 2-85	Slave	Debug ROM base address.
romaddrv	*Signal* on page 2-85	Slave	Debug ROM base address valid.
sei[4]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
smpen[4]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each core.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
standbywfe[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state
standbywfil2	*Signal* on page 2-85	Master	This signal indicated all cores and L2 are idles and in low power state.

Table 3-108 Ports (continued)

Name	Protocol	Type	Description
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-109 Parameters for Cluster_ARM_Cortex-A32

Name	Type	Default value	Description
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTINNER	bool	0x1	Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
CLUSTER_ID	int	0x0	Processor cluster ID value
DBGROMADDR	int	0x0	Initialization value of DBGDRAR register. Bits[47:12] of this register specify the ROM table physical address.
DBGROMADDRV	bool	0x0	If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
PERIPHBASE	int	0x13080000	Base address of peripheral memory space

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-109 Parameters for Cluster_ARM_Cortex-A32 (continued)

Name	Type	Default value	Description
bus_type	int	0x0	Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x8000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation

Table 3-109 Parameters for Cluster_ARM_Cortex-A32 (continued)

Name	Type	Default value	Description
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-110 Parameters for ARM_Cortex-A32

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CP15SDISABLE2	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.

Non-Confidential

Table 3-110 Parameters for ARM_Cortex-A32 (continued)

Name	Type	Default value	Description
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support

3.4.14 ARMCortexA35x1CT

ARMCortexA35x1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA35x1CT contains the following CADI targets:

- ARM_Cortex-A35
- Cluster_ARM_Cortex-A35
- PVCache
- TlbCadi

ARMCortexA35x1CT contains the following MTI components:

- *4.9 ARM_Cortex-A35 - trace* on page 4-1089
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA35x1CT

- The following components also exist:
  - ARMCortexA35x2CT.
  - ARMCortexA35x3CT.
  - ARMCortexA35x4CT.

  The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).
- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for the Cortex-A35 processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- This model supports the Armv8-A Cryptography Extensions, which requires the Crypto plug-in to be loaded. See *Crypto plug-in* on page 5-2909 for details.
- The `semihosting-cwd` parameter sets the CWD that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Table 3-111 Ports

Name	Protocol	Type	Description
`CNTHPIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTPNSIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTPSIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTVIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`aa64naa32[4]`	*Signal* on page 2-85	Slave	Register width after reset.
`acp_s`	`PVBus`	Slave	AXI ACP slave port.
`broadcastcachemaint`	*Signal* on page 2-85	Slave	ACE defined pins.
`broadcastinner`	*Signal* on page 2-85	Slave	ACE defined pins.
`broadcastouter`	*Signal* on page 2-85	Slave	ACE defined pins.
`cfgend[4]`	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
`cfgsdisable`	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
`cfgte[4]`	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
`clk_in`	`ClockSignal`	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
`clrexmonack`	*Signal* on page 2-85	Master	Acknowledge handshake signal for the clrexmonreq signal
`clrexmonreq`	*Signal* on page 2-85	Slave	Signals the clearing of an external global exclusive monitor
`clusterid`	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.

Table 3-111 Ports (continued)

Name	Protocol	Type	Description
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
commrx[4]	*Signal* on page 2-85	Master	Receive portion of Data Transfer Register full.
commtx[4]	*Signal* on page 2-85	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cp15sdisable2[4]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	*Signal* on page 2-85	Slave	CPU power on reset.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross trigger matrix port.
dbgack[4]	*Signal* on page 2-85	Master	External debug interface.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	Processor powerup request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	*Signal* on page 2-85	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	*Signal* on page 2-85	Master	Flush of L2 memory system complete.
l2flushreq	*Signal* on page 2-85	Slave	Request flush of L2 memory system.
l2reset	*Signal* on page 2-85	Slave	Level2 reset.

Table 3-111 Ports (continued)

Name	Protocol	Type	Description
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Debug reset.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt
reset[4]	*Signal* on page 2-85	Slave	Reset.
romaddr	*Value_64* on page 2-85	Slave	Debug ROM base address.
romaddrv	*Signal* on page 2-85	Slave	Debug ROM base address valid.
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.
sei[4]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
smpen[4]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each core.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
standbywfe[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state
standbywfil2	*Signal* on page 2-85	Master	This signal indicated all cores and L2 are idles and in low power state.
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtualised FIQ.

Table 3-111 Ports (continued)

Name	Protocol	Type	Description
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-112 Parameters for ARM_Cortex-A35

Name	Type	Default value	Description
cpu0.AA64nAA32	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CP15SDISABLE2	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.

Table 3-112 Parameters for ARM_Cortex-A35 (continued)

Name	Type	Default value	Description
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support

Table 3-113 Parameters for Cluster_ARM_Cortex-A35

Name	Type	Default value	Description
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTINNER	bool	0x1	Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
CLUSTER_ID	int	0x0	Processor cluster ID value
DBGROMADDR	int	0x0	Initialization value of DBGDRAR register. Bits[47:12] of this register specify the ROM table physical address.
DBGROMADDRV	bool	0x0	If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
PERIPHBASE	int	0x13080000	Base address of peripheral memory space
bus_type	int	0x0	Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)

Table 3-113 Parameters for Cluster_ARM_Cortex-A35 (continued)

Name	Type	Default value	Description
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x8000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-113 Parameters for Cluster_ARM_Cortex-A35 (continued)

Name	Type	Default value	Description
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x8000	L1 I-Cache size in bytes.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation

Table 3-113 Parameters for Cluster_ARM_Cortex-A35 (continued)

Name	Type	Default value	Description
`ptw_latency`	`int`	`0x0`	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
`tlb_latency`	`int`	`0x0`	TLB latency for TA (Timing Annotation), expressed in simulation ticks
`walk_cache_latency`	`int`	`0x0`	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

3.4.15 ARMCortexA53x1CT

ARMCortexA53x1CT CPU component. This model is written in C++ and models version r0p1 of the RTL.

ARMCortexA53x1CT contains the following CADI targets:

- ARM_Cortex-A53
- Cluster_ARM_Cortex-A53
- PVCache
- TlbCadi

ARMCortexA53x1CT contains the following MTI components:

- *4.11 ARM_Cortex-A53 - trace* on page 4-1152
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA53x1CT

- The following components also exist:
  - ARMCortexA53x2CT.
  - ARMCortexA53x3CT.
  - ARMCortexA53x4CT.

  The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).
- This model supports the Armv8-A Cryptography Extensions, which requires the Crypto plug-in to be loaded. See *Crypto plug-in* on page 5-2909 for details.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.

Differences between the CT model and RTL implementations

This component has the following differences from the corresponding revision of the RTL implementation:

- The value of the AArch64 PMCEID0_EL0 register, and the AArch32 alias of this register, differs in the model from the TRM value. The model value reflects the model counters.
- The mechanisms for setting the affinity fields of the MPIDR. The RTL has two ports:
  - CLUSTERIDAFF1[7:0].
  - CLUSTERIDAFF2[7:0].

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

AFF1 sets the value of MPIDR bits[15:8] and AFF2 sets the value of MPIDR bits[23:16]. In contrast, the model has a single `CLUSTER_ID` port. This difference allows the setting of bits[23:8] of the MPIDR using bits[15:0] of the `CLUSTER_ID` value.

- The memory mapped debug registers have a view for cores and a view for external debug agents. In the model, these views require two PVBus ports. In hardware, the system designer decides how the implementation differentiates the views.
- In the model, a single `peer` event port combines the functionality of the `eventi` and `evento` signals in the RTL.
- The Generic Timers are *Programmer's View* (PV) level abstractions: a model-specific protocol connects the `cntvalueb` port to the MemoryMappedCounterModule.
- The GIC CPU Interface is a PV level abstraction: a model-specific protocol connects the GIC CPU Interface to the GIC Distributor.
- The CoreSight™ *Cross Trigger Interface* (CTI) is a PV level abstraction: the interface is a model specific one.
- The model has no mechanism to read the internal memory that the Cache and TLB structures use, through the implementation defined region of the system coprocessor interface. This memory includes the RAM Index Register, IL1DATA Registers, DL1DATA Registers, and associated functionality.
- The model does not implement:
  - ETM registers.
  - The PMUEVENT bus.
  - The WARMRESETREQ signal. However, the warm reset code sequence (see the section *Code sequence to request a Warm reset as a result of RMR_ELx.RR* in the *Arm®v8-A Architecture Reference Manual*) makes the model simulate a warm reset of the core.
  - The PMUSNAPSHOTREQ and PMUSNAPSHOTACK signals.
  - The EXTERRIRQ and INTERRIRQ signals.
  - Processor dynamic-retention signals.
  - The SYSBARDISABLE signal.
  - The DBGPWRDUP, DBGPWRUPREQ, DBGNOPWRDWN, and DBGRSTREQ debug power management signals.
  - The RTL synthesis option to remove FP and ASE.
  - The RTL synthesis option for a Cortex-A15 style debug memory map.
  - Although NEON support is optional for the Cortex-A53 processor, this model does not implement the `ase-present` parameter. This means it is not possible to configure the model to not support NEON.
  - ECC and parity schemes are hardware-specific so are not supported.

Table 3-114 Ports

Name	Protocol	Type	Description
`CNTHPIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SoC.
`CNTPNSIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SoC.
`CNTPSIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SoC.
`CNTVIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SoC.
`aa64naa32[4]`	*Signal* on page 2-85	Slave	Register width after reset.
`acp_s`	PVBus	Slave	AXI ACP slave port.
`broadcastcachemaint`	*Signal* on page 2-85	Slave	Enable broadcasting of cache maintenance operations to downstream caches.

Non-Confidential

Table 3-114 Ports (continued)

Name	Protocol	Type	Description
broadcastinner	*Signal* on page 2-85	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	*Signal* on page 2-85	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	*Signal* on page 2-85	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	*Signal* on page 2-85	Slave	Signals the clearing of an external global exclusive monitor
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
commrx[4]	*Signal* on page 2-85	Master	Receive portion of Data Transfer Register full.
commtx[4]	*Signal* on page 2-85	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	*Signal* on page 2-85	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.

Table 3-114 Ports (continued)

Name	Protocol	Type	Description
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	*Signal* on page 2-85	Master	External debug interface.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgl1rstdisable	*Signal* on page 2-85	Slave	Control ram clear on reset
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	This signals relate to core power down.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	This signals relate to core power down.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	*Signal* on page 2-85	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	*Signal* on page 2-85	Master	Flush of L2 memory system complete.
l2flushreq	*Signal* on page 2-85	Slave	Request flush of L2 memory system.
l2reset	*Signal* on page 2-85	Slave	Reset the shared L2 memory system controller.
l2rstdisable	*Signal* on page 2-85	Slave	-
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.

Table 3-114 Ports (continued)

Name	Protocol	Type	Description
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	*Signal* on page 2-85	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
romaddr	*Value_64* on page 2-85	Slave	Debug ROM base address.
romaddrv	*Signal* on page 2-85	Slave	Debug ROM base address valid.
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.
sei[4]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
smpen[4]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each core.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
standbywfe[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
standbywfil2	*Signal* on page 2-85	Master	Indicate that all the individual processors and the L2 systems are in a WFI state.
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtual FIQ.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtual IRQ.

Table 3-114 Ports (continued)

Name	Protocol	Type	Description
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Processor Virtual System Error Interrupt request.

Table 3-115 Parameters for Cluster_ARM_Cortex-A53

Name	Type	Default value	Description
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTINNER	bool	0x1	Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
CLUSTER_ID	int	0x0	Processor cluster ID value
DBGROMADDR	int	0x0	Initialization value of DBGDRAR register. Bits[47:12] of this register specify the ROM table physical address.
DBGROMADDRV	bool	0x0	If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
PERIPHBASE	int	0x13080000	Base address of peripheral memory space
bus_type	int	0x0	Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-115 Parameters for Cluster_ARM_Cortex-A53 (continued)

Name	Type	Default value	Description
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x8000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Table 3-115 Parameters for Cluster_ARM_Cortex-A53 (continued)

Name	Type	Default value	Description
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x8000	L1 I-Cache size in bytes.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Table 3-115 Parameters for Cluster_ARM_Cortex-A53 (continued)

Name	Type	Default value	Description
l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l2cache-size	int	0x80000	L2 Cache size in bytes.
l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
patch_level	int	0x1	Cosmetic change to patch number in MIDR/ MIDR_EL1. Corresponds to the Y in rXpY.
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
revision_number	int	0x0	Cosmetic change to revision number in MIDR/ MIDR_EL1. Corresponds to the X in rXpY.

Table 3-115 Parameters for Cluster_ARM_Cortex-A53 (continued)

Name	Type	Default value	Description
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-116 Parameters for ARM_Cortex-A53

Name	Type	Default value	Description
cpu0.AA64nAA32	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Table 3-116 Parameters for ARM_Cortex-A53 (continued)

Name	Type	Default value	Description
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support

3.4.16 ARMCortexA55CT

ARMCortexA55CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA55CT contains the following CADI targets:

- ARM_Cortex-A55
- Cluster_ARM_Cortex-A55
- PVCache
- TlbCadi

ARMCortexA55CT contains the following MTI components:

- *4.12 ARM_Cortex-A55 - trace* on page 4-1190
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA55CT

The model supports the following features:

- DynamIQ™ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOPWRDWN are implemented.
- Cache stashing capability.
- Dual ACE masters.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

This component has a variable number of cores per cluster, specified using the NUM_CORES parameter. The following components also exist, with a fixed number of cores per cluster:

- ARMCortexA55x1CT.
- ARMCortexA55x2CT.
- ARMCortexA55x3CT.
- ARMCortexA55x4CT.
- ARMCortexA55x8CT.

The per-core parameters are preceded by cpu*n*., where *n* identifies the core (0-7).

Table 3-117 Ports

Name	Protocol	Type	Description
AENDMP	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
CNTHPIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
aa64naa32[8]	*Signal* on page 2-85	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[8]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[8]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.

Table 3-117 Ports (continued)

Name	Protocol	Type	Description
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[8]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[8]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[8]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[8]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[8]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[8]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[8]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[8]	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[8]	*PChannel* on page 2-80	Slave	PChannels for cores

Table 3-117 Ports (continued)

Name	Protocol	Type	Description
pmuirq[8]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[8]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[8]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[8]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
spiden[8]	*Signal* on page 2-85	Slave	External debug interface.
spniden[8]	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[8]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[8]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[8]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	*Signal* on page 2-85	Slave	Virtualised IRQ.

Table 3-117 Ports (continued)

Name	Protocol	Type	Description
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-118 Parameters for ARM_Cortex-A55

Name	Type	Default value	Description
cpu0.AA64nAA32	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-118 Parameters for ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.

Table 3-118 Parameters for ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support

Table 3-119 Parameters for Cluster_ARM_Cortex-A55

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
bus_type	int	0x0	Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-119 Parameters for Cluster_ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x8000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Table 3-119 Parameters for Cluster_ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x8000	L1 I-Cache size in bytes.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Table 3-119 Parameters for Cluster_ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l3cache-size	int	0x80000	L3 Cache size in bytes.
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-119 Parameters for Cluster_ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
`tlb_latency`	`int`	`0x0`	TLB latency for TA (Timing Annotation), expressed in simulation ticks
`walk_cache_latency`	`int`	`0x0`	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

3.4.17 ARMCortexA55CT_CortexA75CT

ARMCortexA55CT_CortexA75CT CPU component. This model is written in C++.

ARMCortexA55CT_CortexA75CT contains the following CADI targets:

- ARM_Cortex-A55
- Cluster_ARM_Cortex-A55_Cortex-A75
- Subcluster_ARM_Cortex-A55
- Subcluster_ARM_Cortex-A75

ARMCortexA55CT_CortexA75CT contains the following MTI components:

- *4.12 ARM_Cortex-A55 - trace* on page 4-1190
- *4.20 ARM_Cortex-A75 - trace* on page 4-1479
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA55CT_CortexA75CT

For information about the cores in this model, see:

- *3.4.16 ARMCortexA55CT* on page 3-342.
- *3.4.25 ARMCortexA75CT* on page 3-434.

Table 3-120 Ports

Name	Protocol	Type	Description
`AENDMP`	*`Value_64` on page 2-85*	Slave	DynamIQ port to obtain end address of valid peripheral address range (exclusive).
`ASTARTMP`	*`Value_64` on page 2-85*	Slave	DynamIQ port to obtain start address of valid peripheral address range (inclusive).
`CNTHPIRQ[8]`	*`Signal` on page 2-85*	Master	Timer signals to SOC.
`CNTHVIRQ[8]`	*`Signal` on page 2-85*	Master	Timer signals to SOC.
`CNTPNSIRQ[8]`	*`Signal` on page 2-85*	Master	Timer signals to SOC.
`CNTPSIRQ[8]`	*`Signal` on page 2-85*	Master	Timer signals to SOC.
`CNTVIRQ[8]`	*`Signal` on page 2-85*	Master	Timer signals to SOC.

Table 3-120 Ports (continued)

Name	Protocol	Type	Description
aa64naa32[8]	*Signal* on page 2-85	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[8]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[8]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[8]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[8]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[8]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-120 Ports (continued)

Name	Protocol	Type	Description
ctidbgirq[8]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[8]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[8]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[8]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[8]	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[8]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[8]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[8]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[8]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-120 Ports (continued)

Name	Protocol	Type	Description
sei[8]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
spiden[8]	*Signal* on page 2-85	Slave	External debug interface.
spniden[8]	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[8]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[8]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[8]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-121 Parameters for ARM_Cortex-A55

Name	Type	Default value	Description
cpu0.AA64nAA32	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-121 Parameters for ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Table 3-121 Parameters for ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support

Table 3-122 Parameters for Cluster_ARM_Cortex-A55_Cortex-A75

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Non-Confidential

Table 3-122 Parameters for Cluster_ARM_Cortex-A55_Cortex-A75 (continued)

Name	Type	Default value	Description
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
bus_type	int	0x0	Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Table 3-122 Parameters for Cluster_ARM_Cortex-A55_Cortex-A75 (continued)

Name	Type	Default value	Description
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l3cache-size	int	0x80000	L3 Cache size in bytes.
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Table 3-123 Parameters for Subcluster_ARM_Cortex-A55

Name	Type	Default value	Description
subcluster0.NUM_CORES	int	0x1	Number of cores per cluster
subcluster0.cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
subcluster0.cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
subcluster0.dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Table 3-123 Parameters for Subcluster_ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
subcluster0.dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
subcluster0.dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
subcluster0.dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
subcluster0.dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
subcluster0.dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
subcluster0.dcache-size	int	0x8000	L1 D-Cache size in bytes.
subcluster0.dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
subcluster0.dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
subcluster0.dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
subcluster0.has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
subcluster0.icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
subcluster0.icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
subcluster0.icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Table 3-123 Parameters for Subcluster_ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
subcluster0.icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
subcluster0.icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
subcluster0.icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
subcluster0.icache-size	int	0x8000	L1 I-Cache size in bytes.
subcluster0.ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
subcluster0.tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
subcluster0.walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-124 Parameters for Subcluster_ARM_Cortex-A75

Name	Type	Default value	Description
subcluster1.CCSIDR-L1D_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).
subcluster1.CCSIDR-L1I_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).
subcluster1.CCSIDR-L2_override	int	0x0	If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).
subcluster1.NUM_CORES	int	0x1	Number of cores per cluster
subcluster1.cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
subcluster1.cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
subcluster1.dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
subcluster1.dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Table 3-125 Ports

Name	Protocol	Type	Description
AENDMP	*Value_64* on page 2-85	Slave	DynamIQ port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	*Value_64* on page 2-85	Slave	DynamIQ port to obtain start address of valid peripheral address range (inclusive).
CNTHPIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
aa64naa32[8]	*Signal* on page 2-85	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[8]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[8]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[8]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.

Table 3-125 Ports (continued)

Name	Protocol	Type	Description
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[8]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[8]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[8]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[8]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[8]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[8]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[8]	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[8]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[8]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.

Table 3-125 Ports (continued)

Name	Protocol	Type	Description
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[8]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[8]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[8]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
spiden[8]	*Signal* on page 2-85	Slave	External debug interface.
spniden[8]	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[8]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[8]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[8]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-126 Parameters for ARM_Cortex-A55

Name	Type	Default value	Description
cpu0.AA64nAA32	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Table 3-126 Parameters for ARM_Cortex-A55 (continued)

Name	Type	Default value	Description
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.vfp-present	bool	0x1	Set whether the model has VFP support

Table 3-127 Parameters for Cluster_ARM_Cortex-A55_Cortex-A76

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
bus_type	int	0x0	Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Table 3-127 Parameters for Cluster_ARM_Cortex-A55_Cortex-A76 (continued)

Name	Type	Default value	Description
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l3cache-size	int	0x80000	L3 Cache size in bytes.
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Table 3-128 Parameters for Subcluster_ARM_Cortex-A55

Name	Type	Default value	Description
subcluster0.NUM_CORES	int	0x1	Number of cores per cluster
subcluster0.cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
subcluster0.cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
subcluster0.dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
subcluster0.dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
subcluster0.dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
subcluster0.dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
subcluster0.dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
subcluster0.dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
subcluster0.dcache-size	int	0x8000	L1 D-Cache size in bytes.
subcluster0.dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
subcluster0.dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
subcluster0.dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
subcluster0.has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster1.has_statistical_profiling	bool	0x1	Whether Statistical Based Profiling is implemented
subcluster1.icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
subcluster1.icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
subcluster1.icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
subcluster1.icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
subcluster1.icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
subcluster1.icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
subcluster1.ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
subcluster1.tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
subcluster1.treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
subcluster1.walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

3.4.19 ARMCortexA57x1CT

ARMCortexA57x1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA57x1CT contains the following CADI targets:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- ARM_Cortex-A57
- Cluster_ARM_Cortex-A57
- PVCache
- TlbCadi

ARMCortexA57x1CT contains the following MTI components:

- *4.13 ARM_Cortex-A57 - trace* on page 4-1228
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA57x1CT

- The following components also exist:
  - ARMCortexA57x2CT.
  - ARMCortexA57x3CT.
  - ARMCortexA57x4CT.

  The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- This model supports the Armv8-A Cryptography Extensions, which requires the Crypto plug-in to be loaded. See *Crypto plug-in* on page 5-2909 for details.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The value of the AArch64 PMCEID0_EL0 register, and the AArch32 alias of this register, differs in the model from the TRM value. The model value reflects the model counters.
- The mechanisms for setting the affinity fields of the MPIDR. The RTL has two ports:
  - CLUSTERIDAFF1[7:0].
  - CLUSTERIDAFF2[7:0].

  AFF1 sets the value of MPIDR bits[15:8] and AFF2 sets the value of MPIDR bits[23:16]. In contrast, the model has a single `CLUSTER_ID` port. This difference allows the setting of bits[23:8] of the MPIDR using bits[15:0] of the `CLUSTER_ID` value.
- The memory mapped debug registers have a view for cores and a view for external debug agents. In the model, these views require two PVBus ports. In hardware, the system designer decides how the implementation differentiates the views.
- In the model, a single `peer` event port combines the functionality of the `eventi` and `evento` signals in the RTL.
- The Generic Timers are *Programmer's View* (PV) level abstractions: a model-specific protocol connects the `cntvalueb` port to the MemoryMappedCounterModule.
- The GIC CPU Interface is a PV level abstraction: a model-specific protocol connects the GIC CPU Interface to the GIC Distributor.
- The CoreSight *Cross Trigger Interface* (CTI) is a PV level abstraction: the interface is a model-specific one.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- The model has no mechanism to read the internal memory that the Cache and TLB structures use, through the implementation defined region of the system coprocessor interface. This memory includes the RAM Index Register, IL1DATA Registers, DL1DATA Registers, and associated functionality.
- The model does not implement:
  - ETM registers.
  - The PMUEVENT bus.
  - The WARMRESETREQ signal. However, the warm reset code sequence (see the section *Code sequence to request a Warm reset as a result of RMR_ELx.RR* in the *Arm®v8-A Architecture Reference Manual*) makes the model simulate a warm reset of the core.
  - The PMUSNAPSHOTREQ and PMUSNAPSHOTACK signals.
  - The EXTERRIRQ and INTERRIRQ signals.
  - Processor dynamic-retention signals.
  - The SYSBARDISABLE signal.
  - The DBGPWRDUP, DBGPWRUPREQ, DBGNOPWRDWN, and DBGRSTREQ debug power management signals.
  - ECC and parity schemes are hardware-specific so are not supported.

Table 3-130 Ports

Name	Protocol	Type	Description
CNTHPIRQ[4]	*Signal* on page 2-85	Master	The per-EL counter signal.
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	The per-EL counter signal.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	The per-EL counter signal.
CNTVIRQ[4]	*Signal* on page 2-85	Master	The per-EL counter signal.
aa64naa32[4]	*Signal* on page 2-85	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	*Signal* on page 2-85	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	*Signal* on page 2-85	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	*Signal* on page 2-85	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.

Table 3-130 Ports (continued)

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	*Signal* on page 2-85	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	*Signal* on page 2-85	Slave	Signals the clearing of an external global exclusive monitor
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
commrx[4]	*Signal* on page 2-85	Master	Receive portion of Data Transfer Register full.
commtx[4]	*Signal* on page 2-85	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	*Signal* on page 2-85	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	*Signal* on page 2-85	Master	External debug interface.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	These signals relate to core power down.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	These signals relate to core power down.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	*Signal* on page 2-85	Slave	External debug interface.

Table 3-130 Ports (continued)

Name	Protocol	Type	Description
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	*Signal* on page 2-85	Master	Flush of L2 memory system complete
l2flushreq	*Signal* on page 2-85	Slave	Request flush of L2 memory system.
l2reset	*Signal* on page 2-85	Slave	Reset the shared L2 memory system controller.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	*Signal* on page 2-85	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
romaddr	*Value_64* on page 2-85	Slave	Debug ROM base address.
romaddrv	*Signal* on page 2-85	Slave	Debug ROM base address valid.
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.
sei[4]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
smpen[4]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each core.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.

Table 3-130 Ports (continued)

Name	Protocol	Type	Description
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
standbywfe[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
standbywfil2	*Signal* on page 2-85	Master	Indicate that all the individual processors and the L2 systems are in a WFI state.
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtual FIQ.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtual IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Processor Virtual System Error Interrupt request.

Table 3-131 Parameters for ARM_Cortex-A57

Name	Type	Default value	Description
cpu0.AA64nAA32	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-131 Parameters for ARM_Cortex-A57 (continued)

Name	Type	Default value	Description
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Table 3-132 Parameters for Cluster_ARM_Cortex-A57

Name	Type	Default value	Description
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTINNER	bool	0x1	Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
CLUSTER_ID	int	0x0	Processor cluster ID value

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-132 Parameters for Cluster_ARM_Cortex-A57 (continued)

Name	Type	Default value	Description
DBGROMADDR	int	0x0	Initialization value of DBGDRAR register. Bits[47:12] of this register specify the ROM table physical address.
DBGROMADDRV	bool	0x0	If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
PERIPHBASE	int	0x13080000	Base address of peripheral memory space
bus_type	int	0x0	Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Table 3-132 Parameters for Cluster_ARM_Cortex-A57 (continued)

Name	Type	Default value	Description
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Table 3-132 Parameters for Cluster_ARM_Cortex-A57 (continued)

Name	Type	Default value	Description
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l2cache-size	int	0x80000	L2 Cache size in bytes.

Table 3-132 Parameters for Cluster_ARM_Cortex-A57 (continued)

Name	Type	Default value	Description
`l2cache-snoop_data_transfer_latency`	`int`	`0x0`	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
`l2cache-snoop_issue_latency`	`int`	`0x0`	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
`l2cache-write_access_latency`	`int`	`0x0`	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
`l2cache-write_latency`	`int`	`0x0`	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
`ptw_latency`	`int`	`0x0`	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
`tlb_latency`	`int`	`0x0`	TLB latency for TA (Timing Annotation), expressed in simulation ticks
`walk_cache_latency`	`int`	`0x0`	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

3.4.20 ARMCortexA65AECT

ARMCortexA65AECT CPU component. This model is written in C++.

ARMCortexA65AECT contains the following CADI targets:

- ARM_Cortex-A65AE
- Cluster_ARM_Cortex-A65AE
- PVCache
- TlbCadi

ARMCortexA65AECT contains the following MTI components:

- *4.16 ARM_Cortex-A65AE - trace* on page 4-1329
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA65AECT

The model supports the following features:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- DynamIQ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- `BROADCASTPERSIST` pin.

The model does not support the following features:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.
- Split/Lock

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:

- ARMCortexA65AECTx2CT.
- ARMCortexA65AECTx4CT.
- ARMCortexA65AECTx6CT.
- ARMCortexA65AECTx8CT.

The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-7).

Table 3-133 Ports

Name	Protocol	Type	Description
AENDMP	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
CNTHPIRQ[16]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[16]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[16]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[16]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[16]	*Signal* on page 2-85	Master	Timer signals to SOC.
acp_s	PVBus	Slave	AXI ACP slave port
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-133 Ports (continued)

Name	Protocol	Type	Description
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[16]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgte[16]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[16]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	*Signal* on page 2-85	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[16]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[16]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[16]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[16]	*Signal* on page 2-85	Master	These signals relate to core power down.
dbgpwrupreq[16]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-133 Ports (continued)

Name	Protocol	Type	Description
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[16]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[16]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port per thread.
irq[16]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[8]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[16]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[16]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[16]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[16]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.
spiden	*Signal* on page 2-85	Slave	External debug interface.
spniden	*Signal* on page 2-85	Slave	External debug interface.

Table 3-133 Ports (continued)

Name	Protocol	Type	Description
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[16]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[16]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[16]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[16]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[16]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[16]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-134 Parameters for Cluster_ARM_Cortex-A65AE

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value

Table 3-134 Parameters for Cluster_ARM_Cortex-A65AE (continued)

Name	Type	Default value	Description
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
NUM_CORES	int	0x2	Number of cores per cluster
cluster_patch_level	int	0x0	Cosmetic change to patch number in CLUSTERIDR. Corresponds to the Y in rXpY.
cluster_revision_number	int	0x0	Cosmetic change to revision number in CLUSTERIDR, Corresponds to the X in rXpY.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x10000	L1 D-Cache size in bytes.

Non-Confidential

Table 3-134 Parameters for Cluster_ARM_Cortex-A65AE (continued)

Name	Type	Default value	Description
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Table 3-134 Parameters for Cluster_ARM_Cortex-A65AE (continued)

Name	Type	Default value	Description
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x10000	L1 I-Cache size in bytes.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Table 3-134 Parameters for Cluster_ARM_Cortex-A65AE (continued)

Name	Type	Default value	Description
l3cache-size	int	0x400000	L3 Cache size in bytes.
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-135 Parameters for ARM_Cortex-A65AE

Name	Type	Default value	Description
cpu0.thread0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.thread0.enable_single_thread_at_reset	bool	0x0	Enable single thread after reset and keep other thread in reset
cpu0.thread0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16

Table 3-135 Parameters for ARM_Cortex-A65AE (continued)

Name	Type	Default value	Description
cpu0.thread0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-size	int	0x40000	L2 Cache size in bytes.
cpu0.thread0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Table 3-135 Parameters for ARM_Cortex-A65AE (continued)

Name	Type	Default value	Description
cpu0.thread0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.thread0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.thread0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.thread0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.thread0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.thread0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.thread0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.thread0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.thread0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.thread0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.thread0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.thread0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.thread0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.thread0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.thread0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.thread0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.thread0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.thread0.vfp-present	bool	0x1	Set whether the model has VFP support

3.4.21 ARMCortexA65AECT_CortexA76AECT

ARMCortexA65AECT_CortexA76AECT CPU component. This model is written in C++.

ARMCortexA65AECT_CortexA76AECT contains the following CADI targets:

- ARM_Cortex-A65AE
- Cluster_ARM_Cortex-A65AE_Cortex-A76AE
- Subcluster_ARM_Cortex-A65AE
- Subcluster_ARM_Cortex-A76AE

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARMCortexA65AECT_CortexA76AECT contains the following MTI components:

- *4.16 ARM_Cortex-A65AE - trace* on page 4-1329
- *4.22 ARM_Cortex-A76AE - trace* on page 4-1556
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA65AECT_CortexA76AECT

For information about the cores in this model, see:

- *3.4.20 ARMCortexA65AECT* on page 3-384.
- *3.4.26 ARMCortexA76AECT* on page 3-444.

Table 3-136 Ports

Name	Protocol	Type	Description
AENDMP	*Value_64* on page 2-85	Slave	DynamIQ port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	*Value_64* on page 2-85	Slave	DynamIQ port to obtain start address of valid peripheral address range (inclusive).
CNTHPIRQ[12]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[12]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[12]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[12]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[12]	*Signal* on page 2-85	Master	Timer signals to SOC.
acp_s	PVBus	Slave	AXI ACP slave port
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[12]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgte[12]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-136 Ports (continued)

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[12]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[12]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[12]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[12]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[12]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[12]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[12]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[12]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[12]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.

Table 3-136 Ports (continued)

Name	Protocol	Type	Description
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[8]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[12]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[12]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[12]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[12]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
spiden	*Signal* on page 2-85	Slave	External debug interface.
spniden	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[12]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[12]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[12]	*Signal* on page 2-85	Slave	Virtualised FIQ.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-136 Ports (continued)

Name	Protocol	Type	Description
vinithi[12]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[12]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[12]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-137 Parameters for Subcluster_ARM_Cortex-A65AE

Name	Type	Default value	Description
subcluster0.NUM_CORES	int	0x2	Number of cores per cluster
subcluster0.cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
subcluster0.cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
subcluster0.dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
subcluster0.dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
subcluster0.dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
subcluster0.dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
subcluster0.dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
subcluster0.dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
subcluster0.dcache-size	int	0x10000	L1 D-Cache size in bytes.

Non-Confidential

Table 3-137 Parameters for Subcluster_ARM_Cortex-A65AE (continued)

Name	Type	Default value	Description
subcluster0.dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
subcluster0.dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
subcluster0.dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
subcluster0.has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
subcluster0.icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
subcluster0.icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
subcluster0.icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
subcluster0.icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
subcluster0.icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
subcluster0.icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
subcluster0.icache-size	int	0x10000	L1 I-Cache size in bytes.
subcluster0.ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-137 Parameters for Subcluster_ARM_Cortex-A65AE (continued)

Name	Type	Default value	Description
subcluster0.tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
subcluster0.walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-138 Parameters for ARM_Cortex-A65AE

Name	Type	Default value	Description
cpu0.thread0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.thread0.enable_single_thread_at_reset	bool	0x0	Enable single thread after reset and keep other thread in reset
cpu0.thread0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.thread0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-size	int	0x40000	L2 Cache size in bytes.

Table 3-138 Parameters for ARM_Cortex-A65AE (continued)

Name	Type	Default value	Description
cpu0.thread0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.thread0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.thread0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.thread0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.thread0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.thread0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.thread0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.thread0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.thread0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.thread0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.thread0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.thread0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.thread0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.thread0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.thread0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.

Table 3-138 Parameters for ARM_Cortex-A65AE (continued)

Name	Type	Default value	Description
cpu0.thread0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.thread0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.thread0.vfp-present	bool	0x1	Set whether the model has VFP support

Table 3-139 Parameters for Cluster_ARM_Cortex-A65AE_Cortex-A76AE

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Table 3-139 Parameters for Cluster_ARM_Cortex-A65AE_Cortex-A76AE (continued)

Name	Type	Default value	Description
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l3cache-size	int	0x100000	L3 Cache size in bytes.
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Table 3-139 Parameters for Cluster_ARM_Cortex-A65AE_Cortex-A76AE (continued)

Name	Type	Default value	Description
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Table 3-140 Parameters for Subcluster_ARM_Cortex-A76AE

Name	Type	Default value	Description
subcluster1.NUM_CORES	int	0x2	Number of cores per cluster
subcluster1.cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
subcluster1.cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
subcluster1.dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
subcluster1.dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
subcluster1.dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
subcluster1.dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
subcluster1.dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Table 3-140 Parameters for Subcluster_ARM_Cortex-A76AE (continued)

Name	Type	Default value	Description
subcluster1.dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
subcluster1.dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
subcluster1.dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
subcluster1.dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
subcluster1.ext_abort_device_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRE read external aborts
subcluster1.ext_abort_device_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRE write external aborts
subcluster1.ext_abort_so_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE read external aborts
subcluster1.ext_abort_so_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE write external aborts
subcluster1.has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
subcluster1.has_statistical_profiling	bool	0x1	Whether Statistical Based Profiling is implemented
subcluster1.icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
subcluster1.icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
subcluster1.icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Table 3-140 Parameters for Subcluster_ARM_Cortex-A76AE (continued)

Name	Type	Default value	Description
subcluster1.icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
subcluster1.icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
subcluster1.icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
subcluster1.ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
subcluster1.tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
subcluster1.treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
subcluster1.walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

3.4.22 ARMCortexA65CT

ARMCortexA65CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA65CT contains the following CADI targets:

- ARM_Cortex-A65
- Cluster_ARM_Cortex-A65
- PVCache
- TlbCadi

ARMCortexA65CT contains the following MTI components:

- *4.15 ARM_Cortex-A65 - trace* on page 4-1291
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA65CT

The model supports the following features:

- DynamIQ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- `BROADCASTPERSIST` pin.

The model does not support the following features:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This component has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following components also exist, with a fixed number of cores per cluster:

- ARMCortexA65x1CT.
- ARMCortexA65x2CT.
- ARMCortexA65x3CT.
- ARMCortexA65x4CT.

The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).

Table 3-141 Ports

Name	Protocol	Type	Description
`AENDMP`	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
`ASTARTMP`	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
`CNTHPIRQ[16]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTHVIRQ[16]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTPNSIRQ[16]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTPSIRQ[16]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTVIRQ[16]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`acp_s`	`PVBus`	Slave	AXI ACP slave port.

Non-Confidential

Table 3-141 Ports (continued)

Name	Protocol	Type	Description
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[16]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgte[16]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[16]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	*Signal* on page 2-85	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[16]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[16]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[16]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[16]	*Signal* on page 2-85	Master	These signals relate to core power down.
dbgpwrupreq[16]	*Signal* on page 2-85	Master	Debug power up request.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-141 Ports (continued)

Name	Protocol	Type	Description
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[16]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[16]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[16]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[8]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[16]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[16]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[16]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[16]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.
spiden	*Signal* on page 2-85	Slave	External debug interface.
spniden	*Signal* on page 2-85	Slave	External debug interface.

Table 3-141 Ports (continued)

Name	Protocol	Type	Description
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[16]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[16]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[16]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[16]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[16]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[16]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-142 Parameters for Cluster_ARM_Cortex-A65

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value

Table 3-142 Parameters for Cluster_ARM_Cortex-A65 (continued)

Name	Type	Default value	Description
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
cluster_patch_level	int	0x0	Cosmetic change to patch number in CLUSTERIDR. Corresponds to the Y in rXpY.
cluster_revision_number	int	0x0	Cosmetic change to revision number in CLUSTERIDR, Corresponds to the X in rXpY.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x10000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Table 3-142 Parameters for Cluster_ARM_Cortex-A65 (continued)

Name	Type	Default value	Description
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Table 3-142 Parameters for Cluster_ARM_Cortex-A65 (continued)

Name	Type	Default value	Description
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x10000	L1 I-Cache size in bytes.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Table 3-142 Parameters for Cluster_ARM_Cortex-A65 (continued)

Name	Type	Default value	Description
l3cache-size	int	0x400000	L3 Cache size in bytes.
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-143 Parameters for ARM_Cortex-A65

Name	Type	Default value	Description
cpu0.thread0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.thread0.enable_single_thread_at_reset	bool	0x0	Enable single thread after reset and keep other thread in reset
cpu0.thread0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16

Table 3-143 Parameters for ARM_Cortex-A65 (continued)

Name	Type	Default value	Description
cpu0.thread0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-size	int	0x40000	L2 Cache size in bytes.
cpu0.thread0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.thread0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Table 3-143 Parameters for ARM_Cortex-A65 (continued)

Name	Type	Default value	Description
cpu0.thread0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.thread0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.thread0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.thread0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.thread0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.thread0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.thread0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.thread0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.thread0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.thread0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.thread0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.thread0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.thread0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.thread0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.thread0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.thread0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.thread0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.thread0.vfp-present	bool	0x1	Set whether the model has VFP support

3.4.23 ARMCortexA72x1CT

ARMCortexA72x1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA72x1CT contains the following CADI targets:

- ARM_Cortex-A72
- Cluster_ARM_Cortex-A72

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- PVCache
- TlbCadi

ARMCortexA72x1CT contains the following MTI components:

- *4.18 ARM_Cortex-A72 - trace* on page 4-1403
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA72xnCT

- The following components also exist:
  - ARMCortexA72x2CT.
  - ARMCortexA72x3CT.
  - ARMCortexA72x4CT.

  The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).
- The cache latency cluster parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the cache and TLB models.
- ECC and parity schemes are hardware-specific so are not supported.

Table 3-144 Ports

Name	Protocol	Type	Description
CNTHPIRQ[4]	*Signal* on page 2-85	Master	The per-EL counter signal.
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	The per-EL counter signal.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	The per-EL counter signal.
CNTVIRQ[4]	*Signal* on page 2-85	Master	The per-EL counter signal.
aa64naa32[4]	*Signal* on page 2-85	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	*Signal* on page 2-85	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	*Signal* on page 2-85	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	*Signal* on page 2-85	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.

Non-Confidential

Table 3-144 Ports (continued)

Name	Protocol	Type	Description
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	*Signal* on page 2-85	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	*Signal* on page 2-85	Slave	Signals the clearing of an external global exclusive monitor
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
commrx[4]	*Signal* on page 2-85	Master	Receive portion of Data Transfer Register full.
commtx[4]	*Signal* on page 2-85	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	*Signal* on page 2-85	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	*Signal* on page 2-85	Master	External debug interface.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-144 Ports (continued)

Name	Protocol	Type	Description
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	These signals relate to core power down.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	These signals relate to core power down.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	*Signal* on page 2-85	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	*Signal* on page 2-85	Master	Flush of L2 memory system complete.
l2flushreq	*Signal* on page 2-85	Slave	Request flush of L2 memory system.
l2reset	*Signal* on page 2-85	Slave	Reset the shared L2 memory system controller.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	*Signal* on page 2-85	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
romaddr	*Value_64* on page 2-85	Slave	Debug ROM base address.
romaddrv	*Signal* on page 2-85	Slave	Debug ROM base address valid.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-144 Ports (continued)

Name	Protocol	Type	Description
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.
sei[4]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
smpen[4]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each core.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
standbywfe[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
standbywfil2	*Signal* on page 2-85	Master	Indicate that all the individual processors and the L2 systems are in a WFI state.
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtual FIQ
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtual IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Processor Virtual System Error Interrupt request.

Table 3-145 Parameters for Cluster_ARM_Cortex-A72

Name	Type	Default value	Description
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTINNER	bool	0x1	Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
CLUSTER_ID	int	0x0	Processor cluster ID value
DBGROMADDR	int	0x0	Initialization value of DBGDRAR register. Bits[47:12] of this register specify the ROM table physical address.
DBGROMADDRV	bool	0x0	If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
PERIPHBASE	int	0x13080000	Base address of peripheral memory space
bus_type	int	0x0	Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-145 Parameters for Cluster_ARM_Cortex-A72 (continued)

Name	Type	Default value	Description
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-145 Parameters for Cluster_ARM_Cortex-A72 (continued)

Name	Type	Default value	Description
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Table 3-145 Parameters for Cluster_ARM_Cortex-A72 (continued)

Name	Type	Default value	Description
l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l2cache-size	int	0x80000	L2 Cache size in bytes.
l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-146 Parameters for ARM_Cortex-A72

Name	Type	Default value	Description
cpu0.AA64nAA32	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

3.4.24 ARMCortexA73x1CT

ARMCortexA73x1CT CPU component. This model is written in C++ and models version r0p2 of the RTL.

ARMCortexA73x1CT contains the following CADI targets:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- ARM_Cortex-A73
- Cluster_ARM_Cortex-A73
- PVCache
- TlbCadi

ARMCortexA73x1CT contains the following MTI components:

- *4.19 ARM_Cortex-A73 - trace* on page 4-1441
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA73x1CT

- The following components also exist:
  - ARMCortexA73x2CT.
  - ARMCortexA73x3CT.
  - ARMCortexA73x4CT.
- The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).
- This model supports the Armv8-A Cryptography Extensions, which require the Crypto plug-in to be loaded. See *Crypto plug-in* on page 5-2909 for details.
- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The `semihosting-cwd` parameter sets the CWD that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- ECC support is hardware-specific so is not modeled.

Table 3-147 Ports

Name	Protocol	Type	Description
`CNTHPIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTPNSIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTPSIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTVIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`aa64naa32[4]`	*Signal* on page 2-85	Slave	Register width after reset.
`acp_s`	`PVBus`	Slave	AXI ACP slave port.
`broadcastcachemaint`	*Signal* on page 2-85	Slave	ACE defined pins.
`broadcastinner`	*Signal* on page 2-85	Slave	ACE defined pins.
`broadcastouter`	*Signal* on page 2-85	Slave	ACE defined pins.
`cfgend[4]`	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.

Non-Confidential

Table 3-147 Ports (continued)

Name	Protocol	Type	Description
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	*Signal* on page 2-85	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	*Signal* on page 2-85	Slave	Signals the clearing of an external global exclusive monitor
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
commrx[4]	*Signal* on page 2-85	Master	Receive portion of Data Transfer Register full.
commtx[4]	*Signal* on page 2-85	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	*Signal* on page 2-85	Slave	CPU power on reset.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross trigger matrix port.
dbgack[4]	*Signal* on page 2-85	Master	External debug interface.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	Processor powerup request.

Table 3-147 Ports (continued)

Name	Protocol	Type	Description
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	*Signal* on page 2-85	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	*Signal* on page 2-85	Master	Flush of L2 memory system complete.
l2flushreq	*Signal* on page 2-85	Slave	Request flush of L2 memory system.
l2reset	*Signal* on page 2-85	Slave	Level2 reset.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Debug reset.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt
reset[4]	*Signal* on page 2-85	Slave	Reset.
romaddr	*Value_64* on page 2-85	Slave	Debug ROM base address.
romaddrv	*Signal* on page 2-85	Slave	Debug ROM base address valid.
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.
sei[4]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
smpen[4]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each core.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.

Table 3-147 Ports (continued)

Name	Protocol	Type	Description
standbywfe[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state
standbywfil2	*Signal* on page 2-85	Master	This signal indicates all cores and L2 are idle and in low power state.
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-148 Parameters for ARM_Cortex-A73

Name	Type	Default value	Description
cpu0.AA64nAA32	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.SMPEN	bool	0x0	Enable broadcast messages necessary for correct SMP operation at reset.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.

Table 3-148 Parameters for ARM_Cortex-A73 (continued)

Name	Type	Default value	Description
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Table 3-149 Parameters for Cluster_ARM_Cortex-A73

Name	Type	Default value	Description
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTINNER	bool	0x1	Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
CCSIDR-L1D_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-149 Parameters for Cluster_ARM_Cortex-A73 (continued)

Name	Type	Default value	Description
CCSIDR-L1I_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).
CCSIDR-L2_override	int	0x0	If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).
CLUSTER_ID	int	0x0	Processor cluster ID value
DBGROMADDR	int	0x0	Initialization value of DBGDRAR register. Bits[47:12] of this register specify the ROM table physical address.
DBGROMADDRV	bool	0x0	If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
MIDR	int	0x411fd090	Value of MIDR_EL1 register.
PERIPHBASE	int	0x13080000	Base address of peripheral memory space
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-149 Parameters for Cluster_ARM_Cortex-A73 (continued)

Name	Type	Default value	Description
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x8000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Table 3-149 Parameters for Cluster_ARM_Cortex-A73 (continued)

Name	Type	Default value	Description
`l2cache-read_latency`	`int`	`0x0`	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
`l2cache-size`	`int`	`0x80000`	L2 Cache size in bytes.
`l2cache-snoop_data_transfer_latency`	`int`	`0x0`	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
`l2cache-snoop_issue_latency`	`int`	`0x0`	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
`l2cache-write_access_latency`	`int`	`0x0`	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
`l2cache-write_latency`	`int`	`0x0`	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
`ptw_latency`	`int`	`0x0`	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
`tlb_latency`	`int`	`0x0`	TLB latency for TA (Timing Annotation), expressed in simulation ticks
`walk_cache_latency`	`int`	`0x0`	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

3.4.25 ARMCortexA75CT

ARMCortexA75CT CPU component. This model is written in C++.

ARMCortexA75CT contains the following CADI targets:

- ARM_Cortex-A75
- Cluster_ARM_Cortex-A75
- PVCache
- TlbCadi

ARMCortexA75CT contains the following MTI components:

- *4.20 ARM_Cortex-A75 - trace* on page 4-1479
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA75CT

The model supports the following features:

- DynamIQ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.

The model does not support the following features:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.
- Dual ACE masters.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:

- ARMCortexA75x1CT.
- ARMCortexA75x2CT.
- ARMCortexA75x3CT.
- ARMCortexA75x4CT.

The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).

Table 3-150 Ports

Name	Protocol	Type	Description
`AENDMP`	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
`ASTARTMP`	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
`CNTHPIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTHVIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-150 Ports (continued)

Name	Protocol	Type	Description
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
aa64naa32[4]	*Signal* on page 2-85	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[4]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	*Signal* on page 2-85	Slave	Power on reset. Initializes all the processor logic, including debug logic.

Non-Confidential

Table 3-150 Ports (continued)

Name	Protocol	Type	Description
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	*Signal* on page 2-85	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[4]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	*Signal* on page 2-85	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.

Table 3-150 Ports (continued)

Name	Protocol	Type	Description
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtual FIQ.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtual IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-151 Parameters for ARM_Cortex-A75

Name	Type	Default value	Description
cpu0.AA64nAA32	bool	0x1	Register width configuration at reset. 0, AArch32. 1, AArch64.
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-151 Parameters for ARM_Cortex-A75 (continued)

Name	Type	Default value	Description
cpu0.CP15SDISABLE	bool	0x0	Initialize to disable access to some CP15 registers
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-151 Parameters for ARM_Cortex-A75 (continued)

Name	Type	Default value	Description
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Table 3-152 Parameters for Cluster_ARM_Cortex-A75

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-152 Parameters for Cluster_ARM_Cortex-A75 (continued)

Name	Type	Default value	Description
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CCSIDR-L1D_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).
CCSIDR-L1I_override	int	0x0	If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).
CCSIDR-L2_override	int	0x0	If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Table 3-152 Parameters for Cluster_ARM_Cortex-A75 (continued)

Name	Type	Default value	Description
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Table 3-152 Parameters for Cluster_ARM_Cortex-A75 (continued)

Name	Type	Default value	Description
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

3.4.26 ARMCortexA76AECT

ARMCortexA76AECT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA76AECT contains the following CADI targets:

- ARM_Cortex-A76AE
- Cluster_ARM_Cortex-A76AE
- PVCache
- TlbCadi

ARMCortexA76AECT contains the following MTI components:

- *4.22 ARM_Cortex-A76AE - trace* on page 4-1556
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA76AECT

The model supports the following features:

- DynamIQ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- `BROADCASTPERSIST` pin.

The model does not support the following features:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.
- Split/Lock

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:

- ARMCortexA76AEx2CT.
- ARMCortexA76AEx4CT.
- ARMCortexA76AEx6CT.
- ARMCortexA76AEx8CT.

The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-7).

Table 3-153 Ports

Name	Protocol	Type	Description
`AENDMP`	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
`ASTARTMP`	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
`CNTHPIRQ[8]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTHVIRQ[8]`	*Signal* on page 2-85	Master	Timer signals to SOC.

Table 3-153 Ports (continued)

Name	Protocol	Type	Description
CNTPNSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[8]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgte[8]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[8]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	*Signal* on page 2-85	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[8]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[8]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	*Signal* on page 2-85	Slave	External debug interface.

Table 3-153 Ports (continued)

Name	Protocol	Type	Description
dbgnopwrdwn[8]	*Signal* on page 2-85	Master	These signals relate to core power down.
dbgpwrupreq[8]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[8]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[8]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[8]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[8]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[8]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.
spiden	*Signal* on page 2-85	Slave	External debug interface.
spniden	*Signal* on page 2-85	Slave	External debug interface.

Table 3-153 Ports (continued)

Name	Protocol	Type	Description
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[8]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[8]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[8]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-154 Parameters for ARM_Cortex-A76AE

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-154 Parameters for ARM_Cortex-A76AE (continued)

Name	Type	Default value	Description
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-154 Parameters for ARM_Cortex-A76AE (continued)

Name	Type	Default value	Description
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Table 3-155 Parameters for Cluster_ARM_Cortex-A76AE

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)

Table 3-155 Parameters for Cluster_ARM_Cortex-A76AE (continued)

Name	Type	Default value	Description
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Table 3-155 Parameters for Cluster_ARM_Cortex-A76AE (continued)

Name	Type	Default value	Description
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
ext_abort_device_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRE read external aborts
ext_abort_device_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRE write external aborts
ext_abort_so_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE read external aborts
ext_abort_so_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE write external aborts
has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
has_statistical_profiling	bool	0x1	Whether Statistical Based Profiling is implemented
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Table 3-155 Parameters for Cluster_ARM_Cortex-A76AE (continued)

Name	Type	Default value	Description
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l3cache-size	int	0x100000	L3 Cache size in bytes.

Table 3-155 Parameters for Cluster_ARM_Cortex-A76AE (continued)

Name	Type	Default value	Description
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

3.4.27 ARMCortexA76CT

ARMCortexA76CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA76CT contains the following CADI targets:

- ARM_Cortex-A76
- Cluster_ARM_Cortex-A76
- PVCache
- TlbCadi

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARMCortexA76CT contains the following MTI components:

- *4.21 ARM_Cortex-A76 - trace* on page 4-1517
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA76CT

The model supports the following features:

- DynamIQ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- `BROADCASTPERSIST` pin.

The model does not support the following features:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.

This component has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following components also exist, with a fixed number of cores per cluster:

- ARMCortexA76x1CT.
- ARMCortexA76x2CT.
- ARMCortexA76x3CT.
- ARMCortexA76x4CT.

The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).

Table 3-156 Ports

Name	Protocol	Type	Description
`AENDMP`	*`Value_64` on page 2-85*	Slave	Port to obtain end address of valid peripheral address range (exclusive).
`ASTARTMP`	*`Value_64` on page 2-85*	Slave	Port to obtain start address of valid peripheral address range (inclusive).

Table 3-156 Ports (continued)

Name	Protocol	Type	Description
CNTHPIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[4]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgte[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[4]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	*Signal* on page 2-85	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.

Table 3-156 Ports (continued)

Name	Protocol	Type	Description
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	These signals relate to core power down.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[4]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.

Table 3-156 Ports (continued)

Name	Protocol	Type	Description
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-157 Parameters for Cluster_ARM_Cortex-A76

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-157 Parameters for Cluster_ARM_Cortex-A76 (continued)

Name	Type	Default value	Description
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Table 3-157 Parameters for Cluster_ARM_Cortex-A76 (continued)

Name	Type	Default value	Description
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
ext_abort_device_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRE read external aborts
ext_abort_device_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRE write external aborts
ext_abort_so_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE read external aborts
ext_abort_so_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE write external aborts
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
has_statistical_profiling	bool	0x1	Whether Statistical Based Profiling is implemented
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-157 Parameters for Cluster_ARM_Cortex-A76 (continued)

Name	Type	Default value	Description
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Table 3-157 Parameters for Cluster_ARM_Cortex-A76 (continued)

Name	Type	Default value	Description
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l3cache-size	int	0x100000	L3 Cache size in bytes.
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-158 Parameters for ARM_Cortex-A76

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Table 3-158 Parameters for ARM_Cortex-A76 (continued)

Name	Type	Default value	Description
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

3.4.28 ARMCortexA77CT

ARMCortexA77CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA77CT contains the following CADI targets:

- ARM_Cortex-A77
- Cluster_ARM_Cortex-A77

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- PVCache
- TlbCadi

ARMCortexA77CT contains the following MTI components:
- *4.23 ARM_Cortex-A77 - trace* on page 4-1595
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA77CT

The model supports the following features:

- DynamIQ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- `BROADCASTPERSIST` pin.

The model does not support the following features:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:
- ARMCortexA77x1CT.
- ARMCortexA77x2CT.
- ARMCortexA77x3CT.
- ARMCortexA77x4CT.

The per-core parameters are preceded by `cpu`*`n`*`.`, where *n* identifies the core (0-3).

Table 3-159 Ports

Name	Protocol	Type	Description
AENDMP	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
CNTHPIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[4]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.

Non-Confidential

Table 3-159 Ports (continued)

Name	Protocol	Type	Description
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[4]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-159 Ports (continued)

Name	Protocol	Type	Description
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-160 Parameters for ARM_Cortex-A77

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Table 3-160 Parameters for ARM_Cortex-A77 (continued)

Name	Type	Default value	Description
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Table 3-161 Parameters for Cluster_ARM_Cortex-A77

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Table 3-161 Parameters for Cluster_ARM_Cortex-A77 (continued)

Name	Type	Default value	Description
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
ext_abort_device_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRE read external aborts
ext_abort_device_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRE write external aborts
ext_abort_so_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE read external aborts
ext_abort_so_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE write external aborts

Table 3-161 Parameters for Cluster_ARM_Cortex-A77 (continued)

Name	Type	Default value	Description
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
has_statistical_profiling	bool	0x1	Whether Statistical Based Profiling is implemented
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Table 3-161 Parameters for Cluster_ARM_Cortex-A77 (continued)

Name	Type	Default value	Description
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l3cache-size	int	0x100000	L3 Cache size in bytes.
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-161 Parameters for Cluster_ARM_Cortex-A77 (continued)

Name	Type	Default value	Description
`tlb_latency`	`int`	`0x0`	TLB latency for TA (Timing Annotation), expressed in simulation ticks
`treat-dcache-cmos-to-pou-as-nop`	`bool`	`0x0`	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
`walk_cache_latency`	`int`	`0x0`	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

3.4.29 ARMCortexA78CCT

ARMCortexA78CCT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA78CCT contains the following CADI targets:

- ARM_Cortex-A78C
- Cluster_ARM_Cortex-A78C
- PVCache
- TlbCadi

ARMCortexA78CCT contains the following MTI components:

- *4.25 ARM_Cortex-A78C - trace* on page 4-1673
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA78CCT

- DynamIQ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- `BROADCASTPERSIST` pin.

The model does not support the following features:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOPWRDWN are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This component has a variable number of cores per cluster, specified using the NUM_CORES parameter. The following components also exist, with a fixed number of cores per cluster:

- ARMCortexA78x1CCT.
- ARMCortexA78x2CCT.
- ARMCortexA78x4CCT.
- ARMCortexA78x6CCT.
- ARMCortexA78x8CCT.

The per-core parameters are preceded by cpu*n*., where *n* identifies the core (0-7).

Table 3-162 Ports

Name	Protocol	Type	Description
AENDMP	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
CNTHPIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[8]	*Signal* on page 2-85	Master	Timer signals to SOC.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[8]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[8]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.

Table 3-162 Ports (continued)

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[8]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[8]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[8]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[8]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[8]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[8]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-162 Ports (continued)

Name	Protocol	Type	Description
niden	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[8]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[8]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[8]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[8]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[8]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
spiden	*Signal* on page 2-85	Slave	External debug interface.
spniden	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[8]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[8]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	*Signal* on page 2-85	Slave	Virtualised FIQ.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-162 Ports (continued)

Name	Protocol	Type	Description
vinithi[8]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-163 Parameters for Cluster_ARM_Cortex-A78C

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Table 3-163 Parameters for Cluster_ARM_Cortex-A78C (continued)

Name	Type	Default value	Description
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x10000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages

Table 3-163 Parameters for Cluster_ARM_Cortex-A78C (continued)

Name	Type	Default value	Description
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
ext_abort_device_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRE read external aborts
ext_abort_device_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRE write external aborts
ext_abort_so_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE read external aborts
ext_abort_so_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE write external aborts
has_coherent_icache	bool	0x0	Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Table 3-163 Parameters for Cluster_ARM_Cortex-A78C (continued)

Name	Type	Default value	Description
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x10000	L1 I-Cache size in bytes.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
l3cache-size	int	0x100000	L3 Cache size in bytes.
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Table 3-163 Parameters for Cluster_ARM_Cortex-A78C (continued)

Name	Type	Default value	Description
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-164 Parameters for ARM_Cortex-A78C

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Table 3-164 Parameters for ARM_Cortex-A78C (continued)

Name	Type	Default value	Description
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)

Table 3-164 Parameters for ARM_Cortex-A78C (continued)

Name	Type	Default value	Description
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

3.4.30 ARMCortexA78CT

ARMCortexA78CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexA78CT contains the following CADI targets:

- ARM_Cortex-A78
- Cluster_ARM_Cortex-A78
- PVCache
- TlbCadi

ARMCortexA78CT contains the following MTI components:

- *4.24 ARM_Cortex-A78 - trace* on page 4-1634
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexA78CT

The model supports the following features:

- DynamIQ (FCM) system registers.
- Per-core L2 cache.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  — Automatic CPU retention mode.
  — Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOPWRDWN are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This component has a variable number of cores per cluster, specified using the NUM_CORES parameter. The following components also exist, with a fixed number of cores per cluster:

- ARMCortexA78x1CT.
- ARMCortexA78x2CT.
- ARMCortexA78x3CT.
- ARMCortexA78x4CT.

The per-core parameters are preceded by cpu*n*., where *n* identifies the core (0-3).

Table 3-165 Ports

Name	Protocol	Type	Description
AENDMP	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
CNTHPIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.

Table 3-165 Ports (continued)

Name	Protocol	Type	Description
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[4]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-165 Ports (continued)

Name	Protocol	Type	Description
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[4]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.

Non-Confidential

Table 3-165 Ports (continued)

Name	Protocol	Type	Description
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-166 Parameters for Cluster_ARM_Cortex-A78

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)

Table 3-166 Parameters for Cluster_ARM_Cortex-A78 (continued)

Name	Type	Default value	Description
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x10000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Table 3-166 Parameters for Cluster_ARM_Cortex-A78 (continued)

Name	Type	Default value	Description
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
ext_abort_device_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRE read external aborts
ext_abort_device_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRE write external aborts
ext_abort_so_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE read external aborts
ext_abort_so_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE write external aborts
has_coherent_icache	bool	0x0	Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x10000	L1 I-Cache size in bytes.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
l3cache-read_access_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
l3cache-read_latency	int	0x0	L3 Cache timing annotation latency for read accesses given in ticks per byte accessed.l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Table 3-166 Parameters for Cluster_ARM_Cortex-A78 (continued)

Name	Type	Default value	Description
l3cache-size	int	0x100000	L3 Cache size in bytes.
l3cache-snoop_data_transfer_latency	int	0x0	L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
l3cache-snoop_issue_latency	int	0x0	L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-167 Parameters for ARM_Cortex-A78

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Table 3-167 Parameters for ARM_Cortex-A78 (continued)

Name	Type	Default value	Description
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Table 3-167 Parameters for ARM_Cortex-A78 (continued)

Name	Type	Default value	Description
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

3.4.31 ARMCortexM0CT

ARMCortexM0CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexM0CT contains the following CADI targets:

- ARM_Cortex-M0

ARMCortexM0CT contains the following MTI components:

- *4.29 ARM_Cortex-M0 - trace* on page 4-1808
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Differences between the model and the RTL

- This model does not have a parameter that is equivalent to the RAR integration option. The architecturally required register state is reset.
- This model exposes, through CADI, a VTOR register, but this register in not present in hardware.
- Arm does not guarantee that all Armv7-M behavior is absent from models of Armv6-M cores. As a consequence, Arm does not guarantee that code that runs on Armv7-M cores but fails on Armv6-M cores also fails on Armv6-M Fast Models cores.

Table 3-168 Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	*Value* on page 2-85	Master	Current execution priority.
edbgrq	*Signal* on page 2-85	Slave	External debug request.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
intisr[32]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
intnmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
stcalib	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.

Table 3-169 Parameters for ARM_Cortex-M0

Name	Type	Default value	Description
BIGENDINIT	bool	0x0	Initialize processor to big endian mode
BKPT	int	0x4	Number of breakpoint unit comparators implemented
DBG	bool	0x1	Set whether debug extensions are implemented
NUM_IRQ	int	0x20	Number of user interrupts

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-169 Parameters for ARM_Cortex-M0 (continued)

Name	Type	Default value	Description
SYST	bool	0x1	Enable support for SysTick timer functionality
WIC	bool	0x1	Include support for WIC-mode deep sleep
WPT	int	0x2	Number of watchpoint unit comparators implemented
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit

3.4.32 ARMCortexM0PlusCT

ARMCortexM0PlusCT CPU component. This model is written in C++ and models version r0p1 of the RTL.

ARMCortexM0PlusCT contains the following CADI targets:

- ARM_Cortex-M0+

ARMCortexM0PlusCT contains the following MTI components:

- *4.30 ARM_Cortex-M0+ - trace* on page 4-1839
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

Differences between the model and the RTL

- This model does not have a parameter that is equivalent to the RAR integration option. The architecturally required register state is reset.
- Arm does not guarantee that all Armv7-M behavior is absent from models of Armv6-M cores. As a consequence, Arm does not guarantee that code that runs on Armv7-M cores but fails on Armv6-M cores also fails on Armv6-M Fast Models cores.

Table 3-170 Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	*Value* on page 2-85	Master	Current execution priority.
edbgrq	*Signal* on page 2-85	Slave	External debug request.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
intisr[32]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
intnmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
io_port_in	PVBus	Slave	I/O port pair. See the documentation for the io_port_out port.
io_port_out	PVBus	Master	I/O port pair. Used if IOP is true. Transactions from io_port_out which do not "match" should be returned via io_port_in. For performance reasons, the I/O port interface is not modelled directly. Instead, a simple PVBus gasket is inserted at the point in the memory system where the I/O port would be. In hardware, a device would be attached to the port which would tell the CPU whether it would like to intercept each transaction, given its address. This can be modelled in a performant manner by connecting a PVBusMapper-based device to io_port_out which intercepts transactions of interest and passes other transactions back to the CPU via io_port_in. Your I/O port device model is also responsible for aborting transactions which would be aborted on hardware (e.g. exclusives) if necessary.
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
stcalib	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.

Table 3-171 Parameters for ARM_Cortex-M0plus

Name	Type	Default value	Description
BIGENDINIT	bool	0x0	Initialize processor to big endian mode
BKPT	int	0x4	Number of breakpoint unit comparators implemented
DBG	bool	0x1	Set whether debug extensions are implemented
IOP	bool	0x0	Send all d-side transactions to the port, io_port_out. Transactions which do not match should be returned to the port, io_port_in
IRQDIS	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n]
NUM_IRQ	int	0x20	Number of user interrupts
NUM_MPU_REGION	int	0x0	Number of MPU regions
SYST	bool	0x1	Enable support for SysTick timer functionality
USER	bool	0x1	Enable support for Unprivileged/Privileged Extension
VTOR	bool	0x1	Include Vector Table Offset Register
WIC	bool	0x1	Include support for WIC-mode deep sleep
WPT	int	0x2	Number of watchpoint unit comparators implemented
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor (0=default long quantum, 1=low latency mode, short quantum and signal checking, 2=lock-breaking mode, long quantum with additional context switches near load-exclusive instructions, 3=ISSCompare)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit

3.4.33 ARMCortexM3CT

ARMCortexM3CT CPU component. This model is written in C++ and models version r2p1 of the RTL.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARMCortexM3CT contains the following CADI targets:

- ARM_Cortex-M3

ARMCortexM3CT contains the following MTI components:

- *4.32 ARM_Cortex-M3 - trace* on page 4-1901
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The WIC is not currently implemented.
- Power control is not implemented, so the processor does not set the SLEEPING or SLEEPDEEP signals. It does not support powering down of the processor.
- Only the minimal level of debug support is provided (no DAP, FPB, DWT, or halting debug capability).
- Debug-related components are not implemented.
- The unimplemented registers are the processor debug registers, system debug registers, debug interface port registers, TPIU registers, and ETM registers.
- The processor must still be clocked even if it has asserted the sleeping or sleepdeep signals.
- Disabling processor features using the Auxiliary Control Register is not supported.
- Only a single `pvbus_m` master port is provided. This combines the ICode, DCode, and System bus interfaces of the RTL. The external PPB bus is provided by the `pv_ppbus_m` master port.
- In privileged mode, STRT and LDRT to the PPB region are not forbidden access.
- No support for ETM, TPIU, or HTM.
- There is no supported equivalent of the RESET_ALL_REGS configuration setting in RTL (that forces all registers to have a well-defined value on reset).
- The RTL implements the ROM table as an external component on the External Private Peripheral Bus. In the CT model, the ROM table is implemented internally as a fallback if an external PPB access in the ROM table address region aborts. This permits the default ROM table to be overridden (by implementing an external component connected to the external PPB to handle accesses to these addresses) without requiring every user of the processor to implement and connect a ROM table component.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called `ITM`. The `ITM` trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Table 3-172 ITM_PACKET_TYPE field values that the model supports

Field value	Description	Supported by model
`ITM_SYNC`	Synchronization packet	Not supported.
`ITM_P_OVERFLOW`	Protocol: Overflow packet	Not supported.
`ITM_P_LOCAL_TIMESTAMP`	Protocol: Local timestamp packets	Not supported.
`ITM_P_GLOBAL_TIMESTAMP`	Protocol: Global timestamp packets	Not supported.
`ITM_P_EXTEN`	Protocol: Extension packet	Not supported.
`ITM_S_INSTRUMENTATION`	Source: Instrumentation packet	Supported.
`ITM_S_DWT_EVENT_COUNTER`	Hardware source: Event counter wrapping	Not supported.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-172 ITM_PACKET_TYPE field values that the model supports (continued)

Field value	Description	Supported by model
ITM_S_DWT_EXCEPTION	Hardware source: Exception tracing	Supported.
ITM_S_DWT_PC_SAMPLING	Hardware source: PC sampling	Not supported.
ITM_S_DWT_DATA_PC_TRACE	Hardware source: DWT Data trace PC value	Supported.
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Table 3-173 Ports

Name	Protocol	Type	Description
ahb_ap	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
auxfault	*Value* on page 2-85	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	*Value* on page 2-85	Master	Current execution priority.
edbgrq	*Signal* on page 2-85	Slave	External debug request.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
intisr[240]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
intnmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
stcalib	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.

Table 3-174 Parameters for ARM_Cortex-M3

Name	Type	Default value	Description
BB_PRESENT	bool	0x1	Enable bitbanding
BIGENDINIT	bool	0x0	Initialize processor to big endian mode
DBGLVL	int	0x3	0: No debug; 1: Minimal debug; 2: Full debug without DWT address matching; 3: Full debug support with DWT data-comparators
LVL_WIDTH	int	0x3	Number of bits of interrupt priority
NUM_IRQ	int	0x10	Number of user interrupts
NUM_MPU_REGION	int	0x8	Number of MPU regions
TRACE_LVL	bool	0x1	Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included
WIC	bool	0x1	Include support for WIC-mode deep sleep
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor (0=default long quantum, 1=low latency mode, short quantum and signal checking, 2=lock-breaking mode, long quantum with additional context switches near load-exclusive instructions, 3=ISSCompare)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit

3.4.34 ARMCortexM4CT

ARMCortexM4CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexM4CT contains the following CADI targets:

- ARM_Cortex-M4

ARMCortexM4CT contains the following MTI components:

- *4.35 ARM_Cortex-M4 - trace* on page 4-1987
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

Non-Confidential

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The *Wakeup Interrupt Controller* (WIC) is not implemented.
- Power control is not implemented. Powering down of the processor is not supported. The processor must still be clocked even if it has asserted the sleeping or sleepdeep signals.
- Only the minimal level of debug support is provided (no DAP, FPB, DWT, or halting debug capability).
- No debug-related components are implemented.
- The unimplemented registers are the processor debug registers, system debug registers, debug interface port registers, TPIU registers, and ETM registers.
- No support for ETM, TPIU, or HTM.
- There is no supported equivalent of the RESET_ALL_REGS configuration setting in RTL (that forces all registers to have a well-defined value on reset).
- Disabling processor features using the Auxiliary Control Register is not supported.
- Only a single `pvbus_m` master port is provided. This combines the ICode, DCode, and System bus interfaces of the RTL. The external PPB bus is provided by the `pv_ppbus_m` master port.
- In privileged mode, STRT and LDRT to the PPB region are not forbidden access.
- The RTL implements the ROM table as an external component on the External Private Peripheral Bus. In the CT model, the ROM table is implemented internally as a fallback if an external PPB access in the ROM table address region aborts. This permits the default ROM table to be overridden (by implementing an external component connected to the external PPB to handle accesses to these addresses) without requiring every user of the processor to implement and connect a ROM table component.
- Because the CT model does not provide a DAP port or halting debug capability, the `dbgen` signal is ignored.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called `ITM`. The `ITM` trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Table 3-175 ITM_PACKET_TYPE field values that the model supports

Field value	Description	Supported by model
`ITM_SYNC`	Synchronization packet	Not supported.
`ITM_P_OVERFLOW`	Protocol: Overflow packet	Not supported.
`ITM_P_LOCAL_TIMESTAMP`	Protocol: Local timestamp packets	Not supported.
`ITM_P_GLOBAL_TIMESTAMP`	Protocol: Global timestamp packets	Not supported.
`ITM_P_EXTEN`	Protocol: Extension packet	Not supported.
`ITM_S_INSTRUMENTATION`	Source: Instrumentation packet	Supported.
`ITM_S_DWT_EVENT_COUNTER`	Hardware source: Event counter wrapping	Not supported.
`ITM_S_DWT_EXCEPTION`	Hardware source: Exception tracing	Supported.
`ITM_S_DWT_PC_SAMPLING`	Hardware source: PC sampling	Not supported.
`ITM_S_DWT_DATA_PC_TRACE`	Hardware source: DWT Data trace PC value	Supported.

Table 3-175 ITM_PACKET_TYPE field values that the model supports (continued)

Field value	Description	Supported by model
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Table 3-176 Ports

Name	Protocol	Type	Description
ahb_ap	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
auxfault	*Value* on page 2-85	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	*Value* on page 2-85	Master	Current execution priority.
dbgen	*Signal* on page 2-85	Slave	Disallow (DAP) debugger access.
edbgrq	*Signal* on page 2-85	Slave	External debug request.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpudisable	*Signal* on page 2-85	Slave	Configure core with no FPU on reset.
fpxxc	*Value* on page 2-85	Master	Send the value of the FPXXC cumulative exception flags.
intisr[240]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
intnmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
mpudisable	*Signal* on page 2-85	Slave	Configure core with no MPU on reset.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
stcalib	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.

Table 3-177 Parameters for ARM_Cortex-M4

Name	Type	Default value	Description
BB_PRESENT	bool	0x1	Enable bitbanding
BIGENDINIT	bool	0x0	Initialize processor to big endian mode
DBGLVL	int	0x3	0: No debug; 1: Minimal debug; 2: Full debug without DWT address matching; 3: Full debug support with, DWT can compare data as well as address
LVL_WIDTH	int	0x3	Number of bits of interrupt priority
NUM_IRQ	int	0x10	Number of user interrupts
NUM_MPU_REGION	int	0x8	Number of MPU regions
TRACE_LVL	bool	0x1	Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included
WIC	bool	0x1	Include support for WIC-mode deep sleep
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor (0=default long quantum, 1=low latency mode, short quantum and signal checking, 2=lock-breaking mode, long quantum with additional context switches near load-exclusive instructions, 3=ISSCompare)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit
vfp-present	bool	0x1	Set whether the model has VFP support

3.4.35 ARMCortexM7CT

ARMCortexM7CT CPU component. This model is written in C++ and models version r0p2 of the RTL.

ARMCortexM7CT contains the following CADI targets:

- ARM_Cortex-M7

ARMCortexM7CT contains the following MTI components:

- *4.37 ARM_Cortex-M7 - trace* on page 4-2047
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called `ITM`. The `ITM` trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Table 3-178 ITM_PACKET_TYPE field values that the model supports

Field value	Description	Supported by model
`ITM_SYNC`	Synchronization packet	Not supported.
`ITM_P_OVERFLOW`	Protocol: Overflow packet	Not supported.
`ITM_P_LOCAL_TIMESTAMP`	Protocol: Local timestamp packets	Not supported.
`ITM_P_GLOBAL_TIMESTAMP`	Protocol: Global timestamp packets	Not supported.
`ITM_P_EXTEN`	Protocol: Extension packet	Not supported.
`ITM_S_INSTRUMENTATION`	Source: Instrumentation packet	Supported.
`ITM_S_DWT_EVENT_COUNTER`	Hardware source: Event counter wrapping	Not supported.
`ITM_S_DWT_EXCEPTION`	Hardware source: Exception tracing	Supported.
`ITM_S_DWT_PC_SAMPLING`	Hardware source: PC sampling	Not supported.
`ITM_S_DWT_DATA_PC_TRACE`	Hardware source: DWT Data trace PC value	Supported.
`ITM_S_DWT_DATA_ADDRESS_TRACE`	Hardware source: DWT Data trace address value	Supported.
`ITM_S_DWT_DATA_DATA_TRACE`	Hardware source: DWT Data trace DATA value	Supported.

Differences between the model and the RTL

- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- ECC support is hardware-specific so is not modeled.

Table 3-179 Ports

Name	Protocol	Type	Description
`ahbd`	`PVBus`	Slave	Debug AHB - core bus slave driven by the DAP.
`ahbp_m`	`PVBus`	Master	The core will generate Vendor System data accesses on this port.
`ahbs`	`PVBus`	Slave	External master (e.g. DMA) can write TCMs (whether or not enabled in xTCMCR).
`auxfault`	*`Value` on page 2-85*	Slave	This is wired to the Auxiliary Fault Status Register.
`bigend`	*`Signal` on page 2-85*	Slave	Configure big endian data format.

Table 3-179 Ports (continued)

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
cpuwait	*Signal* on page 2-85	Slave	When this signal is HIGH out of reset, it forces the processor into a quiescent state that delays its boot-up sequence and instruction execution until this signal is driven LOW
currpri	*Value* on page 2-85	Master	Current execution priority.
dap_s	PVBus	Slave	Debug Access Port (DAP).
dbgen	*Signal* on page 2-85	Slave	Invasive debug enable.
dbgrestart	*Signal* on page 2-85	Slave	External debug request.
dbgrestarted	*Signal* on page 2-85	Master	External debug request.
edbgrq	*Signal* on page 2-85	Slave	External debug request.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpudisable	*Signal* on page 2-85	Slave	Configure core with no FPU on reset.
fpxxc	*Value* on page 2-85	Master	Port which sends the value of the FPXXC cumulative exception flags.
halted	*Signal* on page 2-85	Master	External debug request.
initvtor	*Value* on page 2-85	Slave	Initial value of the Vector Table Offset Register (VTOR)
intisr[240]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
intnmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
mpudisable	*Signal* on page 2-85	Slave	Configure core with no MPU on reset.
niden	*Signal* on page 2-85	Slave	Non-invasive debug enable.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
stcalib	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.

Table 3-180 Parameters for ARM_Cortex-M7

Name	Type	Default value	Description
BIGENDINIT	bool	0x0	Initialize processor to big endian mode
DBGLVL	int	0x1	0: 2 DWT, 4 FPB; 1: 4 DWT, 8 FPB comparators
DP_FLOAT	bool	0x1	Support 8-byte floats
INITVTOR	int	0x0	vector-table offset at reset
LVL_WIDTH	int	0x3	Number of bits of interrupt priority
NUM_IRQ	int	0x20	Number of user interrupts
NUM_MPU_REGION	int	0x10	Number of MPU regions
TRC	bool	0x1	Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included
WIC	bool	0x1	Include support for WIC-mode deep sleep
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
dcache-size	int	0x8000	L1 D-cache size in bytes
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-ways	int	0x4	L1 D-cache ways (sets are implicit from size)
dtcm_enable	bool	0x0	Enable DTCM at reset
dtcm_size	int	0x100	DTCM size in KB
duplicate_CADI_TCM_writes	bool	0x0	CADI writes to TCMs are also sent to downstream memory at same addresses (for validation platforms)
icache-size	int	0x8000	L1 I-cache size in bytes
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
icache-ways	int	0x2	L1 I-cache ways (sets are implicit from size)
itcm_enable	bool	0x0	Enable ITCM at reset
itcm_size	int	0x100	ITCM size in KB
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor (0=default long quantum, 1=low latency mode, short quantum and signal checking, 2=lock-breaking mode, long quantum with additional context switches near load-exclusive instructions, 3=ISSCompare)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base

Table 3-180 Parameters for ARM_Cortex-M7 (continued)

Name	Type	Default value	Description
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit
vfp-present	bool	0x1	Set whether the model has VFP support

3.4.36 ARMCortexM23CT

ARMCortexM23CT CPU component. This model is written in C++.

ARMCortexM23CT contains the following CADI targets:

- ARM_Cortex-M23

ARMCortexM23CT contains the following MTI components:

- *4.31 ARM_Cortex-M23 - trace* on page 4-1870
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

Differences between the CT model and RTL implementations

The model does not support MTB, ETM, or TPIU. MTB RAM is absent on the model.

Table 3-181 Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
cpuwait	*Signal* on page 2-85	Slave	Clear = Core goes through reset sequence as normal, Set = Core waits out of reset.
currpri	*Value* on page 2-85	Master	Current execution priority.
dap_s	PVBus	Slave	Debug Access Port (DAP).
dbgen	*Signal* on page 2-85	Slave	Invasive debug control signals. Debug enable, Set=enabled, Clear=disabled
dbgrestart	*Signal* on page 2-85	Slave	External request to leave debug state
dbgrestarted	*Signal* on page 2-85	Master	Acknowledge for DBGRESTART
edbgrq	*Signal* on page 2-85	Slave	External debug request.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
halted	*Signal* on page 2-85	Master	Core is in halt mode debug state
hreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).

Table 3-181 Ports (continued)

Name	Protocol	Type	Description
idau	PVBus	Master	The core will generate IDAU requests on this port.
idau_invalidate_region	*Value_64* on page 2-85	Slave	64 bit number to invalid IDAU memory ranage (start_address<<32|end_address)
initvtor	*Value* on page 2-85	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initvtorns	*Value* on page 2-85	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
io_port_in	PVBus	Slave	I/O port pair. See the documentation for the io_port_out port.
io_port_out	PVBus	Master	I/O port pair. Used if IOP is true. Transactions from io_port_out which do not "match" should be returned via io_port_in. For performance reasons, the I/O port interface is not modelled directly. Instead, a simple PVBus gasket is inserted at the point in the memory system where the I/O port would be. In hardware, a device would be attached to the port which would tell the CPU whether it would like to intercept each transaction, given its address. This can be modelled in a performant manner by connecting a PVBusMapper-based device to io_port_out which intercepts transactions of interest and passes other transactions back to the CPU via io_port_in. Your I/O port device model is also responsible for aborting transactions which would be aborted on hardware (e.g. exclusives) if necessary.
irq[240]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
niden	*Signal* on page 2-85	Slave	Non-invasive debug enable, Set=enabled, Clear=disabled
nmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
spiden	*Signal* on page 2-85	Slave	Secure Debug enable , Set=enabled, Clear=disabled
spniden	*Signal* on page 2-85	Slave	Secure Non-invasive debug enable, Set=enabled, Clear=disabled

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-181 Ports (continued)

Name	Protocol	Type	Description
stcalib	*Value* on page 2-85	Slave	This is the calibration value for the Secure (or only, when ARMv8-M Security Extensions are not included) SysTick timer.
stcalibns	*Value* on page 2-85	Slave	This is the calibration value for the Non-Secure SysTick timer. When ARMv8-M Security Extensions are not included, this port will be ignored.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.

Table 3-182 Parameters for ARM_Cortex-M23

Name	Type	Default value	Description
BE	bool	0x0	Initialize processor to big endian mode
BKPT	int	0x4	Number of breakpoint unit comparators implemented
DBG	bool	0x1	Set whether debug extensions are implemented
INITVTOR	int	0x0	Secure vector-table offset at reset
INITVTORNS	int	0x0	Non-Secure vector-table offset at reset
IOP	bool	0x0	Send all d-side transactions to the port, io_port_out. Transactions which do not match should be returned to the port, io_port_in
IRQDIS0	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0]
IRQDIS1	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32]
IRQDIS2	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64]
IRQDIS3	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96]
IRQDIS4	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128]
IRQDIS5	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160]
IRQDIS6	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192]
IRQDIS7	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224]
MPU_NS	int	0x8	Number of regions in the Non-Secure MPU. If Security Extentions are absent, this is the total number of MPU regions
MPU_S	int	0x8	Number of regions in the Secure MPU. If Security Extentions are absent, this is ignored
NUMIRQ	int	0x10	Number of user interrupts
SAU	int	0x4	Number of SAU regions (0 => no SAU)
SAU_CTRL.ALLNS	bool	0x0	At reset, the SAU treats entire memory space as NS when the SAU is disabled if this is set
SAU_CTRL.ENABLE	bool	0x0	Enable SAU at reset
SAU_REGION0.BADDR	int	0x0	Base address of SAU region0 at reset

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-182 Parameters for ARM_Cortex-M23 (continued)

Name	Type	Default value	Description
SAU_REGION0.ENABLE	bool	0x0	Enable SAU region0 at reset
SAU_REGION0.LADDR	int	0x0	Limit address of SAU region0 at reset
SAU_REGION0.NSC	bool	0x0	Set NSC for SAU region0 at reset
SAU_REGION1.BADDR	int	0x0	Base address of SAU region1 at reset
SAU_REGION1.ENABLE	bool	0x0	Enable SAU region1 at reset
SAU_REGION1.LADDR	int	0x0	Limit address of SAU region1 at reset
SAU_REGION1.NSC	bool	0x0	Set NSC for SAU region1 at reset
SAU_REGION2.BADDR	int	0x0	Base address of SAU region2 at reset
SAU_REGION2.ENABLE	bool	0x0	Enable SAU region2 at reset
SAU_REGION2.LADDR	int	0x0	Limit address of SAU region2 at reset
SAU_REGION2.NSC	bool	0x0	Set NSC for SAU region2 at reset
SAU_REGION3.BADDR	int	0x0	Base address of SAU region3 at reset
SAU_REGION3.ENABLE	bool	0x0	Enable SAU region3 at reset
SAU_REGION3.LADDR	int	0x0	Limit address of SAU region3 at reset
SAU_REGION3.NSC	bool	0x0	Set NSC for SAU region3 at reset
SAU_REGION4.BADDR	int	0x0	Base address of SAU region4 at reset
SAU_REGION4.ENABLE	bool	0x0	Enable SAU region4 at reset
SAU_REGION4.LADDR	int	0x0	Limit address of SAU region4 at reset
SAU_REGION4.NSC	bool	0x0	Set NSC for SAU region4 at reset
SAU_REGION5.BADDR	int	0x0	Base address of SAU region5 at reset
SAU_REGION5.ENABLE	bool	0x0	Enable SAU region5 at reset
SAU_REGION5.LADDR	int	0x0	Limit address of SAU region5 at reset
SAU_REGION5.NSC	bool	0x0	Set NSC for SAU region5 at reset
SAU_REGION6.BADDR	int	0x0	Base address of SAU region6 at reset
SAU_REGION6.ENABLE	bool	0x0	Enable SAU region6 at reset
SAU_REGION6.LADDR	int	0x0	Limit address of SAU region6 at reset
SAU_REGION6.NSC	bool	0x0	Set NSC for SAU region6 at reset
SAU_REGION7.BADDR	int	0x0	Base address of SAU region7 at reset
SAU_REGION7.ENABLE	bool	0x0	Enable SAU region7 at reset
SAU_REGION7.LADDR	int	0x0	Limit address of SAU region7 at reset
SAU_REGION7.NSC	bool	0x0	Set NSC for SAU region7 at reset
SECEXT	bool	0x1	Whether the ARMv8-M Security Extensions are included
SYST	int	0x2	Include SysTick timer functionality (0=Absent, 1=Secure only, 2=Secure and NS)
VTOR	bool	0x1	Include Vector Table Offset Register

Table 3-182 Parameters for ARM_Cortex-M23 (continued)

Name	Type	Default value	Description
WIC	bool	0x1	Include support for WIC-mode deep sleep
WPT	int	0x4	Number of watchpoint unit comparators implemented
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
ignore-SCR.SLEEPONEXIT	bool	0x0	Never sleep on exit from handler to thread mode.
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor (0=default long quantum, 1=low latency mode, short quantum and signal checking, 2=lock-breaking mode, long quantum with additional context switches near load-exclusive instructions, 3=ISSCompare)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit

3.4.37 ARMCortexM33CT

ARMCortexM33CT CPU component. This model is written in C++.

ARMCortexM33CT contains the following CADI targets:

- ARM_Cortex-M33

ARMCortexM33CT contains the following MTI components:

- *4.33 ARM_Cortex-M33 - trace* on page 4-1921
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

About ARMCortexM33CT

The model supports Custom Datapath Extension (CDE). For more information, see *5.5 CDE* on page 5-2899.

Differences between the model and the RTL

The model does not support the following:

- ETM, MTB, CTI, or TPIU. MTB RAM is absent on the model.
- The power control (Q-Channel) interface.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called `ITM`. The `ITM` trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Table 3-183 ITM_PACKET_TYPE field values that the model supports

Field value	Description	Supported by model
ITM_SYNC	Synchronization packet	Not supported.
ITM_P_OVERFLOW	Protocol: Overflow packet	Not supported.
ITM_P_LOCAL_TIMESTAMP	Protocol: Local timestamp packets	Not supported.
ITM_P_GLOBAL_TIMESTAMP	Protocol: Global timestamp packets	Not supported.
ITM_P_EXTEN	Protocol: Extension packet	Not supported.
ITM_S_INSTRUMENTATION	Source: Instrumentation packet	Supported.
ITM_S_DWT_EVENT_COUNTER	Hardware source: Event counter wrapping	Not supported.
ITM_S_DWT_EXCEPTION	Hardware source: Exception tracing	Supported.
ITM_S_DWT_PC_SAMPLING	Hardware source: PC sampling	Not supported.
ITM_S_DWT_DATA_PC_TRACE	Hardware source: DWT Data trace PC value	Supported.
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Table 3-184 Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
auxfault	*Value* on page 2-85	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions. Referred to in some documents as 'CLKIN'.
coproc_bus	*CoprocBusProtocol* on page 2-81	Slave	Co-Processor Interface
cpuwait	*Signal* on page 2-85	Slave	Stall the CPU out of reset
currns	*Signal* on page 2-85	Master	Current Security state of the processor
currpri	*Value* on page 2-85	Master	Current execution priority.
dbgen	*Signal* on page 2-85	Slave	Invasive debug enable
dbgrestart	*Signal* on page 2-85	Slave	Request for synchronised exit from halt mode

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-184 Ports (continued)

Name	Protocol	Type	Description
dbgrestarted	*Signal* on page 2-85	Master	Handshakes with DBGRESTART
edbgrq	*Signal* on page 2-85	Slave	External request to enter halt mode
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	*Value* on page 2-85	Master	Port which sends the value of the FPXXC cumulative exception flags.
halted	*Signal* on page 2-85	Master	Indicates that the processor is in halt mode
idau	PVBus	Master	The core will generate IDAU requests on this port.
idau_invalidate_region	*Value_64* on page 2-85	Slave	64 bit number to invalid IDAU memory ranage (start_address<<32|end_address)
initnsvtor	*Value* on page 2-85	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initsvtor	*Value* on page 2-85	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
intnum	*Value* on page 2-85	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
irq[480]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
locknsmpu	*Signal* on page 2-85	Slave	Disable writes to the Non-Secure MPU_*_NS registers
locknsvtor	*Signal* on page 2-85	Slave	Cortex-M33-specific LOCKNSVTOR, LOCKSVTAIRCR, LOCKSMPU, LOCKNSMPU, LOCKSAU. Disable writes to VTOR_NS
locksau	*Signal* on page 2-85	Slave	Disable writes to the SAU_* registers
locksmpu	*Signal* on page 2-85	Slave	Disable writes to the Secure MPU_* registers
locksvtaircr	*Signal* on page 2-85	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
niden	*Signal* on page 2-85	Slave	Non-invasive debug enable
nmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.

Table 3-184 Ports (continued)

Name	Protocol	Type	Description
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
spiden	*Signal* on page 2-85	Slave	Secure invasive debug enable
spniden	*Signal* on page 2-85	Slave	Secure non-invasive debug enable
stcalib[2]	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.
wicenack	*Signal* on page 2-85	Master	Acknowledge signal for WICENREQ
wicenreq	*Signal* on page 2-85	Slave	Request for deep sleep to be WIC-based deep sleep.
wicsense[483]	*Signal* on page 2-85	Master	Indicates which input events can cause the WIC to generate the WAKEUP signal.

Table 3-185 Parameters for ARM_Cortex-M33

Name	Type	Default value	Description
BIGENDINIT	bool	0x0	Initialize processor to big endian mode
CDEMAPPEDONCP	bool	0x1	Specifies whether the instruction for a given Coprocessor is redirected to the CDE module
CFGNOCDECP	int	0x0	Bit N means external coprocessor N (CP7:CP0) disable for CDE coprocessor
CPIF	bool	0x1	Specifies whether the external coprocessor interface is included
CPNSPRESENT	int	0xff	Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state
CPSPRESENT	int	0xff	Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state
DBGLVL	int	0x2	0: Minimal debug; 1: 2 Watchpoints, 4 Breakpoint comparators; 2: 4 Watchpoints, 8 Breakpoint comparators
DSP	bool	0x1	Set whether the model has the DSP extension
FPU	bool	0x1	Set whether the model has VFP support
INITNSVTOR	int	0x0	Non-Secure vector-table offset at reset
INITSVTOR	int	0x0	Secure vector-table offset at reset

Table 3-185 Parameters for ARM_Cortex-M33 (continued)

Name	Type	Default value	Description
IRQDIS0	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0]
IRQDIS1	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32]
IRQDIS10	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320]
IRQDIS11	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352]
IRQDIS12	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384]
IRQDIS13	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416]
IRQDIS14	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448]
IRQDIS2	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64]
IRQDIS3	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96]
IRQDIS4	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128]
IRQDIS5	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160]
IRQDIS6	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192]
IRQDIS7	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224]
IRQDIS8	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256]
IRQDIS9	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288]
IRQLVL	int	0x3	Number of bits of interrupt priority
ITM	bool	0x1	Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included
LOCK_NS_MPU	bool	0x0	Lock down of Non-Secure MPU registers write
LOCK_SAU	bool	0x0	Lock down of SAU registers write
LOCK_S_MPU	bool	0x0	Lock down of Secure MPU registers write
MPU_NS	int	0x8	Number of regions in the Non-Secure MPU. If Security Extentions are absent, this is the total number of MPU regions
MPU_S	int	0x8	Number of regions in the Secure MPU. If Security Extentions are absent, this is ignored
NUMIRQ	int	0x20	Number of user interrupts

Table 3-185 Parameters for ARM_Cortex-M33 (continued)

Name	Type	Default value	Description
SAU	int	0x4	Number of SAU regions (0 => no SAU)
SAU_CTRL.ALLNS	bool	0x0	At reset, the SAU treats entire memory space as NS when the SAU is disabled if this is set
SAU_CTRL.ENABLE	bool	0x0	Enable SAU at reset
SAU_REGION0.BADDR	int	0x0	Base address of SAU region0 at reset
SAU_REGION0.ENABLE	bool	0x0	Enable SAU region0 at reset
SAU_REGION0.LADDR	int	0x0	Limit address of SAU region0 at reset
SAU_REGION0.NSC	bool	0x0	Set NSC for SAU region0 at reset
SAU_REGION1.BADDR	int	0x0	Base address of SAU region1 at reset
SAU_REGION1.ENABLE	bool	0x0	Enable SAU region1 at reset
SAU_REGION1.LADDR	int	0x0	Limit address of SAU region1 at reset
SAU_REGION1.NSC	bool	0x0	Set NSC for SAU region1 at reset
SAU_REGION2.BADDR	int	0x0	Base address of SAU region2 at reset
SAU_REGION2.ENABLE	bool	0x0	Enable SAU region2 at reset
SAU_REGION2.LADDR	int	0x0	Limit address of SAU region2 at reset
SAU_REGION2.NSC	bool	0x0	Set NSC for SAU region2 at reset
SAU_REGION3.BADDR	int	0x0	Base address of SAU region3 at reset
SAU_REGION3.ENABLE	bool	0x0	Enable SAU region3 at reset
SAU_REGION3.LADDR	int	0x0	Limit address of SAU region3 at reset
SAU_REGION3.NSC	bool	0x0	Set NSC for SAU region3 at reset
SAU_REGION4.BADDR	int	0x0	Base address of SAU region4 at reset
SAU_REGION4.ENABLE	bool	0x0	Enable SAU region4 at reset
SAU_REGION4.LADDR	int	0x0	Limit address of SAU region4 at reset
SAU_REGION4.NSC	bool	0x0	Set NSC for SAU region4 at reset
SAU_REGION5.BADDR	int	0x0	Base address of SAU region5 at reset
SAU_REGION5.ENABLE	bool	0x0	Enable SAU region5 at reset
SAU_REGION5.LADDR	int	0x0	Limit address of SAU region5 at reset
SAU_REGION5.NSC	bool	0x0	Set NSC for SAU region5 at reset
SAU_REGION6.BADDR	int	0x0	Base address of SAU region6 at reset
SAU_REGION6.ENABLE	bool	0x0	Enable SAU region6 at reset
SAU_REGION6.LADDR	int	0x0	Limit address of SAU region6 at reset
SAU_REGION6.NSC	bool	0x0	Set NSC for SAU region6 at reset
SAU_REGION7.BADDR	int	0x0	Base address of SAU region7 at reset
SAU_REGION7.ENABLE	bool	0x0	Enable SAU region7 at reset
SAU_REGION7.LADDR	int	0x0	Limit address of SAU region7 at reset

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-185 Parameters for ARM_Cortex-M33 (continued)

Name	Type	Default value	Description
SAU_REGION7.NSC	bool	0x0	Set NSC for SAU region7 at reset
SECEXT	bool	0x1	Whether the ARMv8-M Security Extensions are included
WIC	bool	0x1	Include support for WIC-mode deep sleep
WICLINES	int	0x23	Number of lines supported by the WIC interface
cde_impl_name	string	""	Name of the CDE implementation for this core (implementation contributed by MTI plugin).
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
has_cde	bool	0x0	Enables Custom Datapath Extensions
ignore-SCR.SLEEPONEXIT	bool	0x0	Never sleep on exit from handler to thread mode.
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor (0=default long quantum, 1=low latency mode, short quantum and signal checking, 2=lock-breaking mode, long quantum with additional context switches near load-exclusive instructions, 3=ISSCompare)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit
vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
write_unknown_regs_at_exception	bool	0x0	DEPRECATED and non-functional in device models.

3.4.38 ARMCortexM35PCT

ARMCortexM35PCT CPU component. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARMCortexM35PCT contains the following CADI targets:

- ARM_Cortex-M35P

ARMCortexM35PCT contains the following MTI components:

- *4.34 ARM_Cortex-M35P - trace* on page 4-1954
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

Differences between the model and the RTL

- The model does not support the following:
  - ETM, MTB, CTI, or TPIU. MTB RAM is absent on the model.
  - Caches.
  - The co-processor interface.
  - The power control (Q-Channel) interface.
- The model does not implement any physical security features.
- Bits[3:0] of the Anti-tampering Features Control Register are supported for read/write. No functionality is implemented.
- Read/write access to the Anti-tampering Features Control Register is supported using SECKEY. No functionality is implemented.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called `ITM`. The `ITM` trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Table 3-186 ITM_PACKET_TYPE field values that the model supports

Field value	Description	Supported by model
`ITM_SYNC`	Synchronization packet	Not supported.
`ITM_P_OVERFLOW`	Protocol: Overflow packet	Not supported.
`ITM_P_LOCAL_TIMESTAMP`	Protocol: Local timestamp packets	Not supported.
`ITM_P_GLOBAL_TIMESTAMP`	Protocol: Global timestamp packets	Not supported.
`ITM_P_EXTEN`	Protocol: Extension packet	Not supported.
`ITM_S_INSTRUMENTATION`	Source: Instrumentation packet	Supported.
`ITM_S_DWT_EVENT_COUNTER`	Hardware source: Event counter wrapping	Not supported.
`ITM_S_DWT_EXCEPTION`	Hardware source: Exception tracing	Supported.
`ITM_S_DWT_PC_SAMPLING`	Hardware source: PC sampling	Not supported.
`ITM_S_DWT_DATA_PC_TRACE`	Hardware source: DWT Data trace PC value	Supported.
`ITM_S_DWT_DATA_ADDRESS_TRACE`	Hardware source: DWT Data trace address value	Supported.
`ITM_S_DWT_DATA_DATA_TRACE`	Hardware source: DWT Data trace DATA value	Supported.

Table 3-187 Ports

Name	Protocol	Type	Description
LOCKATFCR	*Signal* on page 2-85	Slave	Port Lock ATFCR register
auxfault	*Value* on page 2-85	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions. Referred to in some documents as 'CLKIN'.
cpuwait	*Signal* on page 2-85	Slave	Stall the CPU out of reset
currns	*Signal* on page 2-85	Master	Current Security state of the processor
currpri	*Value* on page 2-85	Master	Current execution priority.
dbgen	*Signal* on page 2-85	Slave	Invasive debug enable
dbgrestart	*Signal* on page 2-85	Slave	Request for synchronised exit from halt mode
dbgrestarted	*Signal* on page 2-85	Master	Handshakes with DBGRESTART
edbgrq	*Signal* on page 2-85	Slave	External request to enter halt mode
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	*Value* on page 2-85	Master	Port which sends the value of the FPXXC cumulative exception flags.
halted	*Signal* on page 2-85	Master	Indicates that the processor is in halt mode
idau	PVBus	Master	The core will generate IDAU requests on this port.
idau_invalidate_region	*Value_64* on page 2-85	Slave	64 bit number to invalid IDAU memory ranage (start_address<<32|end_address)
initnsvtor	*Value* on page 2-85	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initsvtor	*Value* on page 2-85	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
intnum	*Value* on page 2-85	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
irq[480]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
locknsmpu	*Signal* on page 2-85	Slave	Disable writes to the Non-Secure MPU_*_NS registers

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-187 Ports (continued)

Name	Protocol	Type	Description
locknsvtor	*Signal* on page 2-85	Slave	Disable writes to VTOR_NS
locksau	*Signal* on page 2-85	Slave	Disable writes to the SAU_* registers
locksmpu	*Signal* on page 2-85	Slave	Disable writes to the Secure MPU_* registers
locksvtaircr	*Signal* on page 2-85	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
niden	*Signal* on page 2-85	Slave	Non-invasive debug enable
nmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
spiden	*Signal* on page 2-85	Slave	Secure invasive debug enable
spniden	*Signal* on page 2-85	Slave	Secure non-invasive debug enable
stcalib[2]	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.
wicenack	*Signal* on page 2-85	Master	Acknowledge signal for WICENREQ
wicenreq	*Signal* on page 2-85	Slave	Request for deep sleep to be WIC-based deep sleep.
wicsense[483]	*Signal* on page 2-85	Master	Indicates which input events can cause the WIC to generate the WAKEUP signal.

Table 3-188 Parameters for ARM_Cortex-M35P

Name	Type	Default value	Description
ATFINITEN	bool	0x0	ATFCR is enabled when the core goes out of reset
BIGENDINIT	bool	0x0	Initialize processor to big endian mode
CPIF	bool	0x1	Specifies whether the external coprocessor interface is included
CPNSPRESENT	int	0xff	Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state
CPSPRESENT	int	0xff	Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state

Table 3-188 Parameters for ARM_Cortex-M35P (continued)

Name	Type	Default value	Description
DBGLVL	int	0x2	0: Minimal debug; 1: 2 Watchpoints, 4 Breakpoint comparators; 2: 4 Watchpoints, 8 Breakpoint comparators
DSP	bool	0x1	Set whether the model has the DSP extension
FPU	bool	0x1	Set whether the model has VFP support
INITNSVTOR	int	0x0	Non-Secure vector-table offset at reset
INITSVTOR	int	0x0	Secure vector-table offset at reset
IRQDIS0	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0]
IRQDIS1	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32]
IRQDIS10	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320]
IRQDIS11	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352]
IRQDIS12	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384]
IRQDIS13	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416]
IRQDIS14	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448]
IRQDIS2	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64]
IRQDIS3	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96]
IRQDIS4	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128]
IRQDIS5	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160]
IRQDIS6	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192]
IRQDIS7	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224]
IRQDIS8	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256]
IRQDIS9	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288]
IRQLVL	int	0x3	Number of bits of interrupt priority
ITM	bool	0x1	Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included
LOCK_NS_MPU	bool	0x0	Lock down of Non-Secure MPU registers write
LOCK_SAU	bool	0x0	Lock down of SAU registers write
LOCK_S_MPU	bool	0x0	Lock down of Secure MPU registers write
MPU_NS	int	0x8	Number of regions in the Non-Secure MPU. If Security Extentions are absent, this is the total number of MPU regions
MPU_S	int	0x8	Number of regions in the Secure MPU. If Security Extentions are absent, this is ignored
NUMIRQ	int	0x20	Number of user interrupts
SAU	int	0x4	Number of SAU regions (0 => no SAU)
SAU_CTRL.ALLNS	bool	0x0	At reset, the SAU treats entire memory space as NS when the SAU is disabled if this is set
SAU_CTRL.ENABLE	bool	0x0	Enable SAU at reset

Table 3-188 Parameters for ARM_Cortex-M35P (continued)

Name	Type	Default value	Description
SAU_REGION0.BADDR	int	0x0	Base address of SAU region0 at reset
SAU_REGION0.ENABLE	bool	0x0	Enable SAU region0 at reset
SAU_REGION0.LADDR	int	0x0	Limit address of SAU region0 at reset
SAU_REGION0.NSC	bool	0x0	Set NSC for SAU region0 at reset
SAU_REGION1.BADDR	int	0x0	Base address of SAU region1 at reset
SAU_REGION1.ENABLE	bool	0x0	Enable SAU region1 at reset
SAU_REGION1.LADDR	int	0x0	Limit address of SAU region1 at reset
SAU_REGION1.NSC	bool	0x0	Set NSC for SAU region1 at reset
SAU_REGION2.BADDR	int	0x0	Base address of SAU region2 at reset
SAU_REGION2.ENABLE	bool	0x0	Enable SAU region2 at reset
SAU_REGION2.LADDR	int	0x0	Limit address of SAU region2 at reset
SAU_REGION2.NSC	bool	0x0	Set NSC for SAU region2 at reset
SAU_REGION3.BADDR	int	0x0	Base address of SAU region3 at reset
SAU_REGION3.ENABLE	bool	0x0	Enable SAU region3 at reset
SAU_REGION3.LADDR	int	0x0	Limit address of SAU region3 at reset
SAU_REGION3.NSC	bool	0x0	Set NSC for SAU region3 at reset
SAU_REGION4.BADDR	int	0x0	Base address of SAU region4 at reset
SAU_REGION4.ENABLE	bool	0x0	Enable SAU region4 at reset
SAU_REGION4.LADDR	int	0x0	Limit address of SAU region4 at reset
SAU_REGION4.NSC	bool	0x0	Set NSC for SAU region4 at reset
SAU_REGION5.BADDR	int	0x0	Base address of SAU region5 at reset
SAU_REGION5.ENABLE	bool	0x0	Enable SAU region5 at reset
SAU_REGION5.LADDR	int	0x0	Limit address of SAU region5 at reset
SAU_REGION5.NSC	bool	0x0	Set NSC for SAU region5 at reset
SAU_REGION6.BADDR	int	0x0	Base address of SAU region6 at reset
SAU_REGION6.ENABLE	bool	0x0	Enable SAU region6 at reset
SAU_REGION6.LADDR	int	0x0	Limit address of SAU region6 at reset
SAU_REGION6.NSC	bool	0x0	Set NSC for SAU region6 at reset
SAU_REGION7.BADDR	int	0x0	Base address of SAU region7 at reset
SAU_REGION7.ENABLE	bool	0x0	Enable SAU region7 at reset
SAU_REGION7.LADDR	int	0x0	Limit address of SAU region7 at reset
SAU_REGION7.NSC	bool	0x0	Set NSC for SAU region7 at reset
SECEXT	bool	0x1	Whether the ARMv8-M Security Extensions are included
WIC	bool	0x1	Include support for WIC-mode deep sleep
WICLINES	int	0x23	Number of lines supported by the WIC interface

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-188 Parameters for ARM_Cortex-M35P (continued)

Name	Type	Default value	Description
cde_impl_name	string	""	Name of the CDE implementation for this core (implementation contributed by MTI plugin).
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
has_cde	bool	0x0	Enables Custom Datapath Extensions
ignore-SCR.SLEEPONEXIT	bool	0x0	Never sleep on exit from handler to thread mode.
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor (0=default long quantum, 1=low latency mode, short quantum and signal checking, 2=lock-breaking mode, long quantum with additional context switches near load-exclusive instructions, 3=ISSCompare)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit
vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

3.4.39 ARMCortexM55CT

CortexM55CT CPU component. This model is written in C++.

ARMCortexM55CT contains the following CADI targets:

- ARM_Cortex-M55

ARMCortexM55CT contains the following MTI components:

- *4.36 ARM_Cortex-M55 - trace* on page 4-2009
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761

About ARMCortexM55CT

The model supports Custom Datapath Extension (CDE). For more information, see *5.5 CDE on page 5-2899*.

The model does not support the following functionality:

- Cross Trigger Interface (CTI).
- Programmable MBIST controller (PMC-100).
- Error Correcting Code (ECC).
- Q-Channel.

The following interfaces and registers are not modeled:

- ITM and ETM trace and trace synchronization and trigger interface signals.
- Dual-core lock-step operation.
- Interrupt latencies.
- Memory System Control Register (MSCR).
- Prefetcher Control Register (PFCR).
- Direct cache access registers.

Differences between the FVP_MPS2 model and the MPS2 specification

- The model does not have the random number generator or unique ID/secure storage mentioned in the MPS2 specification because the programmer's view of these devices is yet to be defined.
- The Ethernet controller in the model is a LAN91C111. The MPS2 documents, including those for pre-v8-M cores, specify a LAN9220.
- MTB, ETM, and TPIU are not supported. MTB RAM is absent.
- In the Memory Gating Unit, the model provides a configurable block size. For performance reasons, the minimum block size in the model is 4096 bytes. Hardware and later models might allow smaller block sizes. Software should always use the `BLK_CFG` register to determine block size.
- As in previous MPS2 Fast Models, some of the peripherals have minimal implementations:
  - The Audio controller is RAZ/WI.
  - Only the touchscreen functionality of the STMPE811 touchscreen controller is implemented.
  - A subset of the Ampire LCD module's graphics modes are supported.
- The usual general Fast Models restrictions apply.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called `ITM`. The `ITM` trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Table 3-189 ITM_PACKET_TYPE field values that the model supports

Field value	Description	Supported by model
`ITM_SYNC`	Synchronization packet	Not supported.
`ITM_P_OVERFLOW`	Protocol: Overflow packet	Not supported.
`ITM_P_LOCAL_TIMESTAMP`	Protocol: Local timestamp packets	Not supported.
`ITM_P_GLOBAL_TIMESTAMP`	Protocol: Global timestamp packets	Not supported.
`ITM_P_EXTEN`	Protocol: Extension packet	Not supported.
`ITM_S_INSTRUMENTATION`	Source: Instrumentation packet	Supported.
`ITM_S_DWT_EVENT_COUNTER`	Hardware source: Event counter wrapping	Not supported.
`ITM_S_DWT_EXCEPTION`	Hardware source: Exception tracing	Supported.

Table 3-189 ITM_PACKET_TYPE field values that the model supports (continued)

Field value	Description	Supported by model
ITM_S_DWT_PC_SAMPLING	Hardware source: PC sampling	Not supported.
ITM_S_DWT_DATA_PC_TRACE	Hardware source: DWT Data trace PC value	Supported.
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Table 3-190 Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	-
ahbp_m	PVBus	Master	The core will generate Vendor System data accesses on this port.
auxfault	*Value* on page 2-85	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions. Referred to in some documents as 'CLKIN'.
coproc_bus	*CoprocBusProtocol* on page 2-81	Slave	Co-Processor Interface
cpuwait	*Signal* on page 2-85	Slave	Stall the CPU out of reset
currns	*Signal* on page 2-85	Master	Current Security state of the processor
currpri	*Value* on page 2-85	Master	Current execution priority.
dbgen	*Signal* on page 2-85	Slave	Invasive debug enable
dbgrestart	*Signal* on page 2-85	Slave	Request for synchronised exit from halt mode
dbgrestarted	*Signal* on page 2-85	Master	Handshakes with DBGRESTART
edbgrq	*Signal* on page 2-85	Slave	External request to enter halt mode
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	*Value* on page 2-85	Master	Port which sends the value of the FPXXC cumulative exception flags.
halted	*Signal* on page 2-85	Master	Indicates that the processor is in halt mode
idau	PVBus	Master	The core will generate IDAU requests on this port.
idau_invalidate_region	*Value_64* on page 2-85	Slave	64 bit number to invalid IDAU memory ranage (start_address<<32|end_address)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-190 Ports (continued)

Name	Protocol	Type	Description
initnsvtor	*Value* on page 2-85	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initpahben	*Signal* on page 2-85	Slave	Enable P-AHB on the next reset
initsvtor	*Value* on page 2-85	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
inittcmen[2]	*Signal* on page 2-85	Slave	Reset configuration port - TCM enable initialisation out of reset Bit[0] HIGH = ITCM is enabled Bit[1] HIGH = DTCM is enabled
intnum	*Value* on page 2-85	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
irq[480]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
lockdcaic	*Signal* on page 2-85	Slave	-
locknsmpu	*Signal* on page 2-85	Slave	Disable writes to the Non-Secure MPU_*_NS registers
locknsvtor	*Signal* on page 2-85	Slave	Cortex-M55-specific LOCKNSVTOR, LOCKSVTAIRCR, LOCKSMPU, LOCKNSMPU, LOCKSAU. Disable writes to VTOR_NS
lockpahb	*Signal* on page 2-85	Slave	P-AHB related ports Disable writes to PAHBCR
locksau	*Signal* on page 2-85	Slave	Disable writes to the SAU_* registers
locksmpu	*Signal* on page 2-85	Slave	Disable writes to the Secure MPU_* registers
locksvtaircr	*Signal* on page 2-85	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
niden	*Signal* on page 2-85	Slave	Non-invasive debug enable
nmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
prequest	*PChannel* on page 2-80	Slave	Low Power Interface
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
qrequest	*PChannel* on page 2-80	Slave	-

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-190 Ports (continued)

Name	Protocol	Type	Description
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
spiden	*Signal* on page 2-85	Slave	Secure invasive debug enable
spniden	*Signal* on page 2-85	Slave	Secure non-invasive debug enable
stcalib[2]	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.
wicenack	*Signal* on page 2-85	Master	Acknowledge signal for WICENREQ
wicenreq	*Signal* on page 2-85	Slave	Request for deep sleep to be WIC-based deep sleep.
wicsense[483]	*Signal* on page 2-85	Master	Indicates which input events can cause the WIC to generate the WAKEUP signal.

Table 3-191 Parameters for ARM_Cortex-M55

Name	Type	Default value	Description
BEATS_PER_TICK	int	0x2	Number of beats from each in-flight vector instruction executed in 1 tick (1,2 or 4).
BF_is_nop	bool	0x0	BF instruction executes as NOP, even if we have LO_BRANCH_INFO.
CDEMAPPEDONCP	bool	0x1	Specifies whether the instruction for a given Coprocessor is redirected to the CDE module
CFGBIGEND	bool	0x0	Initialize processor to big endian mode
CFGDTCMSZ	int	0x9	Size of the data TCM. 0=No DTCM implemented. Otherwise=Size of DTCM=pow(2, CFGDTCMSZ - 1) KB. Minimum size is 4KB
CFGITCMSZ	int	0x9	Size of the instruction TCM. 0=No ITCM implemented. Otherwise=Size of ITCM=pow(2, CFGITCMSZ - 1) KB. Minimum size is 4KB
CFGMEMALIAS	int	0x0	Memory address alias bit for the ITCM, DTCM and P-AHB regions. 0=No alias, 1=Alias bit 24, 2=Alias bit 25, 4=Alias bit 26, 8=Alias bit 27, 16=Alias bit 28
CFGNOCDECP	int	0x0	Bit N means external coprocessor N (CP7:CP0) disable for CDE coprocessor

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-191 Parameters for ARM_Cortex-M55 (continued)

Name	Type	Default value	Description
CFGPAHBSZ	int	0x0	Size of the P-AHB peripheral port memory region. 0=P-AHB disabled, 1=64MB, 2=128MB, 3=256MB, 4=512MB
CPIF	bool	0x1	Specifies whether the external coprocessor interface is included
CPNSPRESENT	int	0xff	Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state
CPSPRESENT	int	0xff	Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state
DBGLVL	int	0x2	0: Minimal debug; 1: 2 Watchpoints, 4 Breakpoint comparators; 2: 4 Watchpoints, 8 Breakpoint comparators; 3: 8 Watchpoints, 8 Breakpoint comparators
DCACHESZ	int	0xf	Whether the D-cache is included and, if included, the size of it. Bit 0: 0=No D-cache included, 1=D-cache included. Bits [4:1]: 0x0=4KB D-cache, 0x1=8KB D-cache, 0x3=16KB D-cache, 0x7=32KB D-cache, 0x15=64KB D-cache
DTGU	bool	0x0	DTCM Security Gate Unit included
DTGUBLKSZ	int	0x3	DTCM gate unit block size. Size=pow(2, DTGUBLKSZ + 5) bytes
DTGUMAXBLKS	int	0x0	Maxiumum number of DTCM gate unit blocks. Number of blocks=pow(2, DTGUMAXBLKS)
ECOREVNUM	int	0x0	ECO Revision number
ERRDEVID.NUM	int	0x38	RAS: Number of implemented error record indexes, 0 to 56.
ETM	bool	0x1	Support for ETM trace. false : No ETM trace included, true: ETM trace included
FPU	bool	0x1	Set whether the model has VFP support
ICACHESZ	int	0xf	Whether the I-cache is included and, if included, the size of it. Bit 0: 0=No I-cache included, 1=I-cache included. Bits [4:1]: 0x0=4KB I-cache, 0x1=8KB I-cache, 0x3=16KB I-cache, 0x7=32KB I-cache, 0x15=64KB I-cache

Table 3-191 Parameters for ARM_Cortex-M55 (continued)

Name	Type	Default value	Description
ID_ISAR0.CmpBranch	int	0x3	Support for Compare and Branch instructions. 1 = Supports CBNZ and CBZ instructions; 3 = Supports non-predicated low overhead looping (WLS, DLS, LE, and LC) and branch future (BF, BFX, BFL, BFLX, and BFCSEL) instructions.
INITNSVTOR	int	0x0	Non-Secure vector-table offset at reset
INITPAHBEN	bool	0x0	The P-AHB enable state at reset
INITSVTOR	int	0x0	Secure vector-table offset at reset
IRQDIS0	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0]
IRQDIS1	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32]
IRQDIS10	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320]
IRQDIS11	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352]
IRQDIS12	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384]
IRQDIS13	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416]
IRQDIS14	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448]
IRQDIS2	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64]
IRQDIS3	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96]
IRQDIS4	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128]
IRQDIS5	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160]
IRQDIS6	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192]
IRQDIS7	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224]
IRQDIS8	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256]
IRQDIS9	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288]
IRQLVL	int	0x3	Number of bits of interrupt priority
ITGU	bool	0x0	ITCM Security Gate Unit included

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-191 Parameters for ARM_Cortex-M55 (continued)

Name	Type	Default value	Description
ITGUBLKSZ	int	0x3	ITCM gate unit block size. Size=pow(2, ITGUBLKSZ + 5) bytes
ITGUMAXBLKS	int	0x0	Maxiumum number of ITCM gate unit blocks. Number of blocks=pow(2, ITGUMAXBLKS)
ITM	bool	0x1	Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included
IWIC	bool	0x1	Include support for Internal Wake-up Interrupt Controller
LOCKDTGU	bool	0x0	Lock down of Data TGU registers write
LOCKITGU	bool	0x0	Lock down of Instruction TGU registers write
LOCKTCM	bool	0x0	Lock down of TCM registers write
LOCK_NS_MPU	bool	0x0	Lock down of Non-Secure MPU registers write
LOCK_SAU	bool	0x0	Lock down of SAU registers write
LOCK_S_MPU	bool	0x0	Lock down of Secure MPU registers write
MPU_NS	int	0x8	Number of regions in the Non-Secure MPU. If Security Extentions are absent, this is the total number of MPU regions
MPU_S	int	0x8	Number of regions in the Secure MPU. If Security Extentions are absent, this is ignored
MVE	int	0x1	Set whether the model has MVE support. If FPU = 0: 0=MVE not included, 1=Integer subset of MVE included. If FPU = 1: 0=MVE not included, 1=Integer subset of MVE included, 2=Integer and half and single precision floating point MVE included
NUMIRQ	int	0x20	Number of user interrupts
SAU	int	0x4	Number of SAU regions (0 => no SAU)
SECEXT	bool	0x1	Whether the ARMv8-M Security Extensions are included
WICLINES	int	0x23	Number of lines supported by the WIC interface
aircr_iesb_is_writable	bool	0x1	IS the AIRCR.IESB bit [5] writable?
aircr_iesb_reset	bool	0x0	Set the AIRCR.IESB bit [5] after reset

Table 3-191 Parameters for ARM_Cortex-M55 (continued)

Name	Type	Default value	Description
cde_impl_name	string	""	Name of the CDE implementation for this core (implementation contributed by MTI plugin).
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-ways	int	0x4	L1 D-cache ways (sets are implicit from size)
delay_faultmask_update	bool	0x0	Delay FAULTMASK update to context sync
delay_sysreg_update	bool	0x0	Delay some system register updates (e.g. SHCSR) to context sync
duplicate_CADI_TCM_writes	bool	0x0	CADI writes to TCMs are also sent to downstream memory at same addresses (for validation platforms)
ecc_on	bool	0x0	Enable Error Correcting Code
execute_via_archex	bool	0x1	Use ArchEx-generated code from V8_1_PACBTI_EAC_2_0_INTERNAL for execution
has_cde	bool	0x0	Enables Custom Datapath Extensions
has_pmu	bool	0x0	Availability of optional PMU.
has_unpriviledged_debug	bool	0x1	Unpriviledged Debug Extension supported for Mainline Extension
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
icache-ways	int	0x2	L1 I-cache ways (sets are implicit from size)
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
mve_unpred_config_json	string	'"[["CLEAR_IT","VPNOT_T1","InITBlock"],["OK","VMINNMV_f_T2","Rda==11x1"],["OK","VDDUP","curOffset MOD imm32 != 0"],["OK","VDDUP","bufSize MOD imm32 != 0"],["OK","VDDUP","curOffset >= bufSize"]]"'	A JSON array of arrays of the form [unpred_result, instr, cond] forunpredictable configruation for MVE. Either instr or cond may be omitted. The first match wins. Use 'list' to show the available options
num_pmu_counters	int	0x1f	Number of available PMU counters.

Table 3-191 Parameters for ARM_Cortex-M55 (continued)

Name	Type	Default value	Description
ras_ERRFR0	string	'"{"ED":0x1,"UE":0x1}"'	A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x1,"UE":0x1}'.
ras_cei_pin	int	0x2	RAS: Critical error interrupt pin.
ras_cei_support	bool	0x1	RAS: Whether Critical Error Interrupt is supported
ras_eri_pin	int	0x1	RAS: Error recovery interrupt pin.
ras_eri_support	bool	0x1	RAS: Whether Error Recovery Interrupt is supported
ras_error_record	int	0xffffffffffffff	56 bit value that specifies which nodes out of 0-55 are implemented (ERRDEVID is derived from this parameter)
ras_fhi_pin	int	0x0	RAS: Fault handling interrupt pin.
ras_fhi_support	bool	0x1	RAS: Whether Fault Handling Interrupt is supported
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor (0=default long quantum, 1=low latency mode, short quantum and signal checking, 2=lock-breaking mode, long quantum with additional context switches near load-exclusive instructions, 3=ISSCompare)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit
tcm_fill_pattern_1	int	0xdfdfdfcf	TCM Fill pattern 1
tcm_fill_pattern_2	int	0xcfdfdfdf	TCM Fill pattern 2

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-191 Parameters for ARM_Cortex-M55 (continued)

Name	Type	Default value	Description
`trace_style`	`int`	`0x0`	MVE instruction trace style: 0=Tarmac-like from instDB.json, 1=execute function+params (for debug), 2 = Rosetta. Add 16 for [**--] beat trace. Add 32 for tracing IMPLIED LOB instructions. Add 64 to change opcode of implied BF to 0xBF00
`unpred_config_json_file`	`string`	`""`	Path to the unpredictable configuration file in JSON format
`vfp-enable_at_reset`	`bool`	`0x0`	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

3.4.40 ARMCortexR4CT

ARMCortexR4CT CPU component. This model is written in C++ and models version r1p2 of the RTL.

ARMCortexR4CT contains the following CADI targets:

- ARM_Cortex-R4
- PVCache

ARMCortexR4CT contains the following MTI components:

- *4.38 ARM_Cortex-R4 - trace* on page 4-2080
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761

About ARMCortexR4CT

- The model implements the `cfgie` port, although it is optional in hardware.
- `pvbus_s` is the slave port to access the TCM RAM. Bits [3:0] of the user flags in the transaction are used to select the TCM:
  - 1 selects the ATCM.
  - 2 selects the BTCM.
  - Any other value is reserved.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- There is a single memory port combining instruction, data, DMA and peripheral access.
- ECC and parity schemes are not supported (although the registers might be present).
- The dual core redundancy configuration is not supported.
- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- The hardware refers to the TCMs as “A” and “B”. The model refers to these as “i” and “d”.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- The RTL permits two data TCMs, B0 and B1, to be configured for extra bandwidth. These are not modeled.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

Table 3-192 Ports

Name	Protocol	Type	Description
cfgend0	*Signal* on page 2-85	Slave	Configure BE8 mode after a reset.
cfgie	*Signal* on page 2-85	Slave	Configure big endian instruction format after a reset.
cfgnmfi	*Signal* on page 2-85	Slave	Configure FIQs as non-maskable after a reset.
cfgte	*Signal* on page 2-85	Slave	Configure exceptions to be taken in thumb mode after a reset.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
cpuhalt	*Signal* on page 2-85	Slave	Raising this signal will put the core into halt mode.
fiq	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
initramd	*Signal* on page 2-85	Slave	Configure DTCM enabled after a reset.
initrami	*Signal* on page 2-85	Slave	Configure ITCM enabled after a reset.
irq	*Signal* on page 2-85	Slave	This signal drives the CPU's interrupt handling.
loczrama	*Signal* on page 2-85	Slave	Location of ATCM at reset.
pmuirq	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
pvbus_s	PVBus	Slave	Slave access to TCMs.
reset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
standbywfi	*Signal* on page 2-85	Master	Signal from the core that it is waiting in standby for an interrupt.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.
vic_ack	*Signal* on page 2-85	Master	Vic acknowledge port to primary VIC.
vic_addr	*Value* on page 2-85	Slave	Vic address port from primary VIC.
vinithi	*Signal* on page 2-85	Slave	Configure high vectors after a reset.

Table 3-193 Parameters for ARM_Cortex-R4

Name	Type	Default value	Description
CFGEND0	bool	0x0	Initialize to BE8 endianness
CFGIE	bool	0x0	Set the reset value of the instruction endian bit
CFGNMFI	bool	0x0	Enable nonmaskable FIQ interrupts on startup
CFGTE	bool	0x0	Initialize to take exceptions in T32 state. Model starts in T32 state
INITRAMD	bool	0x0	Set or reset the INITRAMD signal
INITRAMI	bool	0x0	Set or reset the INITRAMI signal
LOCZRAMI	bool	0x0	Set or reset the LOCZRAMI signal

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-193 Parameters for ARM_Cortex-R4 (continued)

Name	Type	Default value	Description
NUM_MPU_REGION	int	0x8	Number of MPU regions
VINITHI	bool	0x0	Initialize with high vectors enabled
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-size	int	0x10000	Set D-cache size in bytes
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dtcm0_base	int	0x800000	Base address of DTCM at startup
dtcm0_size	int	0x8	Size of DTCM in KB
icache-size	int	0x10000	Set I-cache size in bytes
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
implements_vfp	bool	0x1	Set whether the model has been built with VFP support
itcm0_base	int	0x0	Base address of ITCM at startup
itcm0_size	int	0x8	Size of ITCM in KB
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions.
semihosting-ARM_HLT	int	0xf000	ARM HLT number for semihosting
semihosting-ARM_SVC	int	0x123456	ARM SVC number for semihosting
semihosting-Thumb_HLT	int	0x3c	Thumb HLT number for semihosting
semihosting-Thumb_SVC	int	0xab	Thumb SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset

3.4.41 ARMCortexR5x1CT

ARMCortexR5x1CT CPU component. This model is written in C++ and models version r1p2 of the RTL.

ARMCortexR5x1CT contains the following CADI targets:

- ARM_Cortex-R5
- Cluster_ARM_Cortex-R5

ARMCortexR5x1CT contains the following MTI components:

- *4.39 ARM_Cortex-R5 - trace* on page 4-2103
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761

About ARMCortexR5x1CT

- An ARMCortexR5x2CT component also exists.
- The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0 or 1).
- The allowed values for the `LOCK_STEP` parameter are:

  0 Disable. Set for two independent cores.

  1 Lock Step. Appears to the system as two cores but is internally modeled as a single core.

  3 Split Lock. Appears to the system as two cores but can be statically configured from reset either as two independent cores or two locked cores. For the model, these are equivalent to Disable and Lock Step, respectively, except for the value of build options registers. The model does not support dynamically splitting and locking the cluster.
- `pvbus_s` is the slave port to access the TCM RAM of CPU *n*. Bits [3:0] of the user flags in the transaction are used to select the TCM:
  - 1 selects the ATCM of CPU 0.
  - 2 selects the BTCM of CPU 0.
  - 3 selects the ATCM of CPU 1.
  - 4 selects the BTCM of CPU 1.
  - Any other value is reserved.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The RR bit in the SCTLR is ignored.
- The Low Latency Peripheral Port is not modeled.
- The model only has a single bus master port combining instruction, data, DMA and peripheral accesses. The CP15 control registers associated with peripheral buses preserve values but do not have any other effect.
- The model only supports static split lock and not dynamic split lock. Contact Arm for details.
- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- The model cannot experience an ECC error and does not support fault injection into the system, so Arm does not provide the ability to set error schemes for the caches or TCMs. Contact Arm if you require a particular value in the Build Options registers.

Table 3-194 Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	ACP slave port.
cfgatcmsz[2]	*Value* on page 2-85	Slave	ATCM size.
cfgbtcmsz[2]	*Value* on page 2-85	Slave	BTCM Size.
cfgend[2]	*Signal* on page 2-85	Slave	This signal is for EE bit initialisation. This is CFGEE in RTL but cfgend here fastsim consistency reasons.
cfgnmfi[2]	*Signal* on page 2-85	Slave	Controls non-maskable Fast Interrupts.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
cpuhalt[2]	*Signal* on page 2-85	Slave	Raising this signal will put the core into halt mode.
event[2]	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[2]	*Signal* on page 2-85	Slave	This signal drives the CPU's fast-interrupt handling.
groupid	*Value* on page 2-85	Slave	Group ID used for MPIDR.
initrama[2]	*Signal* on page 2-85	Slave	If ATCM is enabled at reset.
initramb[2]	*Signal* on page 2-85	Slave	If BTCM is enabled at reset.
irq[2]	*Signal* on page 2-85	Slave	This signal drives the CPU's interrupt handling.
loczrama[2]	*Signal* on page 2-85	Slave	Location of ATCM at reset.
pmuirq[2]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
pvbus_s[1]	PVBus	Slave	tcm slave port.
reset[2]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
standbywfe[2]	*Signal* on page 2-85	Master	This signal indicate if a core is in wfe state RTL calls this WFEPIPESTOPPED.
standbywfi[2]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state RTL uses WFIPIPESTOPPED.
teinit[2]	*Signal* on page 2-85	Slave	Default exception handling state.
ticks[2]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vic_ack[2]	*Signal* on page 2-85	Master	Vic acknowledge port to primary VIC.
vic_addr[2]	*Value* on page 2-85	Slave	Vic address port from primary VIC.
vinithi[2]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.

Table 3-195 Parameters for Cluster_ARM_Cortex-R5

Name	Type	Default value	Description
GROUP_ID	int	0x0	Value read in GROUP ID register field, bits[15:8] of the MPIDR
INST_ENDIAN	bool	0x1	Controls whether the model supports the instruction endianness bit

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-195 Parameters for Cluster_ARM_Cortex-R5 (continued)

Name	Type	Default value	Description
LOCK_STEP	int	0x0	Affects dual-processor configurations only, and ignored by single-processor configurations
MICRO_SCU	bool	0x1	Controls whether the effects of the MicroSCU are modeled
NUM_BREAKPOINTS	int	0x3	Controls with how many breakpoint pairs the model has been configured. This only affects the build options registers, because debug is not modeled
NUM_MPU_REGION	int	0xc	Sets the number of MPU regions
NUM_WATCHPOINTS	int	0x2	Controls with how many watchpoint pairs the model has been configured. This only affects the build options registers, because debug is not modeled
SLSPLIT	bool	0x0	Sets whether the model starts in split mode or locked mode
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions.

Table 3-196 Parameters for ARM_Cortex-R5

Name	Type	Default value	Description
cpu0.CFGATCMSZ	int	0xe	Sets the size of the ATCM
cpu0.CFGBTCMSZ	int	0xe	Sets the size of the BTCM
cpu0.CFGEND	bool	0x0	Initialize to BE8 endianness
cpu0.CFGIE	bool	0x0	Set the reset value of the instruction endian bit
cpu0.CFGNMFI	bool	0x0	Enable nonmaskable FIQ interrupts on startup
cpu0.DP_FLOAT	bool	0x1	Sets whether double-precision instructions are available
cpu0.INITRAMA	bool	0x0	Initialize with TCMA enabled
cpu0.INITRAMB	bool	0x0	Initialize with TCMB enabled
cpu0.LOCZRAMA	bool	0x0	Initialize with LOCZRAMA set to 1
cpu0.TEINIT	bool	0x0	T32 exception enable. The default has exceptions including reset handled in A32 state
cpu0.VINITHI	bool	0x0	Initialize with high vectors enabled
cpu0.atcm_base	int	0x40000000	Model-specific. Sets the base address of the ATCM (forced to 0 if LOCZRAMA is 1)
cpu0.btcm_base	int	0x0	Model-specific. Sets the base address of the BTCM (forced to 0 if LOCZRAMA is 0)
cpu0.dcache-size	int	0x10000	Set D-cache size in bytes
cpu0.icache-size	int	0x10000	Set I-cache size in bytes

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-196 Parameters for ARM_Cortex-R5 (continued)

Name	Type	Default value	Description
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-ARM_HLT	int	0xf000	ARM HLT number for semihosting
cpu0.semihosting-ARM_SVC	int	0x123456	ARM SVC number for semihosting
cpu0.semihosting-Thumb_HLT	int	0x3c	Thumb HLT number for semihosting
cpu0.semihosting-Thumb_SVC	int	0xab	Thumb SVC number for semihosting
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
cpu0.semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
cpu0.vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset
cpu0.vfp-present	bool	0x1	Set whether model has VFP support

3.4.42 ARMCortexR7x1CT

ARMCortexR7x1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexR7x1CT contains the following CADI targets:

- ARM_Cortex-R7
- Cluster_ARM_Cortex-R7
- PVCache

ARMCortexR7x1CT contains the following MTI components:

- *4.40 ARM_Cortex-R7 - trace* on page 4-2126
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761

About ARMCortexR7x1CT

- An ARMCortexR7x2CT component also exists.
- The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0 or 1).
- `pvbus_s` is the slave port to access the TCM RAM of CPU *n*. Bits [3:0] of the user flags in the transaction are used to select the TCM:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

  - — 0 selects the ITCM of CPU 0.
  - — 1 selects the DTCM of CPU 0.
  - — 2 selects the ITCM of CPU 1.
  - — 3 selects the DTCM of CPU 1.
  - — Any other value is reserved.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- This component does not implement address filtering within the SCU. The enable bit for this feature is ignored.
- The GIC does not respect the CFGSDISABLE signal. This leads to some registers being accessible when they must not be.
- The SCU enable bit is ignored. The SCU is always enabled.
- The SCU ignores the invalidate all register.
- The Broadcast TLB or cache operations in this model do not cause other cores in the cluster that are asleep because of WFI to wake up.
- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- The model cannot be configured with a 128-entry TLB.
- When modeling the SCU, coherency operations are represented by a memory write followed by a read to refill from memory, rather than using cache-to-cache transfers.
- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require an L2 cache you can add a PL310 Level 2 Cache Controller component.
- ECC and parity schemes are hardware-specific so are not supported.

Table 3-197 Ports

Name	Protocol	Type	Description
`acp_s`	`PVBus`	Slave	AXI ACP slave port.
`cfgend[1]`	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
`cfgnmfi[1]`	*Signal* on page 2-85	Slave	This signal disables FIQ mask in CPSR.
`clk_in`	`ClockSignal`	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
`clusterid`	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
`event`	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
`fiq[1]`	*Signal* on page 2-85	Slave	Legacy FIQ request input line.
`fiqout[1]`	*Signal* on page 2-85	Master	Output of individual processor nFIQ from the interrupt controller.
`fpuflags[1]`	*ValueState* on page 2-85	Master	Floating-Point Unit output flags.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-197 Ports (continued)

Name	Protocol	Type	Description
halt[1]	*Signal* on page 2-85	Slave	Raising this signal will put the core into halt mode. Equivalent to the hardware nCPUHALT[N:0] signal.
initram[1]	*Signal* on page 2-85	Slave	This signal enables the processor to boot from the instruction TCM.
ints[480]	*Signal* on page 2-85	Slave	Interrupt distributor interrupt lines.
irq[1]	*Signal* on page 2-85	Slave	Legacy IRQ request input line.
irqout[1]	*Signal* on page 2-85	Master	Output of individual processor nIRQ from the interrupt controller.
mfilteren	*Signal* on page 2-85	Slave	This signal enables filtering of address ranges between master bus ports.
mfilterend	*Value* on page 2-85	Slave	This port sets end of region mapped to pvbus_m1.
mfilterstart	*Value* on page 2-85	Slave	This port sets start of region mapped to pvbus_m1.
periphbase	*Value* on page 2-85	Slave	This port sets the base address of private peripheral region.
periphclk_in	ClockSignal	Slave	The timer and the watchdog take need a clk that is scaled down atleast by factor of two.
periphreset	*Signal* on page 2-85	Slave	This signal resets timer and interrupt controller.
pfilterend	*Value* on page 2-85	Slave	This port sets end of region mapped to pvbus_mp.
pfilterstart	*Value* on page 2-85	Slave	This port sets start of region mapped to pvbus_mp.
pmuirq[2]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_m1	PVBus	Master	The core will generate bus requests on this port.
pvbus_mp	PVBus	Master	The core will generate bus requests on this port.
pvbus_s	PVBus	Slave	tcm slave port
reset[1]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
scureset	*Signal* on page 2-85	Slave	This signal resets SCU.
smpnamp[1]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each Cortex-R7 processor.
standbywfe[1]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
teinit[1]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
ticks[1]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
wdreset[1]	*Signal* on page 2-85	Slave	This signal resets individual watchdog.
wdresetreq[1]	*Signal* on page 2-85	Master	CPU watchdog reset requests.

Table 3-198 Parameters for Cluster_ARM_Cortex-R7

Name	Type	Default value	Description
CLUSTER_ID	int	0x0	Processor cluster ID value
LOCK_STEP	int	0x0	Affects dual-processor configurations only, and ignored by single-processor configurations. 0 - Disable. Set for two independent processors. 1 - Lock Step. Appears to the system as two processors but is internally modeled as a single processor. 3 - Split Lock. Appears to the system as two processors but can be statically configured from reset either as two independent processors or two locked processors. For the model, these are equivalent to Disable and Lock Step, respectively, except for the value of build options registers. The model does not support dynamically splitting and locking the processor.
MFILTEREN	bool	0x0	Enables filtering of address ranges
MFILTEREND	int	0x0	Specifies the end address for address filtering
MFILTERSTART	int	0x0	Specifies the start address for address filtering
NUM_MPU_REGION	int	0xc	Sets the number of MPU regions
PERIPHBASE	int	0xae00 0000	Base address of peripheral memory space
PFILTEREND	int	0x0	Specifies the end address for peripheral port address filtering
PFILTERSTART	int	0xfff0 0000	Specifies the start address for peripheral port address filtering
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dic-spi_count	int	0x40	Number of shared peripheral interrupts implemented
ecc_on	bool	0x0	Enable Error Correcting Code
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions.

Table 3-199 Parameters for ARM_Cortex-R7

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Initialize to BE8 endianness
cpu0.CFGNMFI	bool	0x0	Enable nonmaskable FIQ interrupts on startup
cpu0.DP_FLOAT	bool	0x1	Sets whether double-precision instructions are available
cpu0.INITRAM	bool	0x0	Enable the processor to boot from the instruction TCM
cpu0.POWERCTLI	int	0x0	Default power control state for processor
cpu0.SMPnAMP	bool	0x0	Set whether the processor is part of a coherent domain

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-199 Parameters for ARM_Cortex-R7 (continued)

Name	Type	Default value	Description
cpu0.TEINIT	bool	0x0	T32 exception enable. The default has exceptions including reset handled in A32 state
cpu0.VINITHI	bool	0x0	Initialize with high vectors enabled
cpu0.dcache-size	int	0x8000	Set D-cache size in bytes
cpu0.dtcm_size	int	0x8	DTCM size in KB
cpu0.icache-size	int	0x8000	Set I-cache size in bytes
cpu0.itcm_size	int	0x8	ITCM size in KB
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-ARM_HLT	int	0xf000	ARM HLT number for semihosting
cpu0.semihosting-ARM_SVC	int	0x123456	ARM SVC number for semihosting
cpu0.semihosting-Thumb_HLT	int	0x3c	Thumb HLT number for semihosting
cpu0.semihosting-Thumb_SVC	int	0xab	Thumb SVC number for semihosting
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
cpu0.semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
cpu0.tcm-present	bool	0x1	Disables the DTCM and ITCM
cpu0.vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset
cpu0.vfp-present	bool	0x1	Set whether model has VFP support

3.4.43 ARMCortexR8x1CT

ARMCortexR8x1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexR8x1CT contains the following CADI targets:

- ARM_Cortex-R8
- Cluster_ARM_Cortex-R8
- PVCache

ARMCortexR8x1CT contains the following MTI components:

- *4.41 ARM_Cortex-R8 - trace* on page 4-2161
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761

About ARMCortexR8x1CT

- The following components also exist:
  — ARMCortexR8x2CT.
  — ARMCortexR8x3CT.
  — ARMCortexR8x4CT.

  The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).
- `pvbus_s` is the slave port to access the TCM RAM of CPU *n*. Bits [3:0] of the user flags in the transaction are used to select the TCM:
  — 0 selects the ITCM of CPU 0.
  — 1 selects the DTCM of CPU 0.
  — 2 selects the ITCM of CPU 1.
  — 3 selects the DTCM of CPU 1.
  — 4 selects the ITCM of CPU 2.
  — 5 selects the DTCM of CPU 2.
  — 6 selects the ITCM of CPU 3.
  — 7 selects the DTCM of CPU 3.
  — Any other value is reserved.
- The `semihosting-cwd` parameter sets the CWD that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- This component does not implement address filtering within the SCU. The enable bit for this feature is ignored.
- The GIC does not respect the CFGSDISABLE signal. This leads to some registers being accessible when they must not be.
- The SCU enable bit is ignored. The SCU is always enabled.
- The SCU ignores the invalidate all register.
- The Broadcast TLB or cache operations in this model do not cause other cores in the cluster that are asleep because of WFI to wake up.
- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- The model cannot be configured with a 128-entry TLB.
- When modeling the SCU, coherency operations are represented by a memory write followed by a read to refill from memory, rather than using cache-to-cache transfers.
- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require an L2 cache you can add a PL310 Level 2 Cache Controller component.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Table 3-200 Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
cfgend[1]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgnmfi[1]	*Signal* on page 2-85	Slave	This signal disables FIQ mask in CPSR.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	*Signal* on page 2-85	Slave	Legacy FIQ request input line.
fiqout[1]	*Signal* on page 2-85	Master	Output of individual processor nFIQ from the interrupt controller.
fpfilterend0	*Value* on page 2-85	Slave	This port sets end of region mapped to pvbus_mfp0.
fpfilterend1	*Value* on page 2-85	Slave	This port sets end of region mapped to pvbus_mfp1.
fpfilterend2	*Value* on page 2-85	Slave	This port sets end of region mapped to pvbus_mfp2.
fpfilterend3	*Value* on page 2-85	Slave	This port sets end of region mapped to pvbus_mfp3.
fpfilterstart0	*Value* on page 2-85	Slave	This port sets start of region mapped to pvbus_mfp0.
fpfilterstart1	*Value* on page 2-85	Slave	This port sets start of region mapped to pvbus_mfp1.
fpfilterstart2	*Value* on page 2-85	Slave	This port sets start of region mapped to pvbus_mfp2.
fpfilterstart3	*Value* on page 2-85	Slave	This port sets start of region mapped to pvbus_mfp3.
fpuflags[1]	*ValueState* on page 2-85	Master	Floating-Point Unit output flags.
halt[1]	*Signal* on page 2-85	Slave	Raising this signal will put the core into halt mode. Equivalent to the hardware nCPUHALT[N:0] signal.
initram[1]	*Signal* on page 2-85	Slave	This signal enables the processor to boot from the instruction TCM.
ints[480]	*Signal* on page 2-85	Slave	Interrupt distributor interrupt lines.
irq[1]	*Signal* on page 2-85	Slave	Legacy IRQ request input line.
irqout[1]	*Signal* on page 2-85	Master	Output of individual processor nIRQ from the interrupt controller.
mfilteren	*Signal* on page 2-85	Slave	This signal enables filtering of address ranges between master bus ports.
mfilterend	*Value* on page 2-85	Slave	This port sets end of region mapped to pvbus_m1.
mfilterstart	*Value* on page 2-85	Slave	This port sets start of region mapped to pvbus_m1.
periphbase	*Value* on page 2-85	Slave	This port sets the base address of private peripheral region.
periphclk_in	ClockSignal	Slave	The timer and the watchdog take need a clk that is scaled down atleast by factor of two.
periphreset	*Signal* on page 2-85	Slave	This signal resets timer and interrupt controller.
pfilterend	*Value* on page 2-85	Slave	This port sets end of region mapped to pvbus_mp.

Table 3-200 Ports (continued)

Name	Protocol	Type	Description
pfilterstart	*Value* on page 2-85	Slave	This port sets start of region mapped to pvbus_mp.
pmuirq[2]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	AXI master port 0.
pvbus_m1	PVBus	Master	AXI master port 1.
pvbus_mfp0	PVBus	Master	Fast peripheral port for core 0.
pvbus_mfp1	PVBus	Master	Fast peripheral port for core 1.
pvbus_mfp2	PVBus	Master	Fast peripheral port for core 2.
pvbus_mfp3	PVBus	Master	Fast peripheral port for core 3.
pvbus_mp	PVBus	Master	Shared peripheral port.
pvbus_s	PVBus	Slave	tcm slave port.
reset[1]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
scureset	*Signal* on page 2-85	Slave	This signal resets SCU.
smpnamp[1]	*Signal* on page 2-85	Master	This signals AMP or SMP mode for each Cortex-R8 processor.
standbywfe[1]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
teinit[1]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
ticks[1]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
wdreset[1]	*Signal* on page 2-85	Slave	This signal resets individual watchdog.
wdresetreq[1]	*Signal* on page 2-85	Master	CPU watchdog reset requests.

Table 3-201 Parameters for ARM_Cortex-R8

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Initialize to BE8 endianness
cpu0.CFGNMFI	bool	0x0	Enable nonmaskable FIQ interrupts on startup
cpu0.DP_FLOAT	bool	0x1	Sets whether double-precision instructions are available
cpu0.INITRAM	bool	0x0	Enable the processor to boot from the instruction TCM
cpu0.POWERCTLI	int	0x0	Default power control state for processor
cpu0.SMPnAMP	bool	0x0	Set whether the processor is part of a coherent domain
cpu0.TEINIT	bool	0x0	T32 exception enable. The default has exceptions including reset handled in A32 state
cpu0.VINITHI	bool	0x0	Initialize with high vectors enabled
cpu0.dcache-size	int	0x8000	Set D-cache size in bytes

Table 3-201 Parameters for ARM_Cortex-R8 (continued)

Name	Type	Default value	Description
cpu0.dtcm_size	int	0x8	DTCM size in KB
cpu0.icache-size	int	0x8000	Set I-cache size in bytes
cpu0.itcm_size	int	0x8	ITCM size in KB
cpu0.min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-ARM_HLT	int	0xf000	ARM HLT number for semihosting
cpu0.semihosting-ARM_SVC	int	0x123456	ARM SVC number for semihosting
cpu0.semihosting-Thumb_HLT	int	0x3c	Thumb HLT number for semihosting
cpu0.semihosting-Thumb_SVC	int	0xab	Thumb SVC number for semihosting
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap
cpu0.semihosting-hlt-enable	bool	0x0	Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true
cpu0.semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit
cpu0.tcm-present	bool	0x1	Disables the DTCM and ITCM
cpu0.vfp-enable_at_reset	bool	0x0	Enable coprocessor access and VFP at reset
cpu0.vfp-present	bool	0x1	Set whether model has VFP support

Table 3-202 Parameters for Cluster_ARM_Cortex-R8

Name	Type	Default value	Description
CLUSTER_ID	int	0x0	Processor cluster ID value
FPFILTEREND0	int	0x0	Specifies the end address for the fast peripheral port address filtering
FPFILTEREND1	int	0x0	Specifies the end address for the fast peripheral port address filtering
FPFILTEREND2	int	0x0	Specifies the end address for the fast peripheral port address filtering
FPFILTEREND3	int	0x0	Specifies the end address for the fast peripheral port address filtering

Table 3-202 Parameters for Cluster_ARM_Cortex-R8 (continued)

Name	Type	Default value	Description
FPFILTERSTART0	int	0xfff00000	Specifies the start address for the fast peripheral port address filtering
FPFILTERSTART1	int	0xfff00000	Specifies the start address for the fast peripheral port address filtering
FPFILTERSTART2	int	0xfff00000	Specifies the start address for the fast peripheral port address filtering
FPFILTERSTART3	int	0xfff00000	Specifies the start address for the fast peripheral port address filtering
LOCK_STEP	int	0x0	Affects dual-processor configurations only, and ignored by single-processor configurations. 0 - Disable. Set for two independent processors. 1 - Lock Step. Appears to the system as two processors but is internally modeled as a single processor. 3 - Split Lock. Appears to the system as two processors but can be statically configured from reset either as two independent processors or two locked processors. For the model, these are equivalent to Disable and Lock Step, respectively, except for the value of build options registers. The model does not support dynamically splitting and locking the processor.
MFILTEREN	bool	0x0	Enables filtering of address ranges
MFILTEREND	int	0x0	Specifies the end address for address filtering
MFILTERSTART	int	0x0	Specifies the start address for address filtering
NUM_MPU_REGION	int	0xc	Sets the number of MPU regions
PERIPHBASE	int	0xae000000	Base address of peripheral memory space
PFILTEREND	int	0x0	Specifies the end address for peripheral port address filtering
PFILTERSTART	int	0xfff00000	Specifies the start address for peripheral port address filtering
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dic-spi_count	int	0x40	Number of shared peripheral interrupts implemented
ecc_on	bool	0x0	Enable Error Correcting Code
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions.

3.4.44 ARMCortexR52x1CT

ARMCortexR52x1CT CPU component. This model is written in C++.

ARMCortexR52x1CT contains the following CADI targets:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- ARM_CortexR52
- PVCache
- TlbCadi
- gic_iri

ARMCortexR52x1CT contains the following MTI components:

- *4.43 ARM_CortexR52 - trace* on page 4-2235
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.72 GICv3CPUInterface - trace* on page 4-2474
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexR52x1CT

- The following components also exist:
  - ARMCortexR52x2CT.
  - ARMCortexR52x3CT.
  - ARMCortexR52x4CT.

  The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.
- The Cortex-R52 processor does not implement TrustZone technology, therefore the model does not support S_* or NS_* registers or exceptions.

Differences between the model and the RTL

- The model does not implement redundant cores for Dual-Core Lock-Step operations.
- The model does not implement the Low Power Interface to wake up the target core on receiving a `wake_request` signal from the GIC distributor.
- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- The model does not support running Software Test Libraries (STLs).
- The `vfp-enable_at_reset` parameter is a model-specific behavior with no hardware equivalent.
- ECC and parity schemes are hardware-specific so are not supported.

Table 3-203 Ports

Name	Protocol	Type	Description
`cfgdbgromaddr`	*`Value_64` on page 2-85*	Slave	Debug ROM base address.
`cfgdbgromaddrv`	*`Signal` on page 2-85*	Slave	Debug ROM base address valid.
`cfgendianess[1]`	*`Signal` on page 2-85*	Slave	This signal if for EE bit initialisation.
`cfgperiphbase`	*`Value_64` on page 2-85*	Slave	This port sets the base address of private peripheral region.

Non-Confidential

Table 3-203 Ports (continued)

Name	Protocol	Type	Description
cfgthumbexceptions[1]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
cfgvectable[1]	*Value_64* on page 2-85	Slave	Reset vector base address.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	*Signal* on page 2-85	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	*Signal* on page 2-85	Slave	Signals the clearing of an external global exclusive monitor
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commrx[1]	*Signal* on page 2-85	Master	Receive portion of Data Transfer Register full.
commtx[1]	*Signal* on page 2-85	Master	Transmit portion of Data Transfer Register empty.
cpuhalt[1]	*Signal* on page 2-85	Slave	Raising this signal will put the core into halt mode.
cpuporeset[1]	*Signal* on page 2-85	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cti[1]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
dbgack[1]	*Signal* on page 2-85	Master	External debug interface.
dbgen[1]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[1]	*Signal* on page 2-85	Master	There is no support for PChannel in CortexR52. These signals relate to core power down. Equivalent to COREPACTIVEx
dbgpwrupreq[1]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[1]	*Signal* on page 2-85	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
ext_slave_s	PVBus	Slave	External Slave port. Equivalent to AXIS port
extppi_in_0[9]	*Signal* on page 2-85	Slave	Core 0 external ppi signals.
flash_m[1]	PVBus	Master	Flash Port.

Non-Confidential

Table 3-203 Ports (continued)

Name	Protocol	Type	Description
gdu_external_m	*GICv3Comms* on page 2-84	Master	GDU external messaging port.
hiden[1]	*Signal* on page 2-85	Slave	External debug interface.
hniden[1]	*Signal* on page 2-85	Slave	External debug interface.
llpp_m[1]	PVBus	Master	LLPP (Low-Latency Peripheral Port).
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[1]	*Signal* on page 2-85	Slave	External debug interface.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_core_m[1]	PVBus	Master	The core will generate bus requests on this port. Equivalent to AXIM port
reset[1]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
sei[1]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.
spi_in[960]	*Signal* on page 2-85	Slave	Shared peripheral interrupts.
standbywfe[1]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	*Signal* on page 2-85	Master	This signal indicates if a core is in WFI state.
ticks[1]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
topreset	*Signal* on page 2-85	Slave	This signal resets timer and interrupt controller.
vsei[1]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.
warmrstreq[1]	*Signal* on page 2-85	Master	Warm reset request from core.

Table 3-204 Parameters for ARM_CortexR52

Name	Type	Default value	Description
CLUSTER_ID	int	0x0	CLUSTER_ID[15:8] equivalent to CFGMPIDRAFF2, CLUSTER_ID[7:0] equivalent to CFGMPIDRAFF1
DBGROMADDR	int	0x0	Equivalent to CFGDBGROMADDR

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-204 Parameters for ARM_CortexR52 (continued)

Name	Type	Default value	Description
DBGROMADDRV	bool	0x0	If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid
GICDISABLE	bool	0x0	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
PERIPHBASE	int	0x13080000	Equivalent to CFGPERIPHBASE
cluster_utid	int	0x0	Equivalent to CFGCLUSTERUTID
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
flash_protection_enable_at_reset	bool	0x0	Equivalent to CFGFLASHPROTEN
has_export_m_port	bool	0x1	The interrupt distributor has an optional interrupt export port for routing interrupts to an external device
has_flash	bool	0x0	Equivalent to CFGFLASHIMP

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-204 Parameters for ARM_CortexR52 (continued)

Name	Type	Default value	Description
has_flash_protection	bool	0x1	Equivalent to CFGFLASHPROTIMP
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
memory.ext_slave_base	int	0x0	Equivalent to CFGAXISTCMBASEADDR
memory.flash_base	int	0x0	Equivalent to CFGFLASHBASEADDR
num_protection_regions_s1	int	0x10	Number of v8-R protection regions
num_protection_regions_s2	int	0x10	Number of v8-R hyp protection regions
num_spi	int	0x3c0	Number of interrupts (SPI) into the internal GIC controller
ram_protection_enable_at_reset	bool	0x0	Equivalent to CFGRAMPROTEN

Table 3-205 Parameters for gic_iri

Name	Type	Default value	Description
gic_iri.A3-affinity-supported	bool	0x0	Device supports affinity level 3 values that are non-zero.
gic_iri.ARE-fixed-to-one	bool	0x0	GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one
gic_iri.CPU-affinities	string	""	A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.
gic_iri.CPU-affinities-file	string	""	A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.
gic_iri.DPG-ARE-only	bool	0x0	Limit application of DPG bits to interrupt groups for which ARE=1
gic_iri.DPG-bits-implemented	bool	0x0	Enable implementation of interrupt group participation bits or DPG bits in GICR_CTLR
gic_iri.DS-fixed-to-zero	bool	0x0	Enable/disable support of single security state

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-205 Parameters for gic_iri (continued)

Name	Type	Default value	Description
gic_iri.GICD-alias	int	0x0	In GICv2 mode: the base address for a 4k page alias of the first 4k of the Distributor page, in GICv3 mode. the base address of a 64KB page containing message based SPI signalling register aliases(0:Disabled)
gic_iri.GICD-legacy-registers-as-reserved	bool	0x0	When ARE is RAO/WI, makes superfluous registers in GICD reserved (including for the purpose of STATUSR updates)
gic_iri.GICD_CTLR-DS-1-means-secure-only	bool	0x0	If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.
gic_iri.GICD_ITARGETSR-RAZWI	bool	0x0	If true, the GICD_ITARGETS registers are RAZ/WI
gic_iri.GICD_PIDR	int	0x0	The value for the GICD_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
gic_iri.GICR-clear-enable-supported	bool	0x0	When true, this sets the value of the RO bit GICR_CTLR.CES with the value of the parameter allow-LPIEN-clear, making it visible to software
gic_iri.GICR-invalidate-registers-implemented	bool	0x0	When true, the registers GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented
gic_iri.GICR_PIDR	int	0x0	The value for the GICR_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
gic_iri.GICR_PROPBASER-read-only	bool	0x0	GICR_PROPBASER register is read-only.
gic_iri.GICR_PROPBASER-reset-value	int	0x0	Value of GICR_PROPBASER on reset.
gic_iri.GITS_BASER0-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER0 register.
gic_iri.GITS_BASER0-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER0 register is RAZ/WI.
gic_iri.GITS_BASER0-type	int	0x0	Type field for GITS_BASER0 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
gic_iri.GITS_BASER1-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER1 register.
gic_iri.GITS_BASER1-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER1 register is RAZ/WI.
gic_iri.GITS_BASER1-type	int	0x0	Type field for GITS_BASER1 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
gic_iri.GITS_BASER2-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER2 register.
gic_iri.GITS_BASER2-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER2 register is RAZ/WI.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-205 Parameters for gic_iri (continued)

Name	Type	Default value	Description
gic_iri.GITS_BASER2-type	int	0x0	Type field for GITS_BASER2 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
gic_iri.GITS_BASER3-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER3 register.
gic_iri.GITS_BASER3-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER3 register is RAZ/WI.
gic_iri.GITS_BASER3-type	int	0x0	Type field for GITS_BASER3 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
gic_iri.GITS_BASER4-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER4 register.
gic_iri.GITS_BASER4-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER4 register is RAZ/WI.
gic_iri.GITS_BASER4-type	int	0x0	Type field for GITS_BASER4 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
gic_iri.GITS_BASER5-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER5 register.
gic_iri.GITS_BASER5-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER5 register is RAZ/WI.
gic_iri.GITS_BASER5-type	int	0x0	Type field for GITS_BASER5 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
gic_iri.GITS_BASER6-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER6 register.
gic_iri.GITS_BASER6-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER6 register is RAZ/WI.
gic_iri.GITS_BASER6-type	int	0x0	Type field for GITS_BASER6 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
gic_iri.GITS_BASER7-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER7 register.
gic_iri.GITS_BASER7-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER7 register is RAZ/WI.
gic_iri.GITS_BASER7-type	int	0x0	Type field for GITS_BASER7 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
gic_iri.GITS_PIDR	int	0x0	The value for the GITS_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
gic_iri.ICFGR-PPI-mask	int	0xaaaaaaaa	Mask for writes to ICFGR registers that configure PPIs
gic_iri.ICFGR-PPI-reset	int	0x0	Reset value for ICFGR regesters that configure PPIs

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-205 Parameters for gic_iri (continued)

Name	Type	Default value	Description
gic_iri.ICFGR-SGI-mask	int	0x0	Mask for writes to ICFGR registers that configure SGIs
gic_iri.ICFGR-SGI-reset	int	0xaaaaaaaa	Reset value for ICFGR registers that configure SGIs
gic_iri.ICFGR-SPI-mask	int	0xaaaaaaaa	Mask for writes to ICFGR registers that configure SPIs
gic_iri.ICFGR-SPI-reset	int	0x0	Reset value for ICFGR regesters that configure SPIs
gic_iri.ICFGR-rsvd-bit	bool	0x0	If ARE=0, the value of reserved bits i.e. bit 0,2,4..30 of ICFGRn for n>0
gic_iri.IGROUP-PPI-mask	int	0xffff	Mask for writes to PPI bits in IGROUP registers
gic_iri.IGROUP-PPI-reset	int	0x0	Reset value for SGI bits in IGROUP registers
gic_iri.IGROUP-SGI-mask	int	0xffff	Mask for writes to SGI bits in IGROUP registers
gic_iri.IGROUP-SGI-reset	int	0x0	Reset value for SGI bits in IGROUP registers
gic_iri.IIDR	int	0x0	GICD_IIDR and GICR_IIDR value
gic_iri.IRI-ID-bits	int	0x10	Number of bits used to represent interrupts IDs in the Distributor and Redistributors, forced to 10 when none of LPIs, extended SPIs or extended PPIs is supported
gic_iri.IROUTER-IRM-RAZ-WI	bool	0x0	GICD_IROUTERn.InterruptRoutingMode is RAZ/WI
gic_iri.ITS-BASER-force-page-alignement	bool	0x1	Force alignement of address writen to a GITS_BASER register to the page size configured
gic_iri.ITS-ID-bits	int	0x10	Number of interrupt bits supported by ITS.
gic_iri.ITS-MOVALL-update-collections	bool	0x0	Whether MOVALL command updates the collection entires
gic_iri.ITS-TRANSLATE64R	bool	0x0	Add an implementation specific register at 0x10008 supporting 64 bit TRANSLATER (dev[63:32], interupt[31:0])
gic_iri.ITS-collection-ID-bits	int	0x0	Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0
gic_iri.ITS-count	int	0x0	Number of Interrupt Translation Services to be instantiated (0=none)
gic_iri.ITS-cumulative-collection-tables	bool	0x1	When true, the supported amount of collections is the sum of GITS_TYPER.HCC and the number of collections supported in memory, otherwise, simply the number supported in memory only. Irrelevant when HCC=0
gic_iri.ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
gic_iri.ITS-entry-size	int	0x8	Number of bytes required to store each entry in the ITT tables.
gic_iri.ITS-hardware-collection-count	int	0x0	Number of hardware collections held exclusively in the ITS
gic_iri.ITS-legacy-iidr-typer-offset	bool	0x0	Put the GITS_IIDR and GITS_TYPER registers at their older offset of 0x8 and 0x4 respectively
gic_iri.ITS-shared-vPE-table	int	0x0	Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.
gic_iri.ITS-threaded-command-queue	bool	0x1	Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-205 Parameters for gic_iri (continued)

Name	Type	Default value	Description
gic_iri.ITS-use-physical-target-addresses	bool	0x1	Use physical hardware adresses for targets in ITS commands -- must be true for distributed implementations
gic_iri.ITS-vmovp-bit	bool	0x0	Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.
gic_iri.ITS0-base	int	0x0	Register base address for ITS0 (automatic if 0).
gic_iri.ITS1-base	int	0x0	Register base address for ITS1 (automatic if 0).
gic_iri.ITS2-base	int	0x0	Register base address for ITS2 (automatic if 0).
gic_iri.ITS3-base	int	0x0	Register base address for ITS3 (automatic if 0).
gic_iri.LPI-cache-check-data	bool	0x0	Enable Cached LPI data against memory checking when available for cache type
gic_iri.LPI-cache-type	int	0x1	Cache type for LPIs, 0:No caching, 1:Full caching
gic_iri.MSI_IIDR	int	0x0	Value returned in MSI_IIDR registers.
gic_iri.MSI_NS-frame0-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 0 registers.
gic_iri.MSI_NS-frame0-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.
gic_iri.MSI_NS-frame0-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.
gic_iri.MSI_NS-frame1-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 1 registers.
gic_iri.MSI_NS-frame1-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.
gic_iri.MSI_NS-frame1-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.
gic_iri.MSI_NS-frame2-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 2 registers.
gic_iri.MSI_NS-frame2-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.
gic_iri.MSI_NS-frame2-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.
gic_iri.MSI_NS-frame3-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 3 registers.
gic_iri.MSI_NS-frame3-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.
gic_iri.MSI_NS-frame3-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.
gic_iri.MSI_NS-frame4-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 4 registers.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-205 Parameters for gic_iri (continued)

Name	Type	Default value	Description
gic_iri.MSI_NS-frame4-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.
gic_iri.MSI_NS-frame4-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.
gic_iri.MSI_NS-frame5-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 5 registers.
gic_iri.MSI_NS-frame5-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.
gic_iri.MSI_NS-frame5-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.
gic_iri.MSI_NS-frame6-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 6 registers.
gic_iri.MSI_NS-frame6-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.
gic_iri.MSI_NS-frame6-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.
gic_iri.MSI_NS-frame7-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 7 registers.
gic_iri.MSI_NS-frame7-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.
gic_iri.MSI_NS-frame7-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.
gic_iri.MSI_PIDR	int	0x0	The value for the MSI_PIDR registers, if non-zero and distributor supports GICv2m. Note: fixed fields (device type etc.) will be overriden in this value.
gic_iri.MSI_S-frame0-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 0 registers.
gic_iri.MSI_S-frame0-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.
gic_iri.MSI_S-frame0-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.
gic_iri.MSI_S-frame1-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 1 registers.
gic_iri.MSI_S-frame1-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.
gic_iri.MSI_S-frame1-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.
gic_iri.MSI_S-frame2-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 2 registers.
gic_iri.MSI_S-frame2-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-205 Parameters for gic_iri (continued)

Name	Type	Default value	Description
gic_iri.MSI_S-frame2-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.
gic_iri.MSI_S-frame3-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 3 registers.
gic_iri.MSI_S-frame3-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.
gic_iri.MSI_S-frame3-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.
gic_iri.MSI_S-frame4-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 4 registers.
gic_iri.MSI_S-frame4-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.
gic_iri.MSI_S-frame4-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.
gic_iri.MSI_S-frame5-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 5 registers.
gic_iri.MSI_S-frame5-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.
gic_iri.MSI_S-frame5-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.
gic_iri.MSI_S-frame6-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 6 registers.
gic_iri.MSI_S-frame6-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.
gic_iri.MSI_S-frame6-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.
gic_iri.MSI_S-frame7-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 7 registers.
gic_iri.MSI_S-frame7-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.
gic_iri.MSI_S-frame7-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.
gic_iri.PA_SIZE	int	0x30	Number of valid bits in physical address
gic_iri.PPI-implemented-mask	int	0xffff	Mask of PPIs that are implemented. One bit per PPI bit 0 == PPI 16 (first PPI). This will affect other masks.
gic_iri.SPI-count	int	0xe0	Number of SPIs that are implemented.
gic_iri.SPI-message-based-support	bool	0x1	Distributor supports meassage based signaling of SPI
gic_iri.SPI-unimplemented	string	""	A comma spearated list of unimplemented SPIs ranges for sparse SPI defintion(for ex: '35, 39-42, 73)'
gic_iri.STATUSR-implemented	bool	0x1	Determines whether the GICR_STATUSR register is implemented.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-205 Parameters for gic_iri (continued)

Name	Type	Default value	Description
gic_iri.allow-LPIEN-clear	bool	0x0	Allow RW behaviour on GICR_CTLR.LPIEN isntead of set once
gic_iri.chip-id	int	0x0	Chip ID when multichip operation is enabled.
gic_iri.common-lpi-configuration	int	0x0	Describes which re-distributors share (and must be configured with the same) LPI configuration table as described in GICR_TYPER(0:All, 1:A.x.x.x, 2:A.B.x.x, 3:A.B.C.x
gic_iri.common-vPE-table-affinity	string	""	Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.
gic_iri.consolidators	string	""	Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form 'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1, [etc]' (eg '0x3f100000:64:4096, 0x3f200000:64:4224'). The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.
gic_iri.delay-ITS-accesses	bool	0x1	Delay accesses from the ITS until GICR_SYNCR is read.
gic_iri.delay-redistributor-accesses	bool	0x1	Delay memory accesses from the redistributor until GICR_SYNCR is read.
gic_iri.direct-lpi-support	bool	0x0	Enable support for LPI operations through GICR registers
gic_iri.enable-multichip-operation	bool	0x0	Enables multi-chip operation between Distributors in distributed GIC IRI
gic_iri.enable_protocol_checking	bool	0x0	Enable/disable protocol checking at cpu interface
gic_iri.enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
gic_iri.extended-ppi-count	int	0x0	Number of extended PPI supported
gic_iri.extended-spi-count	int	0x0	Number of extended SPI supported
gic_iri.fixed-routed-spis	string	""	Value of IROUTER[n] register in the form 'n=a.b.c.d, n=*'. The RM bit of IROUTER is 0 when n=a.b.c.d is used else 1 when n=* is used. n can be >= 32 and <= 1019
gic_iri.gicv2-only	bool	0x0	If true, when using the GICv3 model, pretend to be a GICv2 system
gic_iri.has-two-security-states	bool	0x1	If true, has two security states
gic_iri.has_VPENDBASER-dirty-flag-on-load	bool	0x0	GICR_VPENDBASER.Dirty reflects transient loading state when valid=1
gic_iri.has_mpam	bool	0x0	Enable MPAM support on ITS and RDs
gic_iri.ignore-generate-sgi-when-no-are	bool	0x0	Ignore GenerateSGI packets coming form the CPU interface if both ARE_S and ARE_NS are 0
gic_iri.irouter-default-mask	string	""	Default Mask value for IROUTER[32..1019] register in the form 'a.b.c.d'

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-205 Parameters for gic_iri (continued)

Name	Type	Default value	Description
gic_iri.irouter-default-reset	string	""	Default Reset Value of IROUTER[32..1019] register in the form 'a.b.c.d' or *
gic_iri.irouter-mask-values	string	""	Mask Value of IROUTER[n] register in the form 'n=a.b.c.d'.n can be >= 32 and <= 1019
gic_iri.irouter-reset-values	string	""	Reset Value of IROUTER[n] register in the form 'n=a.b.c.d or n=*'.n can be >= 32 and <= 1019
gic_iri.legacy-sgi-enable-rao	bool	0x0	Enables for SGI associated with an ARE=0 regime are RAO/WI
gic_iri.local-SEIs	bool	0x0	Generate SEI to signal internal issues
gic_iri.local-VSEIs	bool	0x0	Generate VSEI to signal internal issues
gic_iri.lockable-SPI-count	int	0x0	Number of SPIs that are locked down when CFGSDISABLE signal is asserted. Only applies for GICv2.
gic_iri.max-pe-on-chip	int	0x4	Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.
gic_iri.monolithic	bool	0x0	Indicate that the implementation is not distributed
gic_iri.mpam_max_partid	int	0xffff	Maximum valid PARTID
gic_iri.mpam_max_pmg	int	0xff	Maximum valid PMG
gic_iri.multichip-threaded-dgi	bool	0x1	Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.
gic_iri.non-ARE-core-count	int	0x8	Maximum number of non-ARE cores; normally used to pass the cluster-level NUM_CORES parameter to the top-level redistributor.
gic_iri.outer-cacheability-support	bool	0x0	Allow configuration of outer cachability attributes in ITS and Redistributor
gic_iri.output_attributes	string	"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS"	User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.
gic_iri.print-memory-map	bool	0x0	Print memory map to stdout
gic_iri.priority-bits	int	0x5	Number of implemented priority bits
gic_iri.processor-numbers	string	""	Specify processor numbers (as appears in GICR_TYPER) in the form 0.0.0.0=0,0.0.0.1=1 etc.) If not specified, will number processors starting at 0.
gic_iri.redistributor-threaded-sync	bool	0x1	Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation
gic_iri.reg-base	int	0x2c010000	Base for decoding GICv3 registers.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-205 Parameters for gic_iri (continued)

Name	Type	Default value	Description
gic_iri.reg-base-per-redistributor	string	""	Base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If reg-base-per-redistributor-file is specified, this parameter is ignored.
gic_iri.reg-base-per-redistributor-file	string	""	Path to file containing the base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If this parameter is specified, reg-base-per-redistributor parameter will be ignored even when it is given.
gic_iri.report-MSI-error-via-statusr	int	0x0	Report MSI error via GITS_STATUSR. (0:unsupported, 1:report by GITS_STATUSR, 2:report by GITS_STATUSR and interrupt as well).
gic_iri.sgi-range-selector-support	bool	0x0	Device has support for the Range Selector feature for SGI
gic_iri.single-set-support	bool	0x0	When true, forces redistributors to recall interrupts with a clear rather than issue a second Set command
gic_iri.supports-shareability	bool	0x1	Device supports shareability attributes on outgoing memory bus (i.e. is modelling an ACElite port rather than an AXI4 port).
gic_iri.trace-speculative-lpi-property-update	bool	0x0	Trace LPI propery updates performed on speculative accesses (useful for debuging LPI)
gic_iri.virtual-lpi-support	bool	0x0	GICv4 Virtual LPIs and Direct injection of Virtual LPIs supported
gic_iri.virtual-priority-bits	int	0x5	Number of implemented virtual priority bits
gic_iri.wakeup-on-reset	bool	0x0	Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.4.45 ARMCortexX1CT

ARMCortexX1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMCortexX1CT contains the following CADI targets:

- ARM_Cortex-X1
- Cluster_ARM_Cortex-X1
- PVCache
- TlbCadi

ARMCortexX1CT contains the following MTI components:

- *4.42 ARM_Cortex-X1 - trace* on page 4-2196
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMCortexX1CT

The model supports the following features:

- DynamIQ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- `BROADCASTPERSIST` pin.

The model does not support the following features:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This component has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following components also exist, with a fixed number of cores per cluster:

- ARMCortexX1x1CT.
- ARMCortexX1x2CT.
- ARMCortexX1x3CT.
- ARMCortexX1x4CT.

The per-core parameters are preceded by `cpu`*n*`.`, where *n* identifies the core (0-3).

Table 3-206 Ports

Name	Protocol	Type	Description
`AENDMP`	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
`ASTARTMP`	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
`CNTHPIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.
`CNTHVIRQ[4]`	*Signal* on page 2-85	Master	Timer signals to SOC.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-206 Ports (continued)

Name	Protocol	Type	Description
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[4]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-206 Ports (continued)

Name	Protocol	Type	Description
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[4]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain

Table 3-206 Ports (continued)

Name	Protocol	Type	Description
sei[4]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-207 Parameters for Cluster_ARM_Cortex-X1

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-207 Parameters for Cluster_ARM_Cortex-X1 (continued)

Name	Type	Default value	Description
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x10000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-207 Parameters for Cluster_ARM_Cortex-X1 (continued)

Name	Type	Default value	Description
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
ext_abort_device_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRE read external aborts
ext_abort_device_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRE write external aborts
ext_abort_so_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE read external aborts
ext_abort_so_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE write external aborts
has_coherent_icache	bool	0x0	Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-207 Parameters for Cluster_ARM_Cortex-X1 (continued)

Name	Type	Default value	Description
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x10000	L1 I-Cache size in bytes.
icache-state_modelled	bool	0x0	Set whether I-cache has stateful implementation
l3cache-hit_latency	int	0x0	L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
l3cache-maintenance_latency	int	0x0	L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
l3cache-miss_latency	int	0x0	L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Table 3-207 Parameters for Cluster_ARM_Cortex-X1 (continued)

Name	Type	Default value	Description
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Table 3-208 Parameters for ARM_Cortex-X1

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Table 3-208 Parameters for ARM_Cortex-X1 (continued)

Name	Type	Default value	Description
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.

Table 3-208 Parameters for ARM_Cortex-X1 (continued)

Name	Type	Default value	Description
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

3.4.46 ARMNeoverseE1CT

ARMNeoverseE1CT CPU component. This model is written in C++.

ARMNeoverseE1CT contains the following CADI targets:

- ARM_Neoverse-E1
- Cluster_ARM_Neoverse-E1
- PVCache
- TlbCadi

ARMNeoverseE1CT contains the following MTI components:

- *4.44 ARM_Neoverse-E1 - trace* on page 4-2273
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMNeoverseE1CT

The model supports the following features:

- DynamIQ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOPWRDWN are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This model has a variable number of cores per cluster, specified using the NUM_CORES parameter. The following models also exist, with a fixed number of cores per cluster:

- ARMNeoverseE1x1CT.
- ARMNeoverseE1x2CT.
- ARMNeoverseE1x3CT.
- ARMNeoverseE1x4CT.

The per-core parameters are preceded by cpu*n*., where *n* identifies the core (0-3).

Table 3-209 Ports

Name	Protocol	Type	Description
AENDMP	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
CNTHPIRQ[16]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[16]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[16]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[16]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[16]	*Signal* on page 2-85	Master	Timer signals to SOC.
acp_s	PVBus	Slave	AXI ACP slave port
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[16]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[16]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.

Non-Confidential

Table 3-209 Ports (continued)

Name	Protocol	Type	Description
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[16]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[16]	*Signal* on page 2-85	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	*Signal* on page 2-85	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[16]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[16]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[16]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[16]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[16]	*Signal* on page 2-85	Master	These signals relate to core power down.
dbgpwrupreq[16]	*Signal* on page 2-85	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[16]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[16]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port per thread.
irq[16]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[16]	*Signal* on page 2-85	Slave	External debug interface.

Table 3-209 Ports (continued)

Name	Protocol	Type	Description
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[8]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[16]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[16]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[8]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[16]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[16]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.
spiden[16]	*Signal* on page 2-85	Slave	External debug interface.
spniden[16]	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[16]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[16]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[16]	*Signal* on page 2-85	Slave	Virtualised FIQ.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-209 Ports (continued)

Name	Protocol	Type	Description
vinithi[16]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[16]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[16]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-210 Parameters for Cluster_ARM_Neoverse-E1

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
cluster_patch_level	int	0x0	Cosmetic change to patch number in CLUSTERIDR. Corresponds to the Y in rXpY.
cluster_revision_number	int	0x0	Cosmetic change to revision number in CLUSTERIDR, Corresponds to the X in rXpY.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-210 Parameters for Cluster_ARM_Neoverse-E1 (continued)

Name	Type	Default value	Description
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-size	int	0x10000	L1 D-Cache size in bytes.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Table 3-210 Parameters for Cluster_ARM_Neoverse-E1 (continued)

Name	Type	Default value	Description
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
has_dot_product	int	0x2	Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.
icache-read_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.
icache-size	int	0x10000	L1 I-Cache size in bytes.

Table 3-211 Parameters for ARM_Neoverse-E1 (continued)

Name	Type	Default value	Description
cpu0.thread0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.thread0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.thread0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.thread0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.thread0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.
cpu0.thread0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.thread0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.thread0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.thread0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.thread0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.thread0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.thread0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.thread0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.thread0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!
cpu0.thread0.vfp-present	bool	0x1	Set whether the model has VFP support

3.4.47 ARMNeoverseN1CT

ARMNeoverseN1CT CPU component. This model is written in C++ and models version r0p0 of the RTL.

ARMNeoverseN1CT contains the following CADI targets:

- ARM_Neoverse-N1
- Cluster_ARM_Neoverse-N1
- PVCache
- TlbCadi

ARMNeoverseN1CT contains the following MTI components:

- *4.45 ARM_Neoverse-N1 - trace* on page 4-2311
- *4.48 ARMv8Cluster - trace* on page 4-2401
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.68 DSU - trace* on page 4-2463
- *4.73 GICv3CPUInterfaceDecoder - trace* on page 4-2489
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.108 PVCache - trace* on page 4-2761
- *4.114 TLB - trace* on page 4-2834

About ARMNeoverseN1CT

The model supports the following features:

- DynamIQ (FCM) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  — Automatic CPU retention mode.
  — Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOPWRDWN are implemented.
- Cache stashing capability.

This model has a variable number of cores per cluster, specified using the NUM_CORES parameter. The following models also exist, with a fixed number of cores per cluster:

- ARMNeoverseN1x1CT.
- ARMNeoverseN1x2CT.
- ARMNeoverseN1x3CT.
- ARMNeoverseN1x4CT.

The per-core parameters are preceded by cpu*n*., where *n* identifies the core (0-3).

Table 3-212 Ports

Name	Protocol	Type	Description
AENDMP	*Value_64* on page 2-85	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	*Value_64* on page 2-85	Slave	Port to obtain start address of valid peripheral address range (inclusive).
CNTHPIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTHVIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPNSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTPSIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
CNTVIRQ[4]	*Signal* on page 2-85	Master	Timer signals to SOC.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastatomic	*Signal* on page 2-85	Slave	CHI defined pins.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-212 Ports (continued)

Name	Protocol	Type	Description
broadcastcachemaint	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastouter	*Signal* on page 2-85	Slave	ACE defined pins.
broadcastpersist	*Signal* on page 2-85	Slave	CHI defined pins.
cfgend[4]	*Signal* on page 2-85	Slave	This signal if for EE bit initialisation.
cfgsdisable	*Signal* on page 2-85	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	*Signal* on page 2-85	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	*Value* on page 2-85	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	*Signal* on page 2-85	Master	DynamIQ pmu irq
cntvalueb	*CounterInterface* on page 2-84	Slave	Interface to SoC level counter module.
commirq[4]	*Signal* on page 2-85	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	*Signal* on page 2-85	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	*Signal* on page 2-85	Slave	Disable cryptography extensions after reset.
cti[4]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Master	Cross trigger matrix port.
ctidbgirq[4]	*Signal* on page 2-85	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[4]	*Signal* on page 2-85	Slave	External debug interface.
dbgnopwrdwn[4]	*Signal* on page 2-85	Master	No power-down request.
dbgpwrupreq[4]	*Signal* on page 2-85	Master	Debug power up request.

Table 3-212 Ports (continued)

Name	Protocol	Type	Description
dev_debug_s	PVBus	Slave	External debug interface.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	*GICv3Comms* on page 2-84	Slave	GICv3 AXI-stream port.
irq[4]	*Signal* on page 2-85	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	*Signal* on page 2-85	Slave	External debug interface.
pchannel_cluster	*PChannel* on page 2-80	Slave	PChannel for cluster.
pchannel_core[4]	*PChannel* on page 2-80	Slave	PChannels for cores
pmuirq[4]	*Signal* on page 2-85	Master	Interrupt signal from performance monitoring unit.
presetdbg	*Signal* on page 2-85	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	*Signal* on page 2-85	Slave	Per core RAM Error Interrupt.
reset[4]	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	*Value_64* on page 2-85	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	*Signal* on page 2-85	Slave	Per core System Error physical pins.
spiden[4]	*Signal* on page 2-85	Slave	External debug interface.
spniden[4]	*Signal* on page 2-85	Slave	External debug interface.
sporeset	*Signal* on page 2-85	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.

Table 3-212 Ports (continued)

Name	Protocol	Type	Description
ticks[4]	*InstructionCount* on page 2-84	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	*Signal* on page 2-85	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	*Signal* on page 2-85	Slave	Virtualised FIQ.
vinithi[4]	*Signal* on page 2-85	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	*Signal* on page 2-85	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	*Signal* on page 2-85	Slave	Per core virtual System Error physical pins.

Table 3-213 Parameters for ARM_Neoverse-N1

Name	Type	Default value	Description
cpu0.CFGEND	bool	0x0	Endianness configuration at reset. 0, little endian. 1, big endian.
cpu0.CFGTE	bool	0x0	Instruction set state when resetting into AArch32. 0, A32. 1, T32.
cpu0.CRYPTODISABLE	bool	0x0	Disable cryptographic features.
cpu0.RVBARADDR	int	0x0	Value of RVBAR_ELx register.
cpu0.VINITHI	bool	0x0	Reset value of SCTLR.V.
cpu0.enable_trace_special_hlt_imm16	bool	0x0	Enable usage of parameter trace_special_hlt_imm16
cpu0.l2cache-hit_latency	int	0x0	L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.
cpu0.l2cache-maintenance_latency	int	0x0	L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-miss_latency	int	0x0	L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Table 3-213 Parameters for ARM_Neoverse-N1 (continued)

Name	Type	Default value	Description
cpu0.l2cache-read_access_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
cpu0.l2cache-read_latency	int	0x0	L2 Cache timing annotation latency for read accesses given in ticks per byte accessed.l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
cpu0.l2cache-size	int	0x80000	L2 Cache size in bytes.
cpu0.l2cache-snoop_data_transfer_latency	int	0x0	L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
cpu0.l2cache-snoop_issue_latency	int	0x0	L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_access_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.
cpu0.l2cache-write_latency	int	0x0	L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
cpu0.max_code_cache_mb	int	0x100	Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)
cpu0.min_sync_level	int	0x0	Force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
cpu0.semihosting-A32_HLT	int	0xf000	A32 HLT number for semihosting calls.
cpu0.semihosting-A64_HLT	int	0xf000	A64 HLT number for semihosting calls.
cpu0.semihosting-ARM_SVC	int	0x123456	A32 SVC number for semihosting calls.
cpu0.semihosting-T32_HLT	int	0x3c	T32 HLT number for semihosting calls.
cpu0.semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting calls.

Table 3-213 Parameters for ARM_Neoverse-N1 (continued)

Name	Type	Default value	Description
cpu0.semihosting-cmd_line	string	""	Command line available to semihosting calls.
cpu0.semihosting-cwd	string	""	Base directory for semihosting file access.
cpu0.semihosting-enable	bool	0x1	Enable semihosting SVC/HLT traps.
cpu0.semihosting-heap_base	int	0x0	Virtual address of heap base.
cpu0.semihosting-heap_limit	int	0xf000000	Virtual address of top of heap.
cpu0.semihosting-stack_base	int	0x10000000	Virtual address of base of descending stack.
cpu0.semihosting-stack_limit	int	0xf000000	Virtual address of stack limit.
cpu0.trace_special_hlt_imm16	int	0xf000	For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered
cpu0.vfp-enable_at_reset	bool	0x0	Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Table 3-214 Parameters for Cluster_ARM_Neoverse-N1

Name	Type	Default value	Description
BROADCASTATOMIC	bool	0x1	Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used
BROADCASTCACHEMAINT	bool	0x1	Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.
BROADCASTOUTER	bool	0x1	Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.
BROADCASTPERSIST	bool	0x1	Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used
CLUSTER_ID	int	0x0	Processor cluster ID value
GICDISABLE	bool	0x1	Disable the new style GICv3 CPU interface in each core model. Should be left enabled unless the platform contains a GICv3 distributor.
cpi_div	int	0x1	Divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	Multiplier for calculating CPI (Cycles Per Instruction)
dcache-hit_latency	int	0x0	L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Table 3-214 Parameters for Cluster_ARM_Neoverse-N1 (continued)

Name	Type	Default value	Description
dcache-maintenance_latency	int	0x0	L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.
dcache-miss_latency	int	0x0	L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.
dcache-prefetch_enabled	bool	0x0	Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true
dcache-read_access_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.
dcache-read_latency	int	0x0	L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed.dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.
dcache-snoop_data_transfer_latency	int	0x0	L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.
dcache-state_modelled	bool	0x0	Set whether D-cache has stateful implementation
dcache-write_access_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.
dcache-write_latency	int	0x0	L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
default_opmode	int	0x4	Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Table 3-214 Parameters for Cluster_ARM_Neoverse-N1 (continued)

Name	Type	Default value	Description
diagnostics	bool	0x0	Enable DynamIQ diagnostic messages
enable_simulation_performance_optimizations	bool	0x1	With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).
ext_abort_device_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRE read external aborts
ext_abort_device_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRE write external aborts
ext_abort_so_read_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE read external aborts
ext_abort_so_write_is_sync	bool	0x0	Synchronous reporting of device-nGnRnE write external aborts
has_coherent_icache	bool	0x0	Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
has_peripheral_port	bool	0x0	If true, additional AXI peripheral port is configured.
has_statistical_profiling	bool	0x1	Whether Statistical Based Profiling is implemented
icache-hit_latency	int	0x0	L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.
icache-maintenance_latency	int	0x0	L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.
icache-miss_latency	int	0x0	L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.
icache-prefetch_enabled	bool	0x0	Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.
icache-read_access_latency	int	0x0	L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Table 3-214 Parameters for Cluster_ARM_Neoverse-N1 (continued)

Name	Type	Default value	Description
l3cache-write_access_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.
l3cache-write_latency	int	0x0	L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.
pchannel_treat_simreset_as_poreset	bool	0x0	Register core as ON state to cluster with simulation reset.
periph_address_end	int	0x0	End address for peripheral port address range exclusive(corresponds to AENDMP input signal).
periph_address_start	int	0x0	Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).
ptw_latency	int	0x0	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
tlb_latency	int	0x0	TLB latency for TA (Timing Annotation), expressed in simulation ticks
treat-dcache-cmos-to-pou-as-nop	bool	0x0	Whether dcache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required
walk_cache_latency	int	0x0	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

3.4.48 ARMSC000CT

ARMSC000CT CPU component. This model is written in C++ and models version r0p1 of the RTL.

ARMSC000CT contains the following CADI targets:

- ARM_SC000

ARMSC000CT contains the following MTI components:

- *4.46 ARM_SC000 - trace* on page 4-2350
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

Differences between the model and the RTL

The model has the following limitations:

- It does not implement any security features.
- Only bit[0] of the Auxiliary Control Register is supported for read/write. No functionality is implemented.
- The Security Features Control Register read/write access is supported using SECKEY. No functionality is implemented.

Table 3-215 Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	*Value* on page 2-85	Master	Current execution priority.
edbgrq	*Signal* on page 2-85	Slave	External debug request.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
intisr[32]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
intnmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
io_port_in	PVBus	Slave	I/O port pair. See the documentation for the io_port_out port.
io_port_out	PVBus	Master	I/O port pair. Used if IOP is true. Transactions from io_port_out which do not "match" should be returned via io_port_in. For performance reasons, the I/O port interface is not modelled directly. Instead, a simple PVBus gasket is inserted at the point in the memory system where the I/O port would be. In hardware, a device would be attached to the port which would tell the CPU whether it would like to intercept each transaction, given its address. This can be modelled in a performant manner by connecting a PVBusMapper-based device to io_port_out which intercepts transactions of interest and passes other transactions back to the CPU via io_port_in. Your I/O port device model is also responsible for aborting transactions which would be aborted on hardware (e.g. exclusives) if necessary.
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
stcalib	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.

Table 3-216 Parameters for ARM_SC000

Name	Type	Default value	Description
BIGENDINIT	bool	0x0	Initialize processor to big endian mode
BKPT	int	0x4	Number of breakpoint unit comparators implemented
DBG	bool	0x1	Set whether debug extensions are implemented
IOP	bool	0x0	Send all d-side transactions to the port, io_port_out. Transactions which do not match should be returned to the port, io_port_in
IRQDIS	int	0x0	IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n]
NUM_IRQ	int	0x20	Number of user interrupts
NUM_MPU_REGION	int	0x0	Number of MPU regions
SYST	bool	0x1	Enable support for SysTick timer functionality
USER	bool	0x1	Enable support for Unprivileged/Privileged Extension
VTOR	bool	0x1	Include Vector Table Offset Register
WIC	bool	0x1	Include support for WIC-mode deep sleep
WPT	int	0x2	Number of watchpoint unit comparators implemented
cpi_div	int	0x1	divider for calculating CPI (Cycles Per Instruction)
cpi_mul	int	0x1	multiplier for calculating CPI (Cycles Per Instruction)
master_id	int	0x0	Master ID presented in bus transactions
min_sync_level	int	0x0	force minimum syncLevel (0=off=default,1=syncState,2=postInsnIO,3=postInsnAll)
scheduler_mode	int	0x0	Control the interleaving of instructions in this processor (0=default long quantum, 1=low latency mode, short quantum and signal checking, 2=lock-breaking mode, long quantum with additional context switches near load-exclusive instructions, 3=ISSCompare)
semihosting-Thumb_SVC	int	0xab	T32 SVC number for semihosting
semihosting-cmd_line	string	""	Command line available to semihosting SVC calls
semihosting-cwd	string	""	Base directory for semihosting file access.
semihosting-enable	bool	0x1	Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.
semihosting-heap_base	int	0x0	Virtual address of heap base
semihosting-heap_limit	int	0x10700000	Virtual address of top of heap
semihosting-prefix	bool	0x0	Prefix semihosting output with target instance name
semihosting-stack_base	int	0x10700000	Virtual address of base of descending stack
semihosting-stack_limit	int	0x10800000	Virtual address of stack limit

3.4.49 ARMSC300CT

ARMSC300CT CPU component. This model is written in C++ and models version r0p1 of the RTL.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ARMSC300CT contains the following CADI targets:

- ARM_SC300

ARMSC300CT contains the following MTI components:

- *4.47 ARM_SC300 - trace* on page 4-2381
- *4.49 AsyncCacheFlushUnit - trace* on page 4-2402
- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

Differences between the model and the RTL

The model has the following limitations:

- It does not implement any security features.
- The Trash Register is implemented as RAZ/WI.
- Only bit[0] of the Auxiliary Control Register is supported for read/write. No functionality is implemented.
- The Security Features Control Register read/write access is supported using SECKEY. No functionality is implemented.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called `ITM`. The `ITM` trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Table 3-217 ITM_PACKET_TYPE field values that the model supports

Field value	Description	Supported by model
`ITM_SYNC`	Synchronization packet	Not supported.
`ITM_P_OVERFLOW`	Protocol: Overflow packet	Not supported.
`ITM_P_LOCAL_TIMESTAMP`	Protocol: Local timestamp packets	Not supported.
`ITM_P_GLOBAL_TIMESTAMP`	Protocol: Global timestamp packets	Not supported.
`ITM_P_EXTEN`	Protocol: Extension packet	Not supported.
`ITM_S_INSTRUMENTATION`	Source: Instrumentation packet	Supported.
`ITM_S_DWT_EVENT_COUNTER`	Hardware source: Event counter wrapping	Not supported.
`ITM_S_DWT_EXCEPTION`	Hardware source: Exception tracing	Supported.
`ITM_S_DWT_PC_SAMPLING`	Hardware source: PC sampling	Not supported.
`ITM_S_DWT_DATA_PC_TRACE`	Hardware source: DWT Data trace PC value	Supported.
`ITM_S_DWT_DATA_ADDRESS_TRACE`	Hardware source: DWT Data trace address value	Supported.
`ITM_S_DWT_DATA_DATA_TRACE`	Hardware source: DWT Data trace DATA value	Supported.

Table 3-218 Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
auxfault	*Value* on page 2-85	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	*Signal* on page 2-85	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	*Value* on page 2-85	Master	Current execution priority.
edbgrq	*Signal* on page 2-85	Slave	External debug request.
event	*Signal* on page 2-85	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
intisr[240]	*Signal* on page 2-85	Slave	This signal array delivers signals to the NVIC.
intnmi	*Signal* on page 2-85	Slave	Configure non maskable interrupt.
lockup	*Signal* on page 2-85	Master	Asserted when the processor is in lockup state.
poreset	*Signal* on page 2-85	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	*Signal* on page 2-85	Master	Asserted when the processor is in deep sleep.
sleeping	*Signal* on page 2-85	Master	Asserted when the processor is in sleep.
stcalib	*Value* on page 2-85	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	*Signal* on page 2-85	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	*Signal* on page 2-85	Master	Asserted to indicate that a reset is required.
ticks	*InstructionCount* on page 2-84	Master	Port allowing the number of instructions since startup to be read from the CPU.

Table 3-219 Parameters for ARM_SC300

Name	Type	Default value	Description
BB_PRESENT	bool	0x1	Enable bitbanding
BIGENDINIT	bool	0x0	Initialize processor to big endian mode
DBGLVL	int	0x3	0: No debug; 1: Minimal debug; 2: Full debug without DWT address matching; 3: Full debug support with DWT data-comparators
LVL_WIDTH	int	0x3	Number of bits of interrupt priority
NUM_IRQ	int	0x10	Number of user interrupts
NUM_MPU_REGION	int	0x8	Number of MPU regions
TRACE_LVL	bool	0x1	Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included

3.5 Media components

This section describes the Media components.

This section contains the following subsections:

- *3.5.1 D71* on page 3-601.
- *3.5.2 DP500* on page 3-602.
- *3.5.3 DP500x2* on page 3-603.
- *3.5.4 DP550* on page 3-604.
- *3.5.5 DP550x2* on page 3-605.
- *3.5.6 DP650* on page 3-606.
- *3.5.7 DP650x2* on page 3-607.
- *3.5.8 Mali_G51* on page 3-608.
- *3.5.9 Mali_G71* on page 3-609.
- *3.5.10 Mali_G72* on page 3-610.
- *3.5.11 Mali_G76* on page 3-612.
- *3.5.12 V61* on page 3-613.
- *3.5.13 V550* on page 3-614.

3.5.1 D71

ARM D71 Display Processor. This model is written in C++.

D71 contains the following CADI targets:

- D71

D71 contains the following MTI components:

- *4.61 D71 - trace* on page 4-2439
- *4.107 PVBusSlave - trace* on page 4-2760

About D71

The model has the following limitations:

- No support for trusted layers.
- No support for image enhancements.
- No coprocessor support for HDR processing.
- No QoS support.
- The following configuration parameters are not available:
  - `CONFIG_MAX_LINE_SIZE`
  - `CONFIG_DISPLAY_TBU_EN`. TBUs are integrated separately using the given ports.
  - `CONFIG_AFBC_DMA_EN`. The ADU is present. If it is not used, do not program it.

Table 3-220 Ports

Name	Protocol	Type	Description
`apb_pvbus_s_adu`	`PVBus`	Slave	Slave port for register access.
`apb_pvbus_s_dpu`	`PVBus`	Slave	-
`axi_pvbus_adu_m`	`PVBus`	Master	Master AXI port for the AFBC unit
`axi_pvbus_lpu_m[2]`	`PVBus`	Master	Master AXI ports for pipelines
`display[2]`	*`LCD` on page 2-72*	Master	LCD ports for display outputs
`irq0_gcu_out`	*`Signal` on page 2-85*	Master	Shared interrupt owned by the GCU
`irq1_adu_out`	*`Signal` on page 2-85*	Master	Interrupt signal for the ADU block
`pixelclock_in[2]`	`ClockSignal`	Slave	Pixel clock inputs for the display outputs

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-220 Ports (continued)

Name	Protocol	Type	Description
pvbus_tbu_m[2]	PVBus	Master	Master ports for connection to TBU (SMMUv3)
pvbus_tbu_s[2]	PVBus	Slave	Slave ports for loopback from TBU (SMMUv3)
reset_signal	*Signal* on page 2-85	Slave	Reset signal.

3.5.2 DP500

ARM DP500 Display Processor. This model is written in C++.

DP500 contains the following CADI targets:

- DP500

DP500 contains the following MTI components:
- *4.65 DP500 - trace* on page 4-2455
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About DP500

This model has basic support for the display and scaling engines. Connect it to a visualization component to view LCD output. This is the single display configuration of DP500. For the dual display configuration, use DP500x2.

It passes tests as part of a booting Android kernel and running under the control of the official DP500 drivers.

It provides the following functionality:

- All RGB and YUV format parsing.
- Color adjustment in *Display Engine* (DE).
- Nearest neighbor scaling.
- All layers.
- Alpha blending.
- Memory writeback.
- Inverse gamma adjustment.
- Basic layer (overlay) and register security semantics.

The model has the following limitations:
- No support for polyphase scaling algorithm. Falls back to nearest neighbor when configured to do so.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No colorspace conversion support.
- No support for two plane YUV memory writeback.

Table 3-221 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
display	*LCD* on page 2-72	Master	Connection to visualization component.
intr	*Signal* on page 2-85	Master	Interrupt signal.
intr_se	*Signal* on page 2-85	Master	Interrupt signal from scaling engine.
pvbus_m	PVBus	Master	Bus for processor 0.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-221 Ports (continued)

Name	Protocol	Type	Description
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	*Signal* on page 2-85	Slave	Reset signal.

3.5.3 DP500x2

ARM DP500 Display Processor x2. This model is written in LISA+.

DP500x2 contains the following CADI targets:

- DP500
- DP500x2

DP500x2 contains the following MTI components:

- *4.65 DP500 - trace* on page 4-2455
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About DP500x2

This component is a model of the dual display configuration of the DP500 Display Processor, with basic support for the display and scaling engines. Connect it to a visualization component to view LCD output.

The model provides the following functionality:

- All RGB and YUV format parsing.
- Color adjustment in *Display Engine* (DE).
- Nearest neighbor scaling.
- All layers.
- Alpha blending.
- Memory writeback.
- Inverse gamma adjustment.
- Basic layer (overlay) and register security semantics.

The model has the following limitations:

- No support for polyphase scaling algorithm. Falls back to nearest neighbor when configured to do so.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No colorspace conversion support.
- No support for two plane YUV memory writeback.

Table 3-222 Ports

Name	Protocol	Type	Description
dc_de_interrupt[2]	*Signal* on page 2-85	Master	Interrup signalling from display engines.
dc_pvbus_m[2]	PVBus	Master	Bus for processor 0 and 1.
dc_se_interrupt[2]	*Signal* on page 2-85	Master	Interrupt signalling from scaling engines.
display[2]	*LCD* on page 2-72	Master	Connection to visualization component.
dp0_clk_in	ClockSignal	Slave	Clock signal for DP0.
dp1_clk_in	ClockSignal	Slave	Clock signal for DP1.
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	*Signal* on page 2-85	Slave	Reset signal.

Table 3-223 Parameters for DP500x2

Name	Type	Default value	Description
disable_snooping_dma	bool	0x0	Disable DMA snooping
force_frame_rate	int	0x0	If 0 - the input clock is used as PXLCLOCK, if >0 then the model ensures the screen display is refreshed n times per simulated second

3.5.4 DP550

ARM DP550 Display Processor. This model is written in C++.

DP550 contains the following CADI targets:

- DP550

DP550 contains the following MTI components:

- *4.66 DP550 - trace* on page 4-2457
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About DP550

This component is a model of the DP550 Display Processor. Connect it to a visualization component to view LCD output. This is the single display configuration of DP550. For the dual display configuration, use DP550x2.

The model provides the following functionality:

- All RGB and YUV format parsing.
- Color adjustment in *Display Engine* (DE).
- Nearest neighbor scaling.
- All layers.
- Alpha blending.
- Memory writeback.
- Inverse gamma adjustment.
- Basic layer (overlay) and register security semantics.

The model has the following limitations:

- No support for polyphase scaling algorithm. Falls back to nearest neighbor when configured to do so.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No colorspace conversion support.
- No support for two plane YUV memory writeback.

Table 3-224 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
display	*LCD on page 2-72*	Master	Connection to visualization component.
intr	*Signal on page 2-85*	Master	Interrupt signal.
intr_se	*Signal on page 2-85*	Master	Interrupt signal from scaling engine.
pvbus_m	PVBus	Master	Bus for processor 0.
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	*Signal on page 2-85*	Slave	Reset signal.

3.5.5 DP550x2

ARM DP550 Display Processor x2. This model is written in LISA+.

DP550x2 contains the following CADI targets:

- DP550
- DP550x2

DP550x2 contains the following MTI components:

- *4.66 DP550 - trace* on page 4-2457
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About DP550x2

This component is a model of the dual display configuration of the DP550 Display Processor. Connect it to a visualization component to view LCD output.

The model provides the following functionality:

- All RGB and YUV format parsing.
- Color adjustment in *Display Engine* (DE).
- Nearest neighbor scaling.
- All layers.
- Alpha blending.
- Memory writeback.
- Inverse gamma adjustment.
- Basic layer (overlay) and register security semantics.

The model has the following limitations:

- No support for polyphase scaling algorithm. Falls back to nearest neighbor when configured to do so.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No colorspace conversion support.
- No support for two plane YUV memory writeback.

Table 3-225 Ports

Name	Protocol	Type	Description
dc_de_interrupt[2]	*Signal* on page 2-85	Master	Interrup signalling from display engines.
dc_pvbus_m[2]	PVBus	Master	Bus for processor 0 and 1.
dc_se_interrupt[2]	*Signal* on page 2-85	Master	Interrupt signalling from scaling engines.
display[2]	*LCD* on page 2-72	Master	Connection to visualization component.
dp0_clk_in	ClockSignal	Slave	Clock signal for DP0.
dp1_clk_in	ClockSignal	Slave	Clock signal for DP1.
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	*Signal* on page 2-85	Slave	Reset signal.

Table 3-226 Parameters for DP550x2

Name	Type	Default value	Description
disable_snooping_dma	bool	0x0	Disable DMA snooping
force_frame_rate	int	0x0	If 0 - the input clock is used as PXLCLOCK, if >0 then the model ensures the screen display is refreshed n times per simulated second

set_primary_prot_streamid	int	0x4003210	Configurable PROT_STREAMID for secure STREAMID values(primary)
set_secondary_nprot_nsaid	int	0xc00ba98	Configurable NPROT_NSAID for non-secure NSAID values(secondary)
set_secondary_nprot_streamid	int	0xc00ba98	Configurable NPROT_STREAMID for non-secure STREAMID values(secondary)
set_secondary_prot_nsaid	int	0x4003210	Configurable PROT_NSAID for secure NSAID values(secondary)
set_secondary_prot_streamid	int	0x4003210	Configurable PROT_STREAMID for secure STREAMID values(secondary)

3.5.6 DP650

ARM DP650 Display Processor. This model is written in C++.

DP650 contains the following CADI targets:

- DP650

DP650 contains the following MTI components:

- *4.67 DP650 - trace* on page 4-2460
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About DP650

This component is a model of the DP650 Display Processor. Connect it to a visualization component to view LCD output. This is the single display configuration of DP650. For the dual display configuration, use DP650x2.

The model has the following limitations:

- No support for the polyphase scaling algorithm, it always uses nearest neighbor.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No YUV 2-plane support for memory writeback.
- No color space conversion support.

Table 3-227 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
display	*LCD* on page 2-72	Master	Connection to visualization component.
intr	*Signal* on page 2-85	Master	Interrupt signal.
intr_se	*Signal* on page 2-85	Master	Interrupt signal from scaling engine.
pvbus_m	PVBus	Master	Bus for processor 0.

Table 3-227 Ports (continued)

Name	Protocol	Type	Description
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	*Signal* on page 2-85	Slave	Reset signal.

3.5.7 DP650x2

ARM DP650 Display Processor x2. This model is written in LISA+.

DP650x2 contains the following CADI targets:

- DP650
- DP650x2

DP650x2 contains the following MTI components:

- *4.67 DP650 - trace* on page 4-2460
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About DP650x2

This component is a model of the dual display configuration of the DP650 Display Processor. To view LCD output, connect it to a visualization component.

The model has the following limitations:

- No support for the polyphase scaling algorithm, it always uses nearest neighbor.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No YUV 2-plane support for memory writeback.
- No color space conversion support.

Table 3-228 Ports

Name	Protocol	Type	Description
dc_de_interrupt[2]	*Signal* on page 2-85	Master	Interrup signalling from display engines.
dc_pvbus_m[2]	PVBus	Master	Bus for processor 0 and 1.
dc_se_interrupt[2]	*Signal* on page 2-85	Master	Interrupt signalling from scaling engines.
display[2]	*LCD* on page 2-72	Master	Connection to visualization component.
dp0_clk_in	ClockSignal	Slave	Clock signal for DP0.
dp1_clk_in	ClockSignal	Slave	Clock signal for DP1.
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	*Signal* on page 2-85	Slave	Reset signal.

3.5.8 Mali_G51

Arm Mali™-G51 GPU. This model is written in C++.

Mali_G51 contains the following CADI targets:

- Mali_G51

Mali_G51 contains the following MTI components:

- *4.87 Mali_G51 - trace* on page 4-2724
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About Mali_G51

The model has the following limitations:

- It does not support Armv8-style page tables.
- It does not execute GPU shader programs.
- It does not validate all register values or job descriptors.

This model outputs values for all Mali PMU hardware counters. These values are not meaningful. Their purpose is to enable you to use the model early in the development process to check that your system is correctly configured to support performance analysis tools, for instance Streamline.

The counter is a 32-bit bitfield, with the following bit assignments:

[31:28]

Identifies which Mali GPU instance generated this value, typically zero for a system with a single GPU.

[27:24]

Identifies which hardware block is the source of the counter. It can have one of the following values:

0 Job manager.

1 Tiler.

2 L2Cache/Memory system.

3+ Shader core.

[23:16]

The counter number within the block.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

[15:0]

Sawtooth counter that counts from 0 to `0xffff` and then resets to 0. This value ensures that consecutive captures show different values and allows you to check that counter values are changing over time.

Note

- These counter values might change in future.
- The model always generates counter values, even if the GPU is idle.
- Streamline does not display the precise values that the model outputs because it needs to correct them for sampling frequency and other profiling effects. However, their size relative to each other is correct. For example, counters from the job manager are always smaller than those from the memory system.

Table 3-230 Ports

Name	Protocol	Type	Description
gpu_reset	*Signal* on page 2-85	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	*Signal* on page 2-85	Master	The interrupt signal generated from the GPU.
irq_job	*Signal* on page 2-85	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	*Signal* on page 2-85	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	*Signal* on page 2-85	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.
pvbus_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

3.5.9 Mali_G71

Arm Mali-G71 GPU. This model is written in C++.

Mali_G71 contains the following CADI targets:

- Mali_G71

Mali_G71 contains the following MTI components:

- *4.88 Mali_G71 - trace* on page 4-2726
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About Mali_G71

The model has the following limitations:

- It does not support Armv8-style page tables.
- It does not execute GPU shader programs.
- It does not validate all register values or job descriptors.

This model outputs values for all Mali PMU hardware counters. These values are not meaningful. Their purpose is to enable you to use the model early in the development process to check that your system is correctly configured to support performance analysis tools, for instance Streamline.

3.5.10 Mali_G72

Arm Mali-G72 GPU. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Mali_G72 contains the following CADI targets:

- Mali_G72

Mali_G72 contains the following MTI components:

- *4.89 Mali_G72 - trace* on page 4-2728
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About Mali_G72

The model has the following limitations:

- It does not support Armv8-style page tables.
- It does not execute GPU shader programs.
- It does not validate all register values or job descriptors.

This model outputs values for all Mali PMU hardware counters. These values are not meaningful. Their purpose is to enable you to use the model early in the development process to check that your system is correctly configured to support performance analysis tools, for instance Streamline.

The counter is a 32-bit bitfield, with the following bit assignments:

[31:28]

Identifies which Mali GPU instance generated this value, typically zero for a system with a single GPU.

[27:24]

Identifies which hardware block is the source of the counter. It can have one of the following values:

0 Job manager.

1 Tiler.

2 L2Cache/Memory system.

3+ Shader core.

[23:16]

The counter number within the block.

[15:0]

Sawtooth counter that counts from 0 to `0xffff` and then resets to 0. This value ensures that consecutive captures show different values and allows you to check that counter values are changing over time.

Note

- These counter values might change in future.
- The model always generates counter values, even if the GPU is idle.
- Streamline does not display the precise values that the model outputs because it needs to correct them for sampling frequency and other profiling effects. However, their size relative to each other is correct. For example, counters from the job manager are always smaller than those from the memory system.

Table 3-232 Ports (continued)

Name	Protocol	Type	Description
irq_mmu	*Signal* on page 2-85	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	*Signal* on page 2-85	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.
pvbus_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

3.5.11 Mali_G76

Arm Mali-G76 GPU. This model is written in C++.

Mali_G76 contains the following CADI targets:

- Mali_G76

Mali_G76 contains the following MTI components:

- *4.90 Mali_G76 - trace* on page 4-2730
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About Mali_G76

The model has the following limitations:

- It does not support Armv8-style page tables.
- It does not execute GPU shader programs.
- It does not validate all register values or job descriptors.

This model outputs values for all Mali PMU hardware counters. These values are not meaningful. Their purpose is to enable you to use the model early in the development process to check that your system is correctly configured to support performance analysis tools, for instance Streamline.

The counter is a 32-bit bitfield, with the following bit assignments:

[31:28]

Identifies which Mali GPU instance generated this value, typically zero for a system with a single GPU.

[27:24]

Identifies which hardware block is the source of the counter. It can have one of the following values:

0 Job manager.

1 Tiler.

2 L2Cache/Memory system.

3+ Shader core.

[23:16]

The counter number within the block.

[15:0]

Sawtooth counter that counts from 0 to `0xffff` and then resets to 0. This value ensures that consecutive captures show different values and allows you to check that counter values are changing over time.

Note

- These counter values might change in future versions.
- The model always generates counter values, even if the GPU is idle.
- Streamline does not display the precise values that the model outputs because it needs to correct them for sampling frequency and other profiling effects. However, their size relative to each other is correct. For example, counters from the job manager are always smaller than those from the memory system.

Table 3-233 Ports

Name	Protocol	Type	Description
gpu_reset	*Signal* on page 2-85	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	*Signal* on page 2-85	Master	The interrupt signal generated from the GPU.
irq_job	*Signal* on page 2-85	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	*Signal* on page 2-85	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	*Signal* on page 2-85	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.
pvbus_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

3.5.12 V61

ARM(r) Mali(tm)-V61 Video Processor. This model is written in C++.

V61 contains the following CADI targets:

- V61

V61 contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.116 V61 - trace* on page 4-2852

About V61

The model requires an external OpenMAX (OMX) IL implementation for codec functionality. By default, V61 looks for `ffomaxil.dll` on Windows or `libffomaxil.so` on Linux in the model binary's directory or in the Fast Models installation. The default library path can be overridden using the `omx-library-path` parameter.

FFomaxIL is an OMX IL implementation provided by Arm in the TPIP package for convenience. Refer to the TPIP package for more details on FFomaxIL.

When querying the OMX core, V61 searches for the following roles in the list of OpenMAX components:

H.264 decode "video_decoder.avc"
JPEG decode "video_decoder.mjpeg"
MPEG2 decode "video_decoder.mpeg2"
MPEG4 decode "video_decoder.mpeg4"

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VC1 decode	"video_decoder.vc1"
VP8 decode	"video_decoder.vp8"
VP8 encode	"video_encoder.vp8"

Note

To build example platforms containing V61, you must either install the TPIP package, or remove the dependency on FFmpeg and libvpx from the platform's sgproj file, by removing the line containing `V5xx.sgrepo`.

The model has the following limitations:

- No support for HEVC, VP9 and RealVideo decoders.
- No support for 10-bit video output.
- No support for RGB or AFBC input for encoding.
- No profiling support.
- No QoS support.
- Power/Test modes are modeled only as register state changes.

Table 3-234 Ports

Name	Protocol	Type	Description
`apb_s`	`PVBus`	Slave	APB Slave port for register access.
`axi_m`	`PVBus`	Master	AXI master bus for memory accesses.
`clk`	`ClockSignal`	Slave	Master clock, typically 300MHz.
`irq`	*Signal* on page 2-85	Master	IRQ signal to host CPU.
`reset`	*Signal* on page 2-85	Slave	Reset signal.

3.5.13 V550

ARM(r) Mali(tm)-V550 Video Processor. This model is written in C++.

V550 contains the following CADI targets:

- V550

V550 contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.115 V550 - trace* on page 4-2838

About V550

The model requires an external OpenMAX (OMX) IL implementation for codec functionality. By default, V550 looks for `ffomaxil.dll` on Windows or `libffomaxil.so` on Linux in the model binary's directory or in the Fast Models installation. The default library path can be overridden using the parameter `omx-library-path`.

FFomaxIL is an OMX IL implementation provided by Arm in the Third-Party IP (*TPIP*) package for convenience. Refer to the TPIP package for more details on FFomaxIL.

When querying the OMX core, V550 searches for the following roles in the list of OpenMAX components:

H.264 decode	"video_decoder.avc"
JPEG decode	"video_decoder.mjpeg"
MPEG2 decode	"video_decoder.mpeg2"

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

MPEG4 decode	"video_decoder.mpeg4"
VC1 decode	"video_decoder.vc1"
VP8 decode	"video_decoder.vp8"
VP8 encode	"video_encoder.vp8"

Note

To build example platforms containing V550, you must either install the TPIP package, or remove the dependency on FFmpeg and libvpx from the platform's sgproj file, by removing the line containing `V5xx.sgrepo`.

The model has the following limitations:

- No support for HEVC and RealVideo decoders.
- No support for 10-bit video output.
- No profiling support.
- No QoS support.
- Power and Test modes are modeled only as register state changes.

Table 3-235 Ports

Name	Protocol	Type	Description
apb_s	PVBus	Slave	APB Slave port for register access.
axi_m	PVBus	Master	AXI master bus for memory accesses.
clk	ClockSignal	Slave	Master clock, typically 300MHz.
irq	*Signal* on page 2-85	Master	IRQ signal to host CPU.
reset	*Signal* on page 2-85	Slave	Reset signal.

3.6 Other components

This section describes the Other components.

This section contains the following subsections:

- *3.6.1 AsyncSignal* on page 3-616.
- *3.6.2 GICv3CommsLogger* on page 3-616.
- *3.6.3 SchedulerInterface* on page 3-616.
- *3.6.4 SchedulerThread* on page 3-617.
- *3.6.5 SchedulerThreadEvent* on page 3-617.

3.6.1 AsyncSignal

Allows to cleanly schedule events from non-simulation threads onto the simulation thread. This model is written in C++.

Table 3-236 Ports

Name	Protocol	Type	Description
async_callback	AsyncSignalCallback	Master	This port emits a call to signal() on the simulation thread asyncronously after async_control.signal() has been called.
async_control	AsyncSignalControl	Slave	Non-simulation threads call signal() on this port in order to schedule an event: a call to async_callback.signal() on the simulation thread.

3.6.2 GICv3CommsLogger

Traces GICv3Comms activity. This model is written in LISA+.

GICv3CommsLogger contains the following CADI targets:

- GICv3CommsLogger

GICv3CommsLogger contains the following MTI components:

- *4.74 GICv3CommsLogger - trace* on page 4-2490

Table 3-237 Ports

Name	Protocol	Type	Description
to_cpu	*GICv3Comms on page 2-84*	Master	To connect to CPU.
to_gic	*GICv3Comms on page 2-84*	Slave	To connect to GIC.

Table 3-238 Parameters for GICv3CommsLogger

Name	Type	Default value	Description
verbose	bool	0x0	Print tracing information to attached debugger in addition to via MTI

3.6.3 SchedulerInterface

A SchedulerInterface instance allows access to the Fast Models scheduler. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SchedulerInterface contains the following CADI targets:

- SchedulerInterface

Table 3-239 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock frequency for waitTicks() function.
control	SchedulerInterfaceControl	Slave	Scheduler interface. Allows to: - wait for time

3.6.4 SchedulerThread

A SchedulerThread instance represents a co-routine thread in the simulation. This model is written in LISA+.

SchedulerThread contains the following CADI targets:

- SchedulerThread

Table 3-240 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock frequency for waitTicks() function.
control	SchedulerThreadControl	Slave	SchedulerThread control. Masters use this to: - control the thread (wait etc) - implement the actual thread function threadProc()

3.6.5 SchedulerThreadEvent

A SchedulerThreadEvent instance is an auto-reset boolean condition variable other threads can wait on. This model is written in LISA+.

SchedulerThreadEvent contains the following CADI targets:

- SchedulerThreadEvent

Table 3-241 Ports

Name	Protocol	Type	Description
control	SchedulerThreadEventControl	Slave	SchedulerThreadEvent control. Masters use this to: - wait for this event - notify waiters that the event happened

3.7.1 AudioOut_File

File based Audio Output for PL041_AACI. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

AudioOut_File contains the following CADI targets:

- AudioOut_File

About AudioOut_File

This component implements an audio output that is suitable for use with the PL041_AACI component. It writes raw 16-bit 48KHz stereo audio data to a user-specified file.

Arm expects this component to have little effect on the performance of PV systems. AudioOut_File drains audio data at the rate that would be expected by software running in the simulation.

Table 3-242 Ports

Name	Protocol	Type	Description
audio	*AudioControl* on page 2-71	Slave	Audio input for a connection to a component such as the PL041_AACI.

Table 3-243 Parameters for AudioOut_File

Name	Type	Default value	Description
fname	string	""	Filename

3.7.2 AudioOut_SDL

SDL based Audio Output for PL041_AACI. This model is written in LISA+.

AudioOut_SDL contains the following CADI targets:

- AudioOut_SDL

About AudioOut_SDL

AudioOut_SDL outputs audio using the host features of the Simple DirectMedia Layer library.

This component results in SDL audio callbacks and might have a small impact on PV systems containing the component. It attempts to drain audio data at whatever rate is required to maintain smooth sound playback on the host PC. This might not match the data rate expected by applications running on the simulation.

Table 3-244 Ports

Name	Protocol	Type	Description
audio	*AudioControl* on page 2-71	Slave	Audio input for a connection to a component such as the PL041_AACI.

3.7.3 Base_PowerController

Base Platforms Power Controller. This model is written in LISA+.

Base_PowerController contains the following CADI targets:

- Base_PowerController

Base_PowerController contains the following MTI components:

- *4.50 Base_PowerController - trace* on page 4-2403
- *4.107 PVBusSlave - trace* on page 4-2760

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-246 Parameters for Base_PowerController

Name	Type	Default value	Description
Affinity-shifted	bool	0x0	Are the CPU affinities shifted ? true if it is one of the APACHE cores otherwise false
CPU-affinities	string	"0.0.0.0"	Definition of which cores are attached to the control pins, as a comma separated list of affinity dotted quads
CPU-available-mask	int	-0x1	One bit per entry in CPU-affinities list, set zero if a CPU is wired up but actually not available
startup	string	"0.0.0.*"	Comma-separated list of cores (wildcards allowed) to be powered up at startup or system reset
use_pchannel_for_threads	bool	0x0	Set this to true if the pchannel is connected to cpus with thread support.

3.7.4 DebugAccessPort

This model is written in C++.

Table 3-247 Ports

3.7.6 DualClusterSystemConfigurationBlock

Dual Cluster System Configuration Block. This model is written in LISA+.

DualClusterSystemConfigurationBlock contains the following CADI targets:

- DualClusterSystemConfigurationBlock

DualClusterSystemConfigurationBlock contains the following MTI components:

- *4.69 DualClusterSystemConfigurationBlock - trace* on page 4-2464
- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-249 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
cluster0_cfgend[4]	*Signal* on page 2-85	Master	-
cluster0_cfgte[4]	*Signal* on page 2-85	Master	-
cluster0_clusterid	*Value* on page 2-85	Master	-
cluster0_corereset[4]	*Signal* on page 2-85	Master	-

Table 3-250 Parameters for DualClusterSystemConfigurationBlock

Name	Type	Default value	Description
CFG_ACTIVECLUSTER	int	0x1	Select which cluster will come out of reset coming out of power-on: bit[0] for primary cluster (Cortex-A15), bit[1] for secondary cluster (Cortex-A7). Value 0 is not allowed as it will hold both clusters in reset indefinitely!
Cluster0IdOnPOReset	int	0x0	ClusterId for primary cluster (Cortex-A15) on power-on reset
Cluster1IdOnPOReset	int	0x1	ClusterId for secondary cluster (Cortex-A7) on power-on reset
DCSCB_PERIPHBASE	int	0x1e000000	PERIPHBASE
DCS_AID	int	0x0	DCS_AID is the Auxiliary ID Register
DCS_ID	int	0x41120000	The value returned by the DCS_ID register.
DCS_ID_BUILD_NUMBER	int	0x1	DCS_ID build number
DCS_LEDS	int	0x0	DCS_LEDS represents eight LEDs on the board that form an 8-bit value that can be r/w from the Dual Cluster System Configuration Block
DCS_SW	int	0x0	DCS_SW represents eight switches on the board that form an 8-bit value that can be read from the Dual Cluster System Configuration Block
FlipVGICWiringForCluster0AndCluster1	bool	0x0	Flip the VGIC wiring round for cluster0 and cluster1. With this false, then cpu0 of cluster0 is cpu interface 0 on the VGIC. If this is true then cpu0 of cluster1 becomes cpu interface 0 on the VGIC.
INTGEN_INTS	int	0x3	Number of custom IRQs controlled by interrupt generator is INTGEN_INTS * 32 + 32.
NumberOfCoresInCluster0	int	0x0	The number of cores in the primary cluster
NumberOfCoresInCluster1	int	0x0	The number of cores in the secondary cluster
ResetValueOfDaughterUserSwitches	int	0x0	Reset value of the user switches on the daughterboard
stop_on_sequence_id	int	0x0	If non-zero the sequence_id of the SW trace mechanism on which to halt the simulator

3.7.7 DummyAPB

DummyAPB. This model is written in LISA+.

DummyAPB contains the following CADI targets:

- DummyAPB

DummyAPB contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About DummyAPB

Use this dummy RAZ/WI APB device component to ensure that software does not receive aborts for accesses to devices that should be part of the system, but are not modeled.

For validation purposes it is useful to have dummy devices that are mostly RAZ/WI but return the correct value when you read ID registers. You can do that with this component in the following ways:

- Specify `periphid_24` for peripherals that follow the ARM pattern of having 12 ID registers at the top of an APB frame. For example:

  ```
  periphid_24="04000000c2b00b000df005b1"
  ```

  You need also to set `periph_framesize` to 4 or 64, depending on whether the peripheral has its registers in a 4KB or 64KB frame.
- Give a space-separated list of *offset:value* pairs in the `periphid_generic` parameter to define read-only values from particular offsets. For example:

  ```
  periphid_generic="000:02468ace 1fc:13579bdf"
  ```

  The number of hex digits used to specify the address is used to define the width of the address mask used. For example, `BC:02468ace` returns `02468ace` at reads from any address ending `BC`.
- Give a space-separated list of *offset:default-value* pairs in the `ram_generic` parameter to construct RAM. That is, the register at the relevant offset returns the default-value, but if changed, it returns the value that it is changed to.

Table 3-251 Ports

Name	Protocol	Type	Description
`pvbus_s`	`PVBus`	Slave	Bus slave interface.

Table 3-252 Parameters for DummyAPB

Name	Type	Default value	Description
`fail`	`bool`	`0x0`	Abort all accesses
`failmsg`	`string`	`""`	String to print when 'fail'=true and access occured
`periph_framesize`	`int`	`-0x1`	Size of frame (4/64, indicating if ID is at xFD0 or xFFD0)
`periphid_24`	`string`	`""`	24 hex digits for the 12 bytes of peripheral ID
`periphid_generic`	`string`	`""`	Set of space-separated offset:value pairs for dwords of ID
`ram_generic`	`string`	`""`	Set of space-seperated offset:default pairs for writable dwords
`warn_once`	`bool`	`0x1`	Warn once for the invalid read and write access.

3.7.8 ElfLoader

ELF loader component. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

ElfLoader contains the following CADI targets:

- ElfLoader

ElfLoader contains the following MTI components:

- *4.106 PVBusMaster - trace* on page 4-2759

About ElfLoader

ElfLoader provides an alternative method of loading ELF files into the system. It can load files in any of the following formats, or in gzip-compressed versions of them:

- ELF.
- Motorola S-Record.
- Intel-Hex.
- Verilog-Hex, in the format:

```
@<address_in_hex> <byte_in_hex>
```

Table 3-253 Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Master port for all memory accesses.
start_address	*Value_64* on page 2-85	Master	Provides a value reflecting the entry point of the last ELF image to be loaded.

Table 3-254 Parameters for ElfLoader

Name	Type	Default value	Description
elf	string	""	ELF file
lfile	string	""	load file for large address mapping
ns_copy	bool	0x1	copy whole file to NS memory space

3.7.9 FlashLoader

A device that can preload a gzipped image into flash at startup. This model is written in C++.

FlashLoader contains the following CADI targets:

- FlashLoader

About FlashLoader

This component complements the IntelStrataFlashJ3 component by providing a means to initialize the contents of up to four Flash components in sequence from a single host flash image file.

Table 3-255 Ports

Name	Protocol	Type	Description
flash_device0	*FlashLoaderPort* on page 2-71	Master	Used to program a flash device.
flash_device1	*FlashLoaderPort* on page 2-71	Master	Used to program a flash device.
flash_device2	*FlashLoaderPort* on page 2-71	Master	Used to program a flash device.
flash_device3	*FlashLoaderPort* on page 2-71	Master	Used to program a flash device.

3.7.10 GICv3CommsPVBus

GICv3 Component for conversion between GICv3Comms protocol and PVBus. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GICv3CommsPVBus contains the following CADI targets:

- GICv3CommsPVBus

GICv3CommsPVBus contains the following MTI components:

- *4.75 GICv3CommsPVBus - trace* on page 4-2494
- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-256 Ports

Name	Protocol	Type	Description
axi_master_id_s[256]	*Value* on page 2-85	Slave	-
distributor_s[256]	*GICv3Comms* on page 2-84	Slave	-
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-

3.7.11 GICv3ProtocolChecker

GICv3 Component for command protocol checking. This model is written in C++.

GICv3ProtocolChecker contains the following CADI targets:

- GICv3ProtocolChecker

GICv3ProtocolChecker contains the following MTI components:

- *4.79 GICv3ProtocolChecker - trace* on page 4-2526

Table 3-257 Ports

Name	Protocol	Type	Description
cpu_comms	*GICv3Comms* on page 2-84	Master	Master GICv3Comms port.
gicv3_comms	*GICv3Comms* on page 2-84	Slave	Slave GICv3Comms port.

3.7.12 GUIPoll

Component providing a real-time periodic callback for GUI refresh. This model is written in C++.

About GUIPoll

Arm intends this component to be used as a subcomponent inside a LISA-based visualization component.

You can configure the period at which the GUIPoll component runs in milliseconds of real time, not simulation time. The component produces a `gui_callback()` signal at approximately this period, even when the simulation is paused.

You must implement the slave side of the `gui_callback()` signal in a LISA-based visualization component. Use this event to invoke the `Visualisation::poll()` method to keep the GUI updated.

Table 3-258 Ports

Name	Protocol	Type	Description
gui_callback	*GUIPollCallback* on page 2-71	Master	Sends callback requests to the visualization component.

3.7.13 HostBridge

Host Socket Interface Component. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

HostBridge contains the following CADI targets:

- HostBridge

About HostBridge

This component acts as a networking proxy for target NIC device models, to forward and receive ethernet packets to and from the host. Two kinds of proxy backend are integrated into this component:

- A host TAP/TUN-like network device, which is an ordinary TAP or MacVTap. This is the default.
- User mode networking, which emulates a built-in IP router and DHCP server to route traffic using the host user mode socket layer. To enable user mode networking, set the `userNetworking` parameter to true.

  For more information see *1.11.1 User mode networking* on page 1-38.

HostBridge requires the following initialization sequence:

```
hostbridge.state.setValue(HostBridge::STATUS);
hostbridge.state.setValue(HostBridge::S_UP);
```

To enable tracing of user-mode networking, which can help to debug networking issues, set the `FASTSIM_USERNET_DUMP` environment variable to any or all of the following values:

```
arpin,arpout,udpin,udpout,etherin,etherout,ipv4in,ipv4out,ipv4fragin,ipv4fragout,tcpin,tcpout
```

Table 3-259 Ports

Name	Protocol	Type	Description
`eth`	*`VirtualEthernet` on page 2-79*	Slave	-
`state`	`ValueState_64`	Slave	-

Table 3-260 Parameters for HostBridge

Name	Type	Default value	Description
`interfaceName`	`string`	""	Host Interface
`userNetOptions`	`string`	""	Control options for UserNet TCP/IP (for internal use only, please do not use)
`userNetPorts`	`string`	""	Listening ports to expose in user-mode networking
`userNetSubnet`	`string`	"172.20.51.0/24"	Virtual subnet for user-mode networking
`userNetworking`	`bool`	`0x0`	Enable user-mode networking

3.7.14 HostSerialInterface

Component which provides access to the host serial interface. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

HostSerialInterface contains the following CADI targets:

- HostSerialInterface

Table 3-261 Ports

Name	Protocol	Type	Description
SerialData	*SerialData on page 2-77*	Slave	Serial data connection to export to host machine.

Table 3-262 Parameters for HostSerialInterface

Name	Type	Default value	Description
baud_rate	int	0x0	Baud rate override
device	string	"/dev/ttyS0"	HW device to use

3.7.15 IntelStrataFlashJ3

Intel Strata Flash J3 LISA+ model. This model is written in LISA+.

IntelStrataFlashJ3 contains the following CADI targets:

- IntelStrataFlashJ3

IntelStrataFlashJ3 contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760

About IntelStrataFlashJ3

This component is an efficient implementation of a NOR flash memory type device, an Intel StrataFlash Memory (J3).

In normal usage, the device acts as *Read Only Memory* (ROM) whose contents can be determined either by programming using the flashloader port or by using standard flash programming software running on the model, such as the Arm Firmware Suite.

The implementation of this component is approximately that of the Intel part in the VE development board. The component is effectively organized as a bank of two 16-bit Intel Flash components forming a 32-bit component that can be read or programmed in parallel. The component supports all hardware behavior except for:

- Protection register.
- Enhanced configuration register.
- Unique device identifier.
- One time programmable cells.
- Suspend/resume, which is silently ignored.
- Status interrupt line.

All block operations are atomic. This means that the status register state machine status bit always reads 1, ready.

In normal operation, this component has no user-visible registers, but you can read from it as if it is memory.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Programming it or changing the configuration requires a sequence of special write operations, see general flash programming documentation. The component supports Common Flash Interface query operations, which allow drivers to determine the properties of the flash memory.

Note

The model interprets all writes as requests to the programming state machine, and there are many state-machine states that do not support subsequent reads and return `0xdeaddead` for them. Therefore, when simulating a ROM, use the `trapwrite=true` option.

Use the `diagnostics` parameter to select the level of diagnostic output:

Level 0
None.

Level 1
Report probable driver error operations:
- Unaligned operations that fault.
- Accesses that the state machine does not expect.
- Transitions of the state machine to unknown states.
- Writes to locked blocks and illegal lock commands.

Level 2

Report unimplemented and therefore ignored operations, and log lock commands.

Level 3
Warn if a flash write attempts to set bits (the write works if `unphysical_writes=true`).

Level 4
Log every read and write.

Table 3-263 Ports

Name	Protocol	Type	Description
`flashloader`	*`FlashLoaderPort` on page 2-71*	Slave	Can be used to load code/data into the flash.
`mem_port`	*`PVDevice` on page 2-77*	Slave	PVDevice port that is connect PVBusSlave port.
`pvbus`	`PVBus`	Slave	This is where the address and the data comes from the bus.

Table 3-264 Parameters for IntelStrataFlashJ3

Name	Type	Default value	Description
`diagnostics`	`int`	`0x0`	Diagnostic level
`enable_read_status_logic`	`bool`	`0x0`	Enables logic to handle the status register reads as per the '3 Volt Intel StrataFlash Memory' specification
`model_blocklock`	`bool`	`0x0`	Model per-block locking and set all the blocks to locked state on reset
`size`	`int`	`0x40000`	Memory Size
`trapwrite`	`bool`	`0x0`	Generate abort on write
`unphysical_writes`	`bool`	`0x1`	Writes to flash are overwrite not AND

3.7.16 MemoryMappedGenericTimer

ARM Generic Timer. This model is written in LISA+.

MemoryMappedGenericTimer contains the following CADI targets:

- MemoryMappedGenericTimer

MemoryMappedGenericTimer contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-265 Ports

Name	Protocol	Type	Description
cntpsirq[8]	*Signal* on page 2-85	Master	-
cntvalueb	*CounterInterface* on page 2-84	Slave	For connection to MemoryMappedCounterModule.
pvbus_base_s[8]	PVBus	Slave	-
pvbus_ctlbase_s	PVBus	Slave	-
pvbus_el0base_s[8]	PVBus	Slave	-
timer_reset	*Signal* on page 2-85	Slave	Reset.

Table 3-266 Parameters for MemoryMappedGenericTimer

Name	Type	Default value	Description
bypass_ctlbase	bool	0x0	Bypass CNTBase Access Control. Enable if only timer frame feature is required without CNTBase access control
cntel0acr_implemented	int	0x0	A bit-field of 8 bits, where bit {n} enables CNTEL0ACR for timer frame {n}
diagnostics	int	0x0	Diagnostics
frame_security	string	""	Hard-wired/configurable security for frames (N/S/X, one character per timer frame)
num_timers	int	0x1	Number of timer frames

3.7.17 MemoryMappedGenericWatchdog

ARM Generic Watchdog. This model is written in LISA+.

MemoryMappedGenericWatchdog contains the following CADI targets:

- MemoryMappedGenericWatchdog

MemoryMappedGenericWatchdog contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About MemoryMappedGenericWatchdog

This is a high-level watchdog that generates two interrupts rather than an interrupt followed by a reset.

Table 3-267 Ports

Name	Protocol	Type	Description
WS0	*Signal* on page 2-85	Master	Set when watchdog expired for the first time.
WS1	*Signal* on page 2-85	Master	Set when watchdog expired for the second time.

Table 3-267 Ports (continued)

Name	Protocol	Type	Description
cntvalueb	*CounterInterface* on page 2-84	Slave	For connection to MemoryMappedCounterModule.
ctl_pvbus_s	PVBus	Slave	Access to control frame.
ref_pvbus_s	PVBus	Slave	Access to refresh frame.
reset_in	*Signal* on page 2-85	Slave	Reset.

Table 3-268 Parameters for MemoryMappedGenericWatchdog

Name	Type	Default value	Description
NONSECURE	bool	0x0	Non-Secure
diagnostics	int	0x0	Diagnostics
product_id	int	0x0	Product Identifier

3.7.18 NonVolatileCounter

Trusted Non-Volatile Counter unit. This model is written in LISA+.

NonVolatileCounter contains the following CADI targets:

- NonVolatileCounter

NonVolatileCounter contains the following MTI components:

- *4.93 NonVolatileCounter - trace* on page 4-2736
- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-269 Ports

Name	Protocol	Type	Description
pvbus_s	PVBus	Slave	Bus slave interface.

Table 3-270 Parameters for NonVolatileCounter

Name	Type	Default value	Description
diagnostics	int	0x0	Diagnostics
rst_non_tz_fw_cnt	int	0x0	Value of NON_TZ_FW_CNT at reset
rst_tz_fw_cnt	int	0x0	Value of TZ_FW_CNT at reset
secure	bool	0x1	Instantiate model as Secure (1) or NS (0)
version	string	"r0"	Version of the model functionality. Valid values are r0 and r1.

3.7.19 PPUMultiThreadModeSwitch

PPU mode switch between single-thread mode and multi-thread mode. Support up to 8 cores and thread number per core is no more than 2. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-271 Ports

Name	Protocol	Type	Description
pchannel_from_ppu_s[8]	*PChannel* on page 2-80	Slave	-
pchannel_to_cpu_m[8]	*PChannel* on page 2-80	Master	-
wakerequest_from_gic_s[16]	*Signal* on page 2-85	Slave	-
wakerequest_to_ppu_m[8]	*Signal* on page 2-85	Master	-

3.7.20 PS2Keyboard

Interface component, which takes the keypress/release signals from the Visualisation component and translates them into clocked PS2Data signals which can be routed to a PL050_KMI component. This model is written in LISA+.

PS2Keyboard contains the following CADI targets:

- PS2Keyboard

About PS2Keyboard

This component translates a stream of key press information into appropriate PS/2 serial data. The key press data stream must be provided by another component such as a visualization component.

Table 3-272 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock signal to rate at which PS2Data signals are generated.
keyboard	*KeyboardStatus* on page 2-72	Slave	Receives keyboard input from, for example, the Visualisation component.
ps2	*PS2Data* on page 2-74	Master	Connection to the PS/2 controller, for example, the PL050_KMI.

3.7.21 PS2Mouse

Interface component, which takes the keypress/release signals from the Visualisation component and translates them into clocked PS2Data signals which can be routed to a PL050_KMI component. This model is written in LISA+.

PS2Mouse contains the following CADI targets:

- PS2Mouse

About PS2Mouse

This component implements the PS/2 register interface of a PS/2 style mouse. The mouse movement and button press data must come from another component such as a visualization component.

Table 3-273 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock signal to rate at which PS2Data signals are generated.
mouse	*MouseStatus* on page 2-74	Slave	Receives keyboard input from, for example, the Visualisation component.
ps2	*PS2Data* on page 2-74	Master	Connection to the PS/2 controller, for example the PL050_KMI.

3.7.22 PVBusGICv3Comms

GICv3 Component for conversion between GICv3Comms protocol and PVBus. This model is written in C++.

PVBusGICv3Comms contains the following CADI targets:

- PVBusGICv3Comms

PVBusGICv3Comms contains the following MTI components:

- *4.103 PVBusGICv3Comms - trace* on page 4-2754
- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-274 Ports

Name	Protocol	Type	Description
axi_master_id_m[256]	*Value* on page 2-85	Master	-
distributor_m[256]	*GICv3Comms* on page 2-84	Master	-
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-

3.7.23 PVMetaDataController

A simulation-only (not in hardware) component that can service metadata requests for transactions on PVBus. This model is written in C++.

Table 3-275 Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-

3.7.24 RAMDevice

RAM device, can be dynamic or static ram. This model is written in LISA+.

RAMDevice contains the following CADI targets:

- RAMDevice

RAMDevice contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760
- *4.110 RAMDevice - trace* on page 4-2769

Note

As a generic device, this component does not have a hardware revision code.

Table 3-276 Ports

Name	Protocol	Type	Description
pvbus	PVBus	Slave	Bus slave interface.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-277 Parameters for RAMDevice

Name	Type	Default value	Description
enable_atomic_ops	bool	0x0	Supports Atomic Operations
fill1	int	0xdfdfdfcf	Fill pattern 1, initialise memory at start of simulation with alternating fill1, fill2 pattern
fill2	int	0xcfdfdfdf	Fill pattern 2, initialise memory at start of simulation with alternating fill1, fill2 pattern
size	int	0x100000000	Memory Size

3.7.25 ROM

Simple ROM device. This model is written in LISA+.

ROM contains the following CADI targets:

- ROM

ROM contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-278 Ports

Name	Protocol	Type	Description
pvbus	PVBus	Slave	-

Table 3-279 Parameters for ROM

Name	Type	Default value	Description
abort_writes	bool	0x0	Abort writes instead of ignoring them
log2_size	int	0x14	Log2 size (bytes) e.g. 20 is 1 MiB
raw_image	string	""	Raw image file to load at init time

3.7.26 RandomNumberGenerator

Random Number Generator unit. This model is written in LISA+.

RandomNumberGenerator contains the following CADI targets:

- RandomNumberGenerator

RandomNumberGenerator contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-280 Ports

Name	Protocol	Type	Description
RNG_intr	*Signal* on page 2-85	Master	Interrupt output.

Table 3-281 Parameters for RandomNumberGenerator

Name	Type	Default value	Description
diagnostics	int	0x0	Diagnostics
seed	int	0x0	Random number seed

3.7.27 RealTimeLimiter

Real Time Limiter. This model is written in LISA+.

RealTimeLimiter contains the following CADI targets:

- ClockDivider
- RealTimeLimiter

RealTimeLimiter contains the following MTI components:

- *4.60 ClockDivider - trace* on page 4-2438

Table 3-282 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock input.

Table 3-283 Parameters for RealTimeLimiter

Name	Type	Default value	Description
ENABLE	bool	0x0	Rate limit simulation
RELATIVE_SPEED	int	0x64	Rate limit to at most this percentage of real time (100: limit to wall clock rate)

3.7.28 RealtimeClockTimer

Host Time Based Timer Module for Generic Timers. This model is written in C++.

Table 3-284 Ports

Name	Protocol	Type	Description
set_frequency	*Value_64* on page 2-85	Slave	-
timer_callback	*TimerCallback64* on page 2-65	Master	-
timer_control	*TimerControl64* on page 2-66	Slave	-

3.7.29 RemapDecoder

The component that provides support for dynamically remappable regions of memory. This model is written in LISA+.

RemapDecoder contains the following CADI targets:

- RemapDecoder
- TZSwitch

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

RemapDecoder contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758

Table 3-285 Ports

Name	Protocol	Type	Description
control	TZSwitchControl	Broadcast	-
input	PVBus	Slave	Incoming bus transactions (connected straight to TZSwitch).
output_remap_clear	PVBus	Master	Outgoing bus transactions when remap is clear.
output_remap_set	PVBus	Master	Outgoing bus transactions when remap is set.
remap	*StateSignal* on page 2-85	Slave	Remapping control.

Table 3-286 Parameters for TZSwitch

Name	Type	Default value	Description
normal	int	0x2	Normal Port
secure	int	0x1	Secure Port

3.7.30 RootKeyStorage

Trusted Root-Key Storage unit. This model is written in LISA+.

RootKeyStorage contains the following CADI targets:

- RootKeyStorage

RootKeyStorage contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-287 Ports

Name	Protocol	Type	Description
pvbus_s	PVBus	Slave	Bus slave interface.

Table 3-288 Parameters for RootKeyStorage

Name	Type	Default value	Description
diagnostics	int	0x0	Diagnostics
hw_unique_key	string	"00000000 00000000 00000000 00000000"	Hardware Unique Key (128-bit, 4 hex words)
hw_unique_key_hex	string	""	Hardware Unique Key (128-bit, little-endian hex byte stream)
private_key	string	"00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000"	Private Endorsement Key (256-bit, 8 hex words)
private_key_hex	string	""	Private Key (256-bit, little-endian hex byte stream)
public_key	string	"00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000"	Public Key (256-bit, 8 hex words)
public_key_hex	string	""	Public Key (256-bit, little-endian hex byte stream)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-288 Parameters for RootKeyStorage (continued)

Name	Type	Default value	Description
ss_key	string	"00000000 00000000 00000000 00000000"	Secret Symmetric Key (128-bit, 4 hex words)
ss_key_hex	string	""	Secret Symmetric Key (128-bit, little-endian hex byte stream)
version	string	"r1"	Version of the model functionality. Valid values are r0 and r1.

3.7.31 SerialCrossover

Implement an equivalent to a null-modem cable, swapping over serial transmit and receive signals. This model is written in C++.

About SerialCrossover

This component implements two SerialData slave ports and can connect two SerialData master ports, such as from PL011_Uart components. Data received on one port is buffered in a FIFO until it is read from the other port. Signals received on one port are latched and available to be read by the other port.

Table 3-289 Ports

Name	Protocol	Type	Description
port_a	*SerialData* on page 2-77	Slave	Slave port for connecting to a SerialData master.
port_b	*SerialData* on page 2-77	Slave	Slave port for connecting to a SerialData master.

3.7.32 TelnetTerminal

A host interface onto a serial port: exposes the two way serial data channel over a TCP/IP interface, and automatically opens a telnet application connected to the network socket, unless a user application connects first. This model is written in C++.

TelnetTerminal contains the following CADI targets:

- TelnetTerminal

About TelnetTerminal

When the simulation is started and the TelnetTerminal component is enabled, the component opens a server (listening) socket on a TCP/IP port. This is port 5000 by default.

Data written to the SerialData port is transmitted over the network socket. When data becomes available on the network socket, the TelnetTerminal component buffers the data. The data can then be read from SerialData.

If there is no connection to the network socket when the first data access is made, a host telnet session is automatically started. Prior to this first access, you can connect a client of your choice to the network socket. If the connection between the TelnetTerminal component and the client is broken at any time, the port is re-opened, permitting you to make another client connection.

To set the parameters, the syntax to use in a configuration file or on the command line is:

`motherboard.terminal_x.parameter=value`

where *x* is the terminal identifier and can be 0, 1, 2, or 3.

The `mode` parameter selects the terminal initialisation mode. You can set it to either of these values:

`telnet` In telnet mode, this component supports a subset of the telnet protocol defined in RFC 854.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`raw` In raw mode, this component does not interpret or modify the byte stream contents. This permits a debugger connection, for example, to connect a gdb client to a gdbserver running on the target operating system.

The `terminal` parameter specifies the command line used to launch a terminal application and connect to the opened TCP port. The `TelnetTerminal` component replaces the keywords `%port` and `%title`, if specified, with the opened port number and component name, respectively. After replacing `%port` and `%title`, the command line is executed verbatim.

An empty string, which is the default, launches xterm on Linux or `telnet.exe` on Windows.

Note

If you specify a non-empty string, it must include `%port`, but `%title` is optional.

For example:

```
motherboard.terminal_0.terminal="putty.exe -telnet %port localhost"
```

Table 3-290 Ports

Name	Protocol	Type	Description
`serial`	*`SerialData` on page 2-77*	Slave	Slave port for connecting to a SerialData master.

3.7.33 UnusedPrimeCell

A dummy component. It can be used to represent any unimplemented PrimeCell components. This model is written in LISA+.

UnusedPrimeCell contains the following CADI targets:

- UnusedPrimeCell

UnusedPrimeCell contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-291 Ports

Name	Protocol	Type	Description
`pvbus`	`PVBus`	Slave	Bus slave interface.

3.7.34 VirtioBlockDevice

virtio block device. This model is written in C++.

VirtioBlockDevice contains the following CADI targets:

- VirtioBlockDevice

VirtioBlockDevice contains the following MTI components:

- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.119 VirtioBlockDevice - trace* on page 4-2868

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

About VirtioBlockDevice

VirtioBlockDevice implements a block device that can be accessed from the simulated OS if it has an appropriate driver. Similarly to the VirtioP9Device, this component is targeted primarily at Linux, which has a built-in Virtio block driver. VirtioBlockDevice allows you to use a file on the host that you specify using the `image_path` parameter, as a hard drive in the simulated OS.

Unlike the VirtioP9Device, you should not need to carry out any special setup to use VirtioBlockDevice on VE or Base platforms, because it is usually already included in the device trees. Set the `image_path` parameter to point to your image, and then on Linux it is available as a block device, usually `/dev/vda`, which you then use like any other hard drive.

Table 3-292 Ports

Name	Protocol	Type	Description
`intr`	*Signal* on page 2-85	Master	Virtio device sets interrupt to signal completion.
`pvbus`	`PVBus`	Slave	Virtio MMIO control/config/status registers.
`virtio_m`	`PVBus`	Master	Virtio device performs DMA accesses via master.

3.7.35 VirtioNetMMIO

Virtio net device over MMIO transport. This model is written in C++.

VirtioNetMMIO contains the following CADI targets:

- VirtioNetMMIO

VirtioNetMMIO contains the following MTI components:

- *4.106 PVBusMaster - trace* on page 4-2759

About VirtioNetMMIO

This is a model of a virtual Ethernet virtio device over MMIO transport, supporting both legacy and current OASIS virtio specifications. It provides much better network performance than the SMSC_91C111 component, because it features host-assisted network acceleration. This means that it can offload packet processing operations from the simulated OS on the target, to the host side. These operations include:

- Checksum computation
- TX packet segmentation
- RX packet combination

If the target simulated Linux or Linux-derived OS has an appropriate virtio net driver, Arm recommends you use VirtioNetMMIO instead of SMSC_91C111.

Unlike SMSC_91C111, which must work with an external HostBridge component, VirtioNetMMIO has a built-in HostBridge sub-component. The parameters to control the HostBridge are described in the VirtioNetMMIO parameters table, with the `hostbridge` parameter sub-namespace.

Note

To enable tracing of user-mode networking, which can help to debug networking issues, set the `FASTSIM_USERNET_DUMP` environment variable to any or all of the following values:

```
arpin,arpout,udpin,udpout,etherin,etherout,ipv4in,ipv4out,ipv4fragin,ipv4fragout,tcpin,tcpout
```

Take the following steps to set up this component in a virtual platform:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- Use a version of Linux that contains a virtio network driver.
- Add the following option to the Linux kernel configuration:

```
CONFIG_VIRTIO_NET=y
```

- Update the device tree to include the `VirtioNetMMIO` component, or specify it on the kernel command line, for example

```
virtio_mmio.device=0x10000@0x1c150000:76
```

  The address range for both VE and Base platforms is `0x1C150000-0x1C15FFFF`. The interrupt number is 44, or IRQ 76, for both VE and Base platforms.
- Select the hostbridge that you want to use to communicate with the host in the model:

```
virtio_net.hostbridge.userNetworking=true/false (User mode or TAP/TUN networking)
```

- Configure the networking environment, as described in the related tasks at the end of this topic.

Example entries for DTS files:

- Add this entry next to the corresponding `virtio_block` or `virtio_p9` entry:

```
virtio_net@0150000 {
        compatible = "virtio,mmio";
        reg = <0x150000 0x1000>;
        interrupts = <0x2c>;
};
```

- Add this entry to the interrupt map:

```
<0 0 44 &gic 0 44 4>;
```

Table 3-293 Ports

Name	Protocol	Type	Description
`intr`	*Signal* on page 2-85	Master	Virtio device sets interrupt to signal completion.
`pvbus`	`PVBus`	Slave	Virtio MMIO control/config/status registers.
`virtio_m`	`PVBus`	Master	Virtio device performs DMA accesses via master.

Table 3-294 Parameters for VirtioNetMMIO

Name	Type	Default value	Description
`checksum`	`string`	""	For checksum-offloaded packets, if 'tx' is specified, outgoings will be checksumed by VirtioNet device; 'rx' is specified for incomings; 'all' for both
`enabled`	`bool`	`0x0`	Enable or disable device. If disabled, device can be accessed, but will not be activated
`mac_address`	`string`	""	Device MAC address, if not specified, a random MAC address is generated
`offload`	`string`	"gso, gro"	Offload TCP/UDP segmentation/receiving operations to host
`secure_accesses`	`bool`	`0x0`	Make device generate transactions with NS=0
`target_endian`	`bool`	`0x0`	Target cpu endianness(0-LE, 1-BE)
`transport`	`string`	"modern"	Choose legacy or modern virtio transport, if not specified, modern transport is used

3.7.36 VirtioP9Device

virtio P9 server. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VirtioP9Device contains the following CADI targets:

- VirtioP9Device

VirtioP9Device contains the following MTI components:

- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.120 VirtioP9Device - trace* on page 4-2871

About VirtioP9Device

This component implements a subset of the Plan 9 file protocol over a virtio transport. It enables accessing a directory on the host's filesystem within Linux, or another operating system that implements the protocol, running on a platform model.

The component implements a subset of the Linux 9P2000.L protocol. It has the following limitations:

- You can mount only one host directory per instance of the component.
- It supports a subset of 9P2000.L message types: Tversion, Tlopen, Tlcreate, Tgetattr, Tsetattr, Treaddir, Tmkdir, Tattach, Twalk, Tread, Twrite, Tclunk, Tremove, Trename. On Linux hosts, it also supports: Treadlink, Tsymlink.
- On Windows hosts, it ignores Unix permissions when writing files.
- On Windows hosts, it performs a simple mapping from Windows to Unix permissions when reading.
- On Windows hosts, symbolic links appear as regular files.
- On Windows hosts, it does not perform writing, deleting, or renaming operations on a file that another process has open.

Take the following steps to set up this component:

- Use a version of Linux that supports v9fs over virtio and virtio-mmio devices.
- Update the device tree to include the VirtioP9Device component, or specify it on the kernel command-line, as shown below. The address range for both VE and Base platforms is `0x1C140000-0x1C14FFFF`.

  The interrupt number is 43, or IRQ 75, for both VE and Base platforms.
- Set the following parameter to the directory on the host that you want to mount in the model:

  VE:

  `motherboard.virtiop9device.root_path`

  Base:

  `bp.virtiop9device.root_path`
- On Linux, mount the host directory by using the following command in the model:

```
$ mount -t 9p -o trans=virtio,version=9p2000.L FM <mount point>
```

Example kernel command-line argument:

```
virtio_mmio.device=0x10000@0x1c140000:75
```

Example entry for DTS files, to add next to the corresponding `virtio_block` entry:

```
virtio_p9@0140000 {
       compatible = "virtio,mmio";
       reg = <0x0 0x1c140000 0x0 0x1000>;
       interrupts = <0x0 0x2b 0x4>;
};
```

Table 3-295 Ports

Name	Protocol	Type	Description
intr	*Signal* on page 2-85	Master	Virtio device sets interrupt to signal completion.
pvbus	PVBus	Slave	Virtio MMIO control/config/status registers.
virtio_m	PVBus	Master	Virtio device performs DMA accesses via master.

3.7.37 VirtioPCIBlockDevice

virtio block device with PCI transport. This model is written in C++.

VirtioPCIBlockDevice contains the following CADI targets:

- VirtioPCIBlockDevice

VirtioPCIBlockDevice contains the following MTI components:

- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760
- *4.121 VirtioPCIBlockDevice - trace* on page 4-2872

Table 3-296 Ports

Name	Protocol	Type	Description
info_s	*Value_64* on page 2-85	Slave	Communicates PCI Info values to device.
intr	*Signal* on page 2-85	Master	Virtio device sets interrupt to signal completion.
msixintr[2]	*Signal* on page 2-85	Master	Interrupts for MSI-X table entries.
pvbus	PVBus	Slave	Virtio pci/control/config/status registers.
virtio_m	PVBus	Master	Virtio device performs DMA accesses via master.

3.7.38 VirtualEthernetCrossover

Ethernet Crossover Cable. This model is written in LISA+.

VirtualEthernetCrossover contains the following CADI targets:

- VirtualEthernetCrossover

VirtualEthernetCrossover contains the following MTI components:

- *4.122 VirtualEthernetCrossover - trace* on page 4-2875

About VirtualEthernetCrossover

This component implements two VirtualEthernet slave ports and enables you to connect two VirtualEthernet master ports. It forwards data received on one port to the other port without delay.

Table 3-297 Ports

Name	Protocol	Type	Description
deva	*VirtualEthernet* on page 2-79	Slave	Slave port for connecting to a VirtualEthernet master.
devb	*VirtualEthernet* on page 2-79	Slave	Slave port for connecting to a VirtualEthernet master.

3.7.39 VirtualEthernetHub3

3 Port Ethernet Hub. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

VirtualEthernetHub3 contains the following CADI targets:

- VirtualEthernetHub3

Table 3-298 Ports

Name	Protocol	Type	Description
deva	*VirtualEthernet on page 2-79*	Slave	Slave port for connecting to a VirtualEthernet master.
devb	*VirtualEthernet on page 2-79*	Slave	Slave port for connecting to a VirtualEthernet master.
devc	*VirtualEthernet on page 2-79*	Slave	Slave port for connecting to a VirtualEthernet master.

3.7.40 VisEventRecorder

Event recorder component for visualisation component (allows to playback and record interactive GUI sessions). This model is written in LISA+.

VisEventRecorder contains the following CADI targets:

- ClockDivider
- VisEventRecorder

VisEventRecorder contains the following MTI components:

- *4.60 ClockDivider - trace* on page 4-2438

Table 3-299 Ports

Name	Protocol	Type	Description
control	VisEventRecorderProtocol	Slave	The visualisation component controls the recorder through this port.
ticks	*InstructionCount on page 2-84*	Slave	Allow VisEventRecorder to get tick count from a core.

Table 3-300 Parameters for VisEventRecorder

Name	Type	Default value	Description
checkInstructionCount	bool	0x1	check instruction count in recording file against actual instruction count during playback
playbackFileName	string	""	playback filename (empty string disables playback)
recordingFileName	string	""	recording filename (empty string disables recording)
recordingTimeBase	int	0x5f5e100	timebase in 1/s (relative to the master clock (e.g. 100000000 means 10 nanoseconds resolution simulated time for a 1Hz master clock)) to be used for recording (higher values -> higher time resolution, playback time base is always taken from the playback file)
verbose	int	0x0	enable verbose messages (1=normal, 2=even more)

3.7.41 WarningMemory

Memory that prints warnings, and RAZ/WIs or aborts. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

WarningMemory contains the following CADI targets:

- WarningMemory

WarningMemory contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-301 Ports

Name	Protocol	Type	Description
pvbus	PVBus	Slave	Bus slave interface.

Table 3-302 Parameters for WarningMemory

Name	Type	Default value	Description
abort_on_reads	bool	0x0	Abort on reads (read 0 if false)
abort_on_writes	bool	0x0	Abort on writes (ignore if false)
read_data	int	0x0	Data to return on reads, if not aborting
warn_on_reads	bool	0x1	Warn on reads
warn_on_writes	bool	0x1	Warn on writes
warning	string	"Invalid access"	Warning string

3.7.42 v8EmbeddedCrossTrigger_Matrix

v8 Embedded Cross Trigger Matrix. This model is written in C++.

About v8EmbeddedCrossTrigger_Matrix

This is a model of a platform level *Cross Trigger Matrix* (CTM) for connection to the *Cross Trigger Interface* (CTI) ports provided on Armv8-A processors in Fast Models. The combination of the CTI and the CTM provides an architectural model of the CoreSight embedded triggering system.

A single instance of the v8EmbeddedCrossTrigger_Matrix component supports up to four clusters, each containing four cores. For example:

```
cluster0.cti[0] => v8ect.cti[0];
cluster0.cti[1] => v8ect.cti[1];
cluster0.cti[2] => v8ect.cti[2];
cluster0.cti[3] => v8ect.cti[3];
...
cluster4.cti[3] => v8ect.cti[12];
cluster4.cti[3] => v8ect.cti[13];
cluster4.cti[3] => v8ect.cti[14];
cluster4.cti[3] => v8ect.cti[15];
```

Table 3-303 Ports

Name	Protocol	Type	Description
cti[32]	*v8EmbeddedCrossTrigger_controlprotocol* on page 2-84	Slave	-

3.8 Signals components

This section describes the Signals components.

This section contains the following subsections:

- *3.8.1 AndGate* on page 3-644.
- *3.8.2 LabellerUserSignals* on page 3-644.
- *3.8.3 OrGate* on page 3-645.
- *3.8.4 SGSignalBuffer* on page 3-645.
- *3.8.5 SignalLogger* on page 3-645.
- *3.8.6 Value64Logger* on page 3-646.
- *3.8.7 ValueLogger* on page 3-646.

3.8.1 AndGate

And Gate. This model is written in LISA+.

AndGate contains the following CADI targets:

- AndGate

About AndGate

This component implements a logical AND of two signal input ports to generate a single output signal. For example, you can use it to combine two interrupt signals.

Table 3-304 Ports

Name	Protocol	Type	Description
input[2]	*Signal* on page 2-85	Slave	2 input signals to be AND'ed.
output	*Signal* on page 2-85	Master	AND'ed output signal.

3.8.2 LabellerUserSignals

This model is written in LISA+.

LabellerUserSignals contains the following CADI targets:

- LabellerUserSignals
- PVBusLogger

LabellerUserSignals contains the following MTI components:

- *4.104 PVBusLogger - trace* on page 4-2756
- *4.105 PVBusMapper - trace* on page 4-2758

Table 3-305 Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output with modified UserFlags.
pvbus_s	PVBus	Slave	Unmodified input.

Table 3-306 Parameters for PVBusLogger

Name	Type	Default value	Description
trace_debug	bool	0x0	Enable tracing of debug transactions
trace_snoops	bool	0x0	Enable tracing of ACE snoop requests

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-307 Parameters for LabellerUserSignals

Name	Type	Default value	Description
user	int	0x0	User signal to be applied to transactions

3.8.3 OrGate

Or Gate. This model is written in LISA+.

OrGate contains the following CADI targets:

- OrGate

About OrGate

This component implements a logical OR of two signal input ports to generate a single output signal. For example, you can use this component to combine two interrupt signals.

Table 3-308 Ports

Name	Protocol	Type	Description
input[16]	*Signal* on page 2-85	Slave	16 input signals to be OR'ed.
output	*Signal* on page 2-85	Master	OR'ed output signal.

3.8.4 SGSignalBuffer

Buffer to synchronise SystemGenerator Signal setValue() calls. This model is written in LISA+.

SGSignalBuffer contains the following CADI targets:

- SGSignalBuffer

Note

Variants of this component also exist with multiple input and output ports.

Table 3-309 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock rate to release buffered signals.
in	*Signal* on page 2-85	Slave	Signal in.
out	*Signal* on page 2-85	Master	Buffered signal out.

3.8.5 SignalLogger

Traces signal activity. This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SignalLogger contains the following CADI targets:

- SignalLogger

SignalLogger contains the following MTI components:

- *4.113 SignalLogger - trace* on page 4-2833

Table 3-310 Ports

Name	Protocol	Type	Description
in	*Signal* on page 2-85	Slave	Input signal port.
out	*Signal* on page 2-85	Master	Output signal port.

3.8.6 Value64Logger

Traces value activity. This model is written in LISA+.

Value64Logger contains the following CADI targets:

- Value64Logger

Value64Logger contains the following MTI components:

- *4.117 Value64Logger - trace* on page 4-2866

Table 3-311 Ports

Name	Protocol	Type	Description
in	*Value_64* on page 2-85	Slave	Input signal port.
out	*Value_64* on page 2-85	Master	Output signal port.

3.8.7 ValueLogger

Traces value activity. This model is written in LISA+.

ValueLogger contains the following CADI targets:

- ValueLogger

ValueLogger contains the following MTI components:

- *4.118 ValueLogger - trace* on page 4-2867

Table 3-312 Ports

Name	Protocol	Type	Description
in	*Value* on page 2-85	Slave	Input signal port.
out	*Value* on page 2-85	Master	Output signal port.

3.9 SystemIP components

This section describes the SystemIP components.

The major SystemIP components are:

- Input/output devices.
- Memory, including flash.
- Ethernet controller.
- Interrupt controllers.
- Static and dynamic memory controllers.
- Audio interface.
- Programmable clock generators.

These components are software implementations of specific hardware functionality.

This section contains the following subsections:

- *3.9.1 AHCI_SATA* on page 3-648.
- *3.9.2 BP141_TZMA* on page 3-648.
- *3.9.3 BP147_TZPC* on page 3-650.

3.9.1 AHCI_SATA

AHCI controller with attached SATA disks and PCIe interface. This model is written in C++.

AHCI_SATA contains the following CADI targets:

- AHCI_SATA

AHCI_SATA contains the following MTI components:

- *4.1 AHCI_SATA - trace* on page 4-864
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-313 Ports

Name	Protocol	Type	Description
ahci_dma_m	PVBus	Master	-
client_s	PCIDevice2ClientProtocol	Slave	-
pvbus	PVBus	Slave	-

3.9.2 BP141_TZMA

PrimeCell Infrastructure AMBA 3 AXI TrustZone Memory Adapter. This model is written in LISA+.

BP141_TZMA contains the following CADI targets:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- BP141_TZMA
- PVBusRange
- TZSwitch

BP141_TZMA contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758

About BP141_TZMA

BP141_TZMA permits a single physical memory cell of up to 2MB to be shared between a secure and non-secure storage area. The partitioning between these areas is flexible.

This component routes transactions according to the following:

- The memory region that they are attempting to access.
- The security mode of the transaction.

The BP141_TZMA fixes the base address of the secure region to the base address of the decode space. It uses the R0SIZE[9:0] input to configure the size of the secure region in 4KB increments up to a maximum of 2MB.

`TZMEMSIZE` is the maximum addressing range of the memory as defined by that parameter. By default, `TZMEMSIZE` is set to 2MB. In the following table, AxADDR is the offset address that the transactions want to access.

Table 3-314 BP141_TZMA security control

AxADDR	Memory Region	Non-secure Transfer	Secure Transfer
AxADDR < R0Size	Secure, R0	Illegal	Legal
R0SIZE <= AxADDR and AxADDR < `TZMEMSIZE`	Non-secure, R1	Legal	Legal
AxADDR => `TZMEMSIZE`	No access	Illegal	Illegal

Table 3-315 Ports

Name	Protocol	Type	Description
`R0Size`	*`Value` on page 2-85*	Slave	A software interface that is driven from the TrustZone Protection Controller (TZPC), setting the secure region size by bits[9:0].
`pv_output`	`PVBus`	Master	Routed PVBus output
`pvbus`	`PVBus`	Slave	Bus slave interface.

Table 3-316 Parameters for PVBusRange

Name	Type	Default value	Description
`pvbusrange_0.range`	`int`	`0x0`	Addressable range routed to pvbus_port_a

Table 3-317 Parameters for TZSwitch

Name	Type	Default value	Description
`normal`	`int`	`0x2`	Normal Port
`secure`	`int`	`0x1`	Secure Port

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-318 Parameters for BP141_TZMA

Name	Type	Default value	Description
TZMEMSIZE	int	0x200000	Addressable range of device
TZSECROMSIZE	int	0x200	Default secure size
TZSEGSIZE	int	0x1000	Segment size

3.9.3 BP147_TZPC

TrustZone Protection Controller. This model is written in LISA+.

BP147_TZPC contains the following CADI targets:

- BP147_TZPC

BP147_TZPC contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About BP147_TZPC

BP147_TZPC provides a software interface to the protection bits in a secure system in a TrustZone design.

Table 3-319 Ports

Name	Protocol	Type	Description
TZPCDECPROT0	*Value* on page 2-85	Master	Output decode protection 0 status.
TZPCDECPROT1	*Value* on page 2-85	Master	Output decode protection 1 status.
TZPCDECPROT2	*Value* on page 2-85	Master	Output decode protection 2 status.
TZPCR0SIZE	*Value* on page 2-85	Master	Output secure RAM region size.
bus_in_s	PVBus	Slave	Slave port for register access.

3.9.4 CCI400

Cache Coherent Interconnect for AXI4 ACE. This model is written in LISA+.

CCI400 contains the following CADI targets:

- CCI400

CCI400 contains the following MTI components:

- *4.51 CCI400 - trace* on page 4-2405

About CCI400

- If you disable the `cache_state_modelled` parameter, this component has negligible performance impact. If you enable `cache_state_modelled`, it adds significant cost to throughput for coherent transactions.
- This model implements the slave interface Shareable Override Register, which can be read and written, but it has no functionality.

ACE limitation

AXI Coherency Extensions (ACE) are extensions to AXI4 that support system-level cache-coherency between multiple clusters. The ACE cache models in the Cortex-A15 and the Cortex-A7, and the ACE support in the CCI-400 have the limitation that they only process one transaction at a time. Normally, the simulation processes each transaction to completion before allowing any master to generate another transaction. However, in the following situation the simulation might fail. If a SystemC bus slave calls

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

`wait()` while it is processing a transaction, this call might allow another master to issue another transaction that passes through the CCI-400 or the Cortex-A15/Cortex-A7 caches. This situation could happen if a SystemC bus master running in another thread is connected to one of the ACE-lite ports on the CCI-400.

Table 3-320 Ports

Name	Protocol	Type	Description
acchannelen	*Value* on page 2-85	Slave	For each upstream port, determine if it is enabled or not with respect to snoop requests.
barrierterminate	*Value* on page 2-85	Slave	For each downstream port, determine if barriers are terminated at that port.
broadcastcachemain	*Value* on page 2-85	Slave	For each downstream port, determine if broadcast cache maintenance operations are forwarded down that port. A three bit signal but as the model only have a single downstream port, setting any of the bits will make it work.
bufferableoverride	*Value* on page 2-85	Slave	For each downstream port, determine if all transactions are forced to non-bufferable (AWCACHE[0] is forced to 0).
clk_in	ClockSignal	Slave	Clock signal for cciregisters
errorirq	*Signal* on page 2-85	Master	A signal stating that the imprecise error register is nonzero.
evntcntoverflow[5]	*Signal* on page 2-85	Master	When an event counter overflows, it sets the corresponding signal.
lint_ace_3_reset_state	*Signal* on page 2-85	Slave	This port can be connected to the reset signals of the system attached to the pvbus_s_ace_3 port.
lint_ace_4_reset_state	*Signal* on page 2-85	Slave	This port can be connected to the reset signals of the system attached to the pvbus_s_ace_4 port.
periphbase	*Value_64* on page 2-85	Slave	This port sets the base address of the private peripheral region.
pvbus_m	PVBus	Master	Master port for all downstream memory accesses.
pvbus_s_ace_3	PVBus	Slave	ACE-capable slave ports.
pvbus_s_ace_4	PVBus	Slave	ACE-capable slave ports.
pvbus_s_ace_lite_plus_dvm_0	PVBus	Slave	Memory bus interface that implements ACE lite and DVM protocol.
pvbus_s_ace_lite_plus_dvm_1	PVBus	Slave	Memory bus interface that implements ACE lite and DVM protocol.
pvbus_s_ace_lite_plus_dvm_2	PVBus	Slave	Memory bus interface that implements ACE lite and DVM protocol.
reset_in	*Signal* on page 2-85	Slave	Signal to reset the CCI.
reset_state_of_ace_lite_ports[3]	*Signal* on page 2-85	Slave	This port can be connected to the reset signals of the system attached to ACE-Lite ports 0,1,2

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-321 Parameters for CCI400

Name	Type	Default value	Description
acchannelen	int	0x1f	For each upstream port, determine if it is enabled or not w.r.t. snoop requests.
barrierterminate	int	0x7	For each downstream port, determine if barriers will be terminated at that port.
broadcastcachemain	int	0x0	For each downstream port a bit determines if broadcast cache maintenance operations are forwarded down that port.
bufferableoverride	int	0x0	For each downstream port, determine if all transactions will be forced to non-bufferable.
cache_state_modelled	bool	0x1	Model the cache state.
force_on_from_start	bool	0x0	The CCI will normally start up with snooping disabled, however, using this then we allow the model to start up as enabled without having to program it. This is only setup at simulation reset and not at signal reset. If the upstreams can ever be held in reset then you *must* connect the reset_state_of_ace_lite_ports[], lint_ace_3_reset_state and lint_ace_4_reset_state so that it knows when to disable snoops to the upstream systems. Otherwise, the upstream system will receive snoop messages whilst in reset and it will complain that it 'received a snoop request whilst it was in reset'.
log_enabled	int	0x1	Enable log messages from the CCI register file. Log level 0 means do not print anything, 1 means print only access violations, 2 means also print writes, 3 means print reads as well.
periphbase	int	0x2c000000	Value for PERIPHBASE. Only bits [39:16] are used. This value may be overriden by an input on the periphbase port
revision	string	"r0p0"	Revision of the CCI400

3.9.5 CCI500

Cache Coherent Interconnect. This model is written in C++.

CCI500 contains the following CADI targets:

- CCI500

CCI500 contains the following MTI components:

- *4.52 CCI500 - trace* on page 4-2407
- *4.107 PVBusSlave - trace* on page 4-2760

About CCI500

The LISA file declares seven upstream ports. You can configure these ports with `num_ace_ports` and `num_ace_lite_ports`. The bottom `num_ace_lite_ports` are ACE-Lite+DVM. The next `num_ace_ports` are ACE. Any remaining ports are ignored. If transactions are made on them, then warnings are produced. For example, if `num_ace_ports` = 1 and `num_ace_lite_ports` = 1 then `pvbus_s[1]` is ACE, `pvbus_s[0]` is ACE-Lite+DVM and `pvbus_s[6-2]` are considered not to exist.

Differences between the model and the RTL

Address Decoder

- Only supports striping down to 4KiB.
- If the address decoder aborts the access, returns `SLVERR` rather than `DECERR`.

Interfaces

The model does not implement the Q-Channel and P-Channel interfaces.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Performance Monitoring Unit

- PMU counters recognize only a few event sources:
  - Slave interface events:
    - **3** ReadOnce.
    - **4** ReadClean, ReadShared, ReadNotSharedDirty, ReadUnique.
    - **5** MakeUnique, CleanUnique.
    - **6** CleanInvalid, CleanShared, MakeInvalid.
    - **7** DVM transaction received from upstream.
    - **9** Read data that is satisfied by a snoop request.
  - No events are implemented for the global events or for the master events.
- The PMU does not implement the event bus (`EVNTBUS`).

Register access

The register file only supports 32-bit accesses to its registers. Later versions of the CCI500 hardware support full write strobes to the register file. This limitation means that byte and halfword accesses work on the hardware but not on this version of the component.

Snoop filter RAMs

Snoop filter RAMs are not modeled. The Status Register fields that relate to the power state of the Snoop filter RAMs are undefined.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-322 Ports

Name	Protocol	Type	Description
acchannelensx[7]	*Value* on page 2-85	Slave	ACCHANNELENSx represents the ports ACCHANNELENS0..ACCHANNELENS7 on the RTL (assuming there are seven upstream ports). * each upstream ACE port 'y' (pvbus_s[y]) has a two bit ACCHANNELENSx * bit 0 == 0 -- DVM messages are disabled from being sent to this interface * bit 1 == 0 -- Snoop messages are disabled from being sent to this interface * each upstream ACE-Lite port 'z' (pvbus_s[z]) has a one bit ACCHANNELENSx * bit 0 == 0 -- DVM messages are disabled from being sent to this interface In the model, as we support a variety of configurations with a single LISA file then each port will behave as though it is one bit or two bit as appropriate. If you send a value that cannot be represented, given the width of the port, then the CCI model will halt and produce a fatal error. The assumed values of these are set by parameters until they are driven, so you need not drive them if they are constant. In the RTL, these signals are sampled at reset. Due to ordering issues w.r.t. reset() on different components then we cannot do that. Instead the signals are sampled at first transaction. Thus any controller that is producing these signals has to hold them constant for long enough. AC channel enables.
address_decoder	CCI500_AddressDecoderProtocol	Master	An address decoder can be attached to the address_decoder port to choose which pvbus_s port a downstream transaction will go out of. If you do not connect an address decoder then all transactions will go out of port 0.
dbgen	*Signal* on page 2-85	Slave	Invasive debug enable.
errirq	*Signal* on page 2-85	Master	Indicates that an error response, DECERR or SLVERR, is received on the RRESP, BRESP, or CRRESP input signals, and it cannot be signaled precisely.
evntcntoverflow[8]	*Signal* on page 2-85	Master	Overflow flags for the PMU clock and counters.
niden	*Signal* on page 2-85	Slave	Non-invasive debug enable.
pvbus_m[6]	PVBus	Master	Bus master ports.
pvbus_register_file_s	PVBus	Slave	The slave port of the register file.
pvbus_s[7]	PVBus	Slave	Bus slave ports.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-322 Ports (continued)

Name	Protocol	Type	Description
reset_in	*Signal* on page 2-85	Slave	Reset the interconnect.
reset_state_of_upstream_port[7]	*Signal* on page 2-85	Slave	Tell the interconnect the reset state of the upstream ports, this can be used by the interconnect to check some aspects of the reset sequencing. If you are using force_on_from_start then you _must_ connect these pins.
spiden	*Signal* on page 2-85	Slave	Secure invasive debug enable.
spniden	*Signal* on page 2-85	Slave	Secure privileged non-invasive debug enable.

Table 3-323 Parameters for CCI500

Name	Type	Default value	Description
acchannelens0	int	0x0	For upstream port 0 determine if it is enabled or not w.r.t. snoop requests.
acchannelens1	int	0x0	For upstream port 1 determine if it is enabled or not w.r.t. snoop requests.
acchannelens2	int	0x0	For upstream port 2 determine if it is enabled or not w.r.t. snoop requests.
acchannelens3	int	0x0	For upstream port 3 determine if it is enabled or not w.r.t. snoop requests.
acchannelens4	int	0x0	For upstream port 4 determine if it is enabled or not w.r.t. snoop requests.
acchannelens5	int	0x0	For upstream port 5 determine if it is enabled or not w.r.t. snoop requests.
acchannelens6	int	0x0	For upstream port 6 determine if it is enabled or not w.r.t. snoop requests.
addr_width	int	0x28	The bit-width of the address that the CCI can accept.
cache_state_modelled	bool	0x1	Model the cache state.
dbgen	bool	0x1	Invasive debug enable. If true, enables the counting of PMU events.
enable_logger	bool	0x0	Enable PVBusLoggers for the downstream ports in the CCI model.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-323 Parameters for CCI500 (continued)

Name	Type	Default value	Description
force_on_from_start	bool	0x0	The interconnect will normally start up with snooping/DVM disabled. This parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if ACCHANNELENSx allows it. No software driver for the interconnect is needed. Any port that could go into reset must have 'reset_state_of_upstream_port[]' reflect the reset state of that upstream system. Otherwise, the upstream system may receive snoop/DVM messages whilst in reset and may complain that it 'received a snoop request whilst it was in reset'. Do not use if software is directly controlling the interconnect. This option does not disavow the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.
niden	bool	0x1	Whether non-secure events are allowed to be counted in the performance monitor
num_ace_lite_ports	int	0x5	The bottom num_ace_lite_ports are ACE-Lite+DVM.
num_ace_ports	int	0x2	The top num_ace_ports are ACE and support full coherency.
number_of_phantom_entries	int	0x20	Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.
qos_threshold_upper	int	0xc	Reset value for the QoS threshold register.
reentrancy_support	string	"env"	Must be one of: on/off/cacheglobal/env: 'on': hazard checking per cache line (normal mode), 'off': no hazard checking (use only for single master systems), 'cacheglobal': hazard checking globally for cache (not per cache line, testing feature, provokes more hazards than necessary), 'env' (or empty string): take value from FM_REENTRANCY_SUPPORT env var, if this is not set use 'on', default is 'env'
spiden	bool	0x1	Secure invasive debug enable. If both SPIDEN and DBGEN are high, enables the counting of both Non-secure and Secure events.
spniden	bool	0x1	Whether secure and non-secure events are allowed to be counted in the performance monitor
version	string	""	The version of the interconnect. Allowed versions are:- r0p0, r0p2, r1p0

3.9.6 CCI550

Cache Coherent Interconnect for AXI4 ACE. This model is written in C++.

CCI550 contains the following CADI targets:

- CCI550

CCI550 contains the following MTI components:

- *4.53 CCI550 - trace* on page 4-2412
- *4.107 PVBusSlave - trace* on page 4-2760

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Differences between the model and the RTL

Address Decoder

- Only supports striping down to 4KiB.
- If the address decoder aborts the access, returns `SLVERR` rather than `DECERR`.

Interfaces

The model does not implement the Q-Channel and P-Channel interfaces.

Performance Monitoring Unit

- PMU counters recognize only a few event sources:
  - Slave interface events:
    - **3** ReadOnce.
    - **4** ReadClean, ReadShared, ReadNotSharedDirty, ReadUnique.
    - **5** MakeUnique, CleanUnique.
    - **6** CleanInvalid, CleanShared, MakeInvalid.
    - **7** DVM transaction received from upstream.
    - **9** Read data that is satisfied by a snoop request.
  - No events are implemented for the global events or for the master events.
- The PMU does not implement the event bus (`EVNTBUS`).

Reset signal sampling

The configuration ports `acchannelensx[]` are sampled in the hardware when coming out of reset. In the model, these ports are sampled at the first transaction to a `pvbus_s` port or to the register file.

Status Register, change-pending, and DVM messages

The Status Register provides information on when the last transaction that could have observed an old value of a snoop or DVM enable has finished in the upstream system. Therefore a port that has been disabled can now have the system upstream of that port turned off. The model does not track DVM messages in the upstream system.

Snoop filter RAMs

- The CCI-550 hardware has a snoop filter that reduces the number of snoop requests that the interconnect has to make. The model does not have a snoop filter and could make more snoop requests than the hardware would. This difference has no programmer-visible effect.
- The Status Register fields that relate to the power state of the Snoop filter RAMs are undefined.

Registers

The following registers provide storage but have no effect on the model.

- QoS registers.
- Interface monitor registers. These registers are intended for silicon debug.

Table 3-324 Ports

Name	Protocol	Type	Description
acchannelensx[7]	*Value* on page 2-85	Slave	The acchannelensx[N] pins are used to tell the interconnect if the upstream system will accept snoops and/or DVM messages.
address_decoder	CCI500_AddressDecoderProtocol	Master	An address decoder can be attached to the address_decoder port to choose which pvbus_s port a downstream transaction will go out of. If you do not connect an address decoder then all transactions will go out of port 0.
dbgen	*Signal* on page 2-85	Slave	Invasive debug enable.
errirq	*Signal* on page 2-85	Master	Some async error was detected.
evntcntoverflow[8]	*Signal* on page 2-85	Master	The output interrupts of the event counters.
niden	*Signal* on page 2-85	Slave	Non-invasive debug enable.
pvbus_m[7]	PVBus	Master	The downstream master ports.
pvbus_register_file_s	PVBus	Slave	The slave port of the register file.
pvbus_s[7]	PVBus	Slave	Bus slave ports.
reset_in	*Signal* on page 2-85	Slave	Reset the interconnect.
reset_state_of_upstream_port[7]	*Signal* on page 2-85	Slave	Tell the interconnect the reset state of the upstream ports, this can be used by the interconnect to check some aspects of the reset sequencing. If you are using force_on_from_start then you _must_ connect these pins.
sci_s[7]	SystemCoherencyInterface	Slave	The System Coherency Interface bus. For those upstream ports that have a corresponding bit set in the bitmap of si_system_coherency_interface then the corresponding sci_m port can be used to move the upstream system into and out of the coherency domain.
spiden	*Signal* on page 2-85	Slave	Secure privileged invasive debug enable.
spniden	*Signal* on page 2-85	Slave	Secure privileged non-invasive debug enable.

Table 3-325 Parameters for CCI550

Name	Type	Default value	Description
acchannelens0	int	0x0	For upstream port 0 determine if it is enabled or not w.r.t. snoop requests.
acchannelens1	int	0x0	For upstream port 1 determine if it is enabled or not w.r.t. snoop requests.
acchannelens2	int	0x0	For upstream port 2 determine if it is enabled or not w.r.t. snoop requests.
acchannelens3	int	0x0	For upstream port 3 determine if it is enabled or not w.r.t. snoop requests.
acchannelens4	int	0x0	For upstream port 4 determine if it is enabled or not w.r.t. snoop requests.
acchannelens5	int	0x0	For upstream port 5 determine if it is enabled or not w.r.t. snoop requests.
acchannelens6	int	0x0	For upstream port 6 determine if it is enabled or not w.r.t. snoop requests.
addr_width	int	0x28	The bit-width of the address that the CCI can accept.
cache_state_modelled	bool	0x1	Model the cache state.
dbgen	bool	0x1	Invasive debug enable. If true, enables the counting of PMU events.
enable_logger	bool	0x0	Enable PVBusLoggers for the downstream ports in the CCI model.
force_on_from_start	bool	0x0	The interconnect will normally start up with snooping/DVM disabled. The parameter si_system_coherency_interface determines which connections are managed by the System Coherency Interface (SCI). For connections that are managed by SCI, then this parameter has no effect. For all other connections, this parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if ACCHANNELENSx allows it. No software driver for the interconnect is needed. Any non-SCI port that could go into reset must have 'reset_state_of_upstream_port[]' reflect the reset state of that upstream system. Otherwise, the upstream system may receive snoop/DVM messages whilst in reset and may complain that it 'received a snoop request whilst it was in reset'. Do not use if software is directly controlling the interconnect. This option does not disavow the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.
niden	bool	0x1	Whether non-secure events are allowed to be counted in the performance monitor
num_ace_lite_ports	int	0x5	The bottom num_ace_lite_ports are ACE-Lite+DVM.
num_ace_ports	int	0x2	The top num_ace_ports are ACE and support full coherency.
number_of_phantom_entries	int	0x20	Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.

Table 3-325 Parameters for CCI550 (continued)

Name	Type	Default value	Description
qos_threshold_upper	int	0xc	Reset value for the QoS threshold register.
reentrancy_support	string	"env"	Must be one of: on/off/cacheglobal/env: 'on': hazard checking per cache line (normal mode), 'off': no hazard checking (use only for single master systems), 'cacheglobal': hazard checking globally for cache (not per cache line, testing feature, provokes more hazards than necessary), 'env' (or empty string): take value from FM_REENTRANCY_SUPPORT env var, if this is not set use 'on', default is 'env'
si0_qos_bw_regulator	bool	0x0	For upstream port 0 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.
si1_qos_bw_regulator	bool	0x0	For upstream port 1 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.
si2_qos_bw_regulator	bool	0x0	For upstream port 2 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.
si3_qos_bw_regulator	bool	0x0	For upstream port 3 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.
si4_qos_bw_regulator	bool	0x0	For upstream port 4 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.
si5_qos_bw_regulator	bool	0x0	For upstream port 5 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.
si6_qos_bw_regulator	bool	0x0	For upstream port 6 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.
si_system_coherency_interface	int	0x0	This parameter tells the interconnect which upstream ports should be controlled by the System Coherency Interface. Each bit corresponds to an upstream port, bit 0 to upstream port 0, etc. If the SCI port is connected but si_system_coherency_interface disable its use then messages from the upstream will be ignored and software must manage the upstream system's entrance and exit of the coherency domain.
spiden	bool	0x1	Secure invasive debug enable. If both SPIDEN and DBGEN are high, enables the counting of both Non-secure and Secure events.
spniden	bool	0x1	Whether secure and non-secure events are allowed to be counted in the performance monitor
version	string	""	The version of the interconnect. Allowed versions are:- r0p0, r1p0

3.9.7 CCN502

CCN502 Interconnect Fast Model. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CCN502 contains the following CADI targets:

- CCN5XX
- CCNCache

CCN502 contains the following MTI components:

- *4.54 CCNCache - trace* on page 4-2417
- *4.55 CCNRegisterSet - trace* on page 4-2422
- *4.102 PVBusExclusiveMonitor - trace* on page 4-2752
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760

About CCN502

CCN502 can be used for connecting components using the ACE and ACE-Lite interfaces. It has an L3 cache that can provide coherency between up to four fully coherent ACE clusters and nine I/O coherent masters. It can connect up to two memory elements to drive transaction requests. This interconnect can be configured to support six or eight crosspoints, both of which are implemented in the model.

CCN502 has three or five downstream ports, depending on the number of crosspoints:

- Two or four SNF ports for the memory controller
- One Acelite port (HNI)

Some useful parameters are:

- `cache_state_modelled`
- `cache_size_in_kbytes`
- `systemaddrmap`

The model has the following limitations:

- No support for 3 SN striping.
- If there are multiple SN-Fs, the distribution of addresses to each SN-F is not guaranteed to match the hardware.
- The parameters for the `CCNCache` subcomponent are not accessible in System Canvas.

Table 3-326 Ports

Name	Protocol	Type	Description
`pvbus_m_hni[1]`	`PVBus`	Master	HNI downstream port.
`pvbus_m_snf[4]`	`PVBus`	Master	SNF downstream ports.
`pvbus_s_rnf[4]`	`PVBus`	Slave	RNF upstream ports.
`pvbus_s_rni[9]`	`PVBus`	Slave	RNI upstream ports
`reset_in`	*Signal* on page 2-85	Slave	Reset signal.

Table 3-327 Parameters for CCNCache

Name	Type	Default value	Description
`ccn_cache.acchannelen_rnf`	`int`	`0xf`	For each upstream port, determine if it is enabled or not w.r.t. snoop requests.
`ccn_cache.acchannelen_rni`	`int`	`0xfff`	For each upstream port, determine if it is enabled or not w.r.t. dvm requests.
`ccn_cache.cache_size_kb`	`int`	`0x2000`	Number of kilo bytes in cache
`ccn_cache.cache_state_modelled`	`bool`	`0x1`	Model the cache state.

Non-Confidential

Table 3-327 Parameters for CCNCache (continued)

Name	Type	Default value	Description
ccn_cache.force_on_from_start	bool	0x0	The CCI will normally start up with snooping disabled, however, using this then we allow the model to start up as enabled without having to program it. This is only setup at simulation reset and not at signal reset. If the upstreams can ever be held in reset then you *must* connect the reset_state_of_upstream_port_3 and reset_state_of_upstream_port_4 so that it knows when to disable snoops to the upstream systems. Otherwise, the upstream system will receive snoop messages whilst in reset and it will complain that it 'received a snoop request whilst it was in reset'.
ccn_cache.number_of_phantom_entries	int	0x20	Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.
ccn_cache.periphbase	int	0x2c000000	Value for PERIPHBASE. Only bits [43:24] are used
ccn_cache.reentrancy_support	string	"env"	Must be one of: on/off/cacheglobal/env: 'on': hazard checking per cache line (normal mode), 'off': no hazard checking (use only for single master systems), 'cacheglobal': hazard checking globally for cache (not per cache line, testing feature, provokes more hazards than necessary), 'env' (or empty string): take value from FM_REENTRANCY_SUPPORT env var, if this is not set use 'on', default is 'env'
ccn_cache.sbas_bridge_present	bool	0x1	For each upstream port, determine if it is enabled or not w.r.t. dvm requests.
ccn_cache.sbsx_bridge_present	bool	0x1	For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

3.9.8 CCN504

CCN504 Interconnect Fast Model. This model is written in C++.

CCN504 contains the following CADI targets:

- CCN5XX
- CCNCache

CCN504 contains the following MTI components:

- *4.54 CCNCache - trace* on page 4-2417
- *4.55 CCNRegisterSet - trace* on page 4-2422
- *4.102 PVBusExclusiveMonitor - trace* on page 4-2752
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760

About CCN504

CCN504 has three downstream ports:

- Two SNF ports for the memory controller.
- One Acelite port (HNI).

ccn_cache.sbsx_bridge_present	bool	0x1	For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

3.9.10 CCN512

CCN512 Interconnect Fast Model. This model is written in C++.

CCN512 contains the following CADI targets:

- CCN5XX
- CCNCache

CCN512 contains the following MTI components:

- *4.54 CCNCache - trace* on page 4-2417
- *4.55 CCNRegisterSet - trace* on page 4-2422
- *4.102 PVBusExclusiveMonitor - trace* on page 4-2752
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760

About CCN512

CCN512 has an L3 cache that can provide coherency between up to 12 fully coherent ACE clusters and 24 I/O coherent masters. It can connect up to four memory elements to drive transaction requests.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

CCN512 has six downstream ports:

- Four SNF ports for the memory controller
- Two Acelite ports (HNI)

Some useful parameters are:

- `cache_state_modelled`
- `cache_size_in_mbytes`
- `systemaddrmap`

The model has the following limitations:

- No support for 3 SN striping.
- If there are multiple SN-Fs, the distribution of addresses to each SN-F is not guaranteed to match the hardware.
- The parameters for the `CCNCache` subcomponent are not accessible in System Canvas.

Table 3-332 Ports

Name	Protocol	Type	Description
`pvbus_m_hni[2]`	`PVBus`	Master	HNI downstream ports.
`pvbus_m_snf[4]`	`PVBus`	Master	SNF downstream ports.
`pvbus_s_rnf[12]`	`PVBus`	Slave	RNF upstream ports.
`pvbus_s_rni[24]`	`PVBus`	Slave	RNI upstream ports.
`reset_in`	*Signal* on page 2-85	Slave	Reset signal.

Table 3-333 Parameters for CCNCache

Name	Type	Default value	Description
`ccn_cache.acchannelen_rnf`	`int`	`0xf`	For each upstream port, determine if it is enabled or not w.r.t. snoop requests.
`ccn_cache.acchannelen_rni`	`int`	`0xfff`	For each upstream port, determine if it is enabled or not w.r.t. dvm requests.
`ccn_cache.cache_size_kb`	`int`	`0x2000`	Number of kilo bytes in cache
`ccn_cache.cache_state_modelled`	`bool`	`0x1`	Model the cache state.
`ccn_cache.force_on_from_start`	`bool`	`0x0`	The CCI will normally start up with snooping disabled, however, using this then we allow the model to start up as enabled without having to program it. This is only setup at simulation reset and not at signal reset. If the upstreams can ever be held in reset then you *must* connect the reset_state_of_upstream_port_3 and reset_state_of_upstream_port_4 so that it knows when to disable snoops to the upstream systems. Otherwise, the upstream system will receive snoop messages whilst in reset and it will complain that it 'received a snoop request whilst it was in reset'.
`ccn_cache.number_of_phantom_entries`	`int`	`0x20`	Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.

ccn_cache.sbas_bridge_present	bool	0x1	For each upstream port, determine if it is enabled or not w.r.t. dvm requests.
ccn_cache.sbsx_bridge_present	bool	0x1	For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

3.9.11 CMN600

CMN600 Interconnect Fast Model. This model is written in C++ and models version r1p1 or r3p0 of the RTL.

CMN600 contains the following CADI targets:

- CMN600
- CMN600Cache

CMN600 contains the following MTI components:

- *4.56 CMN600 - trace* on page 4-2424
- *4.58 CMN600Cache - trace* on page 4-2429
- *4.102 PVBusExclusiveMonitor - trace* on page 4-2752
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760

About CMN600

The CMN600 model supports the following:

- rnf, rni/rnd, hni, and snf/sbsx interface ports. The mapping between the port number and `NodeId` is based on the `NodeId` index. For example, RNF2 controls `pvbus_s_rnf[2]`. Its index is specified in the `node_info` register as `logical_id`. Similar behavior can be expected for HNI.

  If both RND and RNI nodes are present, then all starting rei ports are mapped to RND nodes and then the RNI nodes. For example, for CMN600 or CMN650 with two RND nodes, one RNI node, and given each RNI/RND node controls three interface ports, `pvbus_s_rni[0-2]` maps to RND0, `pvbus_s_rni[3-5]` maps to RND1 and `pvbus_s_rni[6-8]` maps to RNI0. Similarly, SNF and SBSX nodes are mapped to `pvbus_m_snf[]` ports where starting ports are mapped to SNF and then SBSX nodes.
- A parameter to define the mesh placement of the CHI nodes. The parameter `mesh_config_file` can be used in the following ways:
  - This way is recommended. Set `mesh_config_file` to the name of the yml configuration file emitted by Socrates™.
  - This way is deprecated. Set `mesh_config_file` to a JSON file, with a `.json` file extension. The JSON file has the following format:

```
{
    "mesh_row_size":4,
    "mesh_column_size":3,
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

```
    "mesh_placement" : {
    "0.0" : "RND:HND",  "1.0" : "RND:RNF",  "2.0" : "RND:RNF",
    "0.1" : "HNF:HNF",  "1.1" : "HNF:HNF",  "2.1" : "HNF:HNF",
    "0.2" : "HNF:HNF",  "1.2" : "HNF:HNF",  "2.2" : "HNF:HNF",
    "0.3" : "RND:HNF",  "1.3" : "HNF:HNF",  "2.3" : "HNF:SNF"
    }
}
```

In the `mesh_placement` tag:

- The value to the left of a colon (`:`) indicates the position of the XP. For example, `"2.3"` means the XP is positioned at coordinates X=2 and Y=3.
- The value to the right of a colon (`:`) indicates the node protocols for port 0 and port 1. For example, `"RND:HND"` means RND is attached to port 0 and HND is attached to port 1.

- The discovery feature to determine the system address of CHI nodes.
- Hashed and non-hashed memory regions, and the `sys_cache_group` for hashed memory regions.
- RN SAM and HN-F SAM memory partition size of 512MB (CMN-600 r0) and 64MB (CMN-600 r1). To select the desired partition size, use the parameter `sam_mem_partition_granularity`. This parameter can be set to either "64MB" or "512MB".
- DVM filtering using VMF registers.
- Entry/exit of RNs from snoop and DVM domains using both SYSCOREQ/SYSCOACK signals and through software using MXP syscoreq registers.
- Reading the content of the cache through HNF l3_cache_access* registers, if `cache_state_modelled` is true.
- HN-F SAM feature to allocate a range of addresses to a specific SNF.
- HN-F Cache way lock and OCM.
- The model implements version r1p1 of the RTL specification and includes CAL (Core Aggregation Layer) functionality added in r3p0.
- The `revision` parameter selects between the r1p1 and r3p0 implementations.
- CAL r2 and r3 features are supported at release quality. Further testing is planned.
- Set the environment variable `FASTSIM_CMN_DUMP_CONFIG` to 1 to print to `stdout` details of the mesh configuration and memory map for the CMN600 model.

  ——— **Note** ———

  `FASTSIM_CMN_DUMP_CONFIG` is deprecated in Fast Models release 11.12. Use the `print_cmn_ccix_config` parameter instead.

  ———————————

Model limitations

- PMU counters are not supported. Counter registers are implemented as RAZ.
- All RNI and RND nodes control three interface ports. The other variants that control one or two ports are not supported.
- QoS is not supported and all related registers are RAZ/WI.
- Error injection and error generation are not supported. All error registers are RAZ/WI.
- Power/Clock/Interrupt signals are not supported.
- RN SAM and HN-F SAM memory partition size of 128MB is not supported.
- HNT nodes are not supported.
- Atomic operations to noncachable/device regions are not supported.
- External RNSAM is not supported, except based on node type. The model populates the relevant bit in the child pointer register.
- By default, HNF hashing uses the address[12:MAX] instead of the actual address[6:MAX], due to the DMI mechanism in the model. Enable the parameter `enable_snf_hashing` to make hashing logic use the actual address[6:MAX].
- 0KB SLC data RAM and tag RAM are not supported.
- There are no constraints on mesh sizing when XID_WIDTH and YID_WIDTH = 4.
- The CML feature is supported at beta quality.

About the debug_force_snoop parameter

The CMN interconnect normally starts up with snooping disabled.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The parameters `rnf_sci_enable` and `rni_sci_enable` determine which connections are managed by the System Coherency Interface. Connections that are managed by the System Coherency Interface look after themselves for entering and leaving the coherency domain and `debug_force_snoop` has no effect on those ports.

However, for connections that are not managed by the System Coherency Interface, `debug_force_snoop` enables the system upstream of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

Therefore, software does not need to know how to turn snoops in the interconnect on and off. The reset state of the upstream rnf ports is determined by the `rnf_upstream_reset_state[]` signals and must be connected for any port that could go into reset and you want managed by `debug_force_snoop`.

If the connection is managed by SCI or can never go into reset then you need not connect this and the interconnect assumes that the upstream system is not in reset and will always enable the snoops if `ACCHANNELENSx` allows it.

If you fail to connect `rnf_upstream_reset_state[]` correctly, then the upstream system might receive snoop messages while in reset and it will complain that it received a snoop request while it was in reset.

If software overrides the enables then the next change to `rnf_upstream_reset_state[]` or the interconnect reset will overwrite the software values.

Using this operation along with software controlling the enables could confuse the software. This option does not remove the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.

Note

This parameter is for debug purposes only. Do not use it instead of correctly configuring CMN.

Table 3-334 Ports

Name	Protocol	Type	Description
`event_clusters`	*Signal* on page 2-85	Peer	CPU event communication signal from the clusters.
`event_downstream_link_signal[6]`	*Signal* on page 2-85	Master	CPU event communication signal to the CMLHub.
`event_upstream_link_signal[6]`	*Signal* on page 2-85	Slave	-
`pvbus_m_cml`	`PVBus`	Master	CML downstream ports
`pvbus_m_cml_cfg`	`PVBus`	Master	CML downstream hub configuration port
`pvbus_m_hni[8]`	`PVBus`	Master	HNI downstream ports.
`pvbus_m_snf[16]`	`PVBus`	Master	SNF downstream port.
`pvbus_s_cml`	`PVBus`	Slave	CML upstream ports
`pvbus_s_rnf[64]`	`PVBus`	Slave	RNF upstream ports.
`pvbus_s_rni[96]`	`PVBus`	Slave	RNI upstream ports.
`reset_in`	*Signal* on page 2-85	Slave	Reset signal.
`rnf_sci_s[64]`	`SystemCoherencyInterface`	Slave	System Coherency port to move the RNF master in and out of the coherency domain.

Table 3-334 Ports (continued)

Name	Protocol	Type	Description
rnf_upstream_reset_in[64]	*Signal* on page 2-85	Slave	Used by the interconnect to determine the reset state of the RNF master to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.
rni_sci_s[96]	SystemCoherencyInterface	Slave	System Coherency port to move the RNI master in and out of the coherency domain.
rni_upstream_reset_in[96]	*Signal* on page 2-85	Slave	Used by the interconnect to determine the reset state of the RNI master to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.

Table 3-335 Parameters for CMN600Cache

Name	Type	Default value	Description
cmn600_cache.cache_state_modelled	bool	0x1	Model the cache state.
cmn600_cache.force_on_from_start	bool	0x0	The CMN600 will normally start up with snooping disabled, however, using this then we allow the model to start up as enabled without having to program it. This is only setup at simulation reset and not at signal reset. If the upstreams can ever be held in reset then you *must* connect the reset_state_of_upstream_port so that it knows when to disable snoops to the upstream systems. Otherwise, the upstream system will receive snoop messages whilst in reset and it will complain that it 'received a snoop request whilst it was in reset'.
cmn600_cache.number_of_phantom_entries	int	0x20	Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.
cmn600_cache.reentrancy_support	string	"env"	Must be one of: on/off/cacheglobal/env: 'on': hazard checking per cache line (normal mode), 'off': no hazard checking (use only for single master systems), 'cacheglobal': hazard checking globally for cache (not per cache line, testing feature, provokes more hazards than necessary), 'env' (or empty string): take value from FM_REENTRANCY_SUPPORT env var, if this is not set use 'on', default is 'env'

Table 3-336 Parameters for CMN600

Name	Type	Default value	Description
acchannelen_rnf	string	"0"	For each rnf port, indicates if the port is populated with a snoop responding device or not The input value is a string, for example '0xffff' or 'ffff'
acchannelen_rni	string	"0"	For each rni port, indicates if the port is populated with a dvm responding device or not. The input value is a string, for example '0xffff' or 'ffff'
cache_state_modelled	bool	0x0	Model the cache state.
debug_force_snoop	bool	0x0	The CMN600 interconnect will normally start with snooping disabled. The parameter rnf_sci_enable and rni_sci_enable determines which connections are managed by the System Coherency Interface. For connections that are managed by the System Coherency Interface, then they will look after themselves for entering and leaving the coherency domain and this parameter has no effect for those ports. However, for connections that are _not_ managed by the System Coherency Interface, this parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if acchannelen_rnf allows it. NOTE: This parameter is for debug purpose only Do not use this parameter instead of correctly configuring CMN. Refer CMN600 documentation page for more info about this parameter in fast models reference manual
default_hni_port	int	0xffff ffff	HNI port number that is the default boot target.
enable_logger	bool	0x0	Enable PVBusLoggers for the downstream ports in the CMN model.
enable_rnsam_to_hnf_wider_hash	bool	0x0	Enable support of wider hash for the RNSAM to HNF communication. If this variable enabled, then bits[47:6] from PA used in hashing function. By default it is [47:12].
force_rnsam_internal	bool	0x1	Force all RNSAMs to be internal independently of the mesh topology.
hnf_cache_size	string	"128KB"	HNF Node Cache size in KB/MB e.g. 128KB, 2MB
hni_index_to_nodeid	string	""	A string parameter to define relation between hni port num and hni nodeid, for example 0=0x14,1=0x48
mesh_config_file	string	""	Name of a file containing mesh placement of cmn600 components
periphbase	int	0x2c00 0000	Value for PERIPHBASE. Bits [25:0] are treated 0
print_cmn_ccix_config	bool	0x0	Print information about the CCIX configuration.
print_cmn_config	bool	0x0	Print the mesh topology and children pointers acquired from the YML file.
revision	string	"r1p1"	Component revision. Currently r1p1 and r3p0 are supported.
rnd_index_to_nodeid	string	""	A string parameter to define relation between rnd port num and rnd nodeid, for example 0=0x14,1=0x48. Each rnd node covers 3 ports, so port num is multiplied by 3 to cover 3 consecutive ports. So, the ports assigned will be 0,1,2=0x14 and 3,4,5=0x48

3.9.13 CMN650

CMN650 Interconnect Fast Model. This model is written in C++ and models version r1p1 of the RTL.

CMN650 contains the following CADI targets:

- CMN650

CMN650 contains the following MTI components:

- *4.58 CMN600Cache - trace* on page 4-2429
- *4.59 CMN650 - trace* on page 4-2434
- *4.102 PVBusExclusiveMonitor - trace* on page 4-2752
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760

About CMN650

The CMN650 model supports the following:

- rnf, rni/rnd, hni, and snf/sbsx interface ports. The mapping between the port number and `NodeId` is based on the `NodeId` index. For example, RNF2 controls `pvbus_s_rnf[2]`. Its index is specified in the `node_info` register as `logical_id`. Similar behavior can be expected for HNI.

  If both RND and RNI nodes are present, then all starting rni ports are mapped to RND nodes and then the RNI nodes. For example, for CMN650 with two RND nodes, one RNI node, and given each RNI/RND node controls three interface ports, `pvbus_s_rni[0-2]` maps to RND0, `pvbus_s_rni[3-5]` maps to RND1 and `pvbus_s_rni[6-8]` maps to RNI0.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Similarly, SNF and SBSX nodes are mapped to `pvbus_m_snf[]` ports where starting ports are mapped to SNF and then SBSX nodes.

- The parameter `mesh_config_file` is used to define the mesh placement of the CHI nodes in the following ways:
  - This is recommended. Set `mesh_config_file` to the name of the yml configuration file emitted by Socrates.
  - This is deprecated. Set `mesh_config_file` to a JSON file, with a `.json` file extension. The JSON file has the following format:

```
{
    "mesh_row_size":4,
    "mesh_column_size":3,
    "mesh_placement" : {
    "0.0" : "RND:HND",  "1.0" : "RND:RNF",  "2.0" : "RND:RNF",
    "0.1" : "HNF:HNF",  "1.1" : "HNF:HNF",  "2.1" : "HNF:HNF",
    "0.2" : "HNF:HNF",  "1.2" : "HNF:HNF",  "2.2" : "HNF:HNF",
    "0.3" : "RND:HNF",  "1.3" : "HNF:HNF",  "2.3" : "HNF:SNF"
    }
}
```

    In the `mesh_placement` tag:
    - The value to the left of a colon (`:`) indicates the position of the XP. For example, `"2.3"` means the XP is positioned at coordinates X=2 and Y=3.
    - The value to the right of a colon (`:`) indicates the node protocols for port 0 and port 1. For example, `"RND:HND"` means RND is attached to port 0 and HND is attached to port 1.
- The discovery feature to determine the system address of CHI nodes.
- Hashed and non-hashed memory regions, and the `sys_cache_group` for hashed memory regions.
- DVM filtering using VMF registers.
- Entry/exit of RNs from snoop and DVM domains using both `SYSCOREQ`/`SYSCOACK` signals and through software using MXP `syscoreq` registers.
- Reading the content of the cache through HNF `l3_cache_access*` registers, if `cache_state_modelled` is true.
- The HN-F SAM feature to allocate a range of addresses to a specific SNF.
- HN-F cache way lock and OCM.
- The CAL (Core Aggregation Layer) feature.
- The CML (Coherent Multichip Link) feature.
- Use the `print_cmn_ccix_config` parameter to print to `stdout` details of the mesh configuration and memory map for the model.

Model limitations

- PMU counters are not supported. Counter registers are implemented as RAZ.
- All RNI and RND nodes control three interface ports. The other variants that control one or two ports are not supported.
- QoS is not supported and all related registers are RAZ/WI.
- Error injection and error generation are not supported. All error registers are RAZ/WI.
- Power, clock, and interrupt signals are not supported.
- RN SAM and HN-F SAM memory partition size of 128MB is not supported.
- HNT nodes are not supported.
- External RNSAM is not supported, except based on node type. The model populates the relevant bit in the child pointer register.
- By default, HNF hashing uses the address[12:MAX] instead of the actual address[6:MAX], due to the DMI mechanism in the model. Enable the parameter `enable_snf_hashing` to make hashing logic use the actual address[6:MAX].
- 0KB SLC data RAM and tag RAM are not supported.
- HNF-SNF hashing is not supported. HNSAM SNF hashing is a single memory range mapped to multiple SNFs. Example HNFSAM_Mem_Map:

```
0x0000001000 - 0x0000002000 SNF0 SNF1
```

  In this case, the interconnect hardware should hash this range between two SNFs, similarly to HNF hashing. In this release, the model does not support this SNF hashing.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SNF mapping in HNFSAM is supported. Example HNFSAM_Mem_Map:

```
0x0000001000 - 0x0000002000 SNF0
0x0000002000 - 0x0000003000 SNF1
```

About the debug_force_snoop parameter

The CMN interconnect normally starts up with snooping disabled.

The parameters `rnf_sci_enable` and `rni_sci_enable` determine which connections are managed by the System Coherency Interface. Connections that are managed by the System Coherency Interface look after themselves for entering and leaving the coherency domain and `debug_force_snoop` has no effect on those ports.

However, for connections that are not managed by the System Coherency Interface, `debug_force_snoop` enables the system upstream of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

Therefore, software does not need to know how to turn snoops in the interconnect on and off. The reset state of the upstream rnf ports is determined by the `rnf_upstream_reset_state[]` signals and must be connected for any port that could go into reset and you want managed by `debug_force_snoop`.

If the connection is managed by SCI or can never go into reset then you need not connect this and the interconnect assumes that the upstream system is not in reset and will always enable the snoops if `ACCHANNELENSx` allows it.

If you fail to connect `rnf_upstream_reset_state[]` correctly, then the upstream system might receive snoop messages while in reset and it will complain that it received a snoop request while it was in reset.

If software overrides the enables then the next change to `rnf_upstream_reset_state[]` or the interconnect reset will overwrite the software values.

Using this operation along with software controlling the enables could confuse the software. This option does not remove the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.

Note

This parameter is for debug purposes only. Do not use it instead of correctly configuring CMN.

Table 3-339 Ports

Name	Protocol	Type	Description
`event_clusters`	*Signal* on page 2-85	Peer	CPU event communication signal from the clusters.
`event_downstream_link_signal[10]`	*Signal* on page 2-85	Master	CPU event communication signal to the CMLHub.
`event_upstream_link_signal[10]`	*Signal* on page 2-85	Slave	-
`pvbus_m_cml`	`PVBus`	Master	CML downstream ports
`pvbus_m_cml_cfg`	`PVBus`	Master	CML downstream hub configuration port
`pvbus_m_hni[16]`	`PVBus`	Master	HNI downstream ports.
`pvbus_m_snf[40]`	`PVBus`	Master	SNF downstream port.
`pvbus_s_apb`	`PVBus`	Slave	APB interface port.
`pvbus_s_cml`	`PVBus`	Slave	CML upstream ports
`pvbus_s_rnf[64]`	`PVBus`	Slave	RNF upstream ports.

Table 3-340 Parameters for CMN650 (continued)

Name	Type	Default value	Description
enable_rnsam_to_hnf_wider_hash	bool	0x0	Enable support of wider hash for the RNSAM to HNF communication. If this variable enabled, then bits[47:6] from PA used in hashing function. By default it is [47:12].
force_rnsam_internal	bool	0x1	Force all RNSAMs to be internal independently of the mesh topology.
hnf_cache_size	string	"128KB"	HNF Node Cache size in KB/MB following HNF_unit_info register, accepted values: 0, 128KB, 256KB, 512KB, 1MB, 2MB, 3MB, and 4 MB
hni_index_to_nodeid	string	""	A string parameter to define relation between hni port num and hni nodeid, for example 0=0x14,1=0x48
mesh_config_file	string	""	Name of a file containing mesh placement of cmn650 components
periphbase	int	0x2000 0000	Value for PERIPHBASE. Bits [27:0] are treated 0
print_cmn_ccix_config	bool	0x0	Print information about the CCIX configuration.
print_cmn_config	bool	0x0	Print the mesh topology and children pointers acquired from the YML file.
revision	string	"r1p1"	Component revision. Currently r1p1 is supported.
rnd_index_to_nodeid	string	""	A string parameter to define relation between rnd port num and rnd nodeid, for example 0=0x14,1=0x48. Each rnd node covers 3 ports, so port num is multiplied by 3 to cover 3 consecutive ports. So, the ports assigned will be 0,1,2=0x14 and 3,4,5=0x48
rnf_index_to_nodeid	string	""	A string parameter to define relation between rnf port num and rnf nodeid, for example 0=0x14,1=0x48
rnf_sci_enable	string	"0x0"	For each rnf port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit 1 = Managed by SCI, 0 = Managed by Software. The input value is a string, for example '0xffff' or 'ffff'
rni_index_to_nodeid	string	""	A string parameter to define relation between rni port num and rni nodeid, for example 0=0x14,1=0x48. Each rni node covers 3 ports, so port num is multiplied by 3 to cover 3 consecutive ports. So, the ports assigned will be 0,1,2=0x14 and 3,4,5=0x48
rni_sci_enable	string	"0x0"	For each rni port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit 1 = Managed by SCI, 0 = Managed by Software. The input value is a string, for example '0xffff' or 'ffff'
sbsx_index_to_nodeid	string	""	A string parameter to define relation between sbsx port num and sbsx nodeid, for example 0=0x14,1=0x48
skip_cmn_config_check	bool	0x0	Skip any topology configuration checks. The maximum number of devices per type not verified.
snf_index_to_nodeid	string	""	A string parameter to define relation between snf port num and snf nodeid, for example 0=0x14,1=0x48
yml_has_node_addresses	bool	0x0	Does the top-level YML file describe node-addresses ?

3.9.14 DMC500

ARM Dynamic Memory Controller(DMC500). This model is written in C++.

DMC500 contains the following CADI targets:

- DMC500

DMC500 contains the following MTI components:

- *4.62 DMC-500 - trace* on page 4-2448
- *4.107 PVBusSlave - trace* on page 4-2760

About DMC500

A platform can have multiple instances of this component. For example:

```
//LISA instantiation
composition
{
    // Memory controllers
    dmc0    : DMC500("default_region_attributes"=dmc_default_region_attributes,
                     "default_region_id_access"=dmc_default_region_id_access,
                     "passthrough_debug_access"=true);
    dmc1    : DMC500("default_region_attributes"=dmc_default_region_attributes,
                     "default_region_id_access"=dmc_default_region_id_access,
                     "passthrough_debug_access"=true);
}
```

Differences between the model and the RTL

The model has the following limitations:

- It does not support address striping.
- It works with linear addresses and not in rank,bank,row,column form.
- It does not include any mechanism for error injection or detection.
- Scrubbing functionality is only provided from the interface point of view.
- It does not implement direct read or write commands.
- It does not implement any performance counters.
- All OR'd interrupt signals are missing from this release of the model. Users can connect the failed access interrupt as a substitute.
- The model combines separate failed access interrupts for system interfaces 1 and 2 into a single failed access interrupt.
- DMC-500 has three separate reset signals whereas this model has a single reset signal which supports the combined assertion of three resets. This model does not support separate reset signals.

Table 3-341 Ports

Name	Protocol	Type	Description
apb_pvbus_s	PVBus	Slave	Programmers interface to program and control the DMC-500.
failed_access_interrupt_signal	*Signal* on page 2-85	Master	The DMC has detected a system request that has failed a permissions check and a previously detected assertion was not cleared.
filter_pvbus_m	PVBus	Master	DMC master port from System Interface 0 to memory.
filter_pvbus_s	PVBus	Slave	System interface 0. Generally, Non-coherent Interface.
reset_signal	*Signal* on page 2-85	Slave	DMC reset.
si1_filter_pvbus_m	PVBus	Master	DMC master port from System Interface 1 to memory.
si1_filter_pvbus_s	PVBus	Slave	System interface 1. Generally, Coherent Interface.

3.9.15 DMC520

ARM Dynamic Memory Controller(DMC520). This model is written in C++.

DMC520 contains the following CADI targets:

- DMC520

DMC520 contains the following MTI components:

- *4.63 DMC-520 - trace* on page 4-2450
- *4.107 PVBusSlave - trace* on page 4-2760

About DMC520

A platform can have multiple instances of this component. For example:

```
//LISA instantiation
composition
{
    // Memory controllers
    dmc520_0            : DMC520("passthrough_debug_access"=true);
    dmc520_1            : DMC520("passthrough_debug_access"=true);
}
```

Limitations:

- The model does not support address striping.
- It works with linear addresses and not in rank,bank,row,column form.
- It does not include any mechanism for error injection or detection.
- Scrubbing functionality is only provided from the interface point of view.
- It does not implement direct read or write commands.
- It does not implement any performance counters.

Differences between the model and the RTL

The DMC520 and DMC620 models have different interfaces to those in the hardware due to the level of abstraction of memory in Fast Models. These are the differences:

- Like the hardware, the model has a slave port for configuring register accesses, `apb_pvbus_s`, and an AXI interface for incoming memory transactions that are attempting to access memory that is managed by the DMC.
- The hardware component translates incoming transactions on the AXI interface to a format that is conducive to accessing DRAM chips. The model performs TrustZone access control and models the DMC readiness state, but does not translate the transactions. If allowed, the model forwards incoming transactions to be handled by a memory storage handling component that works at the transaction level.

Table 3-342 Ports

Name	Protocol	Type	Description
`all_or_interrupt_signal`	*Signal* on page 2-85	Master	A combined interrupt that is the logical OR of the other interrupts.
`apb_pvbus_s`	`PVBus`	Slave	Programmers interface to program and control the DMC-520.
`arch_fsm_interrupt_signal`	*Signal* on page 2-85	Master	The DMC has detected a change in the architectural state.
`failed_access_interrupt_signal`	*Signal* on page 2-85	Master	The DMC has detected a system request that has failed a permissions check and a previously detected assertion was not cleared.
`filter_pvbus_m`	`PVBus`	Master	DMC master port to memory.
`filter_pvbus_s`	`PVBus`	Slave	System interface.

Table 3-342 Ports (continued)

Name	Protocol	Type	Description
reset_signal	*Signal* on page 2-85	Slave	DMC reset.
scrub_event_in[8]	*Signal* on page 2-85	Slave	Scrub event n trigger.
scrub_event_out[8]	*Signal* on page 2-85	Master	Scrub event n triggered.

3.9.16 DMC620

ARM Dynamic Memory Controller(DMC620). This model is written in C++.

DMC620 contains the following CADI targets:

- DMC620

DMC620 contains the following MTI components:

- *4.64 DMC-620 - trace* on page 4-2452
- *4.107 PVBusSlave - trace* on page 4-2760

About DMC620

The model has the following limitations:

- It does not support address striping.
- It works with linear addresses and not in rank,bank,row,column form.
- It includes error injection and detection mechanisms and syndrome registers support only for RAS error types 4 (ECC single-bit SRAM error) and 5 (ECC double-bit SRAM error).
- Scrubbing functionality is not provided.
- It does not implement direct read or write commands.
- It does not implement any performance counters.

Differences between the model and the RTL

The DMC520 and DMC620 models have different interfaces to those in the hardware due to the level of abstraction of memory in Fast Models. These are the differences:

- Like the hardware, the model has a slave port for configuring register accesses, apb_pvbus_s, and an AXI interface for incoming memory transactions that are attempting to access memory that is managed by the DMC.
- The hardware component translates incoming transactions on the AXI interface to a format that is conducive to accessing DRAM chips. The model performs TrustZone access control and models the DMC readiness state, but does not translate the transactions. If allowed, the model forwards incoming transactions to be handled by a memory storage handling component that works at the transaction level.

Table 3-343 Ports

Name	Protocol	Type	Description
all_or_interrupt_signal	*Signal* on page 2-85	Master	A combined interrupt that is the logical OR of the other interrupts.
apb_pvbus_s	PVBus	Slave	Programmers interface to program and control the DMC-620.
arch_fsm_interrupt_signal	*Signal* on page 2-85	Master	The DMC has detected a change in the architectural state.
failed_access_interrupt_signal	*Signal* on page 2-85	Master	The DMC has detected a system request that has failed a permissions check and a previously detected assertion was not cleared.

Table 3-343 Ports (continued)

Name	Protocol	Type	Description
filter_pvbus_m	PVBus	Master	DMC master port to memory.
filter_pvbus_s	PVBus	Slave	System interface.
interrupt_cfh_master	*Signal* on page 2-85	Master	The DMC has detected and corrected a single bit error on the RAM access.
interrupt_combined_oflow_master	*Signal* on page 2-85	Master	The DMC has detected a counter overflow.
interrupt_fh_master	*Signal* on page 2-85	Master	The DMC has detected a double bit error on the RAM access.
reset_signal	*Signal* on page 2-85	Slave	DMC reset.

3.9.17 DMC_400

ARM PrimeCell Dynamic Memory Controller(DMC400). This model is written in LISA+.

DMC_400 contains the following CADI targets:

- DMC_400

DMC_400 contains the following MTI components:

- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760

About DMC_400

The configuration of this model by setting the registers does not generally affect accesses to main memory.

This component has no timing information, so changing the values of the timing registers has no effect on behavior. The memory models do not attach to the component, and error checking does not update registers because the model does not include the possibility of errors.

Table 3-344 Ports

Name	Protocol	Type	Description
apb_interface	PVBus	Slave	Slave bus interface for register access.
axi_if_in[4]	PVBus	Slave	Slave bus for connecting to bus decoder.
axi_if_out[4]	PVBus	Master	Master to connect to DRAM.
clr_ex_mon	*Signal* on page 2-85	Master	Indicates when global monitors state is cleared.
user_status_ext	*Value* on page 2-85	Slave	Allow user status to be set from outside.

Table 3-345 Parameters for DMC_400

Name	Type	Default value	Description
ECC_SUPPORT	bool	0x1	Does the controller support ECC?
IF_CHIP0	int	-0x1	Set this parameter to 0 if memory is connected
IF_CHIP1	int	-0x1	Set this parameter to 0 if memory is connected
IF_CHIP2	int	-0x1	Set this parameter to 0 if memory is connected
IF_CHIP3	int	-0x1	Set this parameter to 0 if memory is connected

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-345 Parameters for DMC_400 (continued)

Name	Type	Default value	Description
MEMORY_WIDTH	int	0x20	Valid widths are 16, 32 or 64 bits
diagnostics	int	0x0	Diagnostics
revision_string	string	"r0p1"	Revision

3.9.18 EthosU55

Arm Ethos-U55 microNPU. This model is written in C++.

About EthosU55

To use this component, include the following line in your sgrepo file:

```
path = "$(PVLIB_HOME)/LISA/ethosu.sgrepo";
```

The num_macs parameter controls the number of 8x8 MACs performed per cycle. The valid values are 32, 64, 128, or 256. The default value is 128.

Limitations

This model does not support Windows hosts or GCC 4.9. It only supports Linux hosts and GCC 6.4 or GCC 7.3.

Table 3-346 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	NPU clock signal.
irq_out	*Signal* on page 2-85	Master	Sends interrupt requests to the external host application processor.
pvbus_m0	PVBus	Master	Master port 0 to access external memory.
pvbus_m1	PVBus	Master	Master port 1 to access external memory.
pvbus_s	PVBus	Slave	Slave port to access the control registers of the NPU.
resetn_in	*Signal* on page 2-85	Slave	NPU reset signal.

3.9.19 GIC500

GIC500 Component for distribution of interrupts. This model is written in C++.

GIC500 contains the following CADI targets:

- GIC500

GIC500 contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.78 GICv3InterruptTranslationService - trace* on page 4-2505
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

About GIC500

This is a single-component implementation of the GICv3 architecture with support for 256 cores. You can configure the model to support a maximum of 32 clusters with 8 cores per cluster. Use it with an Armv8-A core to deliver interrupts. It supports a single Interrupt Translation Service for message-based interrupts. It supports the architectural features, but does not support the IMPLEMENTATION DEFINED features.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

You must configure some parameters in order to use the GIC500 component. For example:

```
gic500: GIC500(
    "num_clusters" = 2,
    "cpus_per_cluster_0" = 4,
    "cpus_per_cluster_1" = 4,
    "reg-base" = 0x2c200000,
    "SPI-count" = 256
);
```

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to `stderr` the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the *MSIRewriter* on page 3-104 component can be used to create the correct data transactions based on the device ID.

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

Table 3-347 pvbus_s port

PVBus attribute	Bits used	Property encoded	Notes
`MasterID`	Bits[31:0]	Master ID that invoked the register access	-
`ExtendedID`	-	-	Not used.
`UserFlags`	-	-	Not used.

Note

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

Table 3-348 Ports

Name	Protocol	Type	Description
`cfgsdisable`	*Signal* on page 2-85	Slave	Disable some SPIs signal.
`cpu_active_0[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 0.
`cpu_active_1[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 1.
`cpu_active_10[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 10.
`cpu_active_11[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 11.
`cpu_active_12[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 12.
`cpu_active_13[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 13.
`cpu_active_14[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 14.
`cpu_active_15[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 15.
`cpu_active_16[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 16.
`cpu_active_17[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 17.
`cpu_active_18[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 18.
`cpu_active_19[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 19.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-348 Ports (continued)

Name	Protocol	Type	Description
cpu_active_2[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 2.
cpu_active_20[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 20.
cpu_active_21[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 21.
cpu_active_22[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 22.
cpu_active_23[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 23.
cpu_active_24[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 24.
cpu_active_25[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 25.
cpu_active_26[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 26.
cpu_active_27[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 27.
cpu_active_28[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 28.
cpu_active_29[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 29.
cpu_active_3[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 3.
cpu_active_30[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 30.
cpu_active_31[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 31.
cpu_active_4[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 4.
cpu_active_5[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 5.
cpu_active_6[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 6.
cpu_active_7[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 7.
cpu_active_8[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 8.
cpu_active_9[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 9.
po_reset	*Signal* on page 2-85	Slave	Power on reset.
ppi*x*_in_*n*[8]	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID*x*) of cluster *n*, where *x* is in the range 16-31 and *n* is in the range 0-31. • ID22 is typically the Debug Communications Channel (DCC) interrupt. • ID23 is typically the Performance Counter (PMU) overflow interrupt. • ID24 is typically the Cross Trigger Interface (CTI) interrupt. • ID25 is typically the virtual CPU interface maintenance interrupt. • ID26 is typically the hypervisor timer. • ID27 is typically the virtual timer. • ID29 is typically the Secure physical timer. • ID30 is typically the Non-secure physical timer.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	*GICv3Comms* on page 2-84	Master	Input from and output to CPU interface.

Table 3-349 Parameters for GIC500

Name	Type	Default value	Description
GICD_ITARGETSR-RAZWI	bool	0x0	If true, the GICD_ITARGETS registers are RAZ/WI
ITS-count	int	0x1	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
ITS-threaded-command-queue	bool	0x1	Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation
SPI-count	int	0xe0	Number of SPIs that are implemented.
cpus_per_cluster_0	int	0x1	Number of cores within cluster 0
cpus_per_cluster_1	int	0x1	Number of cores within cluster 1
cpus_per_cluster_10	int	0x1	Number of cores within cluster 10
cpus_per_cluster_11	int	0x1	Number of cores within cluster 11
cpus_per_cluster_12	int	0x1	Number of cores within cluster 12
cpus_per_cluster_13	int	0x1	Number of cores within cluster 13
cpus_per_cluster_14	int	0x1	Number of cores within cluster 14
cpus_per_cluster_15	int	0x1	Number of cores within cluster 15
cpus_per_cluster_16	int	0x1	Number of cores within cluster 16
cpus_per_cluster_17	int	0x1	Number of cores within cluster 17
cpus_per_cluster_18	int	0x1	Number of cores within cluster 18
cpus_per_cluster_19	int	0x1	Number of cores within cluster 19
cpus_per_cluster_2	int	0x1	Number of cores within cluster 2
cpus_per_cluster_20	int	0x1	Number of cores within cluster 20
cpus_per_cluster_21	int	0x1	Number of cores within cluster 21
cpus_per_cluster_22	int	0x1	Number of cores within cluster 22
cpus_per_cluster_23	int	0x1	Number of cores within cluster 23
cpus_per_cluster_24	int	0x1	Number of cores within cluster 24
cpus_per_cluster_25	int	0x1	Number of cores within cluster 25
cpus_per_cluster_26	int	0x1	Number of cores within cluster 26
cpus_per_cluster_27	int	0x1	Number of cores within cluster 27
cpus_per_cluster_28	int	0x1	Number of cores within cluster 28
cpus_per_cluster_29	int	0x1	Number of cores within cluster 29
cpus_per_cluster_3	int	0x1	Number of cores within cluster 3
cpus_per_cluster_30	int	0x1	Number of cores within cluster 30
cpus_per_cluster_31	int	0x1	Number of cores within cluster 31
cpus_per_cluster_4	int	0x1	Number of cores within cluster 4
cpus_per_cluster_5	int	0x1	Number of cores within cluster 5
cpus_per_cluster_6	int	0x1	Number of cores within cluster 6

Table 3-349 Parameters for GIC500 (continued)

Name	Type	Default value	Description
cpus_per_cluster_7	int	0x1	Number of cores within cluster 7
cpus_per_cluster_8	int	0x1	Number of cores within cluster 8
cpus_per_cluster_9	int	0x1	Number of cores within cluster 9
delay-ITS-accesses	bool	0x1	Delay accesses from the ITS until GICR_SYNCR is read.
delay-redistributor-accesses	bool	0x1	Delay memory accesses from the redistributor until GICR_SYNCR is read.
enable_protocol_checking	bool	0x0	Enable/disable protocol checking at cpu interface
enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
has-two-security-states	bool	0x1	If true, has two security states
num_clusters	int	0x1	Number of implemented affinity level1 clusters
print-memory-map	bool	0x0	Print memory map to stdout
redistributor-threaded-sync	bool	0x1	Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation
reg-base	int	0x2c010000	GIC500 base address
using-generated-memorymap	bool	0x1	Use the generated memorymap for the GIC500 and warn if superfluous parameters are passed
wakeup-on-reset	bool	0x0	Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.9.20 GIC500_ClusterPorts

GIC500 Component for distribution of interrupts. This model is written in C++.

GIC500_ClusterPorts contains the following CADI targets:

- GIC500

GIC500_ClusterPorts contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.78 GICv3InterruptTranslationService - trace* on page 4-2505
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

Table 3-350 Ports

Name	Protocol	Type	Description
cfgsdisable	*Signal* on page 2-85	Slave	Disable some SPIs signal.
cpu_active_0[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 0.
cpu_active_1[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 1.
cpu_active_10[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 10.
cpu_active_11[8]	*Signal* on page 2-85	Slave	cpu_active pins of cluster 11.

Table 3-350 Ports (continued)

Name	Protocol	Type	Description
redistributor_3[8]	GICv3Comms on page 2-84	Master	Input from and output to CPU interface for cluster 3.
redistributor_30[8]	GICv3Comms on page 2-84	Master	Input from and output to CPU interface for cluster 30.
redistributor_31[8]	GICv3Comms on page 2-84	Master	Input from and output to CPU interface for cluster 31.
redistributor_4[8]	GICv3Comms on page 2-84	Master	Input from and output to CPU interface for cluster 4.
redistributor_5[8]	GICv3Comms on page 2-84	Master	Input from and output to CPU interface for cluster 5.
redistributor_6[8]	GICv3Comms on page 2-84	Master	Input from and output to CPU interface for cluster 6.
redistributor_7[8]	GICv3Comms on page 2-84	Master	Input from and output to CPU interface for cluster 7.
redistributor_8[8]	GICv3Comms on page 2-84	Master	Input from and output to CPU interface for cluster 8.
redistributor_9[8]	GICv3Comms on page 2-84	Master	Input from and output to CPU interface for cluster 9.
reset	Signal on page 2-85	Slave	Reset.
spi_in[988]	Signal on page 2-85	Slave	Shared peripheral interrupts.
wake_request_0[8]	Signal on page 2-85	Master	Power management outputs of cluster 0.
wake_request_1[8]	Signal on page 2-85	Master	Power management outputs of cluster 1.
wake_request_10[8]	Signal on page 2-85	Master	Power management outputs of cluster 10.
wake_request_11[8]	Signal on page 2-85	Master	Power management outputs of cluster 11.
wake_request_12[8]	Signal on page 2-85	Master	Power management outputs of cluster 12.
wake_request_13[8]	Signal on page 2-85	Master	Power management outputs of cluster 13.
wake_request_14[8]	Signal on page 2-85	Master	Power management outputs of cluster 14.
wake_request_15[8]	Signal on page 2-85	Master	Power management outputs of cluster 15.
wake_request_16[8]	Signal on page 2-85	Master	Power management outputs of cluster 16.
wake_request_17[8]	Signal on page 2-85	Master	Power management outputs of cluster 17.
wake_request_18[8]	Signal on page 2-85	Master	Power management outputs of cluster 18.
wake_request_19[8]	Signal on page 2-85	Master	Power management outputs of cluster 19.
wake_request_2[8]	Signal on page 2-85	Master	Power management outputs of cluster 2.
wake_request_20[8]	Signal on page 2-85	Master	Power management outputs of cluster 20.
wake_request_21[8]	Signal on page 2-85	Master	Power management outputs of cluster 21.
wake_request_22[8]	Signal on page 2-85	Master	Power management outputs of cluster 22.
wake_request_23[8]	Signal on page 2-85	Master	Power management outputs of cluster 23.
wake_request_24[8]	Signal on page 2-85	Master	Power management outputs of cluster 24.
wake_request_25[8]	Signal on page 2-85	Master	Power management outputs of cluster 25.
wake_request_26[8]	Signal on page 2-85	Master	Power management outputs of cluster 26.
wake_request_27[8]	Signal on page 2-85	Master	Power management outputs of cluster 27.
wake_request_28[8]	Signal on page 2-85	Master	Power management outputs of cluster 28.
wake_request_29[8]	Signal on page 2-85	Master	Power management outputs of cluster 29.
wake_request_3[8]	Signal on page 2-85	Master	Power management outputs of cluster 3.

Table 3-350 Ports (continued)

Name	Protocol	Type	Description
wake_request_30[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 30.
wake_request_31[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 31.
wake_request_4[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 4.
wake_request_5[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 5.
wake_request_6[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 6.
wake_request_7[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 7.
wake_request_8[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 8.
wake_request_9[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 9.

Table 3-351 Parameters for GIC500

Name	Type	Default value	Description
GICD_ITARGETSR-RAZWI	bool	0x0	If true, the GICD_ITARGETS registers are RAZ/WI
ITS-count	int	0x1	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
ITS-threaded-command-queue	bool	0x1	Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation
SPI-count	int	0xe0	Number of SPIs that are implemented.
cpus_per_cluster_0	int	0x1	Number of cores within cluster 0
cpus_per_cluster_1	int	0x1	Number of cores within cluster 1
cpus_per_cluster_10	int	0x1	Number of cores within cluster 10
cpus_per_cluster_11	int	0x1	Number of cores within cluster 11
cpus_per_cluster_12	int	0x1	Number of cores within cluster 12
cpus_per_cluster_13	int	0x1	Number of cores within cluster 13
cpus_per_cluster_14	int	0x1	Number of cores within cluster 14
cpus_per_cluster_15	int	0x1	Number of cores within cluster 15
cpus_per_cluster_16	int	0x1	Number of cores within cluster 16
cpus_per_cluster_17	int	0x1	Number of cores within cluster 17
cpus_per_cluster_18	int	0x1	Number of cores within cluster 18
cpus_per_cluster_19	int	0x1	Number of cores within cluster 19
cpus_per_cluster_2	int	0x1	Number of cores within cluster 2
cpus_per_cluster_20	int	0x1	Number of cores within cluster 20
cpus_per_cluster_21	int	0x1	Number of cores within cluster 21
cpus_per_cluster_22	int	0x1	Number of cores within cluster 22
cpus_per_cluster_23	int	0x1	Number of cores within cluster 23
cpus_per_cluster_24	int	0x1	Number of cores within cluster 24

Table 3-351 Parameters for GIC500 (continued)

Name	Type	Default value	Description
cpus_per_cluster_25	int	0x1	Number of cores within cluster 25
cpus_per_cluster_26	int	0x1	Number of cores within cluster 26
cpus_per_cluster_27	int	0x1	Number of cores within cluster 27
cpus_per_cluster_28	int	0x1	Number of cores within cluster 28
cpus_per_cluster_29	int	0x1	Number of cores within cluster 29
cpus_per_cluster_3	int	0x1	Number of cores within cluster 3
cpus_per_cluster_30	int	0x1	Number of cores within cluster 30
cpus_per_cluster_31	int	0x1	Number of cores within cluster 31
cpus_per_cluster_4	int	0x1	Number of cores within cluster 4
cpus_per_cluster_5	int	0x1	Number of cores within cluster 5
cpus_per_cluster_6	int	0x1	Number of cores within cluster 6
cpus_per_cluster_7	int	0x1	Number of cores within cluster 7
cpus_per_cluster_8	int	0x1	Number of cores within cluster 8
cpus_per_cluster_9	int	0x1	Number of cores within cluster 9
delay-ITS-accesses	bool	0x1	Delay accesses from the ITS until GICR_SYNCR is read.
delay-redistributor-accesses	bool	0x1	Delay memory accesses from the redistributor until GICR_SYNCR is read.
enable_protocol_checking	bool	0x0	Enable/disable protocol checking at cpu interface
enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
has-two-security-states	bool	0x1	If true, has two security states
num_clusters	int	0x1	Number of implemented affinity level1 clusters
print-memory-map	bool	0x0	Print memory map to stdout
redistributor-threaded-sync	bool	0x1	Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation
reg-base	int	0x2c010000	GIC500 base address
using-generated-memorymap	bool	0x1	Use the generated memorymap for the GIC500 and warn if superfluous parameters are passed
wakeup-on-reset	bool	0x0	Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.9.21 GIC500_Filter

GIC500 Component for distribution of interrupts, filtering version for validation. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GIC500_Filter contains the following CADI targets:

- GIC500

GIC500_Filter contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.78 GICv3InterruptTranslationService - trace* on page 4-2505
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

About GIC500_Filter

This is a single-component implementation of the GICv3 architecture with support for 256 cores. You can configure the model to support a maximum of 32 clusters with 8 cores per cluster. Use it with an Armv8-A core to deliver interrupts. It supports a single Interrupt Translation Service for message-based interrupts. It supports the architectural features, but does not support the IMPLEMENTATION DEFINED features.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to `stderr` the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the *MSIRewriter* on page 3-104 component can be used to create the correct data transactions based on the device ID.

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

Table 3-352 pvbus_s port

PVBus attribute	Bits used	Property encoded	Notes
`MasterID`	Bits[31:0]	Master ID that invoked the register access	-
`ExtendedID`	-	-	Not used.
`UserFlags`	-	-	Not used.

Note

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

Table 3-353 Ports

Name	Protocol	Type	Description
`cfgsdisable`	*Signal* on page 2-85	Slave	Disable some SPIs signal.
`cpu_active_0[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 0.
`cpu_active_1[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 1.
`cpu_active_10[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 10.
`cpu_active_11[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 11.
`cpu_active_12[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 12.
`cpu_active_13[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 13.
`cpu_active_14[8]`	*Signal* on page 2-85	Slave	cpu_active pins of cluster 14.

Name	Protocol	Type	Description
ppi*x*_in_*n*[8]	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID*x*) of cluster *n*, where *x* is in the range 16-31 and *n* is in the range 0-31. • ID22 is typically the Debug Communications Channel (DCC) interrupt. • ID23 is typically the Performance Counter (PMU) overflow interrupt. • ID24 is typically the Cross Trigger Interface (CTI) interrupt. • ID25 is typically the virtual CPU interface maintenance interrupt. • ID26 is typically the hypervisor timer. • ID27 is typically the virtual timer. • ID29 is typically the Secure physical timer. • ID30 is typically the Non-secure physical timer.
pvbus_filtermiss_m	PVBus	Master	passthrough for transactions not targetting one of the pages associated with the IRI.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	*GICv3Comms* on page 2-84	Master	Input from and output to CPU interface.
reset	*Signal* on page 2-85	Slave	Reset.
spi_in[988]	*Signal* on page 2-85	Slave	Shared peripheral interrupts.
wake_request_0[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 0.
wake_request_1[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 1.
wake_request_10[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 10.
wake_request_11[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 11.
wake_request_12[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 12.
wake_request_13[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 13.
wake_request_14[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 14.
wake_request_15[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 15.
wake_request_16[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 16.
wake_request_17[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 17.
wake_request_18[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 18.
wake_request_19[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 19.
wake_request_2[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 2.
wake_request_20[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 20.
wake_request_21[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 21.
wake_request_22[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 22.
wake_request_23[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 23.

Table 3-353 Ports (continued)

Name	Protocol	Type	Description
wake_request_24[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 24.
wake_request_25[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 25.
wake_request_26[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 26.
wake_request_27[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 27.
wake_request_28[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 28.
wake_request_29[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 29.
wake_request_3[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 3.
wake_request_30[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 30.
wake_request_31[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 31.
wake_request_4[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 4.
wake_request_5[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 5.
wake_request_6[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 6.
wake_request_7[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 7.
wake_request_8[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 8.
wake_request_9[8]	*Signal* on page 2-85	Master	Power management outputs of cluster 9.

Table 3-354 Parameters for GIC500

Name	Type	Default value	Description
GICD_ITARGETSR-RAZWI	bool	0x0	If true, the GICD_ITARGETS registers are RAZ/WI
ITS-count	int	0x1	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
ITS-threaded-command-queue	bool	0x1	Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation
SPI-count	int	0xe0	Number of SPIs that are implemented.
cpus_per_cluster_0	int	0x1	Number of cores within cluster 0
cpus_per_cluster_1	int	0x1	Number of cores within cluster 1
cpus_per_cluster_10	int	0x1	Number of cores within cluster 10
cpus_per_cluster_11	int	0x1	Number of cores within cluster 11
cpus_per_cluster_12	int	0x1	Number of cores within cluster 12
cpus_per_cluster_13	int	0x1	Number of cores within cluster 13
cpus_per_cluster_14	int	0x1	Number of cores within cluster 14
cpus_per_cluster_15	int	0x1	Number of cores within cluster 15
cpus_per_cluster_16	int	0x1	Number of cores within cluster 16
cpus_per_cluster_17	int	0x1	Number of cores within cluster 17
cpus_per_cluster_18	int	0x1	Number of cores within cluster 18

Table 3-354 Parameters for GIC500 (continued)

Name	Type	Default value	Description
cpus_per_cluster_19	int	0x1	Number of cores within cluster 19
cpus_per_cluster_2	int	0x1	Number of cores within cluster 2
cpus_per_cluster_20	int	0x1	Number of cores within cluster 20
cpus_per_cluster_21	int	0x1	Number of cores within cluster 21
cpus_per_cluster_22	int	0x1	Number of cores within cluster 22
cpus_per_cluster_23	int	0x1	Number of cores within cluster 23
cpus_per_cluster_24	int	0x1	Number of cores within cluster 24
cpus_per_cluster_25	int	0x1	Number of cores within cluster 25
cpus_per_cluster_26	int	0x1	Number of cores within cluster 26
cpus_per_cluster_27	int	0x1	Number of cores within cluster 27
cpus_per_cluster_28	int	0x1	Number of cores within cluster 28
cpus_per_cluster_29	int	0x1	Number of cores within cluster 29
cpus_per_cluster_3	int	0x1	Number of cores within cluster 3
cpus_per_cluster_30	int	0x1	Number of cores within cluster 30
cpus_per_cluster_31	int	0x1	Number of cores within cluster 31
cpus_per_cluster_4	int	0x1	Number of cores within cluster 4
cpus_per_cluster_5	int	0x1	Number of cores within cluster 5
cpus_per_cluster_6	int	0x1	Number of cores within cluster 6
cpus_per_cluster_7	int	0x1	Number of cores within cluster 7
cpus_per_cluster_8	int	0x1	Number of cores within cluster 8
cpus_per_cluster_9	int	0x1	Number of cores within cluster 9
delay-ITS-accesses	bool	0x1	Delay accesses from the ITS until GICR_SYNCR is read.
delay-redistributor-accesses	bool	0x1	Delay memory accesses from the redistributor until GICR_SYNCR is read.
enable_protocol_checking	bool	0x0	Enable/disable protocol checking at cpu interface
enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
has-two-security-states	bool	0x1	If true, has two security states
num_clusters	int	0x1	Number of implemented affinity level1 clusters
print-memory-map	bool	0x0	Print memory map to stdout
redistributor-threaded-sync	bool	0x1	Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation
reg-base	int	0x2c010000	GIC500 base address

Table 3-354 Parameters for GIC500 (continued)

Name	Type	Default value	Description
`using-generated-memorymap`	`bool`	`0x1`	Use the generated memorymap for the GIC500 and warn if superfluous parameters are passed
`wakeup-on-reset`	`bool`	`0x0`	Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.9.22 GIC600

GIC-600 IRI implementation: Single chip validation/filter component variant limited to 265 PE. This model is written in C++.

GIC600 contains the following CADI targets:

- GIC600

GIC600 contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.78 GICv3InterruptTranslationService - trace* on page 4-2505
- *4.79 GICv3ProtocolChecker - trace* on page 4-2526
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

About GIC600 and GIC600_Filter

GIC600 and GIC600_Filter are minimal models of an Arm GIC-600 Generic Interrupt Controller, suitable for single-chip or multichip systems, where multichip operation has been tested, with the following exceptions:

- LPI/LPI command is implemented but untested.
- Power operation is unimplemented.

They provide a simple configuration interface that allows designers to introduce GIC600-like functionality to their systems, while only implementing the architectural behavior, as defined by the GICv3 architecture.

All implementation-specific registers and functionality are implemented.

As with the other GIC components, there are two variants of the model with slightly different memory interfaces. Both GIC600 and GIC600_Filter have a `pvbus_s` port for register accesses and a `pvbus_m` port for the LPI-related traffic from redistributors and the ITS. The `pvbus_m` port is also used to compose multichip operation.

In addition, the GIC600_Filter variant has a `pvbus_filtermiss_m` port, to which any transactions on the `pvbus_s` port and not directed to a 4K page used by the GIC are forwarded unmodified. Such transactions are terminated in the component when using the GIC600 variant.

It is recommended to use the GIC600 variant in most cases.

Non-Confidential

Also, the RAS register is implemented and various RAS errors are reported through status registers. Not all the RAS errors are available because Fast Models does not model errors that can cause ECC errors. Fast Models supports error record 0 and error record 13+.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to `stderr` the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the *MSIRewriter* on page 3-104 component can be used to create the correct data transactions based on the device ID.

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

Table 3-355 pvbus_s port

PVBus attribute	Bits used	Property encoded	Notes
`MasterID`	Bits[31:0]	Master ID that invoked the register access	-
`ExtendedID`	-	-	Not used.
`UserFlags`	-	-	Not used.

Note

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

Table 3-356 Ports

Name	Protocol	Type	Description
`chip_id`	*Value* on page 2-85	Slave	chip_id port which is valid from GIC600 r1p2. Writing to this port for prior GIC600 version will be ignored.
`cpu_active_s[256]`	*Signal* on page 2-85	Slave	CPUActive pins.
`po_reset`	*Signal* on page 2-85	Slave	Resets.
`ppi_in_n[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu *n*, where *n* is in the range 0-255.
`pvbus_m`	`PVBus`	Master	Memory bus out: transactions generated by the IRI.
`pvbus_s`	`PVBus`	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
`redistributor_m[256]`	*GICv3Comms* on page 2-84	Master	Input from and output to CPU interface.
`reset`	*Signal* on page 2-85	Slave	Resets.
`spi_in[960]`	*Signal* on page 2-85	Slave	Shared peripheral interrupts.
`wake_request[256]`	*Signal* on page 2-85	Master	Power management outputs.

Table 3-357 Parameters for GIC600

Name	Type	Default value	Description
ARE-fixed-to-one	bool	0x1	GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one
CPU-affinities	string	""	A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.
CPU-affinities-file	string	""	A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.
DS-behaviour	int	0x2	GICD_CTLR.DS field behaviour: 0:RAZ/WI, 1:RAO/WI, 2:RW
IIDR	int	0x0	GICD_IIDR and GICR_IIDR value. When the parameter is not given or is set to zero, the GIC600 model is configured to have the latest revision.
ITS-ID-bits	int	0x10	Number of interrupt bits supported by ITS.
ITS-collection-ID-bits	int	0x8	Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0
ITS-count	int	0x1	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
PPI-count	int	0x10	Selects the number of PPI available for each PE as 8(id22-27,29,30), 12(id 20-31) or 16(id 16-31)
RAS-CFI-support	bool	0x0	If true, fault handling interrupt for corrected errors is supported. Not supported otherwise.
RAS-FI-support	bool	0x0	If true, fault handling interrupt is supported. Not supported otherwise.
RAS-UE-support	bool	0x0	If true, In-band uncorrected error reporing is supported. Not supported otherwise.
RAS-UI-support	bool	0x0	If true, error recovery interrupt for uncorrected errors is supported. Not supported otherwise.
SPI-blocks	int	0x1e	Number of SPI blocks supported by the IRI, each block contains 32 SPIs
affinity-width	string	"0.8.8.8"	A dotted quad indicating the bitwidth of fields at each affinity level
chip-id	int	0x0	Chip ID when multichip operation is enabled.
chip-select-affinity-level	int	0x3	Affinity level 2 or 3 can be used for chip select, affinity width is forced to 0 for the level and above as this model supports one chip only
direct-lpi-support	bool	0x0	Enable support for LPI operations through GICR registers
enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
gict-allow-ns-reset	bool	0x1	If true, non-secure read/write access to GICT register is allowed at reset. Not allowed otherwise. This emulates gict_allow_ns tie-off signal.
max-pe-on-chip	int	0x4	Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.
multichip-threaded-dgi	bool	0x1	Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.
print-memory-map	bool	0x0	Print memory map to stdout

Table 3-357 Parameters for GIC600 (continued)

Name	Type	Default value	Description
`redistributor-group`	`string`	`""`	Redistributor grouping information with affinity as JSON : {"0": ["0.0.0.0","0.0.0.1"],"1":["0.0.1.0","0.0.1.1"]} where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.
`redistributor-group-file`	`string`	`""`	File path to redistributor grouping information with affinity as JSON. The file uses the same format as "redistributor-group" parameter.
`redistributor-power-managed-by-pwrr`	`bool`	`0x1`	GIC600 dedistributor power management is done by updating GICR_PWRR register
`reg-base`	`int`	`0x2c010000`	GIC-600 base address

3.9.23 GIC600AE

GIC-600AE IRI implementation: Single chip validation/filter component variant limited to 265 PE. This model is written in C++.

GIC600AE contains the following CADI targets:

- GIC600AE

GIC600AE contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.78 GICv3InterruptTranslationService - trace* on page 4-2505
- *4.79 GICv3ProtocolChecker - trace* on page 4-2526
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

About GIC600AE and GIC600AE_Filter

GIC600AE and GIC600AE_Filter are minimal models of an Arm GIC-600AE Generic Interrupt Controller, suitable for single-chip or multichip systems, where multichip operation has been tested, with the following exceptions:

- LPI/LPI command is implemented but untested.
- Power operation is unimplemented.

They provide a simple configuration interface that allows designers to introduce GIC600AE-like functionality to their systems, while only implementing the architectural behavior, as defined by the GICv3 architecture.

All implementation-specific registers and functionality are implemented.

As with the other GIC components, there are two variants of the model with slightly different memory interfaces. Both GIC600AE and GIC600AE_Filter have a `pvbus_s` port for register accesses and a `pvbus_m` port for the LPI-related traffic from redistributors and the ITS. The `pvbus_m` port is also used to compose multichip operation.

In addition, the GIC600AE_Filter variant has a `pvbus_filtermiss_m` port, to which any transactions on the `pvbus_s` port and not directed to a 4K page used by the GIC are forwarded unmodified. Such transactions are terminated in the component when using the GIC600AE variant.

It is recommended to use the GIC600AE variant in most cases.

Also, the RAS register is implemented and various RAS errors are reported through status registers. Not all the RAS errors are available because Fast Models does not model errors that can cause ECC errors.

Fast Models supports error record 0 and error record 13+. FMU registers are also implemented and are accessible by software.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to `stderr` the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the *MSIRewriter* on page 3-104 component can be used to create the correct data transactions based on the device ID.

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

Table 3-358 pvbus_s port

PVBus attribute	Bits used	Property encoded	Notes
`MasterID`	Bits[31:0]	Master ID that invoked the register access	-
`ExtendedID`	-	-	Not used.
`UserFlags`	-	-	Not used.

Note

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

Table 3-359 Ports

Name	Protocol	Type	Description
`apb_bus`	`PVBus`	Slave	APB4 port to FMU, which will be connected from safety island for FuSa
`chip_id`	*Value* on page 2-85	Slave	chip_id port used for multichip operation
`cpu_active_s[256]`	*Signal* on page 2-85	Slave	CPUActive pins.
`fmu_error_int`	*Signal* on page 2-85	Master	FuSa FMU error interrupt signal
`fmu_fault_int`	*Signal* on page 2-85	Master	FuSa FMU fault interrupt signal
`po_reset`	*Signal* on page 2-85	Slave	Resets. This is used as a dbg_reset in TRM, and also be used for cold reset for PMU and FMU.
`ppi_in_0[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
`ppi_in_1[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
`ppi_in_10[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
`ppi_in_100[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100.
`ppi_in_101[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101.
`ppi_in_102[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102.
`ppi_in_103[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103.
`ppi_in_104[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104.
`ppi_in_105[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105.
`ppi_in_106[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106.

ppi_in_127[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127.
ppi_in_128[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128.
ppi_in_129[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129.
ppi_in_13[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130.
ppi_in_131[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131.
ppi_in_132[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132.
ppi_in_133[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133.
ppi_in_134[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134.
ppi_in_135[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135.
ppi_in_136[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136.
ppi_in_137[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137.
ppi_in_138[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138.

Table 3-359 Ports (continued)

Name	Protocol	Type	Description
ppi_in_139[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139.
ppi_in_14[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140.
ppi_in_141[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141.
ppi_in_142[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142.
ppi_in_143[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143.
ppi_in_144[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144.
ppi_in_145[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145.
ppi_in_146[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146.
ppi_in_147[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147.
ppi_in_148[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148.
ppi_in_149[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149.
ppi_in_15[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150.
ppi_in_151[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151.
ppi_in_152[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152.
ppi_in_153[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153.
ppi_in_154[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154.
ppi_in_155[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155.
ppi_in_156[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 156.
ppi_in_157[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 157.
ppi_in_158[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 158.
ppi_in_159[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 159.
ppi_in_16[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 16.
ppi_in_160[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 160.
ppi_in_161[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 161.
ppi_in_162[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 162.
ppi_in_163[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 163.
ppi_in_164[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 164.
ppi_in_165[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 165.
ppi_in_166[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 166.
ppi_in_167[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 167.
ppi_in_168[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 168.
ppi_in_169[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169.
ppi_in_17[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.

Table 3-359 Ports (continued)

Name	Protocol	Type	Description
ppi_in_170[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170.
ppi_in_171[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171.
ppi_in_172[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172.
ppi_in_173[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 173.
ppi_in_174[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174.
ppi_in_175[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175.
ppi_in_176[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176.
ppi_in_177[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177.
ppi_in_178[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178.
ppi_in_179[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179.
ppi_in_18[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180.
ppi_in_181[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181.
ppi_in_182[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182.
ppi_in_183[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183.
ppi_in_184[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184.
ppi_in_185[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185.
ppi_in_186[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186.
ppi_in_187[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187.
ppi_in_188[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188.
ppi_in_189[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189.
ppi_in_19[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190.
ppi_in_191[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191.
ppi_in_192[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192.
ppi_in_193[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193.
ppi_in_194[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194.
ppi_in_195[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195.
ppi_in_196[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196.
ppi_in_197[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197.
ppi_in_198[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198.
ppi_in_199[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199.
ppi_in_2[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200.

Table 3-359 Ports (continued)

Name	Protocol	Type	Description
ppi_in_201[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201.
ppi_in_202[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202.
ppi_in_203[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203.
ppi_in_204[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204.
ppi_in_205[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205.
ppi_in_206[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206.
ppi_in_207[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207.
ppi_in_208[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208.
ppi_in_209[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209.
ppi_in_21[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210.
ppi_in_211[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211.
ppi_in_212[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212.
ppi_in_213[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213.
ppi_in_214[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214.
ppi_in_215[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215.
ppi_in_216[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216.
ppi_in_217[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217.
ppi_in_218[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218.
ppi_in_219[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219.
ppi_in_22[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220.
ppi_in_221[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221.
ppi_in_222[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222.
ppi_in_223[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223.
ppi_in_224[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224.
ppi_in_225[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225.
ppi_in_226[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226.
ppi_in_227[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227.
ppi_in_228[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228.
ppi_in_229[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229.
ppi_in_23[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230.
ppi_in_231[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231.
ppi_in_232[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232.

Table 3-359 Ports (continued)

Name	Protocol	Type	Description
ppi_in_99[16]	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	*GICv3Comms* on page 2-84	Master	Input from and output to CPU interface.
reset	*Signal* on page 2-85	Slave	Resets.
spi_in[960]	*Signal* on page 2-85	Slave	Shared peripheral interrupts.
wake_request[256]	*Signal* on page 2-85	Master	Power management outputs.

Table 3-360 Parameters for GIC600AE

Name	Type	Default value	Description
ARE-fixed-to-one	bool	0x1	GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one
CPU-affinities	string	""	A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.
CPU-affinities-file	string	""	A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.
DS-behaviour	int	0x2	GICD_CTLR.DS field behaviour: 0:RAZ/WI, 1:RAO/WI, 2:RW
IIDR	int	0x0	GICD_IIDR and GICR_IIDR value. When the parameter is not given or is set to zero, the GIC600 model is configured to have the latest revision.
ITS-ID-bits	int	0x10	Number of interrupt bits supported by ITS.
ITS-collection-ID-bits	int	0x8	Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0
ITS-count	int	0x1	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
PPI-count	int	0x10	Selects the number of PPI available for each PE as 8(id22-27,29,30), 12(id 20-31) or 16(id 16-31)
RAS-CFI-support	bool	0x0	If true, fault handling interrupt for corrected errors is supported. Not supported otherwise.
RAS-FI-support	bool	0x0	If true, fault handling interrupt is supported. Not supported otherwise.
RAS-UE-support	bool	0x0	If true, In-band uncorrected error reporing is supported. Not supported otherwise.
RAS-UI-support	bool	0x0	If true, error recovery interrupt for uncorrected errors is supported. Not supported otherwise.
SPI-blocks	int	0x1e	Number of SPI blocks supported by the IRI, each block contains 32 SPIs
affinity-width	string	"0.8.8.8"	A dotted quad indicating the bitwidth of fields at each affinity level

Table 3-360 Parameters for GIC600AE (continued)

Name	Type	Default value	Description
chip-id	int	0x0	Chip ID when multichip operation is enabled.
chip-select-affinity-level	int	0x3	Affinity level 2 or 3 can be used for chip select, affinity width is forced to 0 for the level and above as this model supports one chip only
direct-lpi-support	bool	0x0	Enable support for LPI operations through GICR registers
enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
gict-allow-ns-reset	bool	0x1	If true, non-secure read/write access to GICT register is allowed at reset. Not allowed otherwise. This emulates gict_allow_ns tie-off signal.
max-pe-on-chip	int	0x4	Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.
multichip-threaded-dgi	bool	0x1	Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.
print-memory-map	bool	0x0	Print memory map to stdout
redistributor-group	string	""	Redistributor grouping information with affinity as JSON : {"0": ["0.0.0.0","0.0.0.1"],"1":["0.0.1.0","0.0.1.1"]} where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.
redistributor-group-file	string	""	File path to redistributor grouping information with affinity as JSON. The file uses the same format as "redistributor-group" parameter.
redistributor-power-managed-by-pwrr	bool	0x1	GIC600 dedistributor power management is done by updating GICR_PWRR register
reg-base	int	0x2c010000	GIC-600 base address

3.9.24 GIC600AE_Filter

GIC-600AE IRI implementation: Single chip validation/filter component variant limited to 265 PE. This model is written in C++.

GIC600AE_Filter contains the following CADI targets:

- GIC600AE

GIC600AE_Filter contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.78 GICv3InterruptTranslationService - trace* on page 4-2505
- *4.79 GICv3ProtocolChecker - trace* on page 4-2526
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

About GIC600AE and GIC600AE_Filter

GIC600AE and GIC600AE_Filter are minimal models of an Arm GIC-600AE Generic Interrupt Controller, suitable for single-chip or multichip systems, where multichip operation has been tested, with the following exceptions:

- LPI/LPI command is implemented but untested.
- Power operation is unimplemented.

They provide a simple configuration interface that allows designers to introduce GIC600AE-like functionality to their systems, while only implementing the architectural behavior, as defined by the GICv3 architecture.

All implementation-specific registers and functionality are implemented.

As with the other GIC components, there are two variants of the model with slightly different memory interfaces. Both GIC600AE and GIC600AE_Filter have a `pvbus_s` port for register accesses and a `pvbus_m` port for the LPI-related traffic from redistributors and the ITS. The `pvbus_m` port is also used to compose multichip operation.

In addition, the GIC600AE_Filter variant has a `pvbus_filtermiss_m` port, to which any transactions on the `pvbus_s` port and not directed to a 4K page used by the GIC are forwarded unmodified. Such transactions are terminated in the component when using the GIC600AE variant.

It is recommended to use the GIC600AE variant in most cases.

Also, the RAS register is implemented and various RAS errors are reported through status registers. Not all the RAS errors are available because Fast Models does not model errors that can cause ECC errors. Fast Models supports error record 0 and error record 13+. FMU registers are also implemented and are accessible by software.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to `stderr` the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the *MSIRewriter* on page 3-104 component can be used to create the correct data transactions based on the device ID.

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

Table 3-361 pvbus_s port

PVBus attribute	Bits used	Property encoded	Notes
`MasterID`	Bits[31:0]	Master ID that invoked the register access	-
`ExtendedID`	-	-	Not used.
`UserFlags`	-	-	Not used.

Note

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

Table 3-362 Ports

Name	Protocol	Type	Description
`apb_bus`	`PVBus`	Slave	APB4 port to FMU, which will be connected from safety island for FuSa
`chip_id`	*Value* on page 2-85	Slave	chip_id port used for multichip operation
`cpu_active_s[256]`	*Signal* on page 2-85	Slave	CPUActive pins.
`fmu_error_int`	*Signal* on page 2-85	Master	FuSa FMU error interrupt signal
`fmu_fault_int`	*Signal* on page 2-85	Master	FuSa FMU fault interrupt signal
`po_reset`	*Signal* on page 2-85	Slave	Reset.

Table 3-362 Ports (continued)

Name	Protocol	Type	Description
ppi_in_0[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_10[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
ppi_in_100[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100.
ppi_in_101[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101.
ppi_in_102[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102.
ppi_in_103[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103.
ppi_in_104[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104.
ppi_in_105[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105.
ppi_in_106[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106.
ppi_in_107[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107.
ppi_in_108[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108.
ppi_in_109[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109.
ppi_in_11[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110.
ppi_in_111[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111.
ppi_in_112[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112.
ppi_in_113[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113.
ppi_in_114[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114.
ppi_in_115[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115.
ppi_in_116[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116.
ppi_in_117[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117.
ppi_in_118[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118.
ppi_in_119[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119.
ppi_in_12[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120.
ppi_in_121[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121.
ppi_in_122[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122.
ppi_in_123[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123.
ppi_in_124[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124.
ppi_in_125[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125.
ppi_in_126[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126.
ppi_in_127[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127.
ppi_in_128[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128.
ppi_in_129[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129.

ppi_in_166[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 166.
ppi_in_167[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 167.
ppi_in_168[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 168.
ppi_in_169[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169.
ppi_in_17[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.
ppi_in_170[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170.
ppi_in_171[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171.
ppi_in_172[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172.
ppi_in_173[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 173.
ppi_in_174[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174.
ppi_in_175[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175.
ppi_in_176[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176.
ppi_in_177[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177.
ppi_in_178[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178.
ppi_in_179[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179.
ppi_in_18[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180.
ppi_in_181[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181.
ppi_in_182[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182.
ppi_in_183[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183.
ppi_in_184[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184.
ppi_in_185[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185.
ppi_in_186[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186.
ppi_in_187[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187.
ppi_in_188[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188.
ppi_in_189[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189.
ppi_in_19[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190.
ppi_in_191[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191.
ppi_in_192[16]	Signal on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192.

ppi_in_97[16]	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97.
ppi_in_98[16]	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98.
ppi_in_99[16]	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99.
pvbus_filtermiss_m	PVBus	Master	Memory bus out. Transactions not filtered by the component.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	*GICv3Comms* on page 2-84	Master	Input from and output to CPU interface.
reset	*Signal* on page 2-85	Slave	Reset.
spi_in[960]	*Signal* on page 2-85	Slave	Shared peripheral interrupts.
wake_request[256]	*Signal* on page 2-85	Master	Power management outputs.

Table 3-363 Parameters for GIC600AE

Name	Type	Default value	Description
ARE-fixed-to-one	bool	0x1	GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one
CPU-affinities	string	""	A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.
CPU-affinities-file	string	""	A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.
DS-behaviour	int	0x2	GICD_CTLR.DS field behaviour: 0:RAZ/WI, 1:RAO/WI, 2:RW
IIDR	int	0x0	GICD_IIDR and GICR_IIDR value. When the parameter is not given or is set to zero, the GIC600 model is configured to have the latest revision.
ITS-ID-bits	int	0x10	Number of interrupt bits supported by ITS.
ITS-collection-ID-bits	int	0x8	Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0

Non-Confidential

Table 3-363 Parameters for GIC600AE (continued)

Name	Type	Default value	Description
ITS-count	int	0x1	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
PPI-count	int	0x10	Selects the number of PPI available for each PE as 8(id22-27,29,30), 12(id 20-31) or 16(id 16-31)
RAS-CFI-support	bool	0x0	If true, fault handling interrupt for corrected errors is supported. Not supported otherwise.
RAS-FI-support	bool	0x0	If true, fault handling interrupt is supported. Not supported otherwise.
RAS-UE-support	bool	0x0	If true, In-band uncorrected error reporing is supported. Not supported otherwise.
RAS-UI-support	bool	0x0	If true, error recovery interrupt for uncorrected errors is supported. Not supported otherwise.
SPI-blocks	int	0x1e	Number of SPI blocks supported by the IRI, each block contains 32 SPIs
affinity-width	string	"0.8.8.8"	A dotted quad indicating the bitwidth of fields at each affinity level
chip-id	int	0x0	Chip ID when multichip operation is enabled.
chip-select-affinity-level	int	0x3	Affinity level 2 or 3 can be used for chip select, affinity width is forced to 0 for the level and above as this model supports one chip only
direct-lpi-support	bool	0x0	Enable support for LPI operations through GICR registers
enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
gict-allow-ns-reset	bool	0x1	If true, non-secure read/write access to GICT register is allowed at reset. Not allowed otherwise. This emulates gict_allow_ns tie-off signal.
max-pe-on-chip	int	0x4	Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.
multichip-threaded-dgi	bool	0x1	Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.
print-memory-map	bool	0x0	Print memory map to stdout
redistributor-group	string	""	Redistributor grouping information with affinity as JSON : {"0": ["0.0.0.0","0.0.0.1"],"1":["0.0.1.0","0.0.1.1"]} where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.
redistributor-group-file	string	""	File path to redistributor grouping information with affinity as JSON. The file uses the same format as "redistributor-group" parameter.
redistributor-power-managed-by-pwrr	bool	0x1	GIC600 dedistributor power management is done by updating GICR_PWRR register
reg-base	int	0x2c010000	GIC-600 base address

3.9.25 GIC600_Filter

GIC-600 IRI implementation: Single chip validation/filter component variant limited to 265 PE. This model is written in C++.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

GIC600_Filter contains the following CADI targets:

- GIC600

GIC600_Filter contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.78 GICv3InterruptTranslationService - trace* on page 4-2505
- *4.79 GICv3ProtocolChecker - trace* on page 4-2526
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

About GIC600 and GIC600_Filter

GIC600 and GIC600_Filter are minimal models of an Arm GIC-600 Generic Interrupt Controller, suitable for single-chip or multichip systems, where multichip operation has been tested, with the following exceptions:

- LPI/LPI command is implemented but untested.
- Power operation is unimplemented.

They provide a simple configuration interface that allows designers to introduce GIC600-like functionality to their systems, while only implementing the architectural behavior, as defined by the GICv3 architecture.

All implementation-specific registers and functionality are implemented.

As with the other GIC components, there are two variants of the model with slightly different memory interfaces. Both GIC600 and GIC600_Filter have a `pvbus_s` port for register accesses and a `pvbus_m` port for the LPI-related traffic from redistributors and the ITS. The `pvbus_m` port is also used to compose multichip operation.

In addition, the GIC600_Filter variant has a `pvbus_filtermiss_m` port, to which any transactions on the `pvbus_s` port and not directed to a 4K page used by the GIC are forwarded unmodified. Such transactions are terminated in the component when using the GIC600 variant.

It is recommended to use the GIC600 variant in most cases.

Also, the RAS register is implemented and various RAS errors are reported through status registers. Not all the RAS errors are available because Fast Models does not model errors that can cause ECC errors. Fast Models supports error record 0 and error record 13+.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to `stderr` the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the *MSIRewriter* on page 3-104 component can be used to create the correct data transactions based on the device ID.

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

Table 3-364 pvbus_s port

PVBus attribute	Bits used	Property encoded	Notes
`MasterID`	Bits[31:0]	Master ID that invoked the register access	-
`ExtendedID`	-	-	Not used.
`UserFlags`	-	-	Not used.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Note

The pvbus_m port does not use MasterID, ExtendedID, or UserFlags.

Table 3-365 Ports

Name	Protocol	Type	Description
chip_id	*Value* on page 2-85	Slave	chip_id port which is valid from GIC600 r1p2. Writing to this port for prior GIC600 version will be ignored.
cpu_active_s[256]	*Signal* on page 2-85	Slave	CPUActive pins.
po_reset	*Signal* on page 2-85	Slave	Reset.
ppi_in_*n*[16]	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu *n*, where *n* is in the range 0-255.
pvbus_filtermiss_m	PVBus	Master	Memory bus out. Transactions not filtered by the component.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	*GICv3Comms* on page 2-84	Master	Input from and output to CPU interface.
reset	*Signal* on page 2-85	Slave	Reset.
spi_in[960]	*Signal* on page 2-85	Slave	Shared peripheral interrupts.
wake_request[256]	*Signal* on page 2-85	Master	Power management outputs.

Table 3-366 Parameters for GIC600

Name	Type	Default value	Description
ARE-fixed-to-one	bool	0x1	GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one
CPU-affinities	string	""	A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.
CPU-affinities-file	string	""	A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.
DS-behaviour	int	0x2	GICD_CTLR.DS field behaviour: 0:RAZ/WI, 1:RAO/WI, 2:RW
IIDR	int	0x0	GICD_IIDR and GICR_IIDR value. When the parameter is not given or is set to zero, the GIC600 model is configured to have the latest revision.
ITS-ID-bits	int	0x10	Number of interrupt bits supported by ITS.
ITS-collection-ID-bits	int	0x8	Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0
ITS-count	int	0x1	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
PPI-count	int	0x10	Selects the number of PPI available for each PE as 8(id22-27,29,30), 12(id 20-31) or 16(id 16-31)

About GIC_400

This component is a wrapper that permits easier configuration of the v7_VGIC component that supports parameterized configuration.

The GIC-400 has several memory-mapped interfaces at the same address. The processor that is communicating with the GIC-400 banks them. The GIC-400 must be able to distinguish from which processor a transaction originates. In the hardware, the AUSER fields on AXI supply this information to the GIC-400. In the model, there is no exact equivalent to this field. However, each transaction has a `master_id` that the model can use to identify the originating processor.

Arm clusters assign the `master_id` as follows:

- Bits[31:16]: SBZ, which the GIC-400 ignores.
- Bits[5:2]: CLUSTERID.
- Bits[1:0]: cpu_id within cluster.

CLUSTERID is the 4-bit field that either a parameter on the processor sets or a value on the `clusterid` port drives. CPUID is the core number within the cluster. CLUSTERID appears in the CP15 register space as part of the MPIDR register.

The Arm architecture suggests that each cluster in the system is given a different CLUSTERID. This distinction is essential for the VGIC to identify the cluster. The parameters in the GIC-400 component permit it to construct the map of `master_id` to interface number.

Processor interfaces that the GIC-400 supports have these parameters:

- `interfaceN.cluster_id`.
- `interfaceN.core_id`.
- `interfaceN.inout_port_number_to_use`.

N is the interface number (0-7). The `cluster_id` and `core_id` tell the GIC-400 to map that cluster or core combination to interface N.

In using `inout_port_number_to_use`, the GIC-400 has some input and output ports that pair with a particular processor interface. For example:

- The `irqcpu[]` pin wires to the `irq` port of the corresponding processor.
- The `cntpnsirq` pin from the processor wires to a `cntpnsirq[]` pin on GIC-400 to transport a *Private Peripheral Interrupt* (PPI) from the processor to the GIC-400.

The `interfaceN.inout_port_number_to_use` parameter supports clusters that can have variable numbers of cores. It tells the GIC-400 that to send to or receive a signal from the processor that is attached to interface N, it must use these pins:

- `irqout[interfaceN.inout_port_number_to_use]`.
- `fiqout[interfaceN.inout_port_number_to_use]`.
- `virqout[interfaceN.inout_port_number_to_use]`.
- `vfiqout[interfaceN.inout_port_number_to_use]`.
- `legacyirq[interfaceN.inout_port_number_to_use]`.
- `cntpnsirq[interfaceN.inout_port_number_to_use]`.
- `cntpsirq[interfaceN.inout_port_number_to_use]`.
- `legacyfiq[interfaceN.inout_port_number_to_use]`.
- `cntvirq[interfaceN.inout_port_number_to_use]`.
- `cnthpirq[interfaceN.inout_port_number_to_use]`.
- ...

`legacyirq` and `legacyfiq` are not signals from the processor but are signals into the GIC-400 from the legacy interrupt system. They are wired to PPIs. If the control registers of the GIC-400 are set up in particular ways, they can also bypass the GIC-400. See *ARM Generic Interrupt Controller Architecture version 2.0 Architecture Specification* for more information.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The fabric between the clusters and the GIC might remap the `master_id` of a transaction. If so, then the GIC might lose the ability to identify the originating processor. The fabrics that ARM ships in Fast Models perform no such transformation.

The comparison that the GIC-400 performs on the `master_id` is only on the bottom 6 bits of the `master_id`. It ignores the rest. If you are writing your own fabric and do not properly propagate the `master_id` or transform it, the GIC-400 might not be able to identify the processor. The source code for the GIC_400 component can be examined to see how it might be adapted for it to understand different `master_id` schemes.

Differences between the model and the RTL

The GIC-400 model has these limitations:

- Reads and writes to GICD_ISACTIVERn/GICD_ICACTIVERn/GICD_ISPENDRn/ GICD_ICPENDRn might not work as expected unless there is a configured target in GICD_ICFGRm.
- Some of the interaction of GICD_CTLR.EnableGrpX and level sensitive interrupts might not work correctly.
- It does not model the signals nIRQOUT/nFIQOUT.
- It models interrupts with positive logic, rather than the negative logic that the hardware uses. Hence, the signal pins omit the “n” prefix in their names.

Table 3-367 Ports

Name	Protocol	Type	Description
`cfgsdisable`	*Signal* on page 2-85	Slave	Disable write access to some GIC registers.
`cnthpirq[8]`	*Signal* on page 2-85	Slave	Secure physical timer event. PPI interrupt id 26.
`cntpnsirq[8]`	*Signal* on page 2-85	Slave	Non-secure physical timer event. PPI interrupt id 30.
`cntpsirq[8]`	*Signal* on page 2-85	Slave	Secure physical timer event. PPI interrupt id 29.
`cntvirq[8]`	*Signal* on page 2-85	Slave	Virtual timer event. PPI interrupt id 27.
`fiqcpu[8]`	*Signal* on page 2-85	Master	FIQ signal to the corresponding processor.
`fiqout[8]`	*Signal* on page 2-85	Master	FIQOUT signal to the corresponding processor.
`irqcpu[8]`	*Signal* on page 2-85	Master	IRQ signal to the corresponding processor.
`irqout[8]`	*Signal* on page 2-85	Master	IRQOUT signal to the corresponding processor.
`irqs[480]`	*Signal* on page 2-85	Slave	Interrupt request input lines for the GIC.
`legacyfiq[8]`	*Signal* on page 2-85	Slave	Signal into the GIC-400 from the legacy interrupt system. PPI interrupt id 28.
`legacyirq[8]`	*Signal* on page 2-85	Slave	Signal into the GIC-400 from the legacy interrupt system. PPI interrupt id 31.
`pvbus_s`	`PVBus`	Slave	Handles incoming transactions from PVBus masters.
`reset_signal`	*Signal* on page 2-85	Slave	Reset signal input.
`vfiqcpu[8]`	*Signal* on page 2-85	Master	Virtual FIQ signal to the processor.
`virqcpu[8]`	*Signal* on page 2-85	Master	Virtual IRQ signal to the processor.

Table 3-368 Parameters for GIC_400

Name	Type	Default value	Description
`enable_log_errors`	`bool`	`0x0`	Enable logging of errors
`enable_log_fatal`	`bool`	`0x0`	Enable logging of fatal errors

Table 3-368 Parameters for GIC_400 (continued)

Name	Type	Default value	Description
enable_log_warnings	bool	0x0	Enable logging of warnings
enabled	bool	0x1	Enable the component. If it is disabled then all register writes will have no effect.

3.9.27 GIC_IRI

GIC metacomponent for redistribution of interrupts(contains Distributor, and configurable numbers of ITSs and Redistributors. This model is written in C++.

GIC_IRI contains the following CADI targets:

- GIC_IRI

GIC_IRI contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

Table 3-369 Ports

Name	Protocol	Type	Description
cfgsdisable	*Signal* on page 2-85	Slave	Disable some SPIs signal.
extended_ppi_in_*n*[64]	*Signal* on page 2-85	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu *n*, where *n* is in the range 0-255.
extended_spi_in[1024]	*Signal* on page 2-85	Slave	Extended Shared peripheral interrupts.
msi_error_interrupt	*Signal* on page 2-85	Master	When report of MSI error allowed through interrupt, loop-back this signal to relevant IRQ input signal
po_reset	*Signal* on page 2-85	Slave	Resets.
ppi_in_*n*[16]	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu *n*, where *n* is in the range 0-255.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	*GICv3Comms* on page 2-84	Master	Input from and output to CPU interface.
reset	*Signal* on page 2-85	Slave	Resets.
spi_in[988]	*Signal* on page 2-85	Slave	Shared peripheral interrupts.
wake_request[256]	*Signal* on page 2-85	Master	Power management outputs.
wire_to_msi_0[1024]	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 0.
wire_to_msi_1[1024]	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 1.
wire_to_msi_2[1024]	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 2.
wire_to_msi_3[1024]	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 3.

Table 3-370 Parameters for GIC_IRI

Name	Type	Default value	Description
A3-affinity-supported	bool	0x0	Device supports affinity level 3 values that are non-zero.
ARE-fixed-to-one	bool	0x0	GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one
CPU-affinities	string	""	A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.
CPU-affinities-file	string	""	A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.
DPG-ARE-only	bool	0x0	Limit application of DPG bits to interrupt groups for which ARE=1
DPG-bits-implemented	bool	0x0	Enable implementation of interrupt group participation bits or DPG bits in GICR_CTLR
DS-fixed-to-zero	bool	0x0	Enable/disable support of single security state
GICD-alias	int	0x0	In GICv2 mode: the base address for a 4k page alias of the first 4k of the Distributor page, in GICv3 mode. the base address of a 64KB page containing message based SPI signalling register aliases(0:Disabled)
GICD-legacy-registers-as-reserved	bool	0x0	When ARE is RAO/WI, makes superfluous registers in GICD reserved (including for the purpose of STATUSR updates)
GICD_CTLR-DS-1-means-secure-only	bool	0x0	If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.
GICD_ITARGETSR-RAZWI	bool	0x0	If true, the GICD_ITARGETS registers are RAZ/WI
GICD_PIDR	int	0x0	The value for the GICD_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
GICR-clear-enable-supported	bool	0x0	When true, this sets the value of the RO bit GICR_CTLR.CES with the value of the parameter allow-LPIEN-clear, making it visible to software
GICR-invalidate-registers-implemented	bool	0x0	When true, the registers GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented
GICR_PIDR	int	0x0	The value for the GICR_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
GICR_PROPBASER-read-only	bool	0x0	GICR_PROPBASER register is read-only.
GICR_PROPBASER-reset-value	int	0x0	Value of GICR_PROPBASER on reset.
GITS_BASER0-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER0 register.
GITS_BASER0-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER0 register is RAZ/WI.
GITS_BASER0-type	int	0x0	Type field for GITS_BASER0 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER1-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER1 register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-370 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
GITS_BASER1-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER1 register is RAZ/WI.
GITS_BASER1-type	int	0x0	Type field for GITS_BASER1 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER2-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER2 register.
GITS_BASER2-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER2 register is RAZ/WI.
GITS_BASER2-type	int	0x0	Type field for GITS_BASER2 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER3-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER3 register.
GITS_BASER3-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER3 register is RAZ/WI.
GITS_BASER3-type	int	0x0	Type field for GITS_BASER3 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER4-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER4 register.
GITS_BASER4-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER4 register is RAZ/WI.
GITS_BASER4-type	int	0x0	Type field for GITS_BASER4 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER5-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER5 register.
GITS_BASER5-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER5 register is RAZ/WI.
GITS_BASER5-type	int	0x0	Type field for GITS_BASER5 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER6-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER6 register.
GITS_BASER6-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER6 register is RAZ/WI.
GITS_BASER6-type	int	0x0	Type field for GITS_BASER6 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER7-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER7 register.
GITS_BASER7-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER7 register is RAZ/WI.
GITS_BASER7-type	int	0x0	Type field for GITS_BASER7 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_PIDR	int	0x0	The value for the GITS_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.

Table 3-370 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
ICFGR-PPI-mask	int	0xaaaaaaaa	Mask for writes to ICFGR registers that configure PPIs
ICFGR-PPI-reset	int	0x0	Reset value for ICFGR regesters that configure PPIs
ICFGR-SGI-mask	int	0x0	Mask for writes to ICFGR registers that configure SGIs
ICFGR-SGI-reset	int	0xaaaaaaaa	Reset value for ICFGR registers that configure SGIs
ICFGR-SPI-mask	int	0xaaaaaaaa	Mask for writes to ICFGR registers that configure SPIs
ICFGR-SPI-reset	int	0x0	Reset value for ICFGR regesters that configure SPIs
ICFGR-rsvd-bit	bool	0x0	If ARE=0, the value of reserved bits i.e. bit 0,2,4..30 of ICFGRn for n>0
IGROUP-PPI-mask	int	0xffff	Mask for writes to PPI bits in IGROUP registers
IGROUP-PPI-reset	int	0x0	Reset value for SGI bits in IGROUP registers
IGROUP-SGI-mask	int	0xffff	Mask for writes to SGI bits in IGROUP registers
IGROUP-SGI-reset	int	0x0	Reset value for SGI bits in IGROUP registers
IIDR	int	0x0	GICD_IIDR and GICR_IIDR value
IRI-ID-bits	int	0x10	Number of bits used to represent interrupts IDs in the Distributor and Redistributors, forced to 10 when none of LPIs, extended SPIs or extended PPIs is supported
IROUTER-IRM-RAZ-WI	bool	0x0	GICD_IROUTERn.InterruptRoutingMode is RAZ/WI
ITS-BASER-force-page-alignement	bool	0x1	Force alignement of address writen to a GITS_BASER register to the page size configured
ITS-ID-bits	int	0x10	Number of interrupt bits supported by ITS.
ITS-MOVALL-update-collections	bool	0x0	Whether MOVALL command updates the collection entires
ITS-TRANSLATE64R	bool	0x0	Add an implementation specific register at 0x10008 supporting 64 bit TRANSLATER (dev[63:32], interupt[31:0])
ITS-collection-ID-bits	int	0x0	Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0
ITS-count	int	0x0	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-cumulative-collection-tables	bool	0x1	When true, the supported amount of collections is the sum of GITS_TYPER.HCC and the number of collections supported in memory, otherwise, simply the number supported in memory only. Irrelevant when HCC=0
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
ITS-entry-size	int	0x8	Number of bytes required to store each entry in the ITT tables.
ITS-hardware-collection-count	int	0x0	Number of hardware collections held exclusively in the ITS
ITS-legacy-iidr-typer-offset	bool	0x0	Put the GITS_IIDR and GITS_TYPER registers at their older offset of 0x8 and 0x4 respectively
ITS-shared-vPE-table	int	0x0	Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.

Non-Confidential

Table 3-370 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
ITS-threaded-command-queue	bool	0x1	Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation
ITS-use-physical-target-addresses	bool	0x1	Use physical hardware adresses for targets in ITS commands -- must be true for distributed implementations
ITS-vmovp-bit	bool	0x0	Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.
ITS0-base	int	0x0	Register base address for ITS0 (automatic if 0).
ITS1-base	int	0x0	Register base address for ITS1 (automatic if 0).
ITS2-base	int	0x0	Register base address for ITS2 (automatic if 0).
ITS3-base	int	0x0	Register base address for ITS3 (automatic if 0).
LPI-cache-check-data	bool	0x0	Enable Cached LPI data against memory checking when available for cache type
LPI-cache-type	int	0x1	Cache type for LPIs, 0:No caching, 1:Full caching
MSI_IIDR	int	0x0	Value returned in MSI_IIDR registers.
MSI_NS-frame0-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 0 registers.
MSI_NS-frame0-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.
MSI_NS-frame0-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.
MSI_NS-frame1-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 1 registers.
MSI_NS-frame1-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.
MSI_NS-frame1-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.
MSI_NS-frame2-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 2 registers.
MSI_NS-frame2-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.
MSI_NS-frame2-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.
MSI_NS-frame3-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 3 registers.
MSI_NS-frame3-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.
MSI_NS-frame3-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.
MSI_NS-frame4-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 4 registers.
MSI_NS-frame4-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.
MSI_NS-frame4-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.

Table 3-370 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
MSI_NS-frame5-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 5 registers.
MSI_NS-frame5-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.
MSI_NS-frame5-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.
MSI_NS-frame6-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 6 registers.
MSI_NS-frame6-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.
MSI_NS-frame6-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.
MSI_NS-frame7-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 7 registers.
MSI_NS-frame7-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.
MSI_NS-frame7-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.
MSI_PIDR	int	0x0	The value for the MSI_PIDR registers, if non-zero and distributor supports GICv2m. Note: fixed fields (device type etc.) will be overriden in this value.
MSI_S-frame0-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 0 registers.
MSI_S-frame0-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.
MSI_S-frame0-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.
MSI_S-frame1-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 1 registers.
MSI_S-frame1-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.
MSI_S-frame1-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.
MSI_S-frame2-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 2 registers.
MSI_S-frame2-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.
MSI_S-frame2-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.
MSI_S-frame3-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 3 registers.
MSI_S-frame3-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.
MSI_S-frame3-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.
MSI_S-frame4-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 4 registers.
MSI_S-frame4-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-370 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
MSI_S-frame4-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.
MSI_S-frame5-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 5 registers.
MSI_S-frame5-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.
MSI_S-frame5-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.
MSI_S-frame6-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 6 registers.
MSI_S-frame6-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.
MSI_S-frame6-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.
MSI_S-frame7-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 7 registers.
MSI_S-frame7-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.
MSI_S-frame7-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.
PA_SIZE	int	0x30	Number of valid bits in physical address
PPI-implemented-mask	int	0xffff	Mask of PPIs that are implemented. One bit per PPI bit 0 == PPI 16 (first PPI). This will affect other masks.
SPI-count	int	0xe0	Number of SPIs that are implemented.
SPI-message-based-support	bool	0x1	Distributor supports meassage based signaling of SPI
SPI-unimplemented	string	""	A comma spearated list of unimplemented SPIs ranges for sparse SPI defintion(for ex: '35, 39-42, 73)'
STATUSR-implemented	bool	0x1	Determines whether the GICR_STATUSR register is implemented.
allow-LPIEN-clear	bool	0x0	Allow RW behaviour on GICR_CTLR.LPIEN isntead of set once
chip-id	int	0x0	Chip ID when multichip operation is enabled.
common-lpi-configuration	int	0x0	Describes which re-distributors share (and must be configured with the same) LPI configuration table as described in GICR_TYPER(0:All, 1:A.x.x.x, 2:A.B.x.x, 3:A.B.C.x
common-vPE-table-affinity	string	""	Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.
consolidators	string	""	Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form 'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1, [etc]' (eg '0x3f100000:64:4096, 0x3f200000:64:4224'). The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.

Table 3-370 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
delay-ITS-accesses	bool	0x1	Delay accesses from the ITS until GICR_SYNCR is read.
delay-redistributor-accesses	bool	0x1	Delay memory accesses from the redistributor until GICR_SYNCR is read.
direct-lpi-support	bool	0x0	Enable support for LPI operations through GICR registers
enable-multichip-operation	bool	0x0	Enables multi-chip operation between Distributors in distributed GIC IRI
enable_protocol_checking	bool	0x0	Enable/disable protocol checking at cpu interface
enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
extended-ppi-count	int	0x0	Number of extended PPI supported
extended-spi-count	int	0x0	Number of extended SPI supported
fixed-routed-spis	string	""	Value of IROUTER[n] register in the form 'n=a.b.c.d, n=*'. The RM bit of IROUTER is 0 when n=a.b.c.d is used else 1 when n=* is used. n can be >= 32 and <= 1019
gicv2-only	bool	0x0	If true, when using the GICv3 model, pretend to be a GICv2 system
has-two-security-states	bool	0x1	If true, has two security states
has_VPENDBASER-dirty-flag-on-load	bool	0x0	GICR_VPENDBASER.Dirty reflects transient loading state when valid=1
has_mpam	bool	0x0	Enable MPAM support on ITS and RDs
ignore-generate-sgi-when-no-are	bool	0x0	Ignore GenerateSGI packets coming form the CPU interface if both ARE_S and ARE_NS are 0
irouter-default-mask	string	""	Default Mask value for IROUTER[32..1019] register in the form 'a.b.c.d'
irouter-default-reset	string	""	Default Reset Value of IROUTER[32..1019] register in the form 'a.b.c.d' or *
irouter-mask-values	string	""	Mask Value of IROUTER[n] register in the form 'n=a.b.c.d'.n can be >= 32 and <= 1019
irouter-reset-values	string	""	Reset Value of IROUTER[n] register in the form 'n=a.b.c.d or n=*'.n can be >= 32 and <= 1019
legacy-sgi-enable-rao	bool	0x0	Enables for SGI associated with an ARE=0 regime are RAO/WI
local-SEIs	bool	0x0	Generate SEI to signal internal issues
local-VSEIs	bool	0x0	Generate VSEI to signal internal issues
lockable-SPI-count	int	0x0	Number of SPIs that are locked down when CFGSDISABLE signal is asserted. Only applies for GICv2.
max-pe-on-chip	int	0x4	Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.
monolithic	bool	0x0	Indicate that the implementation is not distributed
mpam_max_partid	int	0xffff	Maximum valid PARTID
mpam_max_pmg	int	0xff	Maximum valid PMG

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-370 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
multichip-threaded-dgi	bool	0x1	Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.
non-ARE-core-count	int	0x8	Maximum number of non-ARE cores; normally used to pass the cluster-level NUM_CORES parameter to the top-level redistributor.
outer-cacheability-support	bool	0x0	Allow configuration of outer cachability attributes in ITS and Redistributor
output_attributes	string	"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS"	User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.
print-memory-map	bool	0x0	Print memory map to stdout
priority-bits	int	0x5	Number of implemented priority bits
processor-numbers	string	""	Specify processor numbers (as appears in GICR_TYPER) in the form 0.0.0.0=0,0.0.0.1=1 etc.) If not specified, will number processors starting at 0.
redistributor-threaded-sync	bool	0x1	Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation
reg-base	int	0x2c010000	Base for decoding GICv3 registers.
reg-base-per-redistributor	string	""	Base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If reg-base-per-redistributor-file is specified, this parameter is ignored.
reg-base-per-redistributor-file	string	""	Path to file containing the base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If this parameter is specified, reg-base-per-redistributor parameter will be ignored even when it is given.
report-MSI-error-via-statusr	int	0x0	Report MSI error via GITS_STATUSR. (0:unsupported, 1:report by GITS_STATUSR, 2:report by GITS_STATUSR and interrupt as well).
sgi-range-selector-support	bool	0x0	Device has support for the Range Selector feature for SGI
single-set-support	bool	0x0	When true, forces redistributors to recall interrupts with a clear rather than issue a second Set command
supports-shareability	bool	0x1	Device supports shareability attributes on outgoing memory bus (i.e. is modelling an ACElite port rather than an AXI4 port).
trace-speculative-lpi-property-update	bool	0x0	Trace LPI propery updates performed on speculative accesses (useful for debuging LPI)
virtual-lpi-support	bool	0x0	GICv4 Virtual LPIs and Direct injection of Virtual LPIs supported

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-370 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
virtual-priority-bits	int	0x5	Number of implemented virtual priority bits
wakeup-on-reset	bool	0x0	Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.9.28 GIC_IRI_Filter

GIC metacomponent for redistribution of interrupts(contains Distributor, and configurable numbers of ITSs and Redistributors. Validation only version. This model is written in C++.

GIC_IRI_Filter contains the following CADI targets:

- GIC_IRI

GIC_IRI_Filter contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

Table 3-371 Ports

Name	Protocol	Type	Description
cfgsdisable	*Signal* on page 2-85	Slave	Disable some SPIs signal.
extended_ppi_in_*n*[64]	*Signal* on page 2-85	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu *n*, where *n* is in the range 0-255.
extended_spi_in[1024]	*Signal* on page 2-85	Slave	Extended Shared peripheral interrupts.
msi_error_interrupt	*Signal* on page 2-85	Master	When report of MSI error allowed through interrupt, loop-back this signal to relevant IRQ input signal
po_reset	*Signal* on page 2-85	Slave	Resets.
ppi_in_*n*[16]	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu *n*, where *n* is in the range 0-255.
pvbus_filtermiss_m	PVBus	Master	Passthrough for accesses to pages not used by the GIC IRI.
pvbus_m	PVBus	Master	Memory bus for transactions generated by the GIC.
pvbus_s	PVBus	Slave	Memory bus in.
redistributor_m[256]	*GICv3Comms* on page 2-84	Master	Input from and output to CPU interface.
reset	*Signal* on page 2-85	Slave	Resets.
spi_in[988]	*Signal* on page 2-85	Slave	Shared peripheral interrupts.
wake_request[256]	*Signal* on page 2-85	Master	Power management outputs.
wire_to_msi_0[1024]	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 0.
wire_to_msi_1[1024]	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 1.
wire_to_msi_2[1024]	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 2.
wire_to_msi_3[1024]	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 3.

Table 3-372 Parameters for GIC_IRI

Name	Type	Default value	Description
A3-affinity-supported	bool	0x0	Device supports affinity level 3 values that are non-zero.
ARE-fixed-to-one	bool	0x0	GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one
CPU-affinities	string	""	A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.
CPU-affinities-file	string	""	A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.
DPG-ARE-only	bool	0x0	Limit application of DPG bits to interrupt groups for which ARE=1
DPG-bits-implemented	bool	0x0	Enable implementation of interrupt group participation bits or DPG bits in GICR_CTLR
DS-fixed-to-zero	bool	0x0	Enable/disable support of single security state
GICD-alias	int	0x0	In GICv2 mode: the base address for a 4k page alias of the first 4k of the Distributor page, in GICv3 mode. the base address of a 64KB page containing message based SPI signalling register aliases(0:Disabled)
GICD-legacy-registers-as-reserved	bool	0x0	When ARE is RAO/WI, makes superfluous registers in GICD reserved (including for the purpose of STATUSR updates)
GICD_CTLR-DS-1-means-secure-only	bool	0x0	If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.
GICD_ITARGETSR-RAZWI	bool	0x0	If true, the GICD_ITARGETS registers are RAZ/WI
GICD_PIDR	int	0x0	The value for the GICD_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
GICR-clear-enable-supported	bool	0x0	When true, this sets the value of the RO bit GICR_CTLR.CES with the value of the parameter allow-LPIEN-clear, making it visible to software
GICR-invalidate-registers-implemented	bool	0x0	When true, the registers GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented
GICR_PIDR	int	0x0	The value for the GICR_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
GICR_PROPBASER-read-only	bool	0x0	GICR_PROPBASER register is read-only.
GICR_PROPBASER-reset-value	int	0x0	Value of GICR_PROPBASER on reset.
GITS_BASER0-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER0 register.
GITS_BASER0-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER0 register is RAZ/WI.
GITS_BASER0-type	int	0x0	Type field for GITS_BASER0 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER1-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER1 register.

Table 3-372 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
GITS_BASER1-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER1 register is RAZ/WI.
GITS_BASER1-type	int	0x0	Type field for GITS_BASER1 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER2-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER2 register.
GITS_BASER2-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER2 register is RAZ/WI.
GITS_BASER2-type	int	0x0	Type field for GITS_BASER2 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER3-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER3 register.
GITS_BASER3-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER3 register is RAZ/WI.
GITS_BASER3-type	int	0x0	Type field for GITS_BASER3 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER4-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER4 register.
GITS_BASER4-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER4 register is RAZ/WI.
GITS_BASER4-type	int	0x0	Type field for GITS_BASER4 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER5-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER5 register.
GITS_BASER5-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER5 register is RAZ/WI.
GITS_BASER5-type	int	0x0	Type field for GITS_BASER5 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER6-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER6 register.
GITS_BASER6-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER6 register is RAZ/WI.
GITS_BASER6-type	int	0x0	Type field for GITS_BASER6 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER7-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER7 register.
GITS_BASER7-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER7 register is RAZ/WI.
GITS_BASER7-type	int	0x0	Type field for GITS_BASER7 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_PIDR	int	0x0	The value for the GITS_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.

Table 3-372 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
ICFGR-PPI-mask	int	0xaaaaaaaa	Mask for writes to ICFGR registers that configure PPIs
ICFGR-PPI-reset	int	0x0	Reset value for ICFGR regesters that configure PPIs
ICFGR-SGI-mask	int	0x0	Mask for writes to ICFGR registers that configure SGIs
ICFGR-SGI-reset	int	0xaaaaaaaa	Reset value for ICFGR registers that configure SGIs
ICFGR-SPI-mask	int	0xaaaaaaaa	Mask for writes to ICFGR registers that configure SPIs
ICFGR-SPI-reset	int	0x0	Reset value for ICFGR regesters that configure SPIs
ICFGR-rsvd-bit	bool	0x0	If ARE=0, the value of reserved bits i.e. bit 0,2,4..30 of ICFGRn for n>0
IGROUP-PPI-mask	int	0xffff	Mask for writes to PPI bits in IGROUP registers
IGROUP-PPI-reset	int	0x0	Reset value for SGI bits in IGROUP registers
IGROUP-SGI-mask	int	0xffff	Mask for writes to SGI bits in IGROUP registers
IGROUP-SGI-reset	int	0x0	Reset value for SGI bits in IGROUP registers
IIDR	int	0x0	GICD_IIDR and GICR_IIDR value
IRI-ID-bits	int	0x10	Number of bits used to represent interrupts IDs in the Distributor and Redistributors, forced to 10 when none of LPIs, extended SPIs or extended PPIs is supported
IROUTER-IRM-RAZ-WI	bool	0x0	GICD_IROUTERn.InterruptRoutingMode is RAZ/WI
ITS-BASER-force-page-alignement	bool	0x1	Force alignement of address writen to a GITS_BASER register to the page size configured
ITS-ID-bits	int	0x10	Number of interrupt bits supported by ITS.
ITS-MOVALL-update-collections	bool	0x0	Whether MOVALL command updates the collection entires
ITS-TRANSLATE64R	bool	0x0	Add an implementation specific register at 0x10008 supporting 64 bit TRANSLATER (dev[63:32], interupt[31:0])
ITS-collection-ID-bits	int	0x0	Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0
ITS-count	int	0x0	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-cumulative-collection-tables	bool	0x1	When true, the supported amount of collections is the sum of GITS_TYPER.HCC and the number of collections supported in memory, otherwise, simply the number supported in memory only. Irrelevant when HCC=0
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
ITS-entry-size	int	0x8	Number of bytes required to store each entry in the ITT tables.
ITS-hardware-collection-count	int	0x0	Number of hardware collections held exclusively in the ITS
ITS-legacy-iidr-typer-offset	bool	0x0	Put the GITS_IIDR and GITS_TYPER registers at their older offset of 0x8 and 0x4 respectively
ITS-shared-vPE-table	int	0x0	Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-372 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
ITS-threaded-command-queue	bool	0x1	Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation
ITS-use-physical-target-addresses	bool	0x1	Use physical hardware adresses for targets in ITS commands -- must be true for distributed implementations
ITS-vmovp-bit	bool	0x0	Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.
ITS0-base	int	0x0	Register base address for ITS0 (automatic if 0).
ITS1-base	int	0x0	Register base address for ITS1 (automatic if 0).
ITS2-base	int	0x0	Register base address for ITS2 (automatic if 0).
ITS3-base	int	0x0	Register base address for ITS3 (automatic if 0).
LPI-cache-check-data	bool	0x0	Enable Cached LPI data against memory checking when available for cache type
LPI-cache-type	int	0x1	Cache type for LPIs, 0:No caching, 1:Full caching
MSI_IIDR	int	0x0	Value returned in MSI_IIDR registers.
MSI_NS-frame0-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 0 registers.
MSI_NS-frame0-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.
MSI_NS-frame0-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.
MSI_NS-frame1-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 1 registers.
MSI_NS-frame1-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.
MSI_NS-frame1-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.
MSI_NS-frame2-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 2 registers.
MSI_NS-frame2-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.
MSI_NS-frame2-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.
MSI_NS-frame3-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 3 registers.
MSI_NS-frame3-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.
MSI_NS-frame3-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.
MSI_NS-frame4-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 4 registers.
MSI_NS-frame4-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.
MSI_NS-frame4-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.

Table 3-372 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
MSI_NS-frame5-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 5 registers.
MSI_NS-frame5-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.
MSI_NS-frame5-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.
MSI_NS-frame6-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 6 registers.
MSI_NS-frame6-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.
MSI_NS-frame6-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.
MSI_NS-frame7-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 7 registers.
MSI_NS-frame7-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.
MSI_NS-frame7-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.
MSI_PIDR	int	0x0	The value for the MSI_PIDR registers, if non-zero and distributor supports GICv2m. Note: fixed fields (device type etc.) will be overriden in this value.
MSI_S-frame0-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 0 registers.
MSI_S-frame0-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.
MSI_S-frame0-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.
MSI_S-frame1-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 1 registers.
MSI_S-frame1-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.
MSI_S-frame1-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.
MSI_S-frame2-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 2 registers.
MSI_S-frame2-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.
MSI_S-frame2-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.
MSI_S-frame3-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 3 registers.
MSI_S-frame3-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.
MSI_S-frame3-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.
MSI_S-frame4-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 4 registers.
MSI_S-frame4-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.

Table 3-372 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
MSI_S-frame4-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.
MSI_S-frame5-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 5 registers.
MSI_S-frame5-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.
MSI_S-frame5-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.
MSI_S-frame6-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 6 registers.
MSI_S-frame6-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.
MSI_S-frame6-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.
MSI_S-frame7-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 7 registers.
MSI_S-frame7-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.
MSI_S-frame7-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.
PA_SIZE	int	0x30	Number of valid bits in physical address
PPI-implemented-mask	int	0xffff	Mask of PPIs that are implemented. One bit per PPI bit 0 == PPI 16 (first PPI). This will affect other masks.
SPI-count	int	0xe0	Number of SPIs that are implemented.
SPI-message-based-support	bool	0x1	Distributor supports meassage based signaling of SPI
SPI-unimplemented	string	""	A comma spearated list of unimplemented SPIs ranges for sparse SPI defintion(for ex: '35, 39-42, 73)'
STATUSR-implemented	bool	0x1	Determines whether the GICR_STATUSR register is implemented.
allow-LPIEN-clear	bool	0x0	Allow RW behaviour on GICR_CTLR.LPIEN isntead of set once
chip-id	int	0x0	Chip ID when multichip operation is enabled.
common-lpi-configuration	int	0x0	Describes which re-distributors share (and must be configured with the same) LPI configuration table as described in GICR_TYPER(0:All, 1:A.x.x.x, 2:A.B.x.x, 3:A.B.C.x
common-vPE-table-affinity	string	""	Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.
consolidators	string	""	Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form 'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1, [etc]' (eg '0x3f100000:64:4096, 0x3f200000:64:4224'). The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.

Table 3-372 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
delay-ITS-accesses	bool	0x1	Delay accesses from the ITS until GICR_SYNCR is read.
delay-redistributor-accesses	bool	0x1	Delay memory accesses from the redistributor until GICR_SYNCR is read.
direct-lpi-support	bool	0x0	Enable support for LPI operations through GICR registers
enable-multichip-operation	bool	0x0	Enables multi-chip operation between Distributors in distributed GIC IRI
enable_protocol_checking	bool	0x0	Enable/disable protocol checking at cpu interface
enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
extended-ppi-count	int	0x0	Number of extended PPI supported
extended-spi-count	int	0x0	Number of extended SPI supported
fixed-routed-spis	string	""	Value of IROUTER[n] register in the form 'n=a.b.c.d, n=*'. The RM bit of IROUTER is 0 when n=a.b.c.d is used else 1 when n=* is used. n can be >= 32 and <= 1019
gicv2-only	bool	0x0	If true, when using the GICv3 model, pretend to be a GICv2 system
has-two-security-states	bool	0x1	If true, has two security states
has_VPENDBASER-dirty-flag-on-load	bool	0x0	GICR_VPENDBASER.Dirty reflects transient loading state when valid=1
has_mpam	bool	0x0	Enable MPAM support on ITS and RDs
ignore-generate-sgi-when-no-are	bool	0x0	Ignore GenerateSGI packets coming form the CPU interface if both ARE_S and ARE_NS are 0
irouter-default-mask	string	""	Default Mask value for IROUTER[32..1019] register in the form 'a.b.c.d'
irouter-default-reset	string	""	Default Reset Value of IROUTER[32..1019] register in the form 'a.b.c.d' or *
irouter-mask-values	string	""	Mask Value of IROUTER[n] register in the form 'n=a.b.c.d'.n can be >= 32 and <= 1019
irouter-reset-values	string	""	Reset Value of IROUTER[n] register in the form 'n=a.b.c.d or n=*'.n can be >= 32 and <= 1019
legacy-sgi-enable-rao	bool	0x0	Enables for SGI associated with an ARE=0 regime are RAO/WI
local-SEIs	bool	0x0	Generate SEI to signal internal issues
local-VSEIs	bool	0x0	Generate VSEI to signal internal issues
lockable-SPI-count	int	0x0	Number of SPIs that are locked down when CFGSDISABLE signal is asserted. Only applies for GICv2.
max-pe-on-chip	int	0x4	Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.
monolithic	bool	0x0	Indicate that the implementation is not distributed
mpam_max_partid	int	0xffff	Maximum valid PARTID
mpam_max_pmg	int	0xff	Maximum valid PMG

Non-Confidential

Table 3-372 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
multichip-threaded-dgi	bool	0x1	Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.
non-ARE-core-count	int	0x8	Maximum number of non-ARE cores; normally used to pass the cluster-level NUM_CORES parameter to the top-level redistributor.
outer-cacheability-support	bool	0x0	Allow configuration of outer cachability attributes in ITS and Redistributor
output_attributes	string	"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS"	User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.
print-memory-map	bool	0x0	Print memory map to stdout
priority-bits	int	0x5	Number of implemented priority bits
processor-numbers	string	""	Specify processor numbers (as appears in GICR_TYPER) in the form 0.0.0.0=0,0.0.0.1=1 etc.) If not specified, will number processors starting at 0.
redistributor-threaded-sync	bool	0x1	Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation
reg-base	int	0x2c010000	Base for decoding GICv3 registers.
reg-base-per-redistributor	string	""	Base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If reg-base-per-redistributor-file is specified, this parameter is ignored.
reg-base-per-redistributor-file	string	""	Path to file containing the base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If this parameter is specified, reg-base-per-redistributor parameter will be ignored even when it is given.
report-MSI-error-via-statusr	int	0x0	Report MSI error via GITS_STATUSR. (0:unsupported, 1:report by GITS_STATUSR, 2:report by GITS_STATUSR and interrupt as well).
sgi-range-selector-support	bool	0x0	Device has support for the Range Selector feature for SGI
single-set-support	bool	0x0	When true, forces redistributors to recall interrupts with a clear rather than issue a second Set command
supports-shareability	bool	0x1	Device supports shareability attributes on outgoing memory bus (i.e. is modelling an ACElite port rather than an AXI4 port).
trace-speculative-lpi-property-update	bool	0x0	Trace LPI propery updates performed on speculative accesses (useful for debuging LPI)
virtual-lpi-support	bool	0x0	GICv4 Virtual LPIs and Direct injection of Virtual LPIs supported

Table 3-372 Parameters for GIC_IRI (continued)

Name	Type	Default value	Description
`virtual-priority-bits`	`int`	`0x5`	Number of implemented virtual priority bits
`wakeup-on-reset`	`bool`	`0x0`	Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.9.29 GICv3IRI

GICv3 metacomponent for redistribution of interrupts(contains Distributor, and configurable numbers of ITSs and Redistributors. This model is written in C++.

GICv3IRI contains the following CADI targets:

- GICv3IRI

GICv3IRI contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

About GICv3IRI

The GICv3IRI has one slave PVBus interface and one master PVBus interface. It behaves in a similar manner to a GICv3-compatible device, with the slave interface, `pvbus_s`, granting access to the register banks used by the configuration and operation of MSIs and the master interface, `pvbus_m`, issuing transactions that are required by the ITS and the redistributors in LPI-related operations. All transactions that are routed to the slave port terminate in the component. Accesses to unmapped space are RAZ/WI.

An instance of GICv3 requires a small set of parameters to be configured to be useful. For example:

```
gic_iri : GICv3IRI(
    "reg-base" = 0xF0020000, //Base address for GICD_* REGISTERS, 64K aligned
    "CPU-affinities" = "0.0.0.0, 0.0.1.0, 0.0.1.1",
        //A comma-separated list of affinity addresses corresponding to
        //cpu affinities in the system
    "reg-base-per-redistributor"="0.0.0.0=0xF0040000,0.0.1.0=0xF0060000, 0.0.0.0=0xF0080000",
        //Base addresses for each redistributor in a comma-separated list of
        //affinity=address
);
```

To use LPIs, an ITS must be configured. A minimal configuration might consist of, for example:

```
    "ITS-count" = 1, //The number of ITSs in the IRI. Defaults to zero.
    "ITS0-base" = 0xF0100000,
    "GITS_BASER0-type" = 1, //Type 1 is Devices. A device table is always needed.
    "GITS_BASER2-type" = 4, //Type 4 is Collections.
                            //A collection table is needed if GITS_TYPER.HCC is 0.
```

To use GICv4 functionality, one or more ITSs must be configured, as shown in the previous example. In addition, the following parameters are required:

```
    "virtual-lpi-support"=true,
    "GITS_BASER4-type"=2 //Type 2 is Virtual PEs.
                         //Such a table is needed for GICv4 functionality.
```

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to `stderr` the memory map of any GICv3 or later models that are included in the platform being run.
- Set the `GICD_ITARGETSR-RAZWI` parameter to true for legacy, GICv2-style routing, where interrupts are routed to the first processor in the system.

Table 3-373 Ports

Name	Protocol	Type	Description
`cfgsdisable`	*Signal* on page 2-85	Slave	Disable some SPIs signal.
`extended_ppi_in_n[64]`	*Signal* on page 2-85	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu *n*, where *n* is in the range 0-255.
`extended_spi_in[1024]`	*Signal* on page 2-85	Slave	Extended Shared peripheral interrupts.
`msi_error_interrupt`	*Signal* on page 2-85	Master	When report of MSI error allowed through interrupt, loop-back this signal to relevant IRQ input signal
`po_reset`	*Signal* on page 2-85	Slave	Resets.
`ppi_in_n[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu *n*, where *n* is in the range 0-255.
`pvbus_m`	`PVBus`	Master	Memory bus out: transactions generated by the IRI.
`pvbus_s`	`PVBus`	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
`redistributor_m[256]`	*GICv3Comms* on page 2-84	Master	Input from and output to CPU interface.
`reset`	*Signal* on page 2-85	Slave	Resets.
`spi_in[988]`	*Signal* on page 2-85	Slave	Shared peripheral interrupts.
`wake_request[256]`	*Signal* on page 2-85	Master	Power management outputs.
`wire_to_msi_0[1024]`	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 0.
`wire_to_msi_1[1024]`	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 1.
`wire_to_msi_2[1024]`	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 2.
`wire_to_msi_3[1024]`	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 3.

Table 3-374 Parameters for GICv3IRI

Name	Type	Default value	Description
`A3-affinity-supported`	`bool`	`0x0`	Device supports affinity level 3 values that are non-zero.
`ARE-fixed-to-one`	`bool`	`0x0`	GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one
`CPU-affinities`	`string`	`""`	A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.
`CPU-affinities-file`	`string`	`""`	A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.
`DPG-ARE-only`	`bool`	`0x0`	Limit application of DPG bits to interrupt groups for which ARE=1

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-374 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
DPG-bits-implemented	bool	0x0	Enable implementation of interrupt group participation bits or DPG bits in GICR_CTLR
DS-fixed-to-zero	bool	0x0	Enable/disable support of single security state
GICD-alias	int	0x0	In GICv2 mode: the base address for a 4k page alias of the first 4k of the Distributor page, in GICv3 mode. the base address of a 64KB page containing message based SPI signalling register aliases(0:Disabled)
GICD-legacy-registers-as-reserved	bool	0x0	When ARE is RAO/WI, makes superfluous registers in GICD reserved (including for the purpose of STATUSR updates)
GICD_CTLR-DS-1-means-secure-only	bool	0x0	If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.
GICD_ITARGETSR-RAZWI	bool	0x0	If true, the GICD_ITARGETS registers are RAZ/WI
GICD_PIDR	int	0x0	The value for the GICD_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
GICR-clear-enable-supported	bool	0x0	When true, this sets the value of the RO bit GICR_CTLR.CES with the value of the parameter allow-LPIEN-clear, making it visible to software
GICR-invalidate-registers-implemented	bool	0x0	When true, the registers GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented
GICR_PIDR	int	0x0	The value for the GICR_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
GICR_PROPBASER-read-only	bool	0x0	GICR_PROPBASER register is read-only.
GICR_PROPBASER-reset-value	int	0x0	Value of GICR_PROPBASER on reset.
GITS_BASER0-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER0 register.
GITS_BASER0-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER0 register is RAZ/WI.
GITS_BASER0-type	int	0x0	Type field for GITS_BASER0 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER1-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER1 register.
GITS_BASER1-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER1 register is RAZ/WI.
GITS_BASER1-type	int	0x0	Type field for GITS_BASER1 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER2-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER2 register.
GITS_BASER2-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER2 register is RAZ/WI.
GITS_BASER2-type	int	0x0	Type field for GITS_BASER2 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-374 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
GITS_BASER3-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER3 register.
GITS_BASER3-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER3 register is RAZ/WI.
GITS_BASER3-type	int	0x0	Type field for GITS_BASER3 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER4-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER4 register.
GITS_BASER4-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER4 register is RAZ/WI.
GITS_BASER4-type	int	0x0	Type field for GITS_BASER4 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER5-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER5 register.
GITS_BASER5-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER5 register is RAZ/WI.
GITS_BASER5-type	int	0x0	Type field for GITS_BASER5 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER6-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER6 register.
GITS_BASER6-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER6 register is RAZ/WI.
GITS_BASER6-type	int	0x0	Type field for GITS_BASER6 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER7-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER7 register.
GITS_BASER7-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER7 register is RAZ/WI.
GITS_BASER7-type	int	0x0	Type field for GITS_BASER7 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_PIDR	int	0x0	The value for the GITS_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
ICFGR-PPI-mask	int	0xaaaaaaaa	Mask for writes to ICFGR registers that configure PPIs
ICFGR-PPI-reset	int	0x0	Reset value for ICFGR regesters that configure PPIs
ICFGR-SGI-mask	int	0x0	Mask for writes to ICFGR registers that configure SGIs
ICFGR-SGI-reset	int	0xaaaaaaaa	Reset value for ICFGR registers that configure SGIs
ICFGR-SPI-mask	int	0xaaaaaaaa	Mask for writes to ICFGR registers that configure SPIs
ICFGR-SPI-reset	int	0x0	Reset value for ICFGR regesters that configure SPIs
ICFGR-rsvd-bit	bool	0x0	If ARE=0, the value of reserved bits i.e. bit 0,2,4..30 of ICFGRn for n>0
IGROUP-PPI-mask	int	0xffff	Mask for writes to PPI bits in IGROUP registers

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-374 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
IGROUP-PPI-reset	int	0x0	Reset value for SGI bits in IGROUP registers
IGROUP-SGI-mask	int	0xffff	Mask for writes to SGI bits in IGROUP registers
IGROUP-SGI-reset	int	0x0	Reset value for SGI bits in IGROUP registers
IIDR	int	0x0	GICD_IIDR and GICR_IIDR value
IRI-ID-bits	int	0x10	Number of bits used to represent interrupts IDs in the Distributor and Redistributors, forced to 10 when none of LPIs, extended SPIs or extended PPIs is supported
IROUTER-IRM-RAZ-WI	bool	0x0	GICD_IROUTERn.InterruptRoutingMode is RAZ/WI
ITS-BASER-force-page-alignement	bool	0x1	Force alignement of address writen to a GITS_BASER register to the page size configured
ITS-ID-bits	int	0x10	Number of interrupt bits supported by ITS.
ITS-MOVALL-update-collections	bool	0x0	Whether MOVALL command updates the collection entires
ITS-TRANSLATE64R	bool	0x0	Add an implementation specific register at 0x10008 supporting 64 bit TRANSLATER (dev[63:32], interupt[31:0])
ITS-collection-ID-bits	int	0x0	Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0
ITS-count	int	0x0	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-cumulative-collection-tables	bool	0x1	When true, the supported amount of collections is the sum of GITS_TYPER.HCC and the number of collections supported in memory, otherwise, simply the number supported in memory only. Irrelevant when HCC=0
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
ITS-entry-size	int	0x8	Number of bytes required to store each entry in the ITT tables.
ITS-hardware-collection-count	int	0x0	Number of hardware collections held exclusively in the ITS
ITS-legacy-iidr-typer-offset	bool	0x0	Put the GITS_IIDR and GITS_TYPER registers at their older offset of 0x8 and 0x4 respectively
ITS-shared-vPE-table	int	0x0	Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.
ITS-threaded-command-queue	bool	0x1	Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation
ITS-use-physical-target-addresses	bool	0x1	Use physical hardware adresses for targets in ITS commands -- must be true for distributed implementations
ITS-vmovp-bit	bool	0x0	Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.
ITS0-base	int	0x0	Register base address for ITS0 (automatic if 0).
ITS1-base	int	0x0	Register base address for ITS1 (automatic if 0).
ITS2-base	int	0x0	Register base address for ITS2 (automatic if 0).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-374 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
ITS3-base	int	0x0	Register base address for ITS3 (automatic if 0).
LPI-cache-check-data	bool	0x0	Enable Cached LPI data against memory checking when available for cache type
LPI-cache-type	int	0x1	Cache type for LPIs, 0:No caching, 1:Full caching
MSI_IIDR	int	0x0	Value returned in MSI_IIDR registers.
MSI_NS-frame0-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 0 registers.
MSI_NS-frame0-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.
MSI_NS-frame0-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.
MSI_NS-frame1-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 1 registers.
MSI_NS-frame1-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.
MSI_NS-frame1-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.
MSI_NS-frame2-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 2 registers.
MSI_NS-frame2-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.
MSI_NS-frame2-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.
MSI_NS-frame3-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 3 registers.
MSI_NS-frame3-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.
MSI_NS-frame3-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.
MSI_NS-frame4-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 4 registers.
MSI_NS-frame4-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.
MSI_NS-frame4-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.
MSI_NS-frame5-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 5 registers.
MSI_NS-frame5-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.
MSI_NS-frame5-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.
MSI_NS-frame6-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 6 registers.
MSI_NS-frame6-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.
MSI_NS-frame6-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.

Table 3-374 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
MSI_NS-frame7-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 7 registers.
MSI_NS-frame7-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.
MSI_NS-frame7-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.
MSI_PIDR	int	0x0	The value for the MSI_PIDR registers, if non-zero and distributor supports GICv2m. Note: fixed fields (device type etc.) will be overriden in this value.
MSI_S-frame0-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 0 registers.
MSI_S-frame0-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.
MSI_S-frame0-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.
MSI_S-frame1-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 1 registers.
MSI_S-frame1-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.
MSI_S-frame1-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.
MSI_S-frame2-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 2 registers.
MSI_S-frame2-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.
MSI_S-frame2-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.
MSI_S-frame3-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 3 registers.
MSI_S-frame3-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.
MSI_S-frame3-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.
MSI_S-frame4-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 4 registers.
MSI_S-frame4-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.
MSI_S-frame4-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.
MSI_S-frame5-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 5 registers.
MSI_S-frame5-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.
MSI_S-frame5-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.
MSI_S-frame6-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 6 registers.
MSI_S-frame6-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-374 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
MSI_S-frame6-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.
MSI_S-frame7-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 7 registers.
MSI_S-frame7-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.
MSI_S-frame7-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.
PA_SIZE	int	0x30	Number of valid bits in physical address
PPI-implemented-mask	int	0xffff	Mask of PPIs that are implemented. One bit per PPI bit 0 == PPI 16 (first PPI). This will affect other masks.
SPI-count	int	0xe0	Number of SPIs that are implemented.
SPI-message-based-support	bool	0x1	Distributor supports meassage based signaling of SPI
SPI-unimplemented	string	""	A comma spearated list of unimplemented SPIs ranges for sparse SPI defintion(for ex: '35, 39-42, 73)'
STATUSR-implemented	bool	0x1	Determines whether the GICR_STATUSR register is implemented.
allow-LPIEN-clear	bool	0x0	Allow RW behaviour on GICR_CTLR.LPIEN isntead of set once
chip-id	int	0x0	Chip ID when multichip operation is enabled.
common-lpi-configuration	int	0x0	Describes which re-distributors share (and must be configured with the same) LPI configuration table as described in GICR_TYPER(0:All, 1:A.x.x.x, 2:A.B.x.x, 3:A.B.C.x
common-vPE-table-affinity	string	""	Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.
consolidators	string	""	Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form 'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1, [etc]' (eg '0x3f100000:64:4096, 0x3f200000:64:4224'). The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.
delay-ITS-accesses	bool	0x1	Delay accesses from the ITS until GICR_SYNCR is read.
delay-redistributor-accesses	bool	0x1	Delay memory accesses from the redistributor until GICR_SYNCR is read.
direct-lpi-support	bool	0x0	Enable support for LPI operations through GICR registers
enable-multichip-operation	bool	0x0	Enables multi-chip operation between Distributors in distributed GIC IRI
enable_protocol_checking	bool	0x0	Enable/disable protocol checking at cpu interface
enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
extended-ppi-count	int	0x0	Number of extended PPI supported

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-374 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
extended-spi-count	int	0x0	Number of extended SPI supported
fixed-routed-spis	string	""	Value of IROUTER[n] register in the form 'n=a.b.c.d, n=*'. The RM bit of IROUTER is 0 when n=a.b.c.d is used else 1 when n=* is used. n can be >= 32 and <= 1019
gicv2-only	bool	0x0	If true, when using the GICv3 model, pretend to be a GICv2 system
has-two-security-states	bool	0x1	If true, has two security states
has_VPENDBASER-dirty-flag-on-load	bool	0x0	GICR_VPENDBASER.Dirty reflects transient loading state when valid=1
has_mpam	bool	0x0	Enable MPAM support on ITS and RDs
ignore-generate-sgi-when-no-are	bool	0x0	Ignore GenerateSGI packets coming form the CPU interface if both ARE_S and ARE_NS are 0
irouter-default-mask	string	""	Default Mask value for IROUTER[32..1019] register in the form 'a.b.c.d'
irouter-default-reset	string	""	Default Reset Value of IROUTER[32..1019] register in the form 'a.b.c.d' or *
irouter-mask-values	string	""	Mask Value of IROUTER[n] register in the form 'n=a.b.c.d'.n can be >= 32 and <= 1019
irouter-reset-values	string	""	Reset Value of IROUTER[n] register in the form 'n=a.b.c.d or n=*'.n can be >= 32 and <= 1019
legacy-sgi-enable-rao	bool	0x0	Enables for SGI associated with an ARE=0 regime are RAO/WI
local-SEIs	bool	0x0	Generate SEI to signal internal issues
local-VSEIs	bool	0x0	Generate VSEI to signal internal issues
lockable-SPI-count	int	0x0	Number of SPIs that are locked down when CFGSDISABLE signal is asserted. Only applies for GICv2.
max-pe-on-chip	int	0x4	Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.
monolithic	bool	0x0	Indicate that the implementation is not distributed
mpam_max_partid	int	0xffff	Maximum valid PARTID
mpam_max_pmg	int	0xff	Maximum valid PMG
multichip-threaded-dgi	bool	0x1	Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.
non-ARE-core-count	int	0x8	Maximum number of non-ARE cores; normally used to pass the cluster-level NUM_CORES parameter to the top-level redistributor.
outer-cacheability-support	bool	0x0	Allow configuration of outer cachability attributes in ITS and Redistributor

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-374 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
output_attributes	string	"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS"	User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.
print-memory-map	bool	0x0	Print memory map to stdout
priority-bits	int	0x5	Number of implemented priority bits
processor-numbers	string	""	Specify processor numbers (as appears in GICR_TYPER) in the form 0.0.0.0=0,0.0.0.1=1 etc.) If not specified, will number processors starting at 0.
redistributor-threaded-sync	bool	0x1	Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation
reg-base	int	0x2c010000	Base for decoding GICv3 registers.
reg-base-per-redistributor	string	""	Base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If reg-base-per-redistributor-file is specified, this parameter is ignored.
reg-base-per-redistributor-file	string	""	Path to file containing the base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If this parameter is specified, reg-base-per-redistributor parameter will be ignored even when it is given.
report-MSI-error-via-statusr	int	0x0	Report MSI error via GITS_STATUSR. (0:unsupported, 1:report by GITS_STATUSR, 2:report by GITS_STATUSR and interrupt as well).
sgi-range-selector-support	bool	0x0	Device has support for the Range Selector feature for SGI
single-set-support	bool	0x0	When true, forces redistributors to recall interrupts with a clear rather than issue a second Set command
supports-shareability	bool	0x1	Device supports shareability attributes on outgoing memory bus (i.e. is modelling an ACElite port rather than an AXI4 port).
trace-speculative-lpi-property-update	bool	0x0	Trace LPI propery updates performed on speculative accesses (useful for debuging LPI)
virtual-lpi-support	bool	0x0	GICv4 Virtual LPIs and Direct injection of Virtual LPIs supported
virtual-priority-bits	int	0x5	Number of implemented virtual priority bits
wakeup-on-reset	bool	0x0	Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.9.30 GICv3IRI_Filter

GICv3 metacomponent for redistribution of interrupts(contains Distributor, and configurable numbers of ITSs and Redistributors. Validation only version. This model is written in C++.

GICv3IRI_Filter contains the following CADI targets:

- GICv3IRI

GICv3IRI_Filter contains the following MTI components:

- *4.76 GICv3Distributor - trace* on page 4-2496
- *4.77 GICv3IRI - trace* on page 4-2504
- *4.80 GICv3Redistributor - trace* on page 4-2527
- *4.81 GICv3RedistributorInternal - trace* on page 4-2541

About GICv3IRI_Filter

The GICv3IRI_Filter has similar behavior to the GICv3IRI, except for the slave interface. Any transaction accessing a 4KB page that is not used by the GIC, as configurable through the parameters, is forwarded to the `pvbus_filtermiss_m` port, which is only present in this variant.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to `stderr` the memory map of any GICv3 or later models that are included in the platform being run.
- Set the `GICD_ITARGETSR-RAZWI` parameter to true for legacy, GICv2-style routing, where interrupts are routed to the first processor in the system

Table 3-375 Ports

Name	Protocol	Type	Description
`cfgsdisable`	*Signal* on page 2-85	Slave	Disable some SPIs signal.
`extended_ppi_in_n[64]`	*Signal* on page 2-85	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu *n*, where *n* is in the range 0-255.
`extended_spi_in[1024]`	*Signal* on page 2-85	Slave	Extended Shared peripheral interrupts.
`msi_error_interrupt`	*Signal* on page 2-85	Master	When report of MSI error allowed through interrupt, loop-back this signal to relevant IRQ input signal
`po_reset`	*Signal* on page 2-85	Slave	Resets.
`ppi_in_n[16]`	*Signal* on page 2-85	Slave	Private peripheral interrupts (ID16-ID31) for cpu *n*, where *n* is in the range 0-255.
`pvbus_filtermiss_m`	`PVBus`	Master	Passthrough for accesses to pages not used by the GIC IRI.
`pvbus_m`	`PVBus`	Master	Memory bus for transactions generated by the GIC.
`pvbus_s`	`PVBus`	Slave	Memory bus in.
`redistributor_m[256]`	*GICv3Comms* on page 2-84	Master	Input from and output to CPU interface.
`reset`	*Signal* on page 2-85	Slave	Resets.
`spi_in[988]`	*Signal* on page 2-85	Slave	Shared peripheral interrupts.
`wake_request[256]`	*Signal* on page 2-85	Master	Power management outputs.
`wire_to_msi_0[1024]`	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 0.
`wire_to_msi_1[1024]`	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 1.

Table 3-375 Ports (continued)

Name	Protocol	Type	Description
wire_to_msi_2[1024]	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 2.
wire_to_msi_3[1024]	*Signal* on page 2-85	Slave	Wire-to-MSI interrupts for architectural consolidator 3.

Table 3-376 Parameters for GICv3IRI

Name	Type	Default value	Description
A3-affinity-supported	bool	0x0	Device supports affinity level 3 values that are non-zero.
ARE-fixed-to-one	bool	0x0	GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one
CPU-affinities	string	""	A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.
CPU-affinities-file	string	""	A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.
DPG-ARE-only	bool	0x0	Limit application of DPG bits to interrupt groups for which ARE=1
DPG-bits-implemented	bool	0x0	Enable implementation of interrupt group participation bits or DPG bits in GICR_CTLR
DS-fixed-to-zero	bool	0x0	Enable/disable support of single security state
GICD-alias	int	0x0	In GICv2 mode: the base address for a 4k page alias of the first 4k of the Distributor page, in GICv3 mode. the base address of a 64KB page containing message based SPI signalling register aliases(0:Disabled)
GICD-legacy-registers-as-reserved	bool	0x0	When ARE is RAO/WI, makes superfluous registers in GICD reserved (including for the purpose of STATUSR updates)
GICD_CTLR-DS-1-means-secure-only	bool	0x0	If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.
GICD_ITARGETSR-RAZWI	bool	0x0	If true, the GICD_ITARGETS registers are RAZ/WI
GICD_PIDR	int	0x0	The value for the GICD_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
GICR-clear-enable-supported	bool	0x0	When true, this sets the value of the RO bit GICR_CTLR.CES with the value of the parameter allow-LPIEN-clear, making it visible to software
GICR-invalidate-registers-implemented	bool	0x0	When true, the registers GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented
GICR_PIDR	int	0x0	The value for the GICR_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
GICR_PROPBASER-read-only	bool	0x0	GICR_PROPBASER register is read-only.
GICR_PROPBASER-reset-value	int	0x0	Value of GICR_PROPBASER on reset.
GITS_BASER0-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER0 register.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-376 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
GITS_BASER0-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER0 register is RAZ/WI.
GITS_BASER0-type	int	0x0	Type field for GITS_BASER0 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER1-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER1 register.
GITS_BASER1-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER1 register is RAZ/WI.
GITS_BASER1-type	int	0x0	Type field for GITS_BASER1 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER2-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER2 register.
GITS_BASER2-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER2 register is RAZ/WI.
GITS_BASER2-type	int	0x0	Type field for GITS_BASER2 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER3-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER3 register.
GITS_BASER3-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER3 register is RAZ/WI.
GITS_BASER3-type	int	0x0	Type field for GITS_BASER3 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER4-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER4 register.
GITS_BASER4-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER4 register is RAZ/WI.
GITS_BASER4-type	int	0x0	Type field for GITS_BASER4 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER5-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER5 register.
GITS_BASER5-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER5 register is RAZ/WI.
GITS_BASER5-type	int	0x0	Type field for GITS_BASER5 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER6-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER6 register.
GITS_BASER6-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER6 register is RAZ/WI.
GITS_BASER6-type	int	0x0	Type field for GITS_BASER6 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_BASER7-entry-bytes	int	0x8	Number of bytes required per entry for GITS_BASER7 register.

Table 3-376 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
GITS_BASER7-indirect-RAZ	bool	0x0	Indirect field for GITS_BASER7 register is RAZ/WI.
GITS_BASER7-type	int	0x0	Type field for GITS_BASER7 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections
GITS_PIDR	int	0x0	The value for the GITS_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overriden in this value.
ICFGR-PPI-mask	int	0xaaaaaaaa	Mask for writes to ICFGR registers that configure PPIs
ICFGR-PPI-reset	int	0x0	Reset value for ICFGR regesters that configure PPIs
ICFGR-SGI-mask	int	0x0	Mask for writes to ICFGR registers that configure SGIs
ICFGR-SGI-reset	int	0xaaaaaaaa	Reset value for ICFGR registers that configure SGIs
ICFGR-SPI-mask	int	0xaaaaaaaa	Mask for writes to ICFGR registers that configure SPIs
ICFGR-SPI-reset	int	0x0	Reset value for ICFGR regesters that configure SPIs
ICFGR-rsvd-bit	bool	0x0	If ARE=0, the value of reserved bits i.e. bit 0,2,4..30 of ICFGRn for n>0
IGROUP-PPI-mask	int	0xffff	Mask for writes to PPI bits in IGROUP registers
IGROUP-PPI-reset	int	0x0	Reset value for SGI bits in IGROUP registers
IGROUP-SGI-mask	int	0xffff	Mask for writes to SGI bits in IGROUP registers
IGROUP-SGI-reset	int	0x0	Reset value for SGI bits in IGROUP registers
IIDR	int	0x0	GICD_IIDR and GICR_IIDR value
IRI-ID-bits	int	0x10	Number of bits used to represent interrupts IDs in the Distributor and Redistributors, forced to 10 when none of LPIs, extended SPIs or extended PPIs is supported
IROUTER-IRM-RAZ-WI	bool	0x0	GICD_IROUTERn.InterruptRoutingMode is RAZ/WI
ITS-BASER-force-page-alignement	bool	0x1	Force alignement of address writen to a GITS_BASER register to the page size configured
ITS-ID-bits	int	0x10	Number of interrupt bits supported by ITS.
ITS-MOVALL-update-collections	bool	0x0	Whether MOVALL command updates the collection entires
ITS-TRANSLATE64R	bool	0x0	Add an implementation specific register at 0x10008 supporting 64 bit TRANSLATER (dev[63:32], interupt[31:0])
ITS-collection-ID-bits	int	0x0	Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0
ITS-count	int	0x0	Number of Interrupt Translation Services to be instantiated (0=none)
ITS-cumulative-collection-tables	bool	0x1	When true, the supported amount of collections is the sum of GITS_TYPER.HCC and the number of collections supported in memory, otherwise, simply the number supported in memory only. Irrelevant when HCC=0
ITS-device-bits	int	0x10	Number of bits supported for ITS device IDs.
ITS-entry-size	int	0x8	Number of bytes required to store each entry in the ITT tables.

Table 3-376 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
ITS-hardware-collection-count	int	0x0	Number of hardware collections held exclusively in the ITS
ITS-legacy-iidr-typer-offset	bool	0x0	Put the GITS_IIDR and GITS_TYPER registers at their older offset of 0x8 and 0x4 respectively
ITS-shared-vPE-table	int	0x0	Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.
ITS-threaded-command-queue	bool	0x1	Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation
ITS-use-physical-target-addresses	bool	0x1	Use physical hardware adresses for targets in ITS commands -- must be true for distributed implementations
ITS-vmovp-bit	bool	0x0	Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.
ITS0-base	int	0x0	Register base address for ITS0 (automatic if 0).
ITS1-base	int	0x0	Register base address for ITS1 (automatic if 0).
ITS2-base	int	0x0	Register base address for ITS2 (automatic if 0).
ITS3-base	int	0x0	Register base address for ITS3 (automatic if 0).
LPI-cache-check-data	bool	0x0	Enable Cached LPI data against memory checking when available for cache type
LPI-cache-type	int	0x1	Cache type for LPIs, 0:No caching, 1:Full caching
MSI_IIDR	int	0x0	Value returned in MSI_IIDR registers.
MSI_NS-frame0-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 0 registers.
MSI_NS-frame0-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.
MSI_NS-frame0-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.
MSI_NS-frame1-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 1 registers.
MSI_NS-frame1-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.
MSI_NS-frame1-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.
MSI_NS-frame2-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 2 registers.
MSI_NS-frame2-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.
MSI_NS-frame2-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.
MSI_NS-frame3-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 3 registers.
MSI_NS-frame3-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-376 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
MSI_NS-frame3-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.
MSI_NS-frame4-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 4 registers.
MSI_NS-frame4-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.
MSI_NS-frame4-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.
MSI_NS-frame5-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 5 registers.
MSI_NS-frame5-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.
MSI_NS-frame5-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.
MSI_NS-frame6-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 6 registers.
MSI_NS-frame6-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.
MSI_NS-frame6-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.
MSI_NS-frame7-base	int	0x0	If non-zero, sets the base address used for non-secure MSI frame 7 registers.
MSI_NS-frame7-max-SPI	int	0x0	Maximum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.
MSI_NS-frame7-min-SPI	int	0x0	Minimum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.
MSI_PIDR	int	0x0	The value for the MSI_PIDR registers, if non-zero and distributor supports GICv2m. Note: fixed fields (device type etc.) will be overriden in this value.
MSI_S-frame0-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 0 registers.
MSI_S-frame0-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.
MSI_S-frame0-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.
MSI_S-frame1-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 1 registers.
MSI_S-frame1-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.
MSI_S-frame1-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.
MSI_S-frame2-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 2 registers.
MSI_S-frame2-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.
MSI_S-frame2-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.
MSI_S-frame3-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 3 registers.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-376 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
MSI_S-frame3-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.
MSI_S-frame3-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.
MSI_S-frame4-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 4 registers.
MSI_S-frame4-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.
MSI_S-frame4-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.
MSI_S-frame5-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 5 registers.
MSI_S-frame5-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.
MSI_S-frame5-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.
MSI_S-frame6-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 6 registers.
MSI_S-frame6-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.
MSI_S-frame6-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.
MSI_S-frame7-base	int	0x0	If non-zero, sets the base address used for secure MSI frame 7 registers.
MSI_S-frame7-max-SPI	int	0x0	Maximum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.
MSI_S-frame7-min-SPI	int	0x0	Minimum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.
PA_SIZE	int	0x30	Number of valid bits in physical address
PPI-implemented-mask	int	0xffff	Mask of PPIs that are implemented. One bit per PPI bit 0 == PPI 16 (first PPI). This will affect other masks.
SPI-count	int	0xe0	Number of SPIs that are implemented.
SPI-message-based-support	bool	0x1	Distributor supports meassage based signaling of SPI
SPI-unimplemented	string	""	A comma spearated list of unimplemented SPIs ranges for sparse SPI defintion(for ex: '35, 39-42, 73)'
STATUSR-implemented	bool	0x1	Determines whether the GICR_STATUSR register is implemented.
allow-LPIEN-clear	bool	0x0	Allow RW behaviour on GICR_CTLR.LPIEN isntead of set once
chip-id	int	0x0	Chip ID when multichip operation is enabled.
common-lpi-configuration	int	0x0	Describes which re-distributors share (and must be configured with the same) LPI configuration table as described in GICR_TYPER(0:All, 1:A.x.x.x, 2:A.B.x.x, 3:A.B.C.x

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-376 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
common-vPE-table-affinity	string	""	Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.
consolidators	string	""	Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form 'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1, [etc]' (eg '0x3f100000:64:4096, 0x3f200000:64:4224'). The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.
delay-ITS-accesses	bool	0x1	Delay accesses from the ITS until GICR_SYNCR is read.
delay-redistributor-accesses	bool	0x1	Delay memory accesses from the redistributor until GICR_SYNCR is read.
direct-lpi-support	bool	0x0	Enable support for LPI operations through GICR registers
enable-multichip-operation	bool	0x0	Enables multi-chip operation between Distributors in distributed GIC IRI
enable_protocol_checking	bool	0x0	Enable/disable protocol checking at cpu interface
enabled	bool	0x1	Enable GICv3 functionality; when false the component is inactive.
extended-ppi-count	int	0x0	Number of extended PPI supported
extended-spi-count	int	0x0	Number of extended SPI supported
fixed-routed-spis	string	""	Value of IROUTER[n] register in the form 'n=a.b.c.d, n=*'. The RM bit of IROUTER is 0 when n=a.b.c.d is used else 1 when n=* is used. n can be >= 32 and <= 1019
gicv2-only	bool	0x0	If true, when using the GICv3 model, pretend to be a GICv2 system
has-two-security-states	bool	0x1	If true, has two security states
has_VPENDBASER-dirty-flag-on-load	bool	0x0	GICR_VPENDBASER.Dirty reflects transient loading state when valid=1
has_mpam	bool	0x0	Enable MPAM support on ITS and RDs
ignore-generate-sgi-when-no-are	bool	0x0	Ignore GenerateSGI packets coming form the CPU interface if both ARE_S and ARE_NS are 0
irouter-default-mask	string	""	Default Mask value for IROUTER[32..1019] register in the form 'a.b.c.d'
irouter-default-reset	string	""	Default Reset Value of IROUTER[32..1019] register in the form 'a.b.c.d' or *
irouter-mask-values	string	""	Mask Value of IROUTER[n] register in the form 'n=a.b.c.d'.n can be >= 32 and <= 1019
irouter-reset-values	string	""	Reset Value of IROUTER[n] register in the form 'n=a.b.c.d or n=*'.n can be >= 32 and <= 1019
legacy-sgi-enable-rao	bool	0x0	Enables for SGI associated with an ARE=0 regime are RAO/WI
local-SEIs	bool	0x0	Generate SEI to signal internal issues

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-376 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
local-VSEIs	bool	0x0	Generate VSEI to signal internal issues
lockable-SPI-count	int	0x0	Number of SPIs that are locked down when CFGSDISABLE signal is asserted. Only applies for GICv2.
max-pe-on-chip	int	0x4	Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.
monolithic	bool	0x0	Indicate that the implementation is not distributed
mpam_max_partid	int	0xffff	Maximum valid PARTID
mpam_max_pmg	int	0xff	Maximum valid PMG
multichip-threaded-dgi	bool	0x1	Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.
non-ARE-core-count	int	0x8	Maximum number of non-ARE cores; normally used to pass the cluster-level NUM_CORES parameter to the top-level redistributor.
outer-cacheability-support	bool	0x0	Allow configuration of outer cachability attributes in ITS and Redistributor
output_attributes	string	"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS"	User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.
print-memory-map	bool	0x0	Print memory map to stdout
priority-bits	int	0x5	Number of implemented priority bits
processor-numbers	string	""	Specify processor numbers (as appears in GICR_TYPER) in the form 0.0.0.0=0,0.0.0.1=1 etc.) If not specified, will number processors starting at 0.
redistributor-threaded-sync	bool	0x1	Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation
reg-base	int	0x2c010000	Base for decoding GICv3 registers.
reg-base-per-redistributor	string	""	Base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If reg-base-per-redistributor-file is specified, this parameter is ignored.
reg-base-per-redistributor-file	string	""	Path to file containing the base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If this parameter is specified, reg-base-per-redistributor parameter will be ignored even when it is given.
report-MSI-error-via-statusr	int	0x0	Report MSI error via GITS_STATUSR. (0:unsupported, 1:report by GITS_STATUSR, 2:report by GITS_STATUSR and interrupt as well).

Table 3-376 Parameters for GICv3IRI (continued)

Name	Type	Default value	Description
`sgi-range-selector-support`	`bool`	`0x0`	Device has support for the Range Selector feature for SGI
`single-set-support`	`bool`	`0x0`	When true, forces redistributors to recall interrupts with a clear rather than issue a second Set command
`supports-shareability`	`bool`	`0x1`	Device supports shareability attributes on outgoing memory bus (i.e. is modelling an ACElite port rather than an AXI4 port).
`trace-speculative-lpi-property-update`	`bool`	`0x0`	Trace LPI propery updates performed on speculative accesses (useful for debuging LPI)
`virtual-lpi-support`	`bool`	`0x0`	GICv4 Virtual LPIs and Direct injection of Virtual LPIs supported
`virtual-priority-bits`	`int`	`0x5`	Number of implemented virtual priority bits
`wakeup-on-reset`	`bool`	`0x0`	Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.9.31 ICS307

Serially Programmable Clock Source. This model is written in LISA+.

ICS307 contains the following CADI targets:

- ClockDivider
- ICS307

ICS307 contains the following MTI components:

- *4.60 ClockDivider - trace* on page 4-2438

About ICS307

You can use this component to convert the rate of one ClockSignal to another ClockSignal by using configurable multiplier, divider, and scale values. The divider ratio can be set by startup parameters or at runtime by a configuration port. Changes to the input ClockSignal rate and divider ratio are reflected immediately by the output ClockSignal ports.

Three values determine the divisor ratio:

- `vdw`.
- `rdw`.
- `od`.

To calculate the divisor ratio, use:

```
Divisor = ((rdw+2) * scale) / (2 * (vdw+8))
```

where `scale` is derived from this table indexed by `od`:

Table 3-377 od to scale conversion

od	scale
0	10
1	2
2	8

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-377 od to scale conversion (continued)

od	scale
3	4
4	5
5	7
6	3
7	6

The default values of `vdw`, `rdw` and `od` are 4, 6 and 3 to give a default divisor rate of:

```
((6+2) * 4) / (2 * (4+8)) = 4/3
```

Table 3-378 Ports

Name	Protocol	Type	Description
`clk_in`	`ClockSignal`	Slave	Master clock rate.
`clk_out_clk1`	`ClockSignal`	Master	Modified clock rate.
`clk_out_ref`	`ClockSignal`	Master	Pass through of master clock rate for divider chaining.
`configuration`	*ICS307Configuration on page 2-72*	Slave	Configuration port for setting divider ratio dynamically.

Table 3-379 Parameters for ICS307

Name	Type	Default value	Description
`od`	`int`	`0x3`	OD
`rdr`	`int`	`0x6`	RDR
`vdw`	`int`	`0x4`	VDW

3.9.32 IDAU

IDAU is device which provides Security attribute relating to the address pass to it. For each memory access (data and instruction), the CPU checks the IDAU and sets the security of its transactions based on it. This model is written in C++.

About IDAU

An Implementation Defined Attribution Unit (*IDAU*) is a device that provides a security attribute relating to an address passed to it. For each memory access (data and instructions), the CPU checks the IDAU and sets the security of its transactions based on it.

The IDAU model uses the `pv::IDAUSignal` struct to return the security attributes for the address that is passed to it. Unlike the hardware, the CPU Fast Model does not query the IDAU for each access. Communication is at a higher abstraction level to maintain simulation speed.

The fields of the `pv::IDAUSignal` struct map to the hardware signals as follows:

Table 3-380 Mappings between pv::IDAUSignal fields and hardware signals

Hardware signal	`pv::IDAUSignal` field	Description
`IDAUNS`	`bool ns`	Non-secure region response.
`IDAUNSC`	`bool nsc`	Non-secure-callable region response.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-380 Mappings between pv::IDAUSignal fields and hardware signals (continued)

Hardware signal	pv::IDAUSignal field	Description
IDAUID	uint8_t region	Region number.
IDAUIDV	bool valid	Region number valid.
IDAUNCHK	bool exempt	Region exempt from attribution check.

Masters can read or write to the pvbus_s port as follows:

Read

Reads return the IDAU region's pv::IdauRegion struct (32 bytes), which contains information about the IDAU region for the requested address. pv::IdauRegion contains the start address, end address, pv::IDAUSignal and 8 bytes of padding to make it 32-byte aligned.

Write

The port only supports 32-byte write operations to pass in a pv::IdauRegion struct for updating an internal IDAU region.

DMI

The port adds support for DMI requests and provides a pointer to a pv::IdauRegion for the requested address. An invalid DMI call back occurs if the IDAU updates its regions.

Note

To disable the IDAU, set the NUM_IDAU_REGION parameter to zero.

Table 3-381 Ports

Name	Protocol	Type	Description
invalidate_region	*Value_64 on page 2-85*	Master	This port is used as a call back to inform masters that the IDAU has updated its region information.
pvbus_s	PVBus	Slave	-

3.9.33 MMC

Generic Multimedia Card. This model is written in LISA+.

MMC contains the following CADI targets:

- MMC

About MMC

This component simulates an SD or SDHC card that is compatible with the *MultiMedia Card Association* (MMCA, *https://www.jedec.org*) specification version 3.31. The parameters permit configuration of a number of attributes reflected in the CID and CSD registers. You can customize the component further by modifying the supplied MMC model source code directly.

When paired with a PL180_MCI component, the MMC device model provides emulation of a flexible, persistent storage mechanism.

The MMC component uses a file on the host PC to simulate the storage device. The size of this backing store file determines the reported size of the MMC device. As small sections of this file are paged in by the model, large filesystems can be modeled while making efficient use of host PC memory. The backing store file can contain a partition table and filesystems such as FAT or EXT2.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The image file is a direct bit copy of the contents of an SD card. If the image file that the `p_mmc_file` parameter refers to does not exist, the component behaves as if the card is absent. If the image file is read-only, then the component behaves as if the card is read-only.

Note

Operating system boots often attempt to write to the boot filesystem. They might not work properly if the boot filesystem is on a read-only card.

The MMC component does not model card insertion or removal. It models the card having already been inserted at system instantiation time.

You can configure the MMC component to behave as an SDHC card by setting the `card_type` parameter to `SDHC`. SDHC mode is a model-specific extension, and is not supported by PL180 hardware. It supports filesystems that are larger than 2GB.

The component supports these commands:

- `MMC_GO_IDLE_STATE`.
- `MMC_SEND_OP_COND`.
- `MMC_ALL_SEND_CID`.
- `MMC_SET_RELATIVE_ADDR`.
- `MMC_SET_DSR`.
- `MMC_SELDESL_CARD`.
- `MMC_SEND_CSD`.
- `MMC_SEND_CID`.
- `MMC_STOP_TRANSMISSION`.
- `MMC_SEND_STATUS`.
- `MMC_GO_INACTIVE_STATE`.
- `MMC_READ_SINGLE_BLOCK`.
- `MMC_READ_MULTIPLE_BLOCK`.
- `MMC_SET_BLOCK_COUNT`.
- `MMC_WRITE_BLOCK`.
- `MMC_WRITE_MULTIPLE_BLOCK`.
- `MMC_SEND_EXT_CSD`. This command is supported in SDHC mode only.

The block length is 512 bytes. SimGen reports attempts to change it as errors.

The component supports these erase commands (Class 5), but they have no effect on the disk backing storage:

- `MMC_ERASE_GROUP_START`.
- `MMC_ERASE_GROUP_END`.
- `MMC_ERASE`.

The component does not support these commands:

- `MMC_BUSTEST_R`.
- `MMC_BUSTEST_W`.

The component does not support stream read and write commands (Classes 1 and 3):

- `MMC_READ_DAT_UNTIL_STOP`.
- `MMC_WRITE_DAT_UNTIL_STOP`.
- `MMC_PROGRAM_CID`.
- `MMC_PROGRAM_CSD`.

The component does not support block oriented write protection commands (Class 6):

- `MMC_SET_WRITE_PROT`.
- `MMC_CLR_WRITE_PROT`.
- `MMC_SEND_WRITE_PROT`.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The component does not support lock card commands (Class 7) or application-specific commands (Class 8):

- `MMC_LOCK_UNLOCK`.
- `MMC_APP_CMD`.
- `MMC_GEN_CMD`.

The component does not support I/O mode commands (Class 9):

- `MMC_FAST_IO`.
- `MMC_GO_IRQ_STATE`.

The component does not support reserved commands. Using a reserved command sets the MMC `ST_ER_B_ILLEGAL_COMMAND` bit in the status register of the card. Read this with the `MMC_SEND_STATUS` command.

Use the `p_diagnostics` parameter to select the level of diagnostic output, to help to debug device driver and controller-to-card protocol issues. It supports the following levels:

Level 0
None.

Level 1
Warnings about attempting to change read-only settings.

Level 2
Trace of command calls.

Level 3
Information about every step in the MMC_Protocol interaction.

Level 4
Hex dump of every block sent or received.

The registers are not memory mapped. Instead, you access them using relevant MMC commands. The MMC component model makes the registers available through a CADI interface. Modification of these registers through CADI is not recommended, but not prohibited. For example, modifying the card ID (CID) registers can be useful when experimenting with drivers, but direct modification of the STATUS_REG register is likely to put the card model into an indeterminate state.

For a full definition of MMC registers, see the MMCA System Summary documentation. Device-specific register information can also be obtained from MMC vendors.

Table 3-382 MMC registers

Name	CADI register number	Description
OCR_REG	`0x000`	Operating conditions register
CID_REG0	`0x004`	Card ID bits 127:96
CID_REG1	`0x005`	Card ID bits 95:64
CID_REG2	`0x006`	Card ID bits 63:32
CID_REG3	`0x007`	Card ID bits 31:0
CSD_REG0	`0x008`	Card specific data bits 127:96
CSD_REG1	`0x009`	Card specific data bits 95:64
CSD_REG2	`0x00a`	Card specific data bits 63:32
CSD_REG3	`0x00b`	Card specific data bit 31:0
RCA_REG	`0x00c`	Relative card address register
DSR_REG	`0x00d`	Driver stage register

Non-Confidential

Table 3-382 MMC registers (continued)

Name	CADI register number	Description
BLOCKLEN_REG	0x00e	Block length
STATUS_REG	0x00f	Card status
BLOCK_COUNT_REG	0x010	Block count

Table 3-383 Ports

Name	Protocol	Type	Description
card_present	*StateSignal* on page 2-85	Master	Used to signal whether an MMC image is loaded. It is set if an image is loaded, and is clear if no image is loaded.
clk_in	ClockSignal	Slave	Input clock signal used to drive our 'bus'.
mmc	*MMC_Protocol* on page 2-73	Slave	The MMC slave port.

Table 3-384 Parameters for MMC

Name	Type	Default value	Description
card_type	string	"SD"	Card type ('SD' or 'SDHC')
diagnostics	int	0x0	Diagnostics level
force_sector_addressing	bool	0x0	Use sector addressing even on small cards
p_OEMid	int	0x0	Card ID OEM ID
p_fast_access	bool	0x1	Don't simulate MMC block access delays
p_manid	int	0x2	Card ID Manufacturer ID
p_mmc_file	string	"mmc.dat"	MMCard filename
p_prodName	string	"ARMmmc"	Card ID Product Name (6 chars)
p_prodRev	int	0x1	Card ID Product Revision
p_sernum	int	0xca4d0001	Card Serial Number

3.9.34 MMU_400

MMU-400 component. This model is written in LISA+.

MMU_400 contains the following CADI targets:

- MMU_400
- MMU_400_BASE

MMU_400 contains the following MTI components:

- *4.82 MMU_400_BASE - trace* on page 4-2547
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About MMU_400

Set the `use_label_mapping` parameter to `true` if your upstream devices have labels in the top 16 bits of the transaction MasterID.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Note

The model does not have a concept of AXI-ID, but a transaction can have a MasterID set on it.

Label your upstream components 0…*N* so that the parameters of this component can map those integers to StreamID and SSD_Index.

Set `use_label_mapping` to `false` if the StreamID is encoded in the top 16 bits of the MasterID and the bottom 16 bits encode either the SSD_Index or the SSD state directly, depending on `use_ssd_determination_table`. Typically in hardware, a device emits different AXI-IDs, depending on what it is doing. In the model, MasterIDs are usually not diverse and a device might only emit one MasterID.

If `use_ssd_determination_table` is `true`, the bottom 16 bits of the MasterID encode the SSD_Index. They must be < 2^`ssd_index_width`. If it is `false`, they encode the SSD state directly (zero is Secure and nonzero is Non-secure).

This component models all architectural registers that are specified in the Technical Reference Manual (TRM), except that it does not model any of the performance registers, and has the following limitations:

- MMU-400 does not have an SMMU_STLBGSTATUS register because the Secure side is a nominal pass-through. MMU-400 only has stage 2 support and you cannot use stage 2 on the Secure side.
- The SMMU_NSACR is an alias of the Non-secure SMMU_ACR. This component models SMMU_ACR as RAZ/WI.
- The *ACR registers have IMP DEF contents. This component models only the PAGESIZE bit of the SACR, as non-RAZ/WI. It models no other IMP DEF registers.

Table 3-385 Ports

Name	Protocol	Type	Description
`apb3_control_ns`	`PVBus`	Slave	APBv3 control port for Non-secure access to the register file. If this port is used do not use the APBv4 port.
`apb3_control_s`	`PVBus`	Slave	APBv3 control port for Secure access to the register file. If this port is used do not use the APBv4 port.
`apb4_control`	`PVBus`	Slave	APBv4 control port for access to the register file. If this port is used do not use the APBv3 ports.
`cfg_cttw_in`	*Signal* on page 2-85	Slave	Enables coherent page table walks.
`cfg_flt_irpt_ns`	*Signal* on page 2-85	Master	Non-secure configuration access fault interrupt. Corresponds to SMMU architectural signal SMMU_NSgCfgIrpt.
`cfg_flt_irpt_s`	*Signal* on page 2-85	Master	Secure configuration access fault interrupt. Corresponds to SMMU architectural signal SMMU_gCfgIrpt.
`comb_irpt_ns`	*Signal* on page 2-85	Master	Non-secure combined interrupt.
`comb_irpt_s`	*Signal* on page 2-85	Master	Secure combined interrupt.
`cxt_irpt_ns`	*Signal* on page 2-85	Master	Non-secure context bank fault.
`glbl_flt_irpt_ns`	*Signal* on page 2-85	Master	Global Non-secure fault interrupt. Corresponds to SMMU architectural signal SMMU_NSgIrpt.
`glbl_flt_irpt_s`	*Signal* on page 2-85	Master	Global Secure fault interrupt. Corresponds to SMMU architectural signal SMMU_gIrpt.
`priv_internals`	`MMU_400_Internals`	Slave	For internal use only, please do not use.
`pvbus_m`	`PVBus`	Master	Downstream port of the MMU, where translated transactions emerge.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-385 Ports (continued)

Name	Protocol	Type	Description
pvbus_ptw_m	PVBus	Master	Downstream port for page table walks if configured using the ptw_has_separate_port parameter.
pvbus_s	PVBus	Slave	Upstream port of the MMU. Addresses on the port are in VA/IPA.
reset_in	*Signal* on page 2-85	Slave	Signal to reset the MMU.

Table 3-386 Parameters for MMU_400

Name	Type	Default value	Description
always_secure_ssd_indices	string	""	Non-programmable SSD Indexes that are always secure (e.g. 0, 6, 35-64).
cfg_cttw	bool	0x1	Perform coherent page table walks
dump_unpredictablity_in_user_flags	bool	0x0	Override the user flags to encode unpredictable information (validation only)
label0_read_ssd	int	0x0	Label0: Read SDD or SSD_Index

Table 3-386 Parameters for MMU_400 (continued)

Name	Type	Default value	Description
number_of_smrs	int	0x20	Number of stream match registers.
percent_tlbstatus_commits	int	0xa	Percentage of times that a poll of TLBSTATUS will commit the TLBI commands
prefetch_only_requests	int	0x0	Handle prefetch-only requests by:- 0 -- deny them 1 -- use debug table walks and TLB entries 2 -- treat them as normal transactions (dangerous)
programmable_non_secure_by_default_ssd_indices	string	""	Programmable SSD Indexes that are by default non-secure (e.g. 0, 6, 35-84).
programmable_secure_by_default_ssd_indices	string	""	Programmable SSD Indexes that are by default secure (e.g. 0, 6, 35-84).
ptw_has_separate_port	bool	0x1	Page Table Walks use pvbus_ptw_m
pvbus_m_is_ace_lite	bool	0x1	Is pvbus_m (the downstream port that translated transaction exit) ACE-Lite
pvbus_ptw_m_is_ace_lite	bool	0x1	Is pvbus_ptw_m (the downstream port that is used for walks if ptw_has_separate_port is true) ACE-Lite
stream_id_width	int	0x6	StreamID bit width
tlb_depth	int	0x40	TLB Depth (0 means 10000). The model will perform best with more TLB entries.
use_label_mapping	bool	0x1	Use label mapping
use_ssd_determination_table	bool	0x1	Use SSD Determination Table

Table 3-387 Parameters for MMU_400_BASE

Name	Type	Default value	Description
always_secure_ssd_indices	string	""	Non-programmable SSD Indexes that are always secure (e.g. 0, 6, 35-64).
cfg_cttw	bool	0x1	Perform coherent page table walks
dump_unpredictablity_in_user_flags	bool	0x0	Override the user flags to encode unpredictable information (validation only)
number_of_contexts	int	0x8	Number of context banks
number_of_smrs	int	0x10	Number of stream match registers.
percent_tlbstatus_commits	int	0xa	Percentage of times that a poll of TLBSTATUS will commit the TLBI commands
prefetch_only_requests	int	0x0	Handle prefetch-only requests by:- 0 -- deny them 1 -- use debug table walks and TLB entries 2 -- treat them as normal transactions (dangerous)

pvbus_ptw_m_is_ace_lite	bool	0x1	Is pvbus_ptw_m (the downstream port that is used for walks if ptw_has_separate_port is true) ACE-Lite
seed	int	0x12345678	Seed for SMMU
stream_id_width	int	0x6	StreamID bit width
tlb_depth	int	0x40	TLB Depth (0 means 10000). The model will perform best with more TLB entries.
use_ssd_determination_table	bool	0x1	Use SSD Determination Table

3.9.35 MMU_400_BASE

MMU-400 base component. This model is written in LISA+.

MMU_400_BASE contains the following CADI targets:

- MMU_400_BASE

MMU_400_BASE contains the following MTI components:

- *4.82 MMU_400_BASE - trace* on page 4-2547
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-388 Ports

Name	Protocol	Type	Description
apb3_control_ns	PVBus	Slave	If the device has been configured with APB3 control ports then this is used to address the register file with non-secure accesses. If this is the case then the apb4_control port should not be used.
apb3_control_s	PVBus	Slave	If the device has been configured with APB3 control ports then this is used to address the register file with secure accesses. If this is the case then the apb4_control port should not be used.
apb4_control	PVBus	Slave	If the device has been configured with APB4 control ports then this port is used -- it carries the security world with the transaction itself. If this is the case then the apb3_control_s and apb3_control_ns should not be used.
cfg_cttw_in	*Signal* on page 2-85	Slave	The SoC supports coherent page walks, this is meant to be sampled at reset. However, in practice the model has to prevent the race condition between cfg_cttw being asserted at the same 'cycle' as negedge reset. Thus we actually only sample the signal on the first transaction to the SMMU or the first transition on this signal after reset. Thus in the model, we require that cfg_cttw be held for at least this period of time.

Table 3-388 Ports (continued)

Name	Protocol	Type	Description
cfg_flt_irpt_ns	*Signal* on page 2-85	Master	Non-secure Configuration Access Fault Interrupt In the SMMU Architecture this is called SMMU_NSgCfgIrpt.
cfg_flt_irpt_s	*Signal* on page 2-85	Master	Secure Configuration Access Fault Interrupt In the SMMU Architecture this is called SMMU_gCfgIrpt.
comb_irpt_ns	*Signal* on page 2-85	Master	"Non-secure combined interrupt" (cfg_flt_irpt_ns | glbl_flt_irpt_ns | cxt_irpt_ns)?
comb_irpt_s	*Signal* on page 2-85	Master	"Secure combined interrupt"
cxt_irpt_ns	*Signal* on page 2-85	Master	Non-secure context bank fault NOTE that there is only one context bank fault, despite there being potentially 8 contexts. As we are HW stage 2 only then we can't have any banks configured as secure (well if we do then we generate a global fault).
glbl_flt_irpt_ns	*Signal* on page 2-85	Master	Global non-secure Fault Interrupt In the SMMU Architecture this is called SMMU_NSgIrpt.
glbl_flt_irpt_s	*Signal* on page 2-85	Master	Global secure Fault Interrupt In the SMMU Architecture this is called SMMU_gIrpt.
identify	MMU_400_BASE_IDENTIFY	Master	This port is a special model port that is used to take a transaction and map it to an SSD/SSD_Index and StreamID.
priv_internals	MMU_400_Internals	Slave	For internal use only, please do not use.
pvbus_m	PVBus	Master	This downstream port is where the translated accesses from pvbus_s emerge. If page walks are configured to come out of this port, then they will come out with the with the same attributes as described for pvbus_ptw_m.
pvbus_ptw_m	PVBus	Master	This downstream port is where page table walk accesses come from. This is only used if configured to use a separate page table walk port. The MMU-400 will only obey DVM messages if configured to use this port. The page walks come out of this port with the following master_id and user_flags. master_id : 0xFFFFffff The user flags : user_flags[7:0] stage 1 context_id (or 0xFF if stage2 only) user_flags[15:8] stage 2 context_id (or 0xFF if stage 1 with stage 2 bypass) user_flags[18:16] stage 1 level user_flags[21:19] stage 2 level user_flags[23:22] stage 1 descriptor encoding (0=v7s, 1=v7l, 2=v8l, 3=none) user_flags[25:24] stage 2 descriptor encoding (0=v7s, 1=v7l, 2=v8l, 3=none) user_flags[31,30] adomain of the transaction NOTE that if the walk is being done for a stage 1 page walk descriptor fetch then the stage 1 level field will indicate that level. If the walk is being done for a stage 2 descriptor fetch, then the stage 2 level field will show that level. If the context-id for a stage is not valid (0xFF) then the 'level' information is 0x7.
pvbus_s	PVBus	Slave	This port is the upstream port of the device, addresses on the port are in the VA/IPA
reset_in	*Signal* on page 2-85	Slave	The reset pin.

About MMU_500

This is a model of a basic MMU-500. Set the version using the `version` parameter.

You cannot arbitrarily configure how you derive StreamIDs and SSD_Indexes from the transaction attributes.

This component has two label modes which you select using the parameter `use_label_mapping`:

- Set `use_label_mapping` to `true` if your upstream devices have labels in the top 16 bits of the transaction MasterID.

  Note

  The model does not have a concept of AXI-ID, but a transaction can have a MasterID set on it.

  Label your upstream components 0…*N* so that the parameters of this component can map those integers to StreamID and SSD_Index.
- Set `use_label_mapping` to `false` if the StreamID is encoded in the top 16 bits of the MasterID and the bottom 16 bits encode either the SSD_Index or the SSD state directly, depending on `use_ssd_determination_table`:
  - If `use_ssd_determination_table` is `true`, the bottom 16 bits of the MasterID encode the SSD_Index. They must be < 2^`ssd_index_width`.
  - If `use_ssd_determination_table` is `false`, the bottom 16 bits of the MasterID encode the SSD state directly, where zero is Secure and nonzero is Non-secure.

  Typically in hardware, a device emits different AXI-IDs, depending on what it is doing. In the model, MasterIDs are usually not diverse and a device might only emit one MasterID.

This component models the registers as follows:

- It models all architectural registers that the *Technical Reference Manual* (TRM) specifies, except that it does not model any of the performance registers.
- Unlike the MMU-400, MMU-500 does have an SMMU_STLBGSTATUS register because it has stage 1 and stage 2 support.
- The SMMU_NSACR is an alias of the Non-secure SMMU_ACR. This component models SMMU_ACR as RAZ/WI.
- The *ACR registers have IMP DEF contents. This component models only the PAGESIZE bit of the SACR, as non-RAZ/WI. It models no other IMP DEF registers.

Table 3-390 Ports

Name	Protocol	Type	Description
`cfg_cttw_in`	*Signal* on page 2-85	Slave	Enables coherent page table walks.
`comb_irpt_ns`	*Signal* on page 2-85	Master	Non-secure combined interrupt.
`comb_irpt_s`	*Signal* on page 2-85	Master	Secure combined interrupt.
`cxt_irpt[128]`	*Signal* on page 2-85	Master	Context interrupt.
`glbl_flt_irpt_ns`	*Signal* on page 2-85	Master	Global Non-secure fault interrupt.
`glbl_flt_irpt_s`	*Signal* on page 2-85	Master	Global Secure fault interrupt.
`priv_internals`	`MMU_500_Internals`	Slave	For internal use only, please do not use.
`pvbus_control_s`	`PVBus`	Slave	Provides memory-mapped read write access to the control registers of the module.
`pvbus_m[32]`	`PVBus`	Master	For all memory accesses. One for each Translation Buffer Unit (TBU).
`pvbus_ptw_m`	`PVBus`	Master	If ptw_has_separate_port is true, use for page table walks.

Table 3-391 Parameters for MMU_500 (continued)

Name	Type	Default value	Description
percent_tlbstatus_commits	int	0xa	Percentage of times that a poll of TLBSTATUS will commit the TLBI commands
prefetch_only_requests	int	0x0	Handle prefetch-only requests by:- 0 -- deny them 1 -- use debug table walks and TLB entries 2 -- treat them as normal transactions (dangerous)
programmable_non_secure_by_default_ssd_indices	string	""	Programmable SSD Indexes that are by default non-secure (e.g. 0, 6, 35-84).
programmable_secure_by_default_ssd_indices	string	""	Programmable SSD Indexes that are by default secure (e.g. 0, 6, 35-84).
ptw_has_separate_port	bool	0x1	Page Table Walks use pvbus_ptw_m
supports_nested_translations	bool	0x1	Supports nested translations (stage 1 + stage 2)
tlb_depth	int	0x800	TLB Depth (0 means 10000). The model will perform best with more TLB entries.
use_label_mapping	bool	0x1	Use label mapping
use_ssd_determination_table	bool	0x1	Use SSD Determination Table
version	string	"EAC"	Version of the RTL that the model represents. Valid values are LACr1 and EAC.

Table 3-392 Parameters for MMU_500_BASE

Name	Type	Default value	Description
PRIVATE_PARAMETER_personality	string	""	The personality to use (affects ID codes and various imp def features).
PRIVATE_PARAMETER_seed	int	0x12345678	Seed for randomised SMMU implementation defined behaviour
PRIVATE_PARAMETER_validation_mode	int	0x0	Internal validation mode.
always_secure_ssd_indices	string	""	Non-programmable SSD Indexes that are always secure (e.g. 0, 6, 35-64).
cfg_cttw	bool	0x1	Perform coherent page table walks
dump_unpredictablity_in_user_flags	bool	0x0	Override the user flags to encode unpredictable information (validation only)
number_of_contexts	int	0x8	Number of context banks
number_of_smrs	int	0x10	Number of stream match registers.
percent_tlbstatus_commits	int	0xa	Percentage of times that a poll of TLBSTATUS will commit the TLBI commands
prefetch_only_requests	int	0x0	Handle prefetch-only requests by:- 0 -- deny them 1 -- use debug table walks and TLB entries 2 -- treat them as normal transactions (dangerous)

programmable_secure_by_default_ssd_indices	string	""	Programmable SSD Indexes that are by default secure (e.g. 0, 6, 35-84).
ptw_has_separate_port	bool	0x1	Page Table Walks use pvbus_ptw_m (or uses pvbus_m[0])
supports_nested_translations	bool	0x1	Supports nested translations (stage 1 + stage 2)
tlb_depth	int	0x800	TLB Depth (0 means 10000). The model will perform best with more TLB entries.
use_ssd_determination_table	bool	0x1	Use SSD Determination Table
version	string	"EAC"	Version of the RTL that the model represents. Valid values are LACr1 and EAC.

3.9.37 MMU_500_BASE

MMU-500 base component. This model is written in LISA+.

MMU_500_BASE contains the following CADI targets:

- MMU_500_BASE

MMU_500_BASE contains the following MTI components:

- *4.83 MMU_500_BASE - trace* on page 4-2576
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-393 Ports

Name	Protocol	Type	Description
cfg_cttw_in	*Signal* on page 2-85	Slave	The SoC supports coherent page walks, this is meant to be sampled at reset. However, in practice the model has to prevent the race condition between cfg_cttw being asserted at the same 'cycle' as negedge reset. Thus we actually only sample the signal on the first transaction to the SMMU or the first transition on this signal after reset. Thus in the model, we require that cfg_cttw be held for at least this period of time.
comb_irpt_ns	*Signal* on page 2-85	Master	"Non-secure combined interrupt"
comb_irpt_s	*Signal* on page 2-85	Master	"Secure combined interrupt"
cxt_irpt[128]	*Signal* on page 2-85	Master	Non-secure context bank fault.
glbl_flt_irpt_ns	*Signal* on page 2-85	Master	Global non-secure Fault Interrupt In the SMMU Architecture this is called SMMU_NSgIrpt.
glbl_flt_irpt_s	*Signal* on page 2-85	Master	Global secure Fault Interrupt In the SMMU Architecture this is called SMMU_gIrpt.
identify	MMU_500_BASE_IDENTIFY	Master	This port is a special model port that is used to take a transaction and map it to an SSD/SSD_Index and StreamID.

Table 3-393 Ports (continued)

Name	Protocol	Type	Description
priv_internals	MMU_500_Internals	Slave	For internal use only, please do not use.
pvbus_control_s	PVBus	Slave	The register port of the device is AXI.
pvbus_m[32]	PVBus	Master	This downstream port is where the translated accesses from pvbus_s emerge. See notes for pvbus_s[] as well. If the Page Table Walk (PTW) does not have a separate port then PTW accesses will emerge at port 0 with the same attributes as described in pvbus_ptw_m.
pvbus_ptw_m	PVBus	Master	This downstream port is where page table walk accesses come from. This is only used if configured to use a separate page table walk port. The MMU-500 will only obey DVM messages if configured to use this port. The page walks come out of this port with the following master_id and user_flags. master_id : 0xFFFFffff The user flags : user_flags[7:0] stage 1 context_id (or 0xFF if stage2 only) user_flags[15:8] stage 2 context_id (or 0xFF if stage 1 with stage 2 bypass) user_flags[18:16] stage 1 level user_flags[21:19] stage 2 level user_flags[31,30] adomain of the transaction NOTE that if the walk is being done for a stage 1 page walk descriptor fetch then the stage 1 level field will indicate that level. If the walk is being done for a stage 2 descriptor fetch, then the stage 2 level field will show that level. If the context-id for a stage is not valid (0xFF) then the 'level' information is 0x7.
pvbus_s[32]	PVBus	Slave	This port is the upstream port of the device, addresses on the port are in the VA/IPA Each TBU in the design is represented by a pair of pvbus_s[tbu_id] and pvbus_m[tbu_id]. That is transactions that go into pvbus_s[tbu_id] will emerge at pvbus_m[tbu_id]. The port index that a transaction comes in on is the tbu_number_ parameter to the MMU_500_BASE_IDENTIFY::identify() function. The identify() function must use all the information it is given by the parameters to map to the architectural concepts of StreamID and SSD_Index/SSD. How it does this is IMPLEMENTATION DEFINED and depends on the topology of the SoC and the masters upstream of the TBUs.
reset_in	*Signal* on page 2-85	Slave	The reset pin.

Table 3-394 Parameters for MMU_500_BASE

Name	Type	Default value	Description

3.9.38 MMU_600

This model is written in C++.

MMU_600 contains the following CADI targets:

- MMU_600

MMU_600 contains the following MTI components:

- *4.84 MMU_600 - trace* on page 4-2605
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760

About MMU_600 and MMU_700

MMU_600 and MMU_700 are SMMUv3-compliant devices and are used for I/O virtualization of devices.

The hardware is a distributed SMMU. It consists of the following:

- A single Translation Control Unit (TCU), which has a port for the programming interface of the SMMU, receives DVM messages, and does all the page walking and queue manipulation, for example.
- One or more Translation Bus Units (TBUs), which translate transactions from upstream client devices into downstream transactions.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- Zero or more connections to PCIe Root Complexes (PCIe-RCs). A maximum of 62 TBUs and PCIe-RCs can be attached.
- An interconnect that connects the TBUs and PCIe-RCs to the TCU.

A PCIe-RC has one connection to the TCU to make ATS requests but the PCIe-RC uses one or more TBUs to transform the transactions and pass them to the memory system. In the model, the TBUs used are listed in the parameter `list_of_pcie_mode`. The SMMU does not know which TBUs a particular PCIe-RC is attached to.

The TBU ORs a value into each StreamID that it receives. In the model, this is configured by the following parameters:

- `list_of_s_sid_high_at_bitpos0`
- `list_of_ns_sid_high_at_bitpos0`

The TCU, TBU, and the interconnect are all represented by this single model component.

In the model, the `tbs_pvbus_s[i]` and `tbm_pvbus_m[i]` port pair represent a TBU `i`, or `tbs_pvbus_s[i]` represents an incoming connection for a PCIe-RC. The corresponding reverse connection from the TCU to the PCIe-RC is by a special bus called `pvbus_id_routed_m` that is used to transport ATC Invalidates to the PCIe-RC.

To reduce system construction complexity, the `tbs_pvbus_s[i]` and `tbm_pvbus_m[i]` pair also acts as a TBU so that the PCIe-RC does not need to separate its normal transactions and its ATS requests.

However, ATC Invalidates are only sent to a port which appears in `list_of_pcie_rc`. It should be uniquely decoded to a single port based on `list_of_ns_sid_high_at_bitpos0`, and ATC Invalidates must be routed to the correct PCIe subsystem to invalidate the cache of ATS Responses in the subsystem. Therefore all TBUs that a PCIe-RC uses must have a unique reverse mapping from stream id to port.

Note

A bad configuration renders the model inactive.

Some configuration can be adjusted by configuration pins. These are only sampled at the negative edge of the reset pin. If you want to use these pins, then you must drive them before sending a negative edge on the reset pin. During simulation_reset, the component driving them must also drive this transition again.

The pin `sup_oas` is not supported, instead it is a parameter, as it is assumed that it would be tied to a fixed value in any specific platform.

Debug reads to the registers do not disturb the state.

Writes to registers with Update flags, including debug writes, are ignored if the Update flag is already set to one.

Debug and real accesses to the registers must be 32 bits or 64 bits.

MSIs are issued on the `qtw_pvbus_m` port using attributes that are determined by the parameter `msi_attribute_transform`, while Event queue writes are always issued with `ExtendedID=0, UserFlags=0, MasterID=0xFFFFffff`. In the hardware, there is no way of distinguishing Event queue writes from MSI writes. However, this provides a mechanism for the model system to distinguish them.

The hardware only has a single cacheability attribute for input transactions, but `PVBus` transports have both inner and outer cacheability.

For non-PCIe-mode TBUs, whose index does not appear in `list_of_pcie_mode` or `list_of_pcie_rc`, for non-cache maintenance operations:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- If the input attribute is any type of device then it is well defined as being outer-shared and Device-nGnRnE or Device-nGnRE. There is no support for Gathering or Reordering.
- If the outer cacheable input attribute is normal, and it is Write-back, this is converted to Inner Write-back Outer Write-back (iWB-oWB) with the desired shareability. No Transient hint is supported and is always treated as non-transient.
- This leaves all other normal memory types that are mapped to Inner Normal Non-cacheable, Outer Normal Non-cacheable outer shared (iNC-oNC-osh).

Therefore, the upstream devices must present the cacheability in the *outer* cacheability attribute on `PVBus` if it is cacheable. If it is a device type then both the inner and outer attributes must be set to the same value. If it is iNC-oNC-osh, then it must be presented as such.

For PCIe-mode TBUs, that is, whose index appears in `list_of_pcie_mode` or `list_of_pcie_rc`:

- Input transactions are from PCIe and the only indication of the memory type is in the NoSnoop bit of the transaction. No shareability is transported. NoSnoop is interpreted as iNC-oNC-osh. ! NoSnoop is interpreted as iWB-oWB-ish (note Inner Shareable).
- If a NoSnoop transaction has an attribute transform applied to it and the result of the transform is weaker than iNC-oNC-osh, it is forced to iNC-oNC-osh. For example, if a NoSnoop transaction uses a page table and is transformed to iWB-oWB-nsh then it is forced to iNC-oNC-osh. However, if the page tables transformed it to a device type, then as all device types are stronger than iNC-oNC-osh, it exits the SMMU as the device type.
- In the model, transactions are classified by their incoming memory attributes as to whether they are NoSnoop or not and then are normalized appropriately:
  - iWB-oWB-any-shareability are interpreted as ! NoSnoop, therefore are normalized to iWB-oWB-ish.
  - Anything else is considered NoSnoop, and therefore is normalized to iNC-oNC-osh.
- Translated accesses also have the same interpretation to determine NoSnoop and how they are normalized. Therefore they could enter the system with different attributes to if they entered the SMMU as Untranslated Accesses and were translated by the normal translation process, before exiting downstream of the SMMU and entering the system
- It is expected that there is a component downstream of the SMMU that is aware of the system address map and will override the memory type to `device` for any transaction that accesses a peripheral.

The hardware has a single cacheability on input, and, for transactions that are neither cache-maintenance operations nor PCIe transactions, it normalizes the input to an architectural form before performing the SMMUv3 architectural transform:

- Any device type is left untouched. The input can only represent Device-nGnRE and Device-nGnRnE.
- If the input is Write-back (WB), it is normalized to iWB-oWB with the incoming shareability.
- If the input is anything else, it is normalized to iNC-oNC-osh.

The model accepts full architectural attributes of two levels of cacheability and so has to decide how to interpret this in terms of the hardware. For transactions that are not cache maintenance operations, the model replicates the outer attribute into the inner attribute and then performs the normalization that the hardware does.

The hardware normalizes the architectural output attributes and outputs a single level of cacheability and a user flag (OC) specifying if the architectural attributes were cacheable in the outer cacheable domain. If the transaction is classified as a PCIe transaction, the NoSnoop transform previously described is applied. That is, if the original transaction was NoSnoop then any weaker memory type is strengthened to iNC-oNC-osh, and the following transform is applied:

```
if      iWB-oWB-nsh/ish/osh     then output WB-nsh/ish/osh, OC = 1
else if i(NC/WT/WB)-o(WB/WT)    then output NC-Sys,         OC = 1
else if i(NC/WT/WB)-oNC         then output NC-Sys,         OC = 0
else if Device-(GRE/nGRE/nGnRE) then output DV-Sys,         OC = 0
else                                 output SO-Sys,         OC = 0
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The model only normalizes according to PCIe but otherwise leaves the architectural attributes intact on the output bus.

Important

The model deals with groups of transactions with the same attributes and a similar range of addresses. The mapping that is used is stored by the bus infrastructure and is used for subsequent sufficiently similar transactions without needing the intervention of the SMMU model, and therefore are not traced.

Model limitations

- The Performance Monitoring Unit (PMU) has limited functionality. It is intended for demonstration purposes only and does not implement all architecturally required events. It does not implement the `pmusnapshot_ack` or `pmusnapshot_req` interface.
- The model does not implement:
  - RAS.
  - Power control.
  - `sup_oas`, which controls the OAS of the SMMU. This is expected to be constant for a system.
  - The SYSCO interface.
  - The Low-Power Interface
- Cache maintenance operations cannot be inserted into the TBU ports of the SMMU.
- `PVBus` has no representation of the cache stash operations, so they are not supported.
- `TCU_CFG.XLATE_SLOTS` is fixed at 512.
- `TCU_STATUS.GNT_XLATE_SLOTS` always reads as 512.

Table 3-395 Ports

Name	Protocol	Type	Description
`clk_in`	`ClockSignal`	Slave	Clock signal (in RTL aclk) This is a clock time-base used by the TCU to spread some of its processing over time, if enabled by the wait_* parameters. The clock must always be connected.
`cmd_sync_irpt_ns`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for non-secure CMD_SYNC having a completion signal of SIG_IRQ.
`cmd_sync_irpt_s`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for the PRI queue becoming non-empty. Pulsed interrupt output signal for secure CMD_SYNC having a completion signal of SIG_IRQ.
`event_q_irpt_ns`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for the non-secure event queue becoming non-empty.
`event_q_irpt_s`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for the secure event queue becoming non-empty.
`evento`	*Signal* on page 2-85	Master	Event signal
`global_irpt_ns`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for non-secure SMMU_GERROR(N) signalling an error.
`global_irpt_s`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for secure SMMU_S_GERROR(N) signalling an error.

Non-Confidential

Table 3-395 Ports (continued)

Name	Protocol	Type	Description
identify	*SMMUv3AEMIdentifyProtocol* on page 2-78	Master	Map the transaction to the tuple (StreamID, SubStreamID, SubStreamIDValid, SSD) The StreamID that is produced by the implementation of this protocol is not the final StreamID. The final StreamID is produced by using the list_of_ns_sid_high_at_bitpos0/ list_of_s_sid_high_at_bitpos0 parameter to map the StreamID based on the upstream port index. Also see the parameter howto_identify which can replace the functionality of this port under certain circumstances.
prog_pvbus_s	PVBus	Slave	Register slave port (in RTL PROG)
pvbus_id_routed_m[62]	PVBus	Master	This is a special "id-routed" port for transmitting ATC invalidates upstream into the PCIe EndPoints, it is not a normal bus. The FastModels ATC Invalidate and PRI Response protocol specifies how to route and deal with this port.
qtw_pvbus_m	PVBus	Master	Master port used for Table Walks, MSIs and Queue access when separate_tw_msi_qs_port==true (in RTL QTW)
sec_override	*Signal* on page 2-85	Slave	Allow certain registers to be accessible to non-secure accesses from reset, as described in the TCU_SCR register.
sup_btm	*Signal* on page 2-85	Slave	System supports BTM and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. If BTM (Broadcast Table Maintenance) is not supported then DVM messages will be ignored.
sup_cohacc	*Signal* on page 2-85	Slave	System supports COHACC and will be reflected in the IDR registers.
sup_sev	*Signal* on page 2-85	Slave	System supports SEV and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers.
tbm_pvbus_m[62]	PVBus	Master	The TBU master ports that carry transactions that have been translated from the correspondingly numbered tbs_pvbus_s[] port.
tbs_pvbus_s[62]	PVBus	Slave	The TBU slave ports that receive transactions to be translated. They will exit the SMMU through the same numbered pvbus_m[] port.
tbu_pmu_irpt[62]	*Signal* on page 2-85	Master	TBU Performance Monitoring Unit interrupt, one per TBU.
tbu_pmusnapshot_ack[62]	*Signal* on page 2-85	Master	PMU snapshot interface for the TBU, ack a snapshot.
tbu_pmusnapshot_req[62]	*Signal* on page 2-85	Slave	PMU snapshot interface for the TBU, request a snapshot.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-395 Ports (continued)

Name	Protocol	Type	Description
tbu_ras_irpt[62]	*Signal* on page 2-85	Master	The RAS interrupt pin for errors detected in the TBUs.
tbu_reset_in[62]	*Signal* on page 2-85	Slave	Reset signals The TBUs can have independent reset signals. Each signal tbu_reset_in[n] corresponds to the TBU using tbs_pvbus_s[n]/ tbs_pvbus_s[n] pair. If the SMMU receives a transaction whilst the TBU is expected to be in reset then it will complain using the ArchMsg.Warning.warning trace source. Those tbu_reset_in that correspond to a PCIe-RC connection can be connected to monitor the PCIe-RC's reset signal. If it receives an ATS request when in reset then it will complain in a similar way. You must connect these pins if you wish the TCU_NODE_STATUS for the nodes to be accurate (including any connected to the PCIe-RC).
tcu_pmu_irpt	*Signal* on page 2-85	Master	TCU Performance Monitoring Unit interrupt
tcu_pmusnapshot_ack	*Signal* on page 2-85	Master	PMU snapshot interface for the TCU, ack a snapshot.
tcu_pmusnapshot_req	*Signal* on page 2-85	Slave	PMU snapshot interface This is a four-phase handshake to have the corresponding PMCG perform a capture of the current counter values. PMU snapshot interface for the TCU, request a snapshot.
tcu_ras_irpt	*Signal* on page 2-85	Master	The RAS interrupt pin for errors detected in the TCU.
tcu_reset_in	*Signal* on page 2-85	Slave	The reset signal to the TCU interface.

Table 3-396 Parameters for MMU_600

Name	Type	Default value	Description
all_error_messages_through_trace	bool	0x0	Some conditions in the SMMU are so strange that the software programming the SMMU has done something wrong. At this point messages are output to either ArchMsg.Error.* or ArchMsg.Warning.* or to the error stream of the simulator. Outputting to the error stream of the simulator may cause it to return with a non-zero exit status. If you set this option to true then instead of using the error stream of the simulator it will always use a trace stream allowing the simulation to exit with a zero exit status.
behaviour_of_sampled_at_reset_signals	int	0x0	Some configuration signals into the SMMU are sampled on negedge of reset. However, it can sometimes be hard to arrange to drive a configuration pin before the negedge of reset. The configuration pins are sampled: 0 -- at negedge reset. 1 -- at negedge reset, but if a later change occurs at the same simulated time, and no transactions have occurred, then they will be resampled and the SMMU reset again.

Table 3-396 Parameters for MMU_600 (continued)

Name	Type	Default value	Description
cmdq_max_number_of_commands_to_buffer	int	0xa	The command queues can buffer fetched commands before issuing them. This parameter is roughly the maximum number of commands to do this for. The programmer visible effects are that just because the CONS pointer shows a command has been _consumed_ does not necessarily mean that it has been issued (and completed). Higher values will accentuate this effect.
enable_device_id_checks	bool	0x1	If this parameter is true then the DeviceIDs seen by the GIC are: * for client devices: DeviceID = StreamID + translated_device_id_base * for SMMU-generated MSIs: smmu_msi_device_id This parameter enables two checks: * If the DeviceID is used in the output_attribute_transform then if it overflows 32 bits then the model will warn. If the DeviceID is not used then it is assumed that the external agent that forms the DeviceID will warn if it overflows. * If the SMMU supports MSIs, then the model will check that the GIC will be able to distinguish an MSI generated by the SMMU from one generated by a client device. As the exact mechanism to determine the DeviceID is in the system and not necessarily under control of the SMMU then you can disable these warnings using this parameter. See also the parameters: output_attribute_transform and msi_attribute_transform.
howto_identify	string	"use-identify"	If 'use-identify' then will use the 'identify' port to determine the SSD, StreamID, SubStreamID of a transaction. Otherwise, this string extracts them from the transaction's attributes. Examples:- SEC_SID=ExtendedID[63], SSV=ExtendedID[62], SubstreamID=ExtendedID[51:32], StreamID=ExtendedID[31:0] nSEC_SID=ExtendedID[63], StreamID=ExtendedID[55:24], nSSV=ExtendedID[20], SubstreamID=ExtendedID[19:0] SEC_SID is one bit wide, true if StreamID is secure. SSV is one bit wide, true if SubstreamID is valid. The alternative symbols nSEC_SID and nSSV have the negative logic to SEC_SID and SSV. You must not use the negative and positive logic for the same symbol at the same time. However, just because you use negative logic for one symbol does not force you to use negative logic for the other. SubstreamID is 20 bits wide and StreamID is 32 bits. More complex examples: StreamID[31:24]=0, StreamID[23:0]=ExtendedID[23:0], SSV=1[0], ... Available attributes: ExtendedID, MasterID, UserFlags
list_of_ns_sid_high_at_bitpos0	string	""	A comma-separated list of values to bitwise OR into each Non-secure StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID. Each TBU that is connected to a PCIe subsystem must serve a unique contiguous subset of StreamIDs as determined by their top bits. This is used in order to know which port to route ATC Invalidates to the PCIe subsystems.

Table 3-396 Parameters for MMU_600 (continued)

Name	Type	Default value	Description
list_of_pcie_mode	string	""	A comma-separated list of ranges of ports that represent TBUs that are attached to PCIe Root Complexes (PCIe-RC). A single PCIe-RC might use several TBUs and stripe accesses across them. The attributes handling for these TBUs are slightly different in that if the PCIe transaction is NoSnoop and the output attributes of the translation would be weaker than iNC-oNC-osh then the output is forced to iNC-oNC-osh. iNC-oNC-osh == "inner normal non-cacheable, out normal non-cacheable, outer shared"
list_of_pcie_rc	string	""	This is a list of ports that are connected to PCIe Root Complex (PCIe-RC) by a protocol called DTI-ATS. This port is used to transport ATS and PRI Requests to the SMMU from the PCIe-RC. In the real hardware, then the PCIe-RC uses this port for ATS/PRI, and then the actual transactions go through separate TBUs. In the model, then this port can accept actual transactions as well. However, in the model, then the ATC Invalidates and the PRI Responses need to be transferred over the corresponding pvbus_id_routed_m port as DTI-ATS is bidirectional, but PVBus is not.
list_of_s_sid_high_at_bitpos0	string	""	A comma-separated list of values to bitwise OR into each Secure StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID.
msi_attribute_transform	string	"ExtendedID[31:0]=smmu_msi_device_id, MasterID=0xFFFFffff"	This parameter determines the MSI output attributes of SMMU-generated MSIs: * MasterID * UserFlags * ExtendedID of the transaction to use. This is a set of comma separated transforms on the output attributes. The right hand side is: * a numeric literal (or a slice of a literal) * the parameter smmu_msi_device_id * the symbol 'interrupt_kind' * 0/1 -- EVENTQ Secure/Non-secure * 2 -- PRIQ * 3/4 -- CMD_SYNC Secure/Non-secure * 5/6 -- GERROR Secure/Non-secure * 7/8 -- PMCG Secure/Non-Secure * 9/10/11 -- RAS FHI/ERI/CRI * HWATTR_KIND_0 Example: UserFlags[15:0]=smmu_msi_device_id[31:16], MasterID[15:0]=smmu_msi_device_id[15:0], ExtendedID=0 This transform might be used as part of a system-specific way of determining the DeviceID that is passed to the GIC to distinguish MSIs generated by the SMMU and those generated by client devices of the SMMU. See also: output_attribute_transform and enable_device_id_checks.
number_of_ports	int	0x1	The number of port pairs that the SMMU has.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-396 Parameters for MMU_600 (continued)

Name	Type	Default value	Description
output_attribute_transform	string	"ExtendedID[31:0]=DeviceID"	Transform the downstream attributes of a translated transaction. * "" or "none" -- the input and output attributes are identical. * How to alter the output attributes, e.g. "ExtendedID[15:0]=DeviceID[15:0], UserFlags[31]=nSSV, UserFlags[19:0]=SubstreamID" The attributes that can appear on the left hand side of the transform are ExtendedID, MasterID and UserFlags. The source attributes that can be used are: * ExtendedID/MasterID/UserFlags -- the incoming attributes. * DeviceID -- StreamID + translated_device_id_base * StreamID/SubstreamID/SSV/SEC_SID * nSEC_SID/nSSV -- the negative logic versions. * St1PBHA/St2PBHA -- the Page Based Hardware Attributes from any used leaf descriptors (or zero if not used). * STE_IMPDEF1 -- STE[127:116] The right hand side may also contain numeric literals. Any bits of the attributes that have no transform specified are retained from the input. The StreamID has had ns_sid_high/s_sid_high ORred into it for the appropriate TBU.
prefetch_only_requests	int	0x0	The simulator supports 'prefetch-only' DMI requests, which can occur for anytime for any reason and are intended to be invisible to the end execution of the model and to the user. 0 -- deny all prefetch-only requests 1 -- use debug requests for any page table walks -- form and use debug TLB/cache entries -- any faults will not record, but deny the prefetch request 2 -- treat prefetch-only requests like normal transactions -- use normal page table walk transactions -- use and form normal TLB/cache entries -- faults will alter the programmer visible state of the SMMU 0 is the safest. 1 treats the access like a debug request and requires that debug page table walks are treated correctly downstream. Any descriptors that need HTTU to allow the transaction to proceed will fail the request. 2 is dangerous, it use real transactions and reports faults that are unphysical. Real transactions can be wait()ed and this disobeys the SystemC spec for get_direct_mem_ptr().
sec_override	bool	0x0	The IMP DEF port sec_override controls whether some of the registers are accessible to secure or non-secure transactions. This parameter is the default value assumed for that port if the port is not driven by a signal.
seed	int	0x12345678	Used to seed the pseudo-random number generator that the SMMU model uses.
size_of_cd_cache	int	0x0	The number of entries in the cache holding CD structures. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.
size_of_l1cd_cache	int	0x0	The number of entries in the cache holding L1CD descriptors. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-396 Parameters for MMU_600 (continued)

Name	Type	Default value	Description
size_of_l1ste_cache	int	0x0	The number of entries in the cache holding L1STE descriptors. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.
size_of_ste_cache	int	0x0	The number of entries in the cache holding STE structures. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.
size_of_tlb	int	0x0	The number of entries in the TLB. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.
smmu_msi_device_id	int	0x0	When appropriately enabled, assume that MSIs that are generated by the SMMU are presented to the GIC with this DeviceID. See parameter msi_attribute_transform and enable_device_id_checks.
sup_cohacc	bool	0x1	The value to put in SMMU_IDR0.COHACC
sup_oas	int	0x5	The hardware has an input port sup_oas[2:0] that indicates what output address size (OAS) the _system_ has. This is sampled at reset. The model does not have this port as it is expected to be a constant for the system and not to change. Instead it is just a parameter. The allowed values are: 0 -- 32 bits 1 -- 36 bits 2 -- 40 bits 3 -- 42 bits 4 -- 44 bits 5 -- 48 bits
tlb_when_do_f_tlb_conflict_on_overlap	int	0x0	If a TLB entry is created by a walk and it overlaps an existing entry. Then there are some architectural situations where the result is known. For all others, then an implementation is allowed to use an UNPREDICTABLE combination of the two entries, or it can generate F_TLB_CONFLICT: 0 -- never generate 1 -- sometimes generate 2 -- always generate Conflicts between global and non-global entries are not detected by the model.
translated_device_id_base	int	0x0	When appropriately enabled, assume that client device accesses are translated to a DeviceID as seen by the GIC of: StreamID + translated_device_id_base See parameter output_attribute_transform and enable_device_id_checks.
tw_qs_attribute_transform	string	""	This transforms the attributes of table walk and queue transactions. * ""/"none" -- no transform * How to alter the output attributes. An example is: "ExtendedID[35:32]=HWATTR_KIND_0 The attributes that can appear on the left hand side of the transform are ExtendedID, MasterID and UserFlags. The source attributes that can be used are: * ExtendedID/MasterID/UserFlags -- the incoming attributes. * HWATTR_KIND_0 -- PBHA information The right hand side may also contain numeric literals. Any bits of the attributes with no transform are unchanged. NOTE that MPAM information comes from the parameter mpam_attribute_transform. See also output_attribute_transform and msi_attribute_transform.
version	string	"r0p0"	The version of this product

Table 3-396 Parameters for MMU_600 (continued)

Name	Type	Default value	Description
wait_cmdq_ticks	int	0x0	This is the time to wait before doing something on the command queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))).
wait_eventq_ticks	int	0x0	This is the time to wait before doing something on the event queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))).
wait_imp_def_work_ticks	int	0x0	This is the time to wait before doing an IMP DEF operation. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))). The IMP DEF work in this case is the number of ticks between raising pmusnapshot_req and pmusnapshot_ack being raised, and the converse operation.
wait_msi_ticks	int	0x0	This is the time to wait before sending an MSI. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))).
wait_pri_req_ticks	int	0x0	This is the time to wait before processing a PRI Request. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))).
wait_pri_resp_ticks	int	0x1	This is the time to wait before sending a PRI Response back to the PCIe subsystem. When a PRI Response is an auto-response then the ATC might immediately make a new ATS request, that immediately fails, that immediately makes a PRI Request, that auto-responds, etc. To break this loop, then we introduce a minimum time on all PRI Responses to give other components in the system a chance to run. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))).

3.9.39 MMU_700

This model is written in C++.

MMU_700 contains the following CADI targets:

- MMU_700

MMU_700 contains the following MTI components:

- *4.85 MMU_700 - trace* on page 4-2664
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.107 PVBusSlave - trace* on page 4-2760

About MMU_600 and MMU_700

MMU_600 and MMU_700 are SMMUv3-compliant devices and are used for I/O virtualization of devices.

The hardware is a distributed SMMU. It consists of the following:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- A single Translation Control Unit (TCU), which has a port for the programming interface of the SMMU, receives DVM messages, and does all the page walking and queue manipulation, for example.
- One or more Translation Bus Units (TBUs), which translate transactions from upstream client devices into downstream transactions.
- Zero or more connections to PCIe Root Complexes (PCIe-RCs). A maximum of 62 TBUs and PCIe-RCs can be attached.
- An interconnect that connects the TBUs and PCIe-RCs to the TCU.

A PCIe-RC has one connection to the TCU to make ATS requests but the PCIe-RC uses one or more TBUs to transform the transactions and pass them to the memory system. In the model, the TBUs used are listed in the parameter `list_of_pcie_mode`. The SMMU does not know which TBUs a particular PCIe-RC is attached to.

The TBU ORs a value into each StreamID that it receives. In the model, this is configured by the following parameters:

- `list_of_s_sid_high_at_bitpos0`
- `list_of_ns_sid_high_at_bitpos0`

The TCU, TBU, and the interconnect are all represented by this single model component.

In the model, the `tbs_pvbus_s[i]` and `tbm_pvbus_m[i]` port pair represent a TBU `i`, or `tbs_pvbus_s[i]` represents an incoming connection for a PCIe-RC. The corresponding reverse connection from the TCU to the PCIe-RC is by a special bus called `pvbus_id_routed_m` that is used to transport ATC Invalidates to the PCIe-RC.

To reduce system construction complexity, the `tbs_pvbus_s[i]` and `tbm_pvbus_m[i]` pair also acts as a TBU so that the PCIe-RC does not need to separate its normal transactions and its ATS requests.

However, ATC Invalidates are only sent to a port which appears in `list_of_pcie_rc`. It should be uniquely decoded to a single port based on `list_of_ns_sid_high_at_bitpos0`, and ATC Invalidates must be routed to the correct PCIe subsystem to invalidate the cache of ATS Responses in the subsystem. Therefore all TBUs that a PCIe-RC uses must have a unique reverse mapping from stream id to port.

Note

A bad configuration renders the model inactive.

Some configuration can be adjusted by configuration pins. These are only sampled at the negative edge of the reset pin. If you want to use these pins, then you must drive them before sending a negative edge on the reset pin. During simulation_reset, the component driving them must also drive this transition again.

The pin `sup_oas` is not supported, instead it is a parameter, as it is assumed that it would be tied to a fixed value in any specific platform.

Debug reads to the registers do not disturb the state.

Writes to registers with Update flags, including debug writes, are ignored if the Update flag is already set to one.

Debug and real accesses to the registers must be 32 bits or 64 bits.

MSIs are issued on the `qtw_pvbus_m` port using attributes that are determined by the parameter `msi_attribute_transform`, while Event queue writes are always issued with `ExtendedID=0, UserFlags=0, MasterID=0xFFFFffff`. In the hardware, there is no way of distinguishing Event queue writes from MSI writes. However, this provides a mechanism for the model system to distinguish them.

The hardware only has a single cacheability attribute for input transactions, but `PVBus` transports have both inner and outer cacheability.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

For non-PCIe-mode TBUs, whose index does not appear in `list_of_pcie_mode` or `list_of_pcie_rc`, for non-cache maintenance operations:

- If the input attribute is any type of device then it is well defined as being outer-shared and Device-nGnRnE or Device-nGnRE. There is no support for Gathering or Reordering.
- If the outer cacheable input attribute is normal, and it is Write-back, this is converted to Inner Write-back Outer Write-back (iWB-oWB) with the desired shareability. No Transient hint is supported and is always treated as non-transient.
- This leaves all other normal memory types that are mapped to Inner Normal Non-cacheable, Outer Normal Non-cacheable outer shared (iNC-oNC-osh).

Therefore, the upstream devices must present the cacheability in the *outer* cacheability attribute on `PVBus` if it is cacheable. If it is a device type then both the inner and outer attributes must be set to the same value. If it is iNC-oNC-osh, then it must be presented as such.

For PCIe-mode TBUs, that is, whose index appears in `list_of_pcie_mode` or `list_of_pcie_rc`:

- Input transactions are from PCIe and the only indication of the memory type is in the NoSnoop bit of the transaction. No shareability is transported. NoSnoop is interpreted as iNC-oNC-osh. ! NoSnoop is interpreted as iWB-oWB-ish (note Inner Shareable).
- If a NoSnoop transaction has an attribute transform applied to it and the result of the transform is weaker than iNC-oNC-osh, it is forced to iNC-oNC-osh. For example, if a NoSnoop transaction uses a page table and is transformed to iWB-oWB-nsh then it is forced to iNC-oNC-osh. However, if the page tables transformed it to a device type, then as all device types are stronger than iNC-oNC-osh, it exits the SMMU as the device type.
- In the model, transactions are classified by their incoming memory attributes as to whether they are NoSnoop or not and then are normalized appropriately:
  - iWB-oWB-any-shareability are interpreted as ! NoSnoop, therefore are normalized to iWB-oWB-ish.
  - Anything else is considered NoSnoop, and therefore is normalized to iNC-oNC-osh.
- Translated accesses also have the same interpretation to determine NoSnoop and how they are normalized. Therefore they could enter the system with different attributes to if they entered the SMMU as Untranslated Accesses and were translated by the normal translation process, before exiting downstream of the SMMU and entering the system
- It is expected that there is a component downstream of the SMMU that is aware of the system address map and will override the memory type to `device` for any transaction that accesses a peripheral.

The hardware has a single cacheability on input, and, for transactions that are neither cache-maintenance operations nor PCIe transactions, it normalizes the input to an architectural form before performing the SMMUv3 architectural transform:

- Any device type is left untouched. The input can only represent Device-nGnRE and Device-nGnRnE.
- If the input is Write-back (WB), it is normalized to iWB-oWB with the incoming shareability.
- If the input is anything else, it is normalized to iNC-oNC-osh.

The model accepts full architectural attributes of two levels of cacheability and so has to decide how to interpret this in terms of the hardware. For transactions that are not cache maintenance operations, the model replicates the outer attribute into the inner attribute and then performs the normalization that the hardware does.

The hardware normalizes the architectural output attributes and outputs a single level of cacheability and a user flag (OC) specifying if the architectural attributes were cacheable in the outer cacheable domain. If the transaction is classified as a PCIe transaction, the NoSnoop transform previously described is applied. That is, if the original transaction was NoSnoop then any weaker memory type is strengthened to iNC-oNC-osh, and the following transform is applied:

```
if      iWB-oWB-nsh/ish/osh     then output WB-nsh/ish/osh, OC = 1
else if i(NC/WT/WB)-o(WB/WT)    then output NC-Sys,         OC = 1
else if i(NC/WT/WB)-oNC         then output NC-Sys,         OC = 0
else if Device-(GRE/nGRE/nGnRE) then output DV-Sys,         OC = 0
else                                 output SO-Sys,         OC = 0
```

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

The model only normalizes according to PCIe but otherwise leaves the architectural attributes intact on the output bus.

Important

The model deals with groups of transactions with the same attributes and a similar range of addresses. The mapping that is used is stored by the bus infrastructure and is used for subsequent sufficiently similar transactions without needing the intervention of the SMMU model, and therefore are not traced.

Model limitations

- The Performance Monitoring Unit (PMU) has limited functionality. It is intended for demonstration purposes only and does not implement all architecturally required events. It does not implement the `pmusnapshot_ack` or `pmusnapshot_req` interface.
- The model does not implement:
  - RAS.
  - Power control.
  - `sup_oas`, which controls the OAS of the SMMU. This is expected to be constant for a system.
  - The SYSCO interface.
  - The Low-Power Interface
- Cache maintenance operations cannot be inserted into the TBU ports of the SMMU.
- `PVBus` has no representation of the cache stash operations, so they are not supported.
- `TCU_CFG.XLATE_SLOTS` is fixed at 512.
- `TCU_STATUS.GNT_XLATE_SLOTS` always reads as 512.
- The `HWATTR` side-band signal is available by configuring `output_attribute_transform`, `msi_attribute_transform`, and `tw_qs_attribute_transform` with `HWATTR_KIND_0`. For some transactions, the `HWATTR` comes from the `SMMU_s_AGBPA[3:0]`. In the hardware, this register has an Update bit[31] that should be written as 1 and is turned to zero when all transactions using the old value have completed. The model does not implement this behavior and the Update bit is RAZ/WI.

Table 3-397 Ports

Name	Protocol	Type	Description
`clk_in`	`ClockSignal`	Slave	Clock signal (in RTL aclk) This is a clock time-base used by the TCU to spread some of its processing over time, if enabled by the wait_* parameters. The clock must always be connected.
`cmd_sync_irpt_ns`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for non-secure CMD_SYNC having a completion signal of SIG_IRQ.
`cmd_sync_irpt_s`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for secure CMD_SYNC having a completion signal of SIG_IRQ.
`event_q_irpt_ns`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for the non-secure event queue becoming non-empty.
`event_q_irpt_s`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for the secure event queue becoming non-empty.
`evento`	*Signal* on page 2-85	Master	Event signal
`global_irpt_ns`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for non-secure SMMU_GERROR(N) signalling an error.
`global_irpt_s`	*Signal* on page 2-85	Master	Pulsed interrupt output signal for secure SMMU_S_GERROR(N) signalling an error.

Table 3-397 Ports (continued)

Name	Protocol	Type	Description
identify	*SMMUv3AEMIdentifyProtocol* on page 2-78	Master	Map the transaction to the tuple (StreamID, SubStreamID, SubStreamIDValid, SSD) The StreamID that is produced by the implementation of this protocol is not the final StreamID. The final StreamID is produced by using the list_of_ns_sid_high_at_bitpos0/ list_of_s_sid_high_at_bitpos0 parameter to map the StreamID based on the upstream port index. Also see the parameter howto_identify which can replace the functionality of this port under certain circumstances.
pri_q_irpt_ns	*Signal* on page 2-85	Master	Pulsed interrupt output signal for the PRI queue becoming non-empty.
prog_pvbus_s	PVBus	Slave	Register slave port (in RTL PROG)
pvbus_id_routed_m[62]	PVBus	Master	This is a special "id-routed" port for transmitting ATC invalidates upstream into the PCIe EndPoints, it is not a normal bus. The FastModels ATC Invalidate and PRI Response protocol specifies how to route and deal with this port.
qtw_pvbus_m	PVBus	Master	Master port used for Table Walks, MSIs and Queue access when separate_tw_msi_qs_port==true (in RTL QTW)
sec_override	*Signal* on page 2-85	Slave	Allow certain registers to be accessible to non-secure accesses from reset, as described in the TCU_SCR register.
sup_btm	*Signal* on page 2-85	Slave	System supports BTM and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. If BTM (Broadcast Table Maintenance) is not supported then DVM messages will be ignored.
sup_cohacc	*Signal* on page 2-85	Slave	System supports COHACC and will be reflected in the IDR registers.
sup_sev	*Signal* on page 2-85	Slave	System supports SEV and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers.
tbm_pvbus_m[62]	PVBus	Master	The TBU master ports that carry transactions that have been translated from the correspondingly numbered tbs_pvbus_s[] port.
tbs_pvbus_s[62]	PVBus	Slave	The TBU slave ports that receive transactions to be translated. They will exit the SMMU through the same numbered pvbus_m[] port.

Non-Confidential

Table 3-397 Ports (continued)

Name	Protocol	Type	Description
tbu_cri_irpt[62]	*Signal* on page 2-85	Master	Critical error interrupt for RAS events from the TBU. This is used for specific uncorrected errors where a System Coprocessor (SCP) might have to reset the system because the stability of the system can no longer be guaranteed.
tbu_eri_irpt[62]	*Signal* on page 2-85	Master	Error Recovery Interrupt for RAS events from the TBU. This is used for uncorrected errors.
tbu_fhi_irpt[62]	*Signal* on page 2-85	Master	Fault Handling Interrupt for RAS events from the TBU. Usually this is for corrected errors.
tbu_pmu_irpt[62]	*Signal* on page 2-85	Master	TBU Performance Monitoring Unit interrupt, one per TBU.
tbu_pmusnapshot_ack[62]	*Signal* on page 2-85	Master	PMU snapshot interface for the TBU, ack a snapshot.
tbu_pmusnapshot_req[62]	*Signal* on page 2-85	Slave	PMU snapshot interface for the TBU, request a snapshot.
tbu_reset_in[62]	*Signal* on page 2-85	Slave	Reset signals The TBUs can have independent reset signals. Each signal tbu_reset_in[n] corresponds to the TBU using tbs_pvbus_s[n]/ tbs_pvbus_s[n] pair. If the SMMU receives a transaction whilst the TBU is expected to be in reset then it will complain using the ArchMsg.Warning.warning trace source. Those tbu_reset_in that correspond to a PCIe-RC connection can be connected to monitor the PCIe-RC's reset signal. If it receives an ATS request when in reset then it will complain in a similar way. You must connect these pins if you wish the TCU_NODE_STATUS for the nodes to be accurate (including any connected to the PCIe-RC).
tcu_cri_irpt	*Signal* on page 2-85	Master	Critical error interrupt for RAS events from the TCU. This is used for specific uncorrected errors where a System Coprocessor (SCP) might have to reset the system because the stability of the system can no longer be guaranteed.
tcu_eri_irpt	*Signal* on page 2-85	Master	Error Recovery Interrupt for RAS events from the TCU. This is used for uncorrected errors.
tcu_fhi_irpt	*Signal* on page 2-85	Master	Fault Handling Interrupt for RAS events from the TCU. Usually this is for corrected errors.
tcu_pmu_irpt	*Signal* on page 2-85	Master	TCU Performance Monitoring Unit interrupt
tcu_pmusnapshot_ack	*Signal* on page 2-85	Master	PMU snapshot interface for the TCU, ack a snapshot.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-397 Ports (continued)

Name	Protocol	Type	Description
tcu_pmusnapshot_req	*Signal* on page 2-85	Slave	PMU snapshot interface This is a four-phase handshake to have the corresponding PMCG perform a capture of the current counter values. PMU snapshot interface for the TCU, request a snapshot.
tcu_reset_in	*Signal* on page 2-85	Slave	The reset signal to the TCU interface.

Table 3-398 Parameters for MMU_700

Name	Type	Default value	Description
all_error_messages_through_trace	bool	0x0	Some conditions in the SMMU are so strange that the software programming the SMMU has done something wrong. At this point messages are output to either ArchMsg.Error.* or ArchMsg.Warning.* or to the error stream of the simulator. Outputting to the error stream of the simulator may cause it to return with a non-zero exit status. If you set this option to true then instead of using the error stream of the simulator it will always use a trace stream allowing the simulation to exit with a zero exit status.
behaviour_of_sampled_at_reset_signals	int	0x0	Some configuration signals into the SMMU are sampled on negedge of reset. However, it can sometimes be hard to arrange to drive a configuration pin before the negedge of reset. The configuration pins are sampled: 0 -- at negedge reset. 1 -- at negedge reset, but if a later change occurs at the same simulated time, and no transactions have occurred, then they will be resampled and the SMMU reset again.
cmdq_max_number_of_commands_to_buffer	int	0xa	The command queues can buffer fetched commands before issuing them. This parameter is roughly the maximum number of commands to do this for. The programmer visible effects are that just because the CONS pointer shows a command has been _consumed_ does not necessarily mean that it has been issued (and completed). Higher values will accentuate this effect.
enable_device_id_checks	bool	0x1	If this parameter is true then the DeviceIDs seen by the GIC are: * for client devices: DeviceID = StreamID + translated_device_id_base * for SMMU-generated MSIs: smmu_msi_device_id This parameter enables two checks: * If the DeviceID is used in the output_attribute_transform then if it overflows 32 bits then the model will warn. If the DeviceID is not used then it is assumed that the external agent that forms the DeviceID will warn if it overflows. * If the SMMU supports MSIs, then the model will check that the GIC will be able to distinguish an MSI generated by the SMMU from one generated by a client device. As the exact mechanism to determine the DeviceID is in the system and not necessarily under control of the SMMU then you can disable these warnings using this parameter. See also the parameters: output_attribute_transform and msi_attribute_transform.

Non-Confidential

Table 3-398 Parameters for MMU_700 (continued)

Name	Type	Default value	Description
howto_identify	string	"use-identify"	If 'use-identify' then will use the 'identify' port to determine the SSD, StreamID, SubStreamID of a transaction. Otherwise, this string extracts them from the transaction's attributes. Examples:- SEC_SID=ExtendedID[63], SSV=ExtendedID[62], SubstreamID=ExtendedID[51:32], StreamID=ExtendedID[31:0] nSEC_SID=ExtendedID[63], StreamID=ExtendedID[55:24], nSSV=ExtendedID[20], SubstreamID=ExtendedID[19:0] SEC_SID is one bit wide, true if StreamID is secure. SSV is one bit wide, true if SubstreamID is valid. The alternative symbols nSEC_SID and nSSV have the negative logic to SEC_SID and SSV. You must not use the negative and positive logic for the same symbol at the same time. However, just because you use negative logic for one symbol does not force you to use negative logic for the other. SubstreamID is 20 bits wide and StreamID is 32 bits. More complex examples: StreamID[31:24]=0, StreamID[23:0]=ExtendedID[23:0], SSV=1[0], ... Available attributes: ExtendedID, MasterID, UserFlags
list_of_ns_sid_high_at_bitpos0	string	""	A comma-separated list of values to bitwise OR into each Non-secure StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID. Each TBU that is connected to a PCIe subsystem must serve a unique contiguous subset of StreamIDs as determined by their top bits. This is used in order to know which port to route ATC Invalidates to the PCIe subsystems.
list_of_pcie_mode	string	""	A comma-separated list of ranges of ports that represent TBUs that are attached to PCIe Root Complexes (PCIe-RC). A single PCIe-RC might use several TBUs and stripe accesses across them. The attributes handling for these TBUs are slightly different in that if the PCIe transaction is NoSnoop and the output attributes of the translation would be weaker than iNC-oNC-osh then the output is forced to iNC-oNC-osh. iNC-oNC-osh == "inner normal non-cacheable, out normal non-cacheable, outer shared"
list_of_pcie_rc	string	""	This is a list of ports that are connected to PCIe Root Complex (PCIe-RC) by a protocol called DTI-ATS. This port is used to transport ATS and PRI Requests to the SMMU from the PCIe-RC. In the real hardware, then the PCIe-RC uses this port for ATS/ PRI, and then the actual transactions go through separate TBUs. In the model, then this port can accept actual transactions as well. However, in the model, then the ATC Invalidates and the PRI Responses need to be transferred over the corresponding pvbus_id_routed_m port as DTI-ATS is bidirectional, but PVBus is not.
list_of_s_sid_high_at_bitpos0	string	""	A comma-separated list of values to bitwise OR into each Secure StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID.

Non-Confidential

Table 3-398 Parameters for MMU_700 (continued)

Name	Type	Default value	Description
mpam_attribute_transform	string	"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS"	If MPAM is supported, then this is the transform applied to _all_ downstream transactions to transport the MPAM information. If MPAM is not supported then the transform is not applied, however, it is still checked that it is syntactically checked. If MPAM is supported in one security state, it is considered to be supported in all security states, even if that state has PARTID_MAX == 0 or PMG_MAX == 0 and the transform will be applied. NOTE that for translated transactions from client devices then: MPAM_NS = ! SEC_SID
msi_attribute_transform	string	"ExtendedID[31:0]=smmu_msi_device_id, MasterID=0xFFFFffff"	This parameter determines the MSI output attributes of SMMU-generated MSIs: * MasterID * UserFlags * ExtendedID of the transaction to use. This is a set of comma separated transforms on the output attributes. The right hand side is: * a numeric literal (or a slice of a literal) * the parameter smmu_msi_device_id * the symbol 'interrupt_kind' * 0/1 -- EVENTQ Secure/Non-secure * 2 -- PRIQ * 3/4 -- CMD_SYNC Secure/Non-secure * 5/6 -- GERROR Secure/Non-secure * 7/8 -- PMCG Secure/Non-Secure * 9/10/11 -- RAS FHI/ERI/CRI * HWATTR_KIND_0 Example: UserFlags[15:0]=smmu_msi_device_id[31:16], MasterID[15:0]=smmu_msi_device_id[15:0], ExtendedID=0 This transform might be used as part of a system-specific way of determining the DeviceID that is passed to the GIC to distinguish MSIs generated by the SMMU and those generated by client devices of the SMMU. See also: output_attribute_transform and enable_device_id_checks.
number_of_ports	int	0x1	The number of port pairs that the SMMU has.
output_attribute_transform	string	"ExtendedID[31:0]=DeviceID"	Transform the downstream attributes of a translated transaction. * "" or "none" -- the input and output attributes are identical. * How to alter the output attributes, e.g. "ExtendedID[15:0]=DeviceID[15:0], UserFlags[31]=nSSV, UserFlags[19:0]=SubstreamID" The attributes that can appear on the left hand side of the transform are ExtendedID, MasterID and UserFlags. The source attributes that can be used are: * ExtendedID/MasterID/UserFlags -- the incoming attributes. * DeviceID -- StreamID + translated_device_id_base * StreamID/SubstreamID/SSV/SEC_SID * nSEC_SID/nSSV -- the negative logic versions. * St1PBHA/St2PBHA -- the Page Based Hardware Attributes from any used leaf descriptors (or zero if not used). * STE_IMPDEF1 -- STE[127:116] The right hand side may also contain numeric literals. Any bits of the attributes that have no transform specified are retained from the input. The StreamID has had ns_sid_high/s_sid_high ORred into it for the appropriate TBU.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.

Table 3-398 Parameters for MMU_700 (continued)

Name	Type	Default value	Description
prefetch_only_requests	int	0x0	The simulator supports 'prefetch-only' DMI requests, which can occur for anytime for any reason and are intended to be invisible to the end execution of the model and to the user. 0 -- deny all prefetch-only requests 1 -- use debug requests for any page table walks -- form and use debug TLB/cache entries -- any faults will not record, but deny the prefetch request 2 -- treat prefetch-only requests like normal transactions -- use normal page table walk transactions -- use and form normal TLB/cache entries -- faults will alter the programmer visible state of the SMMU 0 is the safest. 1 treats the access like a debug request and requires that debug page table walks are treated correctly downstream. Any descriptors that need HTTU to allow the transaction to proceed will fail the request. 2 is dangerous, it use real transactions and reports faults that are unphysical. Real transactions can be wait()ed and this disobeys the SystemC spec for get_direct_mem_ptr().
sec_override	bool	0x0	The IMP DEF port sec_override controls whether some of the registers are accessible to secure or non-secure transactions. This parameter is the default value assumed for that port if the port is not driven by a signal.
seed	int	0x12345678	Used to seed the pseudo-random number generator that the SMMU model uses.
size_of_cd_cache	int	0x0	The number of entries in the cache holding CD structures. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.
size_of_l1cd_cache	int	0x0	The number of entries in the cache holding L1CD descriptors. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.
size_of_l1ste_cache	int	0x0	The number of entries in the cache holding L1STE descriptors. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.
size_of_ste_cache	int	0x0	The number of entries in the cache holding STE structures. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.
size_of_tlb	int	0x0	The number of entries in the TLB. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.
smmu_msi_device_id	int	0x0	When appropriately enabled, assume that MSIs that are generated by the SMMU are presented to the GIC with this DeviceID. See parameter msi_attribute_transform and enable_device_id_checks.
sup_cohacc	bool	0x1	The value to put in SMMU_IDR0.COHACC

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-398 Parameters for MMU_700 (continued)

Name	Type	Default value	Description
sup_oas	int	0x6	The hardware has an input port sup_oas[2:0] that indicates what output address size (OAS) the _system_ has. This is sampled at reset. The model does not have this port as it is expected to be a constant for the system and not to change. Instead it is just a parameter. The allowed values are: 0 -- 32 bits 1 -- 36 bits 2 -- 40 bits 3 -- 42 bits 4 -- 44 bits 5 -- 48 bits 6 -- 52 bits
tlb_when_do_f_tlb_conflict_on_overlap	int	0x0	If a TLB entry is created by a walk and it overlaps an existing entry. Then there are some architectural situations where the result is known. For all others, then an implementation is allowed to use an UNPREDICTABLE combination of the two entries, or it can generate F_TLB_CONFLICT: 0 -- never generate 1 -- sometimes generate 2 -- always generate Conflicts between global and non-global entries are not detected by the model.
translated_device_id_base	int	0x0	When appropriately enabled, assume that client device accesses are translated to a DeviceID as seen by the GIC of: StreamID + translated_device_id_base See parameter output_attribute_transform and enable_device_id_checks.
tw_qs_attribute_transform	string	""	This transforms the attributes of table walk and queue transactions. * ""/"none" -- no transform * How to alter the output attributes. An example is: "ExtendedID[35:32]=HWATTR_KIND_0 The attributes that can appear on the left hand side of the transform are ExtendedID, MasterID and UserFlags. The source attributes that can be used are: * ExtendedID/MasterID/UserFlags -- the incoming attributes. * HWATTR_KIND_0 -- PBHA information The right hand side may also contain numeric literals. Any bits of the attributes with no transform are unchanged. NOTE that MPAM information comes from the parameter mpam_attribute_transform. See also output_attribute_transform and msi_attribute_transform.
version	string	"r0p0"	The version of this product
wait_cmdq_ticks	int	0x0	This is the time to wait before doing something on the command queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))).
wait_eventq_ticks	int	0x0	This is the time to wait before doing something on the event queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))).
wait_msi_ticks	int	0x0	This is the time to wait before sending an MSI. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))).

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-398 Parameters for MMU_700 (continued)

Name	Type	Default value	Description
wait_pri_req_ticks	int	0x0	This is the time to wait before processing a PRI Request. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))).
wait_pri_resp_ticks	int	0x1	This is the time to wait before sending a PRI Response back to the PCIe subsystem. When a PRI Response is an auto-response then the ATC might immediately make a new ATS request, that immediately fails, that immediately makes a PRI Request, that auto-responds, etc. To break this loop, then we introduce a minimum time on all PRI Responses to give other components in the system a chance to run. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFffff))).

3.9.40 MemoryMappedCounterModule

Memory Mapped Counter Module for Generic Timers. This model is written in C++.

MemoryMappedCounterModule contains the following CADI targets:

- MemoryMappedCounterModule

MemoryMappedCounterModule contains the following MTI components:

- *4.91 MemoryMappedCounterModule - trace* on page 4-2732
- *4.107 PVBusSlave - trace* on page 4-2760

About MemoryMappedCounterModule

This component must be used by multicluster models. It also must be used to run a single core system with a timer that runs at a rate other than the input clock to the core.

Note

The component has two bus slave ports because the architecture specification permits you to map each set of registers at different, non-contiguous base addresses.

Table 3-399 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	This clock input determines the frequency of the Physical Count provided to the clusters connected to the cntvalueb port.
cntvalueb	*CounterInterface* on page 2-84	Master	This master port implements a private protocol between the cluster and the MemoryMappedCounterModule. This must be connected to the cntvalueb port on each cluster in the system and to the MemoryMappedCounterModule component.
counter_reset	*Signal* on page 2-85	Slave	Resets when set.
pvbus_control_s	PVBus	Slave	This slave port provides memory-mapped read write access to the control registers of the module.
pvbus_read_s	PVBus	Slave	This slave port provides memory-mapped read access to the status frame registers.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-400 Parameters for MemoryMappedCounterModule

Name	Type	Default value	Description
base_frequency	int	0x5f5e100	Reset value for CNTFID0, base frequency in Hz
cntcidr0123_C	int	0x0	Values to be returned for control-frame CIDR registers
cntcidr0123_R	int	0x0	Values to be returned for read-frame CIDR registers
cntpidr0123_C	int	0x0	Values to be returned for control-frame PIDR registers 0-3
cntpidr0123_R	int	0x0	Values to be returned for read-frame PIDR registers 0-3
cntpidr4567_C	int	0x0	Values to be returned for control-frame PIDR registers 4-7
cntpidr4567_R	int	0x0	Values to be returned for read-frame PIDR registers 4-7
diagnostics	int	0x0	Diagnostics
has_counter_scaling	bool	0x0	Implements ARMv8.4 generic counter scaling
non_arch_fixed_frequency	int	0x0	If set, ignore CNTFID0 and instead use this frequency in Hz
non_arch_start_at_default	bool	0x0	Firmware is expected to enable the timer at boot time. However, turning this parameter on is a model-specific way of enabling the counter module out of reset.
readonly_is_WI	bool	0x0	Ignore (rather than failing) on writes to read-frame
use_real_time	bool	0x0	Update the Generic Timer counter at a real-time base frequency instead of simulator time

3.9.41 MessageHandlingUnitV2

Message Handling Unit Version 2. This model is written in C++.

MessageHandlingUnitV2 contains the following CADI targets:

- MessageHandlingUnitV2

MessageHandlingUnitV2 contains the following MTI components:

- *4.92 MessageHandlingUnitV2 - trace* on page 4-2733

About MessageHandlingUnitV2

MessageHandlingUnitV2 is a unidirectional message channel with two APB interfaces, one for the sender and one for the receiver. There is one message handling unit for each sender and receiver pair.

The receiver can be powered off. A Q-Channel is provided for power control on the receiver side.

The message payload can be written directly to status registers. Multiple channels can be combined into a single message.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

3.9.42 PL011_Uart

ARM PrimeCell UART(PL011). This model is written in LISA+.

PL011_Uart contains the following CADI targets:

- ClockDivider
- PL011_Uart

PL011_Uart contains the following MTI components:

- *4.60 ClockDivider - trace* on page 4-2438
- *4.94 PL011_Uart - trace* on page 4-2737
- *4.107 PVBusSlave - trace* on page 4-2760

About PL011_Uart

When the `untimed_fifos` parameter is false, characters of serial data are clocked to or from the SerialData port at a rate controlled by the `clk_in_ref` clock rate and the baud-rate-divider configuration of the UART clock. Enabling `untimed_fifos` permits serial data to be sent or received as fast as it can be generated or consumed. The modem control signals are still generated correctly, so the UART is not

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

able to transmit data faster than the receiving end can handle. For example, TelnetTerminal uses the CTS signal to avoid overflowing its TCP/IP buffer.

Differences between the model and the RTL

This component does not implement the DMA functionality of the PL011 PrimeCell.

Table 3-402 Ports

Name	Protocol	Type	Description
clk_in_ref	ClockSignal	Slave	Clock input, typically 14.745MHz, which sets the master transmit/receive rate.
intr	*Signal* on page 2-85	Master	Interrupt signal.
pvbus	PVBus	Slave	Slave port for register access.
serial_out	*SerialData* on page 2-77	Master	Serial input/output and control signals. Used to communicate with a serial device, such as a terminal.

Table 3-403 Parameters for PL011_Uart

Name	Type	Default value	Description
baud_rate	int	0x9600	Baud rate.
clock_rate	int	0xe10000	Clock rate for PL011.
enable_dc4	bool	0x1	Enable DC4 commands (try echo -e "help\024" in a Linux shell in a serial console)
flow_ctrl_mask_en	bool	0x0	Enable hardware flow control workaround which forcefully disables CTSen and RTSen bits in UARTCR register
in_file	string	""	Input file for data to be read by the UART
in_file_escape_sequence	string	"##"	Input file escape sequence
out_file	string	""	Output file to hold data written by the UART (use '-' to send all output to stdout)
revision	string	"r1p4"	Revision to simulate
shutdown_on_eot	bool	0x0	Shutdown simulation when a EOT (ASCII 4) char is transmitted (useful for regression tests when semihosting is not available)
shutdown_tag	string	""	Shutdown simulation when a string is transmitted
uart_enable	bool	0x0	Enable uart when the system starts up. (clock_rate and baud_rate are only valid when this option is enabled.)
unbuffered_output	bool	0x0	Unbuffered output
untimed_fifos	bool	0x1	Ignore the clock rate and transmit/receive serial data immediately

3.9.43 PL022_SSP

ARM PrimeCell Synchronous Serial Port(PL022). This model is written in LISA+.

PL022_SSP contains the following CADI targets:

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- ClockDivider
- PL022_SSP

PL022_SSP contains the following MTI components:

- *4.60 ClockDivider - trace* on page 4-2438
- *4.107 PVBusSlave - trace* on page 4-2760

Differences between the model and the RTL

Although the PL022_SSP component has clock input, it is not internally clock-driven. This is different to the hardware.

Note

This component is a preliminary release. It is not a fully-supported peripheral.

Table 3-404 Ports

Name	Protocol	Type	Description
clk	ClockSignal	Slave	Main PrimeCell SSP clock input.
clkin	ClockSignal	Slave	PrimeCell SSP clock input.
clkout	ClockSignal	Master	Clock output.
intr	*Signal* on page 2-85	Master	Interrupt signaling.
pvbus	PVBus	Slave	Slave port for connection to PV bus master/decoder.
rorintr	*Signal* on page 2-85	Master	Receive overrun interrupt.
rtintr	*Signal* on page 2-85	Master	Receive timeout interrupt. We don't implement time out interrupt.
rx_dma_port	*PL080_DMAC_DmaPortProtocol* on page 2-74	Master	PrimeCell SSP receive DMA port.
rxd	*Value* on page 2-85	Slave	PrimeCell SSP receive data.
rxintr	*Signal* on page 2-85	Master	Receive FIFO service request port.
tx_dma_port	*PL080_DMAC_DmaPortProtocol* on page 2-74	Master	PrimeCell SSP transmit DMA port.
txd	*Value* on page 2-85	Master	PrimeCell SSP transmit data.
txintr	*Signal* on page 2-85	Master	Transmit FIFO service request.

3.9.44 PL030_RTC

ARM PrimeCell Real Time Clock(PL030). This model is written in LISA+.

PL030_RTC contains the following CADI targets:

- PL030_RTC

PL030_RTC contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

Table 3-405 Ports

Name	Protocol	Type	Description
clock	ClockSignal	Slave	Clock input, typically 1MHz, driving master count rate.
intr	*Signal* on page 2-85	Master	Interrupt signaling.
pvbus	PVBus	Slave	Slave port for connection to PV bus master/decoder.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

3.9.45 PL031_RTC

ARM PrimeCell Real Time Clock(PL031). This model is written in LISA+.

PL031_RTC contains the following CADI targets:

- PL031_RTC

PL031_RTC contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About PL031_RTC

This component can provide a basic alarm function or long time base counter.

It has no impact on the performance of a PV system when idle or counting down. The component only executes code when the counter expires or during bus accesses.

Table 3-406 Ports

Name	Protocol	Type	Description
clock	ClockSignal	Slave	Clock input, typically 1MHz, driving master count rate.
intr	*Signal* on page 2-85	Master	Interrupt signaling.
pvbus	PVBus	Slave	Slave port for connection to PV bus master/decoder.

Table 3-407 Parameters for PL031_RTC

Name	Type	Default value	Description
RTCDR_reset_value	int	0x0	Reset value for RTCDR
RTCDR_use_current_time	bool	0x1	Use current Unix/POSIX time for reset value for RTCDR. If true RTCDR_reset_value is ignored

3.9.46 PL041_AACI

ARM PrimeCell Advanced Audio CODEC Interface(PL041). This model is written in LISA+.

PL041_AACI contains the following CADI targets:

- PL041_AACI

PL041_AACI contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About PL041_AACI

The PL041_AACI component is designed to connect to an audio output component such as AudioOutFile or AudioOut_SDL.

The ability to play audio through this component depends on the AudioOut component in use and on the performance requirements of the software running on the simulated system. The rate of FIFO draining is controlled by the audio output to which the component is connected. This might not correspond to the rate that would be expected from the reference clock.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

This component also contains a minimal register model of the LM4529 secondary codec as implemented on development boards supplied by Arm.

Note

This component is not a complete implementation of the AACI because the following functionality is not implemented:

- Audio input
- DMA access to FIFOs, rather than Programmed I/O
- Programming of the secondary codec through FIFOs rather than slot registers

Table 3-408 Ports

Name	Protocol	Type	Description
audio	*AudioControl* on page 2-71	Master	Used to communicate with an audio out device.
clk_in_ref	ClockSignal	Slave	Reference clock input, typically 25MH.
dma_rx	*PL080_DMAC_DmaPortProtocol* on page 2-74	Master	DMA receive port.
dma_tx	*PL080_DMAC_DmaPortProtocol* on page 2-74	Master	DMA transmit port.

3.9.47 PL050_KMI

ARM PrimeCell PS2 Keyboard/Mouse Interface(PL050). This model is written in LISA+.

PL050_KMI contains the following CADI targets:

- ClockDivider
- PL050_KMI

PL050_KMI contains the following MTI components:

- *4.60 ClockDivider - trace* on page 4-2438
- *4.107 PVBusSlave - trace* on page 4-2760

About PL050_KMI

This model communicates with models of PS/2-like devices, for example a PS2Keyboard or PS2Mouse.

Table 3-410 Ports

Name	Protocol	Type	Description
clock	ClockSignal	Slave	Clock input, typically 1MHz, which sets the master transmit/receive rate.
intr	*Signal* on page 2-85	Master	Master port signaling completion of transmit or receive.

3.9.48 PL061_GPIO

ARM PrimeCell General Purpose Input/Output(PL061). This model is written in LISA+.

PL061_GPIO contains the following CADI targets:

- PL061_GPIO

PL061_GPIO contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About PL061_GPIO

This component provides eight programmable inputs or outputs. Ports of different widths can be created by multiple instantiation. In addition, an interrupt interface is provided to configure any number of pins as interrupt sources.

Table 3-411 Ports

Name	Protocol	Type	Description
GPIO_In	*Value* on page 2-85	Slave	Input lines. 32-bit data in, only [7:0] is used.
GPIO_Intr	*Signal* on page 2-85	Master	Interrupt signal indicating to an interrupt controller that an interrupt occurred in one or more of the GPIO_In lines.
GPIO_MIS	*Value* on page 2-85	Master	Indicates the masked interrupt status. 32-bit data out , only [7:0] is used. NOT necessary, as the GPIOMIS can be read from address 0x418.
GPIO_Out	*Value* on page 2-85	Master	Output lines. 32-bit data out, only [7:0] is used.
pvbus	PVBus	Slave	Slave port for register access.

About PL080_DMAC

This component provides 8 configurable DMA channels and 16 DMA ports for handshaking with peripherals. You can configure each channel to operate in one of eight flow control modes either under DMA control or the control of the source or destination peripheral. Transfers can occur on either master channel and can optionally be endian converted on both source and destination transfers.

This component might have a significant impact on system performance in certain flow control modes. Channels configured for small bursts, or using single bursts, and with peripheral DMA handshaking could add significant overhead. The peripheral has not been fully optimized to make use of the advanced features of the PVBus model.

Table 3-413 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock signal to control DMA transfer rate.
dma_port[16]	*PL080_DMAC_DmaPortProtocol* on page 2-74	Slave	request/response ports for communicating with devices.
interr	*Signal* on page 2-85	Master	DMA error interrupt signal.
intr	*Signal* on page 2-85	Master	Combined DMA error and terminal count signal.
inttc	*Signal* on page 2-85	Master	DMA terminal count signal.
pvbus0_m	PVBus	Master	Master bus interface 0 for DMA transfers.
pvbus1_m	PVBus	Master	Master bus interface 1 for DMA transfers.
pvbus_s	PVBus	Slave	Slave port for register accesses.
reset_in	*Signal* on page 2-85	Slave	System reset.

Table 3-414 Parameters for PL080_DMAC

Name	Type	Default value	Description
activate_delay	int	0x0	request delay
fifo_size	int	0x10	Channel FIFO size in bytes
generate_clear	bool	0x0	Generate clear response
max_transfer	int	0x100	Largest atomic transfer

3.9.50 PL110_CLCD

ARM PrimeCell Color LCD Controller(PL110). This model is written in LISA+.

PL110_CLCD contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL110_CLCD
- PL11x_CLCD
- SchedulerThread
- SchedulerThreadEvent

PL110_CLCD contains the following MTI components:

- *4.95 PL11x_CLCD - trace* on page 4-2738
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About PL110_CLCD

This implementation provides a register model of the LCD controller.

You can connect the model through a framebuffer port to a visualization component, for example, so that LCD output can be viewed.

The implementation is optimized for situations where the majority of the framebuffer does not change. For instance, displaying full-screen video results in significantly reduced performance. Rendering pixel data into an appropriate form for the framebuffer port (rasterization) can also take a significant amount of simulation time. If the pixel data are coming from a PVBusSlave region that has been configured as memory-like, rasterization only occurs in regions where memory contents are modified.

Table 3-415 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
control	*Value* on page 2-85	Slave	Auxiliary control register 1.
display	*LCD* on page 2-72	Master	Connection to visualization component.
intr	*Signal* on page 2-85	Master	Interrupt signaling for flyback events.
pvbus	PVBus	Slave	Slave port for register access.
pvbus_m	PVBus	Master	DMA port for video data.

Table 3-416 Parameters for PL11x_CLCD

Name	Type	Default value	Description
pl11x_clcd.disable_snooping_dma	bool	0x0	Disable DMA snooping
pl11x_clcd.pixel_double_limit	int	0x12c	Minimum LCD pixel width before display will be zoomed
pl11x_clcd.pl11x_behavior	int	0x0	Define PL11x behaviour. 0 for PL110, 1 for PL111

Table 3-417 Parameters for PL110_CLCD

Name	Type	Default value	Description
disable_snooping_dma	bool	0x0	Disable DMA snooping
pixel_double_limit	int	0x12c	Minimum LCD pixel width before display will be zoomed

3.9.52 PL180_MCI

ARM PrimeCell Multimedia Card Interface (PL180). This model is written in LISA+.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

PL180_MCI contains the following CADI targets:

- PL180_MCI

PL180_MCI contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About PL180_MCI

When paired with an MMC card model, the PL180_MCI component provides emulation of a flexible, persistent storage mechanism. The PL180_MCI component fully models the registers of the corresponding PrimeCell, but supports a subset of the functionality of the PL180:

- The controller supports block mode transfers, but does not currently support streaming data transfer.
- The controller can be attached to a single MMC device. The MMC bus mode and SDIO modes of the PL180 PrimeCell are not supported.
- Command and Data timeouts are not simulated.
- Payload CRC errors are not simulated.
- The DMA interface present in the PL180 PrimeCell is not modeled.
- Minimal timing is implemented within the model.

Note

At compile time, you can enable command tracing within the PL180_MCI component by modifying the `PL180_TRACE` macro in the `MMC.lisa` file. This sends command and event trace to standard output. You can use this output to help diagnose device driver and controller-to-card protocol issues.

Table 3-421 Ports

Name	Protocol	Type	Description
`MCIINTR[2]`	*`Signal`* on page 2-85	Master	Interrupts.
`mmc_m`	*`MMC_Protocol`* on page 2-73	Master	The MultiMediaCard (MMC) master port.
`pvbus`	`PVBus`	Slave	Slave port for register access.

Table 3-422 Parameters for PL180_MCI

Name	Type	Default value	Description
`pl180_fifo_depth`	`int`	`0x10`	PL180 FIFO Depth

3.9.53 PL192_VIC

ARM PrimeCell Vectored Interrupt Controller(PL192). This model is written in LISA+.

PL192_VIC contains the following CADI targets:

- PL192_VIC

PL192_VIC contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About PL192_VIC

This component aggregates interrupts and generates interrupt signals for the Arm processor. When coupled with an Arm processor that provides a VIC port, routing to the appropriate interrupt handler can optionally be performed in hardware, reducing interrupt latency. The PL192_VIC can also be daisy-

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

chained with other PL192 VICs to permit more than 32 interrupts. The VIC supports hardware and software prioritization of interrupts.

Table 3-423 Ports

Name	Protocol	Type	Description
VICIRQACK	*Signal* on page 2-85	Slave	Receive acknowledge signal from next level VIC or processor.
VICIRQACKOUT	*Signal* on page 2-85	Master	Used to send out acknowledge signals when daisy chained.
VICIntSource[32]	*Signal* on page 2-85	Slave	Interrupt source input sources.
VICVECTADDRIN	*ValueState* on page 2-85	Slave	Used to receive vector address when daisy chained.
VICVECTADDROUT	*ValueState* on page 2-85	Master	Used to send vector address to next level VIC or processor.
nVICFIQ	*Signal* on page 2-85	Master	Send out FIQ signal to the next level VIC or CPI.
nVICFIQIN	*Signal* on page 2-85	Slave	Used to receive FIQ signal when daisy chained.
nVICIRQ	*Signal* on page 2-85	Master	Send out IRQ signal to the next level VIC or procesessor.
nVICIRQIN	*Signal* on page 2-85	Slave	Used to receive IRQ signal when daisy chained.
pvbus	PVBus	Slave	Slave port for register access.

3.9.54 PL310_L2CC

ARM PrimeCell Level 2 Cache Controller (PL310). This model is written in LISA+.

PL310_L2CC contains the following CADI targets:

- PL310_L2CC

PL310_L2CC contains the following MTI components:
- *4.96 PL310_L2CC - trace* on page 4-2739

About PL310_L2CC

The presence of additional on-chip secondary cache can improve performance when significant memory traffic is generated by the processor. A secondary cache assumes the existence of a Level 1, or primary, cache that is closely coupled or internal to the processor.

This component has two modes of operation, which are controlled by the `cache-state_modelled` parameter:

Register view
Cache control registers are present but the cache behavior is not modeled.

Functional model
Cache behavior is modeled.

Arm supports the use of the PL310 when connected to the Arm Cortex-A5 or Cortex-A9 processor.

This component implements the programmer-visible functionality of the PL310, and excludes some non-programmer visible features. The following features are implemented in the model:

- Physically addressed and physically tagged.
- Lockdown format C supported, for data and instructions. Lockdown format C is also known as way locking.
- Lockdown by line supported.
- Lockdown by master ID supported.
- Direct mapped to 16-way associativity, depending on the configuration and the use of lockdown registers. The associativity is configurable as 8 or 16.
- L2 cache available size can be 16KB to 8MB, depending on configuration and the use of the lockdown registers.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

- Fixed line length of 32 bytes (8 words or 256 bits).
- Supports all of the AXI cache modes:
  - write-through and write-back.
  - read allocate, write allocate, read and write allocate.
- Force write-allocate option to always have cacheable writes allocated to L2 cache, for processors not supporting this mode.
- Normal memory non-cacheable shared reads are treated as cacheable non-allocatable. Normal memory non-cacheable shared writes are treated as cacheable write-through no write-allocate. There is an option, Shared Override, to override this behavior.
- TrustZone support, with the following features:
  - Non-Secure (NS) tag bit added in tag RAM and used for lookup in the same way as an address bit.
  - NS bit in Tag RAM used to determine security level of evictions to L3.
  - Restrictions for NS accesses for control, configuration, and maintenance registers to restrict access to secure data.
- Pseudo-Random victim selection policy. You can make this deterministic with use of lockdown registers.
- Software option to enable exclusive cache configuration.
- Configuration registers accessible using address decoding in the component.
- Interrupt triggering in case of an error response when accessing L3.
- Maintenance operations.
- Prefetching capability.

The performance of this component depends on the configuration of the associated L1 caches and the mode it is in:

- Register mode: no significant effect.
- Functional mode with functional-mode L1: the addition of a functional L2 cache has minimal further impact on performance when running applications that are cache-bound.
- Functional mode with a register-mode L1: there is a significant impact on system performance.

Differences between the model and the RTL

This model does not implement the following features, most of which are not relevant from a PV modeling point of view:

- There is no interface to the data and tag RAM as they are embedded to the model.
- Critical word first linefill is not supported, as it is not relevant for PV modeling.
- Buffers are not modeled.
- Outstanding accesses on slave and master ports cannot occur by design in a PV model as all transactions are atomic.
- Option to select one or two master ports and option to select one or two slave ports is not supported. Only one master port and one slave port is supported.
- Clock management and power modes are not supported, as they are not relevant for PV modeling.
- Wait, latency, clock enable, parity, and error support for data and tag RAMs not included, as they are not relevant for PV modeling, and the data and tag RAMs embedded in the model cannot generate error responses.
- MBIST support is not included.
- Debug mode and debug registers are not supported.
- Test mode and scan chains are not supported.
- L2 cache event monitoring is not supported.
- Address filtering in the master ports is not supported.
- Performance counters are not supported.
- Specific Cortex-A9 related optimizations are not supported: Prefetch hints, Full line of zero and Early write response.
- Hazard detection is not required because of the atomic nature of the accesses at PV modeling and the fact that buffers are not modeled, therefore hazards cannot occur.
- Registers that belong to unimplemented features are accessible but do not have any functionality.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

This model implements the following features differently to the hardware:

- Error handling. DECERR from the master port is mapped to SLVERR. Internal errors in cache RAM (like parity errors) cannot happen in the model.
- Background cache operations do not occur in the background. They occur atomically.
- The LOCKDOWN_BY_LINE and LOCKDOWN_BY_MASTER parameter values are reflected in the CacheType register, but the feature is not switched off when the parameter is 0.

This feature is additional:

- Data RAM and Tag RAM are embedded to the model.

Table 3-424 Ports

Name	Protocol	Type	Description
DECERRINTR	*Signal* on page 2-85	Master	Decode error received on master port from L3.
ECNTRINTR	*Signal* on page 2-85	Master	Event Counter Overflow / Increment.
ERRRDINTR	*Signal* on page 2-85	Master	Error on L2 data RAM read.
ERRRTINTR	*Signal* on page 2-85	Master	Error on L2 tag RAM read.
ERRWDINTR	*Signal* on page 2-85	Master	Error on L2 data RAM write.
ERRWTINTR	*Signal* on page 2-85	Master	Error on L2 tag RAM write.
L2CCINTR	*Signal* on page 2-85	Master	Combined interrupt output.
PARRDINTR	*Signal* on page 2-85	Master	Parity error on L2 data RAM read.
PARRTINTR	*Signal* on page 2-85	Master	Parity error on L2 tag RAM read.
SLVERRINTR	*Signal* on page 2-85	Master	Slave error on master port from L3.
pvbus_m	PVBus	Master	Master port for connection to PV bus master/decoder.
pvbus_s	PVBus	Slave	Slave port for connection to PV bus master/decoder.

Table 3-425 Parameters for PL310_L2CC

Name	Type	Default value	Description
ASSOCIATIVITY	int	0x0	Associativity for Auxiliary Control Register
CACHEID	int	0x0	Cache controller cache ID
CFGBIGEND	int	0x0	Big-endian mode for accessing configuration registers out of reset
LOCKDOWN_BY_LINE	int	0x0	Lockdown by line - value is reflected in CacheType register Bit 25, but the feature is not switched off when the parameter is 0
LOCKDOWN_BY_MASTER	int	0x0	Lockdown by master - value is reflected in CacheType register Bit 26, but the feature is not switched off when the parameter is 0
REGFILEBASE	int	0x1f002000	Base address for accessing configuration registers
WAYSIZE	int	0x1	Size of ways for Auxiliary Control Register
cache-state_modelled	bool	0x0	Specifies whether real cache state is modelled (vs. register model)
delay_cache_hit	int	0x0	Cost to handle a cache hit
delay_cache_miss	int	0x0	Cost to handle a cache miss
delay_cache_perbeat	int	0x0	Cost to handle one beat of cache data movement

1.4.2 Caches in PV models on page 1-20

3.9.55 PL330_DMAC

ARM PrimeCell DMA Controller(PL330). This model is written in LISA+.

PL330_DMAC contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL330_DMAC
- SchedulerThread
- SchedulerThreadEvent

PL330_DMAC contains the following MTI components:

- *4.97 PL330_DMAC - trace* on page 4-2742
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About PL330_DMAC

The model uses a single LISA+ component but with a C++ model for each of the channels included in the LISA+ file. Enabled channels are kept on an enabled channels stack in priority order. When a channel state changes, re-arbitration takes place to make the highest (topmost) channel active.

Each transaction carries the identity of the requesting thread. This controller has up to eight channel threads and a manager thread. Each has an ID. In the hardware, the ID is AxID[3:0], with `0x0 - (numberOfChannels - 1)` identifying channels and `(numberOfChannels)` identifying the manager. For example, `0x0-0x7` and `0x8`, respectively. The manager originates only instruction fetches, and the manager ID is also used for instruction fetches issued by the channels.

In the model, the identity of the requesting thread is encoded into each transaction using the low-order 16 bits of the Master ID field:

- Channel data: `0-7`.
- Channel instruction fetch: `0xffff`.
- Manager instruction fetch: `0xffff`.

If a downstream component needs to know the IDs of bus masters that use either the low-order 16 bits or the label, use the label. The LabellerForDMA330 component shifts the low-order 16 bits into the label, while providing a degree of control over the label encoding. The example below maintains separate IDs for each data channel while using the correct hardware ID to identify instruction fetch for a DMA-330 with 8 channels:

```
pl330_dma : PL330_DMAC( "p_max_channels" = 8 );
dma_labeller : LabellerForDMA330(
    "dma330_discriminate_data_channels" = true,
    "dma330_s_instruction_label" = 8,
    "dma330_ns_instruction_label" = 8 );
pl330_dma.pvbus_m => dma_labeller.pvbus_s;
dma_labeller.pvbus_m => output_bus.pvbus_s;
```

Table 3-426 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock input.
irq_abort_master_port	*Signal on page 2-85*	Master	Undefined instruction or instruction error.
irq_master_port[32]	*Signal on page 2-85*	Master	Sets when DMASEV.
pvbus_m	PVBus	Master	Master port for all memory accesses.
pvbus_s	PVBus	Slave	Slave port for all register accesses (secure).

p_perip_request_acceptance_5	int	0x2	Peripheral 5 request acceptance
p_perip_request_acceptance_6	int	0x2	Peripheral 6 request acceptance
p_perip_request_acceptance_7	int	0x2	Peripheral 7 request acceptance
p_perip_request_acceptance_8	int	0x2	Peripheral 8 request acceptance
p_perip_request_acceptance_9	int	0x2	Peripheral 9 request acceptance
p_periph_nsecure	bool	0x0	Peripherals non-secure at reset
p_read_issuing_capability	int	0x1	AXI read issuing capability
p_reset_pc	int	0x60000000	DMA PC at reset
p_write_issuing_capability	int	0x1	AXI write issuing capability
revision	string	"r0p0"	revision ID

3.9.56 PL350_SMC

ARM PrimeCell Static Memory Controller(PL350). This model is written in LISA+.

PL350_SMC contains the following CADI targets:

- PL350_SMC
- PVBusExclusiveMonitor
- TZSwitch

PL350_SMC contains the following MTI components:

- *4.102 PVBusExclusiveMonitor - trace* on page 4-2752
- *4.105 PVBusMapper - trace* on page 4-2758
- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

About PL350_SMC

This component provides two memory interfaces. Each interface can be connected to a maximum of four memory devices, giving a total of eight inputs from the PVBusDecoder and eight outputs to either

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

SRAM or NAND devices. Only one kind of memory can be connected to a particular interface, either SRAM or NAND.

It provides a PVBus slave to control the device behavior. A remap port is also provided to assist in remapping particular memory regions.

This component is optimized to have negligible impact on transaction performance, except when memory remap settings are changed, when there might be a significant effect.

Table 3-428 Ports

Name	Protocol	Type	Description
apb_interface	PVBus	Slave	This is where we expect to receive all the APB data which is used to read/write the device regs.
axi_chip_if0_in[4]	PVBus	Slave	This is where we expect to receive all the AXI data which is used to read/wrie NAND/RAM mem.
axi_chip_if0_out[4]	PVBus	Master	Master interface 0 to connect to SRAM/NAND.
axi_chip_if1_in[4]	PVBus	Slave	This is where we expect to receive all the AXI data which is used to read/wrie NAND/RAM mem.
axi_chip_if1_out[4]	PVBus	Master	Master interface 1 to connect to SRAM/NAND.
axi_remap	PVBus	Slave	This is the remap port that the designer needs to connect to zero.
irq_in_if0	*Signal* on page 2-85	Slave	Interrupt signals from devices connected on interface 0.
irq_in_if1	*Signal* on page 2-85	Slave	Interrupt signals from device connected on interface 1.
irq_out	*Signal* on page 2-85	Master	Interrupt port.
nand_remap_port	PVBus	Slave	Remaps the connected NAND port to 0x0.

Table 3-429 Parameters for PVBusExclusiveMonitor

Name	Type	Default value	Description
apply_access_width_criteria_to_non_excl_stores	bool	0x1	Apply the given exclusive store width matching criteria to non-exclusive stores
clear_on_strex_address_mismatch	bool	0x1	Whether monitor is cleared when strex fails due to address mismatch
enable_component	bool	0x1	Enable component
log2_granule_size	int	0x0	log2 of address granule size
match_access_width	bool	0x0	Fail STREX if not the same access width as LDREX
match_secure_state	bool	0x1	Treat the secure state like an address bit
monitor_access_level	int	0x0	0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device
monitor_non_excl_stores	bool	0x0	Monitor non-exclusive stores from the same master

Table 3-429 Parameters for PVBusExclusiveMonitor (continued)

Name	Type	Default value	Description
number_of_monitors	int	0x8	Number of monitors
shareability_domain	int	0x3	Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system)

Table 3-430 Parameters for TZSwitch

Name	Type	Default value	Description
normal	int	0x2	Normal Port
secure	int	0x1	Secure Port

Table 3-431 Parameters for PL350_SMC

Name	Type	Default value	Description
IF0_CHIP0	bool	0x0	Interface 0 chip 0 connected
IF0_CHIP0_BASE	int	0x0	Interface 0 chip 0 Base address
IF0_CHIP0_SIZE	int	0x0	Interface 0 chip 0 Size
IF0_CHIP1	bool	0x0	Interface 0 chip 1 connected
IF0_CHIP1_BASE	int	0x0	Interface 0 chip 1 Base address
IF0_CHIP1_SIZE	int	0x0	Interface 0 chip 1 Size
IF0_CHIP2	bool	0x0	Interface 0 chip 2 connected
IF0_CHIP2_BASE	int	0x0	Interface 0 chip 2 Base address
IF0_CHIP2_SIZE	int	0x0	Interface 0 chip 2 Size
IF0_CHIP3	bool	0x0	Interface 0 chip 3 connected
IF0_CHIP3_BASE	int	0x0	Interface 0 chip 3 Base address
IF0_CHIP3_SIZE	int	0x0	Interface 0 chip 3 Size
IF0_MEM_TYPE_PARAMETER	int	0x0	Interface 0 Mem type
IF1_CHIP0	bool	0x0	Interface 1 chip 0 connected
IF1_CHIP0_BASE	int	0x0	Interface 1 chip 0 Base address
IF1_CHIP0_SIZE	int	0x0	Interface 1 chip 0 Size
IF1_CHIP1	bool	0x0	Interface 1 chip 1 connected
IF1_CHIP1_BASE	int	0x0	Interface 1 chip 1 Base address
IF1_CHIP1_SIZE	int	0x0	Interface 1 chip 1 Size
IF1_CHIP2	bool	0x0	Interface 1 chip 2 connected
IF1_CHIP2_BASE	int	0x0	Interface 1 chip 2 Base address
IF1_CHIP2_SIZE	int	0x0	Interface 1 chip 2 Size

Table 3-431 Parameters for PL350_SMC (continued)

Name	Type	Default value	Description
IF1_CHIP3	bool	0x0	Interface 1 chip 3 connected
IF1_CHIP3_BASE	int	0x0	Interface 1 chip 3 Base address
IF1_CHIP3_SIZE	int	0x0	Interface 1 chip 3 Size
IF1_MEM_TYPE_PARAMETER	int	0x0	Interface 1 Mem type
PERIPH_ID_0	int	0x52	Periph_ID_0 value
REMAP	int	-0x1	Remap the device
revision	string	"r1p2"	Revision

3.9.57 PL350_SMC_NAND_FLASH

A NAND Flash implementation which works with PL350. This model is written in LISA+.

PL350_SMC_NAND_FLASH contains the following CADI targets:

- PL350_SMC_NAND_FLASH

PL350_SMC_NAND_FLASH contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About PL350_SMC_NAND_FLASH

Program the component as you would the hardware.

Table 3-432 Ports

Name	Protocol	Type	Description
irq	*Signal* on page 2-85	Master	Interrupt signaling.
pvbus	PVBus	Slave	Slave port for connection to PV bus master/decoder.

Table 3-433 Parameters for PL350_SMC_NAND_FLASH

Name	Type	Default value	Description
DEVICE_1	int	0xec	Device manufacturer code
DEVICE_2	int	0xda	Device code
DEVICE_3	int	0x80	Device 3rd cycle code
DEVICE_4	int	0x15	Device 4th cycle code
DEVICE_NAME	string	"Samsung K9F1G08U0M"	Device Name
NAND_BLOCK_COUNT	int	0x800	number of blocks in the flash device
NAND_FLASH_SIZE	int	0x10800000	flash size in byte
NAND_PAGE_COUNT_PER_BLOCK	int	0x40	number of pages in each block
NAND_PAGE_SIZE	int	0x840	page size
NAND_SPARE_SIZE_PER_PAGE	int	0x40	Spare size per page
NAND_VALID_SIZE_PER_PAGE	int	0x800	valid page size

3.9.58 PL370_HDLCD

ARM PrimeCell HD Color LCD Controller (Nominal Designation PL370). This model is written in LISA+.

PL370_HDLCD contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL370_HDLCD
- SchedulerThread
- SchedulerThreadEvent

PL370_HDLCD contains the following MTI components:

- *4.106 PVBusMaster - trace* on page 4-2759
- *4.107 PVBusSlave - trace* on page 4-2760

Note

Too fast a pixel clock can slow the rest of the simulation.

Table 3-434 Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
display	*LCD on page 2-72*	Master	Connection to visualization component.
intr	*Signal on page 2-85*	Master	Interrupt signaling line for flyback events.
pvbus	PVBus	Slave	Slave port for connection to PV bus master/decoder.
pvbus_m	PVBus	Master	DMA port for collecting video data from memory/framebuffer.

Table 3-435 Parameters for PL370_HDLCD

Name	Type	Default value	Description
diagnostics	int	0x0	Diagnostics level
disable_snooping_dma	bool	0x0	Disable DMA snooping
force_frame_rate	int	0x32	Force frame rate to the value of the parameter in frames per simulated second, regardless of the input clock. When 0, use the input clock as a pixel clock

3.9.59 PL390_GIC

Generic Interrupt Controller (PL390). This model is written in LISA+.

PL390_GIC contains the following CADI targets:

- PL390_GIC

PL390_GIC contains the following MTI components:

- *4.107 PVBusSlave - trace* on page 4-2760

About PL390_GIC

The GIC provides support for three interrupt types:

- Software Generated Interrupts (SGI)
- Private Peripheral Interrupts (PPI)
- Shared Peripheral Interrupts (SPI)

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

You can set:

- Security state for an interrupt
- Priority state for an interrupt
- Enabling or disabling state for an interrupt
- Processors that receive an interrupt

A processor interface consists of a pair of interfaces called `pvbus_cpu` and `pvbus_distributor`. The `enable_c<n>` and `match_c<n>` signals identify the originator of a transaction on `pvbus_cpu`. Similarly, `enable_d<n>` and `match_d<n>` signals identify the originator of a transaction on `pvbus_distributor`. <n> corresponds to the number of a processor interface.

Note

To reduce compile time, the registers are not available by default. To activate them, uncomment either of the following statements in `PL390_GIC.lisa`:

```
// #define FEW_CADI_REGISTER
// #define ALL_CADI_REGISTER
```

Table 3-436 Ports

Name	Protocol	Type	Description
cfgsdisable	*Signal* on page 2-85	Slave	Set preventing write accesses to security-critical configuration registers.
enable_c[8]	*ValueState* on page 2-85	Slave	Compared with masked PVBus master id to select processor interface: (master_id & enable_c<n>) == match_c<n>.
enable_d[8]	*ValueState* on page 2-85	Slave	Compared with masked PVBus master id to select distributor interface: (master_id & enable_d<n>) == match_d<n>.
legacy_nfiq[8]	*Signal* on page 2-85	Slave	Legacy FIQ interrupt for processor Interface <n>.
legacy_nirq[8]	*Signal* on page 2-85	Slave	Input interrupt signals.
match_c[8]	*ValueState* on page 2-85	Slave	Mask on the PVBus master id to select processor interface: (master_id & enable_c<n>) == match_c<n>.
match_d[8]	*ValueState* on page 2-85	Slave	Mask on the PVBus master id to select distributor interface: (master_id & enable_d<n>) == match_d<n>.
nfiq[8]	*Signal* on page 2-85	Master	Send out FIQ signal to processor <n>.
nirq[8]	*Signal* on page 2-85	Master	Send out IRQ signal to processor <n>.
ppi_c0[16]	*Signal* on page 2-85	Slave	Private peripheral interrupt for processor 0 (num_cpus> = 1).
ppi_c1[16]	*Signal* on page 2-85	Slave	Private peripheral interrupt for processor 1 (num_cpus> = 2).
ppi_c2[16]	*Signal* on page 2-85	Slave	Private peripheral interrupt for processor 2 (num_cpus> = 3).
ppi_c3[16]	*Signal* on page 2-85	Slave	Private peripheral interrupt for processor 3 (num_cpus> = 4).
ppi_c4[16]	*Signal* on page 2-85	Slave	Private peripheral interrupt for processor 4 (num_cpus> = 5).
ppi_c5[16]	*Signal* on page 2-85	Slave	Private peripheral interrupt for processor 5 (num_cpus> = 6).
ppi_c6[16]	*Signal* on page 2-85	Slave	Private peripheral interrupt for processor 6 (num_cpus> = 7).
ppi_c7[16]	*Signal* on page 2-85	Slave	Private peripheral interrupt for processor 7 (num_cpus> = 8).
pvbus_cpu	PVBus	Slave	Slave port for connection to processor interface.
pvbus_distributor	PVBus	Slave	Slave port for connection to distributor interface.

Table 3-436 Ports (continued)

Name	Protocol	Type	Description
reset_in	*Signal* on page 2-85	Slave	Reset signal.
spi[988]	*Signal* on page 2-85	Slave	Shared peripheral interrupt inputs.

Table 3-437 Parameters for PL390_GIC

Name	Type	Default value	Description
ARCHITECTURE_VERSION	int	0x1	set architecture version in periph_id register
AXI_IF	bool	0x1	set interface type in peripheral identification register 8
C_ID_WIDTH	int	0x20	width of the cpu interface master id
D_ID_WIDTH	int	0x20	width of the distributor interface master id
ENABLE_LEGACY_FIQ	bool	0x1	provide legacy fiq interrupt inputs
ENABLE_LEGACY_IRQ	bool	0x1	provide legacy irq interrupt inputs
ENABLE_PPI_EDGE	bool	0x0	ppi edge sensitive
ENABLE_TRUSTZONE	bool	0x1	support trustzone
INIT_ENABLE_C0	int	0xffffffff	initial value of register ENABLE_C0
INIT_ENABLE_C1	int	0xffffffff	initial value of register ENABLE_C1
INIT_ENABLE_C2	int	0xffffffff	initial value of register ENABLE_C2
INIT_ENABLE_C3	int	0xffffffff	initial value of register ENABLE_C3
INIT_ENABLE_C4	int	0xffffffff	initial value of register ENABLE_C4
INIT_ENABLE_C5	int	0xffffffff	initial value of register ENABLE_C5
INIT_ENABLE_C6	int	0xffffffff	initial value of register ENABLE_C6
INIT_ENABLE_C7	int	0xffffffff	initial value of register ENABLE_C7
INIT_ENABLE_D0	int	0xffffffff	initial value of register ENABLE_D0
INIT_ENABLE_D1	int	0xffffffff	initial value of register ENABLE_D1
INIT_ENABLE_D2	int	0xffffffff	initial value of register ENABLE_D2
INIT_ENABLE_D3	int	0xffffffff	initial value of register ENABLE_D3
INIT_ENABLE_D4	int	0xffffffff	initial value of register ENABLE_D4
INIT_ENABLE_D5	int	0xffffffff	initial value of register ENABLE_D5
INIT_ENABLE_D6	int	0xffffffff	initial value of register ENABLE_D6
INIT_ENABLE_D7	int	0xffffffff	initial value of register ENABLE_D7
INIT_MATCH_C0	int	0x0	initial value of register MATCH_C0
INIT_MATCH_C1	int	0x1	initial value of register MATCH_C1
INIT_MATCH_C2	int	0x2	initial value of register MATCH_C2
INIT_MATCH_C3	int	0x3	initial value of register MATCH_C3
INIT_MATCH_C4	int	0x4	initial value of register MATCH_C4
INIT_MATCH_C5	int	0x5	initial value of register MATCH_C5

Table 3-437 Parameters for PL390_GIC (continued)

Name	Type	Default value	Description
INIT_MATCH_C6	int	0x6	initial value of register MATCH_C6
INIT_MATCH_C7	int	0x7	initial value of register MATCH_C7
INIT_MATCH_D0	int	0x0	initial value of register MATCH_D0
INIT_MATCH_D1	int	0x1	initial value of register MATCH_D1
INIT_MATCH_D2	int	0x2	initial value of register MATCH_D2
INIT_MATCH_D3	int	0x3	initial value of register MATCH_D3
INIT_MATCH_D4	int	0x4	initial value of register MATCH_D4
INIT_MATCH_D5	int	0x5	initial value of register MATCH_D5
INIT_MATCH_D6	int	0x6	initial value of register MATCH_D6
INIT_MATCH_D7	int	0x7	initial value of register MATCH_D7
NUM_CPU	int	0x8	number of cpu interfaces
NUM_LSPI	int	0x1f	number of lockable shared peripheral interrupts
NUM_PPI	int	0x10	number of peripheral interrupts
NUM_PRIORITY_LEVELS	int	0x100	number of priority levels
NUM_SGI	int	0x10	number of software generated interrupts
NUM_SPI	int	0x3dc	number of shared peripheral interrupts

3.9.60 PPUMTWakerequest

Power Policy Unit (PPU) v8.2 Multi-threaded Core Wakerequest Logic. This model is written in C++.

Table 3-438 Ports

Name	Protocol	Type	Description
cpu_pchannel_m	*PChannel* on page 2-80	Master	-
ppu_pchannel_s	*PChannel* on page 2-80	Slave	-
thread_wake_request[2]	*Signal* on page 2-85	Slave	-
wakerequest	*Signal* on page 2-85	Master	-

3.9.61 PPUv0

Power Policy Unit (PPU) v0.8 architectural model. This model is written in C++.

PPUv0 contains the following CADI targets:

- PPUv0

PPUv0 contains the following MTI components:

- *4.98 PPUv0 - trace* on page 4-2747
- *4.107 PVBusSlave - trace* on page 4-2760

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-439 Ports

Name	Protocol	Type	Description
irq	*Signal* on page 2-85	Master	-
powerdown	*Signal* on page 2-85	Master	-
ppuhwstat	*Value* on page 2-85	Master	-
pvbus_s	PVBus	Slave	-
reset_in	*Signal* on page 2-85	Slave	-
smpen	*Signal* on page 2-85	Slave	-
standbywfi	*Signal* on page 2-85	Slave	-
wakerequest	*Signal* on page 2-85	Slave	-

3.9.62 PPUv1

Power Policy Unit (PPU) v1.1 architectural model. This model is written in C++.

PPUv1 contains the following CADI targets:

- PPUv1

PPUv1 contains the following MTI components:
- *4.99 PPUv1 - trace* on page 4-2748
- *4.107 PVBusSlave - trace* on page 4-2760

About PPUv1

Software can determine which features the PPU supports by reading the PPU Identification Register 0, PPU_IDR0 and the PPU Identification Register 1, PPU_IDR1.

The following power policies are offered by the PPU model, in order of increasing priority:
- Off.
- Emulated Off.
- Memory Retention.
- Emulated Memory Retention.
- Logic Retention.
- Full Retention.
- Memory Off.
- Functional Retention.
- On.
- Warm Reset.
- Debug Recovery Reset.

For the power mode transition rules, see *Arm Power Policy Unit Architecture Specification*.

There are 16 operating mode values. The meaning of these values is specific to the device that is connected to the PPU. The operating mode can only be configured to change during a power transition of ON to ON.

The PPU model supports static and dynamic transitions on the P-Channel interface. It does not yet support Q-Channel.

DEVPACTIVE and DEVPSTATE have the following bit encodings:

DEVPACTIVE bits [10:0]
Each bit indicates a required power mode.

DEVPSTATE bits [3:0]
The integer formed by this bitfield indicates a power mode.

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

DEVPACTIVE bits [23:16]
Operating mode. The interpretation of these bits depends on the DEVPACTIVE use model (Ladder or Independent).

DEVPSTATE bits [7:4]
The integer formed by this bitfield indicates an operating mode.

Communication over the Low Power Interface (PREQUEST and PACTIVE) uses blocking calls and does not model any delays. See *2.5.1 PChannel protocol* on page 2-80 for further details.

For static transitions, software sets the policy as the required power mode. The PPU then sends a PREQUEST with the required power state to the attached device. The device can ACCEPT or DENY it. For dynamic transitions, software sets the policy as a minimum power mode. Based on whether the device has sent a signal using DEVPACTIVE, the PPU sends a PREQUEST with the required power state to the attached device. The device can ACCEPT or DENY it.

The PPU model is automatically reset by the simulation engine when the model starts up. Reset can also occur through the reset_in port. The PPU model is reset only when the signal value is Signal::Set. Use Signal::Set instead of zero, its integer value, to prevent unexpected behavior.

The ppuhwstat port notifies the power state change inside the PPU and the definition of each bit is the same as DEVPACTIVE[10:0].

The smpen and standbywfi ports are defined in PPUv0 and are not supported in PPUv1.

Differences between the model and the RTL

- Q-Channel is not supported
- The PPU model has been validated with devices supporting only ON and OFF power modes. Arm has not tested the case where a connected device supports other power modes offered by the PPU.

Table 3-440 Ports

Name	Protocol	Type	Description
devpactive	*PChannel* on page 2-80	Master	P-Channel port
irq	*Signal* on page 2-85	Master	PPU IRQ signal
powerdown	*Signal* on page 2-85	Master	Notify whether or not the PPU is in OFF state.
ppuhwstat	*Value* on page 2-85	Master	Notify the power state change inside the PPU. The definition of each bit is the same as DEVPACTIVE[10:0].
pvbus_s	PVBus	Slave	PPU APB bus slave port
reset_in	*Signal* on page 2-85	Slave	PPU reset signal input
wakerequest	*Signal* on page 2-85	Slave	Input port for the wakerequest signal. It is ORed with PACTIVE[8] (ON) inside the PPU as input to PPU DEVPACTIVE[8] (ON). The "is_core_ppu" parameter controls whether there is additional logic to hold this signal until the PPU is in OFF/OFF_EMU state.

Table 3-441 Parameters for PPUv1

Name	Type	Default value	Description
RevD_support	bool	0x0	Whether to support Rev D locked IRQ
default_op_dyn_en	bool	0x0	Whether to enable operating mode dynamic transition by default
default_op_policy	int	0x0	Default operating policy
default_power_state_on	bool	0x0	Default power state ON
default_pwr_dyn_en	bool	0x0	Whether to enable dynamic power mode transition by default

Copyright © 2014–2020 Arm Limited or its affiliates. All rights reserved.
Non-Confidential

Table 3-441 Parameters for PPUv1 (continued)

Name	Type	Default value	Description
device_channels	int	0x0	Number of device channels (0: P-Channel, 1-8: Q-Channels)
dynamic_off	bool	0x0	Dynamic Off
dynamic_on	bool	0x0	Dynamic On
dynamic_warm_reset	bool	0x0	Dynamic Warm Reset
