The CMD_SYNC has been unhazardous as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

ns_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

ns_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

ns_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

ns_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

ns_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

ns_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

ns_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

pmcg_irq_config

The interrupt configuration of the Performance Monitor Counter Group (PMCG) changed.
Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

SMMU_PMCG_CTRL.IRQEN.

memattr enum

Memory type.

mpam_ns bool

The NS state of the MPAM PARTID and MPAM PMG.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_supported bool

Are MSIs supported for this security world.

ns bool

Non-secure bus attribute.

number_of_interrupts_in_flight unsigned int

The number of interrupts that have been committed to be produced or in flight.

pmcg_index unsigned int

Index of the PMCG.

sh enum

Shareability.

smmu_pmcg_gmpam_Update bool

The SMMU_PMCG_GMPAM.Update flag. Only when this is zero are writes predictable.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen

A trace of SMMU_PMCG_IRQ_CTRL.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen_ack

A trace of SMMU_PMCG_IRQ_CTRLACK.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_merging_interrupts

An interrupt was wanted to be generated, but one was already pending so the two were merged together. Fields:

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_trigger

A PMCG counter has been triggered. Fields:

NoStreamID bool

True if the transaction is a NoStreamID transaction.

counter_index unsigned int

The index of the counter within the PMCG.

event_id unsigned int

The event id that has been triggered.

ns_event bool

Is the event associated with non-secure state.

pmcg_index unsigned int

Index of the PMCG.

prior_counter_value unsigned int

The Counter value *before* the event has incremented it.

ssd enum

The security state associated with the event.

streamid unsigned int

The StreamID associated with the event, if there is one.

tbu_index unsigned int

The TBU index of the transaction, or ~0u if not applicable.

pmu_active_counter

Traces what active counters are in a PMCG and what StreamIDs it might filter on. Those counters that trace StreamIDs for multiple security states, or those that are not filtered by StreamID, will appear multiple times, once for each security state. All active counters for a PMCG are traced one after another. Fields:

NoStreamID bool

True if NoStreamID transactions will be traced.

begin_streamid unsigned int

The start StreamID to filter on.

counter_index unsigned int

The counter index within the PMCG.

end_incl_streamid unsigned int

The end inclusive StreamID to filter on.

evcnt unsigned int

The current count.

event_id unsigned int

The event ID to filter.

ns bool

Are the StreamIDs non-secure?.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd enum

SSD of the StreamID.

tbu_index_to_match unsigned int

The TBU index that must match, or ~0u if no matching applicable.

pmu_all_counters_in_pmcg_became_inactive

The PMCG was tracing some events and now is not tracing any. Fields:

pmcg_index unsigned int

The index of the PMCG.

pmu_capture

For some reason, a capture event occurred. Fields:

pmcg_index unsigned int

The index of the PMCG that the capture occurred on.

why enum

Why did the capture occur?.

pmu_counter_configured_to_use_unsupported_event

An enabled counter was configured to use a unsupported event. Fields:

counter_index unsigned int

The counter index within the PMCG.

event_id unsigned int

The unsupported event id.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

pmu_counter_overflowed

A counter in a particular PMCG overflowed. Fields:

already_overflowed bool

True if the overflow flag was already set.

capture bool

True if it captured the other counter values.

counter_index unsigned int

The counter index within the PMCG.

interrupt bool

True if going to attempt to generate an interrupt.

interrupt_action enum

The interrupt action that is going to occur.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd_ns bool

The PMCG is controlled by the Non-secure security state.

priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool

The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int

The transaction ID of the PPR that caused the overflow.

priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

priq_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int

The value of SMMU_PRIQ.CON.SRD_and_RD_wrap.

number_of_pprs unsigned int

The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int

This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int

The number of writes to the PRIQ that are currently in flight.

ovackflg bool

The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool

The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool

There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool

The value of SMMU_CRO.PRIQEN. The *effective* value is 0 if SMMUEN == 0.

priqenack bool

The value of SMMU_CROACK.PRIQEN.

prod_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool

The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CRO.PRIQEN.

smmuen bool

The value of SMMU_CRO.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool

The value of SMMU_CRO.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int

The size of the table in the number of items it can hold.

priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int

The transaction ID of the PPR that aborted.

priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we wrote..

trans_id unsigned int

The transaction ID of the PPR.

priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue.

Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int

PROD position including the wrap bit.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

ptw_read

Page Table Walk (read). This is the result of the physical access that the SMMU is making.

Fields:

abort enum

Non-zero if the access aborted/failed.

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

data unsigned int

The data fetch if it didn't abort.

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of

output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_stl_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_stl_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AP21 enum

The access permissions.

AttrIndx210 unsigned int

The attribute index into the MAIR0/1. If AIE is implemented then this is the full index AttrIndx[3:0].

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

NS bool

The encoding is for non-secure if this is a secure fetch.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIIIndex unsigned int

The S2PIIndex if S2PIE is in use, or 0xFFFF if not.

PXN bool

Privileged eXecute Never.

Protected enum

Is the descriptor producing an AssuredTranslation.

SH10 enum

The shareability.

XN bool

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

hwu_pbha unsigned int

Top four bits are appropriate CD.HWU, *bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by CD.HWU0/CD.HWU1**.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nG bool

not Global.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

NSTable bool

The next level table descriptor is forced to non-secure.

PXNTable bool

Force PXN independently of subsequent descriptors.

Protected enum

Is the descriptor capable of producing an AssuredTranslation.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AssuredOnly enum

The descriptor is marked as AssuredOnly.

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

HAP21 enum

The access permissions.

MemAttr3_0 enum

The memory attributes.

NS enum

Whether this descriptor forces NS.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIIIndex unsigned int

The S2PIIndex if S2PIE is in use, or 0xFFFF if not.

POE_POIndex unsigned int

The S2POIndex if S2POE is in use, or 0xFFFF if not.

SH10 enum

The shareability.

XN enum

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

s2hwu_pbha unsigned int

Top four bits are STE.S2HWU, bottom bits[62:59] of descriptor. Page Based Hardware
Attributes: only valid on a bit-per-bit basis enabled by STE.S2HWU.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

tth_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

PXNTable bool

Force PXN independently of subsequent descriptors.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

raw_register_end_read

The raw register read transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

read_data unsigned int

The data read.

raw_register_end_write

The raw register write transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

raw_register_start_read

The raw register read transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

raw_register_start_write

The raw register write transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

write_data unsigned int

The data to write.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string

The text description of the register value read.

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string

The text description of the register value written.

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string

The text description of the register value.

register_read_string

A text representation of the read of a register. Fields:

out string

The text description of the register value read.

register_write_reserved

A text representation of an access to a register address that is reserved or a write to a **RES0** field in a register. Fields:

in string

The text description of the register value.

register_write_string

A text representation of the write of a register. Fields:

in string

The text description of the register value written.

rl_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

s_cmd_sync_completed_irq

“Secure” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_no_action

Secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_sev

Secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_with_error

Secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issued

Secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issuing

Secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_starting_completion_action_irq

Secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

s_cmd_sync_starting_completion_action_sev

Secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

s_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

s_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

error enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

s_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

s_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

s_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd, 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

s_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

s_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwritable and the queue is now writable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

s_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

s_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

s_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

s_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

s_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

s_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

s_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

s_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

s_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

s_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

sec_override

Controls non-secure accesses to some registers. Fields:

value bool

The value of the signal.

sev

Send a SEV. Fields:

why enum

Why the SEV was generated.

smmu_atc_inv

The CMD_ATC_INV command is sent. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_atc_inv_completed

The CMD_ATC_INV command completed. Fields:

cmd_id unsigned int

Command id, if top-bit is set then was issued from the Non-secure CMDQ.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

response enum

The response.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_cmdq enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

smmu_atc_inv_end

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

response enum

The response to the ATC invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_atc_inv_start

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_ats_initial

This is the initial ATS request. Fields:

XT bool

The XT bit.

ia unsigned int

Input address.

max_number_of_replies unsigned int

The maximum number of replies allowed to return.

no_write bool

The NW (no write flag) of the ATS request. If clear then the requester is going to do a write.

pasid_execute_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for execution permissions.

pasid_privileged_mode_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for the privileged mode's permissions.

protected_mode bool

Is the ATS Request protected-mode?.

source_cxl bool

Does the ATS request have Source.CXL set?.

ssd enum

The SSD of the ATS request.

ssd_ns bool

Incoming SSD is non-secure.

streamid unsigned int

StreamID of the ATS request.

substreamid unsigned int

SubstreamID (which is identical to the PASID) of the ATS request. If no PASID-prefix is sent then this is ~0u.

tbu unsigned int

Translation Buffer Unit number.

smmu_ats_reply_failure

This is an ATS reply indicating failure. Fields:

event enum

Equivalent event number that would have been generated for an equivalent ordinary transaction.

failure enum

What is the failure response code?.

state enum

The transaction state of the successfully ATS request.

smmu_ats_reply_success

This is an ATS reply, typically the SMMU will only return a single response, even if the requester indicated it could accept more replies. NOTE that the SMMU responds with 'success' in some cases when a fault is encountered and RW==0. Fields:

N bool

Non-snooped access. If one then the requester must clear the NoSnoop bit on transactions, unless otherwise enabled in a Function-specific manner.

P bool

Privileged mode. These permissions related to privileged mode.

RWX enum

Read/Write/Execute.

U bool

Untranslated access. If one, and RW !=0 then use UntranslatedAccesses for the allowed accesses by RW(X).

cxl_io bool

The CXL.io response.

inner enum

The inner cacheability attributes to use for TranslatedAccesses.

input_address unsigned int

Input address of the ATS request.

instcfg enum

The STE.INSTCFG field.

outer enum

The outer cacheability attributes to use for TranslatedAccesses.

pas enum

The PAS this mapping corresponds to. This holds the same information as the TE bit for realm streams.

privcfg enum

The STE.PRIVCFG field.

shareability unsigned int

The shareability to use for TranslatedAccesses.

size unsigned int

The size of the region covered by this translation.

state enum

The transaction state of the successfully ATS request.

translated_address unsigned int

If $RW \neq 0$ & $U \neq 0$, then the Translated Address that a TranslatedAccess can be made with.

smmu_axi_stream_msi

An SMMU generated MSI is directly sent through the axi_stream_msi_m port, typically connected to the GIC port axi_stream_msi_s. Fields:

TDEST unsigned int

Routing information for the data stream, typically identifying the GIC.

TID unsigned int

Data stream identifier for the SMMU.

axi_stream_msi_addr_to_match unsigned int

Current address to match for SMMU-originated MSIs to send out of the axi_stream_msi_m port.

data unsigned int

The MSI sent.

smmu_final_transaction

This is the transaction group request to remap has completed one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. If it stalls then it will report through this trace source, stall (stag_if_stalling != ~0u) and when resume will issue another smmu_initial_transaction as it undergoes remapping again. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum

The AxMMUFLOW for this transaction group. storable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-storable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

begin_input_address_range unsigned int

The start of the input address range that is size_of_region_in_bytes.

begin_ipa_range unsigned int

The start of the IPA range that is of size_of_region_in_bytes.

begin_output_address_range unsigned int

The start of the output address range that is of size_of_region_in_bytes.

cmo_point enum

The point associated with the CMO, if applicable.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

ipa_address unsigned int

The IPA of the transaction.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The MECID of the transaction.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

operation enum

The kind of operation that this represents.

output_address unsigned int

The input address of the transaction group.

output_inner enum

Inner cacheability for the output attributes.

output_outer enum

Outer cacheability for the output attributes.

output_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

output_sh enum

Shareability for the output attributes.

output_vmid unsigned int

The output VMID/GBPA.IMPDEF or ~0u if not valid.

size_of_region_in_bytes unsigned int

An imp def size of region for which this translation is valid for.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

stag_if_stalling unsigned int

This is the STAG used by the transaction if it is going to stall. It is ~0u if it is not going to stall.

state enum

The final transaction state.

streamid unsigned int

The StreamID of the transaction. ~0u if NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFF if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_gpt_tlb_invalidate

A GPT TLB invalidate has been initiated. Fields:

address unsigned int

The address as it appears in the operation.

encoded_size unsigned int

The size as it is encoded in the operation.

kind enum

The kind of operation this is.

pgs_in_bytes unsigned int

The PGS size in bytes.

size_in_bytes unsigned int

For range operations, the size as it appears in the operation.

source enum

Where the TLBI came from.

state enum

Is the operation well formed.

trans_id unsigned int

The transaction id of this invalidate.

smmu_gpt_tlb_invalidate_complete

The GPT TLB invalidate completed. Fields:

source enum

Where the TLBI came from.

trans_id unsigned int

The transaction id of this invalidate.

smmu_initial_transaction

This is the transaction group request to remap is going to start one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. A stalling transaction will report through this trace source when it unstalls. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

XT_and_output_pas_checking enum

The XT bit for PCIe Transactions. This specifies the requested check on the output PAS that the device asked for.

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum

The point associated with the CMO, if applicable.

dcmdq_qcp_and_index unsigned int

If this is a DCMDQ fetch being translated then this field indicates the DCMDQ QCP index in bits [23:8] and the index in the page in bits [7:0]. Otherwise this is 0xFFFFFFFF.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The incoming MECID for NoStreamID transactions. ~0u for all other transactions.

mpam_partid unsigned int

The MPAM_PARTID for NoStreamID transactions. ~0u for all other transactions.

mpam_pmg unsigned int

The MPAM_PMG for NoStreamID transactions. ~0u for all other transactions.

mpam_sp enum

The MPAM_SP for NoStreamID transactions. ~0u for all other transactions.

operation enum

The kind of operation that this represents.

protected_mode enum

The PM bit.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFFFFF if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_normalize_input_transaction

If the input transaction is normalized before being processed then this traceevent will fire. This is usually dependent on parameters of the implementation. Fields:

incoming_inner enum

The inner cacheability attributes.

incoming_is_instruction bool

The incoming transaction is marked as 'instruction'.

incoming_is_privileged bool

The incoming transaction is marked as 'privileged'.

incoming_outer enum

The outer cacheability attributes.

incoming_pas enum

The PAS of the incoming transaction.

incoming_shareability unsigned int

The incoming shareability.

normalized_inner enum

The normalized inner cacheability attributes.

normalized_is_instruction bool

The incoming transaction is marked as 'instruction'.

normalized_is_privileged bool

The incoming transaction is marked as 'privileged'.

normalized_outer enum

The normalized outer cacheability attributes.

normalized_pas enum

The PAS this mapping corresponds to.

normalized_shareability unsigned int

The normalized shareability.

ssd enum

The SSD of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

trans_id unsigned int

ID of the original transaction.

smmu_pmusnapshot_ack

Acknowledge the pmusnapshot_req to indicate the snapshot has occurred. This is part of a four-phase handshake. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_pmusnapshot_ack_overridden

The value of pmusnapshot_ack was overridden (likely due to being in integration mode).

Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_pmusnapshot_ack_override_end

The overriding of the pmusnapshot_ack signal has ended. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

smmu_pmusnapshot_req

Take a snap shot of the PMU values as though SMMU_PMCG_CAPR.CAPTURE had been written. This is part of a four-phase handshake. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_poison_tw_data

Poison data has been returned to a table walk transaction. Fields:

bitmap_of_poison unsigned int

The bitmap of which beats of the transaction where poisoned.

is_cas bool

True if this is a compare-and-swap operation.

number_of_64bit_beats unsigned int

Number of beats this transaction fetched.

paddress unsigned int

Physical address of the table walk transaction.

pas enum

The PAS of the bus transaction.

ras_group_id unsigned int

If non-~0u then is the RAS group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

ras_record_index_in_group unsigned int

If non-~0u then is the RAS record index in the group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

what enum

What table walk was being performed.

smmu_pri_resp

The CMD_PRI_RESP command is queued to be sent to the PCIe system. Fields:

auto_response_trans_id unsigned int

trans_id of PRI request we are auto-responding to, or ~0u if not valid.

cmd_id unsigned int

Command id, or ~0u if not valid.

cons unsigned int

CONS of the command. ~0u if an auto-response.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_pri_resp_nop

The CMD_PRI_RESP command was NOPped. Fields:

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why the CMD_PRI_RESP was NOPped.

smmu_priq_resp_fake_return

A PRIQ Response is posted to the PCIe subsystem and so has no acknowledgement that it is received. However, in the model then we artificially know when the the PRIQ Response has been delivered to the PCIe subsystem, even if the ATC has not yet acted on it. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

what enum

What happened.

smmu_priq_resp_start

A PRIQ Response has been posted to the PCIe subsystem. As the response is posted then there is no way of knowing when it is received by the EndPoint. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_thread_wait_wake

Traces a thread's wait/wake status. Fields:

current_ticks unsigned int

The current tick count of simulated time.

event enum

What is happening to this thread.

thread_index unsigned int

The ID of this thread.

ticks unsigned int

If the event relates to a time then this is held in this field. Otherwise, 0.

stall_transaction

A transaction is about to stall. Fields:

stag unsigned int

STAG.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_inhibited_by_STALL_MAX

A transaction is about to stall but the maximum number of transactions have stalled and we can't report this one to the event queue (even if non-full). Fields:

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_resuming

A stalled transaction is resuming. Fields:

stag unsigned int

STAG if appropriate, or if was inhibited by STALL_MAX then 0xFAFA.

stallresult enum

What the transaction resumed to do.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ste_cc.STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

ste_cc.STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

ste_entry_allocated

An STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

ste string

A textual description of the STE.

streamid unsigned int

The StreamID of the entry this will match.

sup_btm

The pin is driven. This indicates the system supports BTM. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_cohacc

The pin is driven. This indicates the system supports COHACC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_sev

The pin is driven. This indicates the system supports SEV. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

tbu0_reset_in

The reset signal of the TBU0. Fields:

value bool

The value of the signal.

tcu_reset_in

The reset signal. Fields:

value bool

The value of the signal.

tlb_entry_allocated

A TLB entry has been allocated. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_end_incl_address unsigned int

The end inclusive address of the output range.

output_start_address unsigned int

The start address of the output range.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

tbi bool

Was the entry formed using Top Byte Ignore (TBI).

vmid unsigned int

VMID if appropriate.

tlb_info_tlb_entries_overlap

A TLB entry was inserted into the TLB and it overlaps an existing entry. This isn't a problem as it was inserted in such a way that it architecturally works. Fields:

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

how_inserted enum

How the entry was inserted.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

verbose_commentary

This is a verbose commentary on the translation process the SMMU is performing. Fields:

output string

The stream output.

warning_MSI_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_pmcg_address_out_of_range_of_oas

The MSI Address of the Performance Monitor Counter Group (PMCG) is out of range of the OAS and so will be silently truncated. Fields:

address unsigned int

The untruncated address of the MSI.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

warning_discarding_interrupt_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HDBSS_IRQEN.

warning_discarding_interrupt_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_S_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_S_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_S_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_S_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HDBSS_IRQEN.

warning_ns_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc string

The textual description of what happened.

warning_s_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

what_going_to_do_with_terminated_event

A terminating transaction has produced an event, this tells you what the model is going to do with the event. Fields:

CD.S bool

The CD.S field if available.

S2 bool

The event is related to Stage 2.

STE.S1STALLD bool

The STE.S1STALLD field if available.

STE.S2S bool

The STE.S2S field if available.

aborts bool

The transaction will abort.

axmmuflow enum

The AxMMUFLOW for this transaction group. storable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-storable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

is_tr_fault bool

Is a Translation Related fault.

protected_mode bool

The transaction is protected-mode. As such, it cannot stall and will obey the report configuration bits.

reports bool

The transaction will attempt to report.

ssd enum

The SSD of the transaction.

ssd_ns bool

The transaction is classified as SSD non-secure.

supports_stall_model bool

The implementation supports the stall model.

trans_id unsigned int

The transaction id.

why_abort_decision enum

The reason why the transaction aborted/did not abort.

why_report_decision enum

The reason why the transaction reported/did not report.

2.125 MMU_700

This section describes the trace sources.

ArchMsg.Error.error

These messages are about activity occurring on the SMMU that is considered an error. Messages will only come out here if parameter `all_error_messages_through_trace` is true. `DISPLAY %{\output}`. Fields:

output string

The stream output.

ArchMsg.Error.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int

The address of the descriptor fetch.

desc_inner enum

Inner cacheability of descriptor.

desc_outer enum

Outer cacheability of descriptor.

desc_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

desc_sh enum

Shareability of descriptor.

ssd enum

The SSD of the transaction.

ssd_ns bool

Is the Security State Determination of the transaction non-secure.

stage unsigned int

The stage at which we had a problem.

streamid unsigned int

The StreamID of the transaction.

substreamid unsigned int

The SubstreamID of the transaction (or ~0u if no substreamid).

trans_id unsigned int

Transaction id.

ArchMsg.Error.ns_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.priq_streamid_truncated

The SMMU received a PCIe PRI request with a StreamID that was larger than that which the SMMU has been configured for. The StreamID that appears in the PRIQ entry will be truncated. Fields:

actual_streamid unsigned int

The actual StreamID that this request has.

sidsize unsigned int

The bit width of the SMMU for StreamIDs, as indicated by SMMU_IDR1.SIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_streamid unsigned int

The truncated StreamID that will appear in the PRIQ entry.

ArchMsg.Error.priq_substreamid_truncated

The SMMU received a PCIe PRI request with a PASID prefix (SubstreamID) that was larger than that which the SMMU has been configured for. The SubstreamID that appears in the PRIQ entry will be truncated. Fields:

actual_substreamid unsigned int

The actual SubstreamID that this request has.

ssidsize unsigned int

The bit width of the SMMU for SubstreamIDs, as indicated by SMMU_IDR1.SSIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_substreamid unsigned int

The truncated SubstreamID that will appear in the PRIQ entry.

ArchMsg.Error.s_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.tlb_entries_overlap

A TLB entry was attempted to be inserted into the TLB and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

do_f_tlb_conflict bool

Chosen to perform an F_TLB_CONFLICT.

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

why enum

Why it is an error for these two entries to overlap.

ArchMsg.Error.tlb_entry_not_invalidated_due_to_ril

An entry in the cache was not invalidated even though in the right address range because of the RIL fields of the command the entry do not match. Fields:

cmd_num unsigned int

The NUM field of the RIL part of the command.

cmd_ril_tg enum

The RIL_TG field of the RIL part of the command.

cmd_ril_ttl unsigned int

The TTL field of the RIL part of the command, zero means any level. 0x80 means match level 0 (and is from a DVM message).

cmd_scale unsigned int

The SCALE field of the RIL part of the command.

entry_id unsigned int

The entry id that is being invalidated.

tlb_entry string

The TLB entry.

ArchMsg.Error.vatos_sel_vmid_out_of_range

The SMMU_(S_)VATOS_SEL.VMID field was programmed with a VMID that was too wide for this implementation (SMMU_IDR0.VMID16 == 0). DISPLAY %{ssd_ns:(s-|ns-)}VMID:%{vmid} is out of range. Fields:

ssd_ns bool

The security state of the VATOS interface.

vmid unsigned int

The VMID programmed.

ArchMsg.Info.info

These are information messages about what is happening in the SMMU. DISPLAY %{output}. Fields:

output string

The stream output.

ArchMsg.Warning.CMD_RESUME_no_transaction_resumed

A CMD_RESUME was issued that matched no transaction. Fields:

stag unsigned int

STAG in the CMD_RESUME.

streamid unsigned int

StreamID in the CMD_RESUME.

streamid_ns bool

The StreamID was for the non-secure world.

ArchMsg.Warning.atc_inv_strange

Something was odd about the CMD_ATC_INV. DISPLAY CMD_ATC_INV strange as: %{why}.
Fields:

cmd_id unsigned int

Command id.

ssd_of_cmdq enum

The SSD of the CMDQ.

why string

Why the CMD_ATC_INV was strange.

ArchMsg.Warning.bad_axi_stream_msi_addr_to_match_s

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value unsigned int

The default value of the signal we have been assuming.

value unsigned int

The value of the signal.

ArchMsg.Warning.bad_conf_reset_of_SMMU_S_GBPA_ABORT

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sec_override

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_btm

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_cohacc

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_httu

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_sev

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_tbu0_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive

the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_tcu_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.contig_bit_gives_too_large_region_for_TxSZ

If the contig bit was used then the size of the contig region would be larger than that indicated by TxSZ. Fields:

desc_kind enum

Descriptor kind.

el enum

Exception level.

input_address unsigned int

Input address.

log2_contig_region_size unsigned int

Log2(contig region size in bytes).

output_address unsigned int

Output address.

stage_and_level unsigned int

The stage in bits [7:4] and the level in [3:0]. Level -1 is 0xF.

vmid unsigned int

VMID if appropriate.

ArchMsg.Warning.contig_bit_has_inconsistent_input_and_output_address

If the contig bit was used then the some bits of the output address held in the descriptor and the input address must match. Fields:

desc_kind enum

Descriptor kind.

el enum

Exception level.

input_address unsigned int

Input address.

log2_contig_region_size unsigned int

Log2(contig region size in bytes).

match_mask unsigned int

Bits that must match.

output_address unsigned int

Output address.

stage_and_level unsigned int

The stage in bits [7:4] and the level in [3:0]. Level -1 is 0xF.

vmid unsigned int

VMID if appropriate.

ArchMsg.Warning.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int

The address of the descriptor fetch.

desc_inner enum

Inner cacheability of descriptor.

desc_outer enum

Outer cacheability of descriptor.

desc_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

desc_sh enum

Shareability of descriptor.

ssd enum

The SSD of the transaction.

ssd_ns bool

Is the Security State Determination of the transaction non-secure.

stage unsigned int

The stage at which we had a problem.

streamid unsigned int

The StreamID of the transaction.

substreamid unsigned int

The SubstreamID of the transaction (or ~0u if no substreamid).

trans_id unsigned int

Transaction id.

ArchMsg.Warning.msi_address_truncated

An MSI was generated, but the address was silently truncated due to the limited downstream address bus width. Fields:

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

truncated_address unsigned int

The truncated address.

untruncated_address unsigned int

The untruncated address.

which enum

Which MSI this is.

ArchMsg.Warning.msi_lost

An MSI was attempted to be sent, but couldn't be sent. Fields:

id unsigned int

ID of this interrupt transaction.

kind enum

What kind of interrupt.

why enum

Why this interrupt was denied.

ArchMsg.Warning.pmcg_non_secure_world

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between security states. Fields:

commentary string

The commentary.

ArchMsg.Warning.pmcg_programming_violates_security

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between different security states. This is under the assumption that an agent from another security state could be writing to the PMCG. Fields:

commentary string

The commentary.

ArchMsg.Warning.priq_auto_response_failed_to_find_STE

The PRIQ was going to generate an auto-response, but failed to find an STE and so is returning a Failure message to the EndPoint which should disable the PRI interface of the EndPoint. Fields:

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

ArchMsg.Warning.priq_overflow_bad_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG but an overflow condition did not exist. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

ArchMsg.Warning.priq_smmuen_forces_effective_priqen_low

If SMMUEN == 0, then the effective value of PRIQEN is 0. This warning is triggered when PRIQEN == 1 && SMMUEN == 0; which may not be what was intended. The PRIQ cannot be active if SMMUEN == 0.

ArchMsg.Warning.sev_lost

A SEV was lost because it isn't supported according to SMMU_IDRO.SEV. DISPLAY SEV was lost because: %{why}. Fields:

why enum

Why the SEV was generated.

ArchMsg.Warning.smmu_pcie_rc_is_in_reset_ignoring_atc_invalidate

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that mapped to a PCIe Root Complex that is in reset. The message will be discarded and act as though completed successfully. Fields:

port_index unsigned int

The port index (node index) that is in reset but we would have sent it to.

streamid unsigned int

The StreamID that failed to map.

ArchMsg.Warning.smmu_pcie_rc_not_found_for_streamid

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that did not map to a PCIe Root Complex. This might be that the SW used an incorrect StreamID or it might be that the model has not been connected correctly. ATC Invalidate messages complete as though successful and PRI Requests are ignored. Fields:

streamid unsigned int

The StreamID that failed to map.

ArchMsg.Warning.smmu_pmusnapshot

Something strange happened on the pmusnapshot_req/pmusnapshot_ack interface. Fields:

pin_index unsigned int

If the PMCG index corresponds to an array of signals, this is the index in the array, or 0 otherwise.

pmcg_index enum

The PMCG index.

warning string

The warning message.

ArchMsg.Warning.suspicious_overlapping_entries

Two DPT TLB entries are overlapping but they differ in ways that are potentially a SW error. Fields:

new_AC enum

The value of the 'AC' field that controls access to this region.

new_FWB bool

The region is FWB.

new_VMID unsigned int

The VMID, if any, associated with this region.

new_entry_index unsigned int

The entry index of the new DPT TLB entry.

new_entry_is_vmsa_formed bool

The new entry was inserted as a result of VMSA information.

new_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

new_input_start_address unsigned int

The start address of the input range that this matches.

new_output_pas enum

The output PAS of this DPT region.

new_ssd enum

The SSD of the streams this region captures.

new_writeable bool

True if this region is writeable.

old_AC enum

The value of the 'AC' field that controls access to this region.

old_FWB bool

The region is FWB.

old_VMID unsigned int

The VMID, if any, associated with this region.

old_entry_index unsigned int

The entry index of the old DPT TLB entry.

old_entry_is_vmsa_formed bool

The old entry was inserted as a result of VMSA information.

old_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

old_input_start_address unsigned int

The start address of the input range that this matches.

old_output_pas enum

The output PAS of this DPT region.

old_ssd enum

The SSD of the streams this region captures.

old_writeable bool

True if this region is writeable.

pas_differ bool

The output PAS of the two entries differ.

vmids_differ bool

The VMIDs are used by at least one of the AC schemes and are different.

vmsa_formed_writeable_while_DPT_entry_is_not bool

The VMSA-formed entry is writeable but the DPT Entry says it is not writeable.

ArchMsg.Warning.warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the SMMU. DISPLAY %{output}. Fields:

output string

The stream output.

ArchMsg.Warning.warning_effective_EOPD_differs_from_what_would_be_cached_in_TLB

Effective value of EOPD differs from what would be cached in the TLB DISPLAY transaction (%{transaction_id}), sid (%{sid}), ssid (%{ssid}), ssd (%{ssd}), effective EOPD (%{effective_EOPD}), cached EOPD (%{cached_EOPD}). Fields:

cached_EOPD bool

The EOPD value that would be cached in the TLB.

effective_EOPD bool

The effective value of EOPD.

ssd enum

SSD.

streamid unsigned int

StreamID or ~0ull if NoStreamID.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

transaction_id unsigned int

The transaction ID.

DPTTLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

DPTTLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irgen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

HACDBS_PROCESSING_COMPLETE_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

HACDBS_PROCESSING_COMPLETE_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

HACDBS_PROCESSING_COMPLETE_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

HDBSS_TABLE_FULL_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

PRIQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

PRIQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

PRIQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

SMMU_CR0ACK_SMMUEN_hazarded_by_priq

The SMMU_r_CR0ACK.SMMUEN cannot acknowledge the change to SMMUEN because there are outstanding PRIQ writes.

SMMU_CR0ACK_SMMUEN_update

The acknowledge to SMMU_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_CR0.SMMUEN completed.

Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_CR0_SMMUEN_write

A write to SMMU_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_GBPA completed. Fields:

last bool

This is the last set completing.

old_value unsigned int

The old value of the set completing.

SMMU_GBPA_update

The Update flag to SMMU_GBPA was lowered. Fields:

new_value unsigned int

The new value of the register.

SMMU_GBPA_write

A write to SMMU_GBPA occurred. Fields:

new_value unsigned int

The new value of the register.

old_value unsigned int

The old value of the register.

SMMU_S_CR0ACK_SMMUEN_update

The acknowledge to SMMU_S_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_S_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_S_CR0.SMMUEN completed.

Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_S_CR0_SMMUEN_write

A write to SMMU_S_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_S_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_S_GBPA completed. Fields:

last bool

This is the last set completing.

old_value unsigned int

The old value of the set completing.

SMMU_S_GBPA_update

The Update flag to SMMU_S_GBPA was lowered. Fields:

new_value unsigned int

The new value of the register.

SMMU_S_GBPA_write

A write to SMMU_S_GBPA occurred. Fields:

new_value unsigned int

The new value of the register.

old_value unsigned int

The old value of the register.

S_EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irgen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool
read-allocate attribute.

sh enum
Shareability.

smmu_idr0_msi bool
Are MSIs supported for this security world.

tr bool
transient attribute.

wa bool
write-allocate attributes.

S_ERROR_irqen
The IRQEN has been changed. Fields:

new_value bool
The new value of IRQEN.

S_ERROR_irqen_ack
The IRQEN change has been acked. Fields:

new_value bool
The new value of IRQEN.

S_HACDBS_PROCESSING_COMPLETE_config
Configuration of interrupt updated. Fields:

address unsigned int
Address of the MSI.

data unsigned int
Data payload of the MSI.

irqen bool
Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
Memory type.

ns bool
PAS of bus attribute is non-secure.

pas enum
PAS of the MSI.

ra bool
read-allocate attribute.

sh enum
Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_HACDBS_PROCESSING_COMPLETE_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_HACDBS_PROCESSING_COMPLETE_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_HDBSS_TABLE_FULL_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

TLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

TLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

atc_inv_nop

The CMD_ATC_INV command is ignored as a **NOP**. This may be emitted multiple times if the CMD_ATC_INV is being ignored for multiple reasons. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why was NOPped.

atos_complete_fault

The ATOS operation completed with a fault. Fields:

effective_st1translate bool

Because of the settings and/or the ATOS type then the effective st1translate can be different.

fault_faddr unsigned int

The fault FADDR.

fault_faultcode enum

The fault code.

fault_reason enum

The fault reason.

ssd_ns bool

This is a non-secure ATOS operation.

st1translate bool

The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool

The translation suffered a stage 2 translation.

state enum

The final transaction state of the ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_complete_fault_inv_req

The ATOS operation completed, faulted and generated an INV_REQ response. Fields:

ssd_ns bool

This is a non-secure ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

why enum

Why the ATOS operation generated an INV_REQ.

atos_complete_success

The ATOS operation completed successfully. Fields:

base_addr unsigned int

The actual base address of region.

effective_st1translate bool

Because of the settings and/or the ATOS type then the effective st1translate can be different.

par_addr unsigned int

The PAR.ADDR field.

par_mair unsigned int

The memory attributes encoded as a MAIR.

par_ns bool

The PAR.NS field, for an SSD-ns request then this will always be 0.

par_sh enum

Shareability.

par_size bool

The PAR.Size field.

size_in_bytes unsigned int

The actual size in bytes of the region.

ssd_ns bool

This is a non-secure ATOS operation.

st1translate bool

The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool

The translation suffered a stage 2 translation.

state enum

The final transaction state of the ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_run_set

The SMMU_s_GATOS_CTRL.RUN field was set to start the ATOS operation. Fields:

ssd_ns bool

This is a non-secure ATOS operation.

vatos bool

This is a VATOS operation.

atos_starting

The ATOS operation is starting. Fields:

addr unsigned int

The input address to the ATOS operation.

httui bool

Inhibit HTTU update.

ind bool

Instruction Data.

pnu bool

Privileged not User.

rnw bool

Read not Write.

ssd_ns bool

This is a non-secure ATOS operation.

ssec bool

If this is a secure ATOS operation then this is if it is secure or not.

streamid unsigned int

The StreamID requested.

substreamid unsigned int

The SubstreamID requested, or ~0u if no SubstreamID.

type enum

The requested ATOS type.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

axi_stream_msi_addr_to_match_s

Address to use to send SMMU originated MSIs directly to the GIC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value unsigned int

The value of the signal.

cd_cc.CD_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

cd_cc.CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

cd_entry_allocated

An CD entry has been allocated. Fields:

AssuredTranslation bool

The CD (and any L1CD) was fetched from an AssuredOnly stage 2 page and so might be capable of creating AssuredTranslations.

cd string

A textual description of the CD.

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

streamid unsigned int

The StreamID of the entry this will match.

substreamid unsigned int

The SubstreamID of the entry this will match. This may be zero for transactions without a SubstreamID.

conf_reset_of_SMMU_S_GBPA_ABORT

The pin is driven. This is the reset value of SMMU_S_GBPA.ABORT. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

dpttlb_entry_allocated

A DPT TLB entry has been allocated. Fields:

AC enum

The value of the 'AC' field that controls access to this region.

FWB bool

The region is FWB.

VMID unsigned int

The VMID, if any, associated with this region.

index unsigned int

Index of the TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_pas enum

The output PAS of this DPT region.

ssd enum

The SSD of the streams this region captures.

trans_id unsigned int

The trans_id of the transaction that caused this allocation.

vmsa_formed bool

The entry was formed from VMSA information rather than from a DPT walk.

writeable bool

True if this region is writeable.

dpttlb_invalidate_intersects_but_does_not_cover_entry_range

ENCODED_SIZE < size of the region covered by the DPT entry so invalidation is not architecturally guaranteed. No invalidation is performed. Fields:

dpttlb_entry_id unsigned int

ID of the TLB entry.

entry_end_incl_address unsigned int

Last address covered by the TLB entry.

entry_start_address unsigned int

First address covered by the TLB entry.

invalidate_end_incl_address unsigned int

Last address covered by the invalidation range.

invalidate_start_address unsigned int

First address covered by the invalidation range.

ssd enum

The security state of the TLB entry.

dpttlb_overlapping_entries

Two DPT TLB entries are overlapping. Fields:

new_AC enum

The value of the 'AC' field that controls access to this region.

new_FWB bool

The region is FWB.

new_VMID unsigned int

The VMID, if any, associated with this region.

new_entry_index unsigned int

The entry index of the new DPT TLB entry.

new_entry_is_vmsa_formed bool

The new entry was inserted as a result of VMSA information.

new_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

new_input_start_address unsigned int

The start address of the input range that this matches.

new_output_pas enum

The output PAS of this DPT region.

new_ssd enum

The SSD of the streams this region captures.

new_writeable bool

True if this region is writeable.

old_AC enum

The value of the 'AC' field that controls access to this region.

old_FWB bool

The region is FWB.

old_VMID unsigned int

The VMID, if any, associated with this region.

old_entry_index unsigned int

The entry index of the old DPT TLB entry.

old_entry_is_vmsa_formed bool

The old entry was inserted as a result of VMSA information.

old_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

old_input_start_address unsigned int

The start address of the input range that this matches.

old_output_pas enum

The output PAS of this DPT region.

old_ssd enum

The SSD of the streams this region captures.

old_writeable bool

True if this region is writeable.

dvm_tlbinvalidate_complete

The DVM TLB Invalidate message completed. Fields:

id unsigned int

The unique id of this DVM message.

ok bool

The DVM message was OK.

dvm_tlbinvalidate_received

A DVM message for a TLB Invalidate has been received. Fields:

address unsigned int

The VA or IPA to use if match_address.

asid unsigned int

The ASID to match if match_asid.

by_ipa bool

The operation is for an IPA operation if match_address.

id unsigned int

The unique id of this DVM message.

ignored enum

The DVM message was ignored.

last_level bool

The operation is for last level if supported.

match_address bool

Match the address field.

match_asid bool

Match the asid field.

match_vmid bool

Match the vmid field.

num unsigned int

If a range operation, the NUM field. If a single-address operation this is 0.

prot enum

The protection level for which this TLB Invalidate will operate on.

security_world enum

The security world that this will apply to.

smmu_scale unsigned int

If a range operation, then the SCALE field with the meaning in the SMMU architecture which is different to the PE architecture. If a single-address operation this is 0.

stage1_only bool

The operation is for stage 1 only if supported.

tg enum

If a single-address or address-range operation, then the Translation Granule hint. Address-range operations always supply a Translation Granule.

translation_table_level enum

The leaf level of the translation table.

vmid unsigned int

The VMID to match if match_vmid.

found_tlb_entry_has_different_aset

Architecturally, a particular ASID either should be ASET0 or ASET1. However, we have managed to find a TLB entry that has a different ASET than that which we were searching for. This indicates a programming error. You should examine all contexts with this particular ASID/VMID and ensure they are consistent. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_start_address unsigned int

The start address of the input range that this matches.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

vmid unsigned int

VMID if appropriate.

httu_update_abandoned_update

The HTTU update of a descriptor in memory was potentially possible, but it was behind an update that failed to apply cleanly. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

what enum

What this descriptor represents.

httu_update_end_update

The attempted update of a descriptor in memory has occurred. Fields:

is_big_endian bool

The descriptor is big-endian in memory.

original_descriptor unsigned int

The original descriptor value.

result enum

The result of the attempt to update.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int

The new descriptor value that tried to replace the original.

value_that_was_in_memory unsigned int

The value that the compare-and-swap operation returned as the value that was in memory.

httu_update_not_done

A discretionary HTTU update could occur and the implementation choose not to do it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

what enum

What this descriptor represents.

httu_update_start_update

An HTTU update could occur and the implementation chose to try it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

is_big_endian bool

The descriptor will be written to memory as big-endian.

mecid unsigned int

The masked MECID used for the update transaction, or ~0u if not appropriate.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int

The new descriptor value that is going to try replace the original.

what enum

What this descriptor represents.

will_do_AF bool

What the implementation chose to do for the AF update.

will_do_DBM bool

What the implementation chose to do for the DBM update.

interrupt_returned

An interrupt/MSI returned from downstream. Fields:

InD_NS_PnU enum

Instruction/Data, Non-secure/Secure/Root/Realm, Privileged/User. Bit[1] = PAS[0], and bit[3] = PAS[1].

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

dcmdqcp_and_index unsigned int

If this not a DCMDQ MSI CMD_SYNC, then this is 0xFFFFFFFF. If it is then the DCMDQ QCP index is in bits[31:16] and the index in the QCP is in [7:0].

gpc_denied_msi bool

True if the MSI was denied as it failed its GPC checks. Thus the field 'ok' will be false.

id unsigned int

ID of this interrupt transaction.

inner_cache enum

The actual attributes of the access.

kind enum

What kind of interrupt.

mecid unsigned int

The MECID of the MSI, if applicable.

mpam_ns bool

For a non-RME system, this is true if the MPAM space is Non-secure. For an RME system, this is MPAM_SP[0].

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP security state of the MPAM partition. 0 – secure, 1 – non-secure, 2 – root, 3 – realm.

msi_valid bool

MSI will attempt to be sent.

ok bool

Did the access return OK or an abort?.

outer_cache enum

The actual attributes of the access.

pas enum

The PAS of the MSI, if applicable.

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum

Shareability.

interrupt_sent

An interrupt is raised. If it sends an MSI then this is *after* any device-dependent transform on the architectural attributes and so may differ from what is programmed. Fields:

InD_NS_PnU enum

Instruction/Data, Non-secure/Secure/Root/Realm, Privileged/User. Bit[1] = PAS[0], and bit[3] = PAS[1].

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

dcmdq_device_id unsigned int

If this is a DCMDQ then this is the DeviceID of the MSI write. Otherwise, 0xFFFF'ffff.

dcmdq_qcp_and_index unsigned int

If this not a DCMDQ MSI CMD_SYNC, then this is 0xFFFF'ffff. If it is then the DCMDQ QCP index is in bits[31:16] and the index in the QCP is in [7:0].

id unsigned int

ID of this interrupt transaction.

inner_cache enum

The actual attributes of the access.

kind enum

What kind of interrupt.

mecid unsigned int

The MECID of the MSI, if applicable.

mpam_ns bool

For a non-RME system, this is true if the MPAM space is Non-secure. For an RME system, this is MPAM_SP[0].

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP security state of the MPAM partition. 0 – secure, 1 – non-secure, 2 – root, 3 – realm.

msi_valid bool

MSI will attempt to be sent.

outer_cache enum

The actual attributes of the access.

pas enum

The PAS of the MSI, if applicable.

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

qSID unsigned int

If this is a DCMDQ then this is the qSID of the MSI write. Otherwise, 0xFFFF'ffff.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum

Shareability.

l1cd_cc.L1CD_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

l1cd_cc.L1CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

l1cd_entry_allocated

An L1 CD entry has been allocated. Fields:

AssuredTranslation bool

The L1CD was fetched from an AssuredOnly stage 2 page and so might be capable of creating AssuredTranslations.

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

normalised_substreamid unsigned int

The first SubstreamID of the range of SubstreamIDs that this L1CD entry will match.

ns enum

For the non-secure world.

pa_l2 unsigned int

The PA of the L2 CD table. This is L2Ptr << 12.

ssd enum

The SSD of the entry.

streamid unsigned int

The StreamID this CD is for.

valid bool

Is the entry valid.

l1ste_cc.L1STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

l1ste_cc.l1ste_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

l1ste_entry_allocated

An L1 STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

first_streamid_of_range unsigned int

The first StreamID of the range of StreamIDs that this L1STE entry will match.

ns enum

For the non-secure world.

num_entries_in_l2 unsigned int

The number of entries in the L2 table. This is $2^{(\text{Span}-1)}$ or 0 if invalid.

pa_l2 unsigned int

The PA of the L2 ST table. This is $\text{L2Ptr} \ll 6$ and aligned to the size of the table.

ssd enum

The SSD of the entry.

level_interrupt_sent

A level interrupt changed state. Fields:

kind enum

What kind of interrupt.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a level RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

set_high bool

Level interrupt state.

mmu700_integration_mode_end_ras_level_interrupt_restored

RAS level sensitive interrupt restored due to integration mode ending. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being restored.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

value bool

Level of the interrupt signal.

mmu700_integration_mode_pmcg_interrupt_lost

PMCG interrupt lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

pmcg_interrupt enum

PMCG interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

mmu700_integration_mode_pmusnapshot_ack_lost

pmusnapshot_ack lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

mmu700_integration_mode_ras_interrupt_lost

RAS interrupt lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

mmu700_integration_mode_ras_level_interrupt_lost

RAS level sensitive interrupt lost due to being in integration mode. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

value bool

Level of the interrupt signal.

mmu700_integration_mode_start_ras_level_interrupt_cleared

RAS level sensitive interrupt cleared due to integration mode starting. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being cleared.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

mmu700_integration_mode_tcu_evento_lost

Evento lost due to being in integration mode.

mmu700_integration_mode_tcu_interrupt_lost

Interrupt lost due to being in integration mode. Fields:

interrupt enum

Interrupt that is being dropped.

mmu700_integration_register_change

An integration register write occurred and it's modified, which drives a signal. Fields:

is_tcu enum

Is TCU integration mode.

new_value bool

New value of the signal.

old_value bool

Old value of the signal.

register enum

The register being modified.

register_value unsigned int

Value written to the register.

signal string

Signal affected by the register write.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

ns_cmd_sync_completed_irq

"Non-secure" CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_no_action

Non-secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_sev

Non-secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_with_error

Non-secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_issued

Non-secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_issuing

Non-secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_starting_completion_action_irq

Non-secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

ns_cmd_sync_starting_completion_action_sev

Non-secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

ns_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

ns_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

ns_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

ns_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

ns_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

ns_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

ns_eventq_cmd_sync_unhazardred

The CMD_SYNC has been unhazardred as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

ns_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

ns_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

ns_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

ns_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

ns_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

ns_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

ns_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

pmcg_irq_config

The interrupt configuration of the Performance Monitor Counter Group (PMCG) changed.
Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

SMMU_PMCG_CTRL.IRQEN.

memattr enum

Memory type.

mpam_ns bool

The NS state of the MPAM PARTID and MPAM PMG.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_supported bool

Are MSIs supported for this security world.

ns bool

Non-secure bus attribute.

number_of_interrupts_in_flight unsigned int

The number of interrupts that have been committed to be produced or in flight.

pmcg_index unsigned int

Index of the PMCG.

sh enum

Shareability.

smmu_pmcg_gmpam_Update bool

The SMMU_PMCG_GMPAM.Update flag. Only when this is zero are writes predictable.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen

A trace of SMMU_PMCG_IRQ_CTRL.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen_ack

A trace of SMMU_PMCg_IRQ_CTRLACK.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_merging_interrupts

An interrupt was wanted to be generated, but one was already pending so the two were merged together. Fields:

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_trigger

A PMCG counter has been triggered. Fields:

NoStreamID bool

True if the transaction is a NoStreamID transaction.

counter_index unsigned int

The index of the counter within the PMCG.

event_id unsigned int

The event id that has been triggered.

ns_event bool

Is the event associated with non-secure state.

pmcg_index unsigned int

Index of the PMCG.

prior_counter_value unsigned int

The Counter value *before* the event has incremented it.

ssd enum

The security state associated with the event.

streamid unsigned int

The StreamID associated with the event, if there is one.

tbu_index unsigned int

The TBU index of the transaction, or ~0u if not applicable.

pmu_active_counter

Traces what active counters are in a PMCG and what StreamIDs it might filter on. Those counters that trace StreamIDs for multiple security states, or those that are not filtered by StreamID, will appear multiple times, once for each security state. All active counters for a PMCG are traced one after another. Fields:

NoStreamID bool

True if NoStreamID transactions will be traced.

begin_streamid unsigned int

The start StreamID to filter on.

counter_index unsigned int

The counter index within the PMCG.

end_incl_streamid unsigned int

The end inclusive StreamID to filter on.

evcnt unsigned int

The current count.

event_id unsigned int

The event ID to filter.

ns bool

Are the StreamIDs non-secure?.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd enum

SSD of the StreamID.

tbu_index_to_match unsigned int

The TBU index that must match, or ~0u if no matching applicable.

pmu_all_counters_in_pmcg_became_inactive

The PMCG was tracing some events and now is not tracing any. Fields:

pmcg_index unsigned int

The index of the PMCG.

pmu_capture

For some reason, a capture event occurred. Fields:

pmcg_index unsigned int

The index of the PMCG that the capture occurred on.

why enum

Why did the capture occur?.

pmu_counter_configured_to_use_unsupported_event

An enabled counter was configured to use a unsupported event. Fields:

counter_index unsigned int

The counter index within the PMCG.

event_id unsigned int

The unsupported event id.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

pmu_counter_overflowed

A counter in a particular PMCG overflowed. Fields:

already_overflowed bool

True if the overflow flag was already set.

capture bool

True if it captured the other counter values.

counter_index unsigned int

The counter index within the PMCG.

interrupt bool

True if going to attempt to generate an interrupt.

interrupt_action enum

The interrupt action that is going to occur.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd_ns bool

The PMCG is controlled by the Non-secure security state.

priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool

The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int

The transaction ID of the PPR that caused the overflow.

priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

priq_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.RD_and_RD_wrap.

number_of_pprs unsigned int

The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int

This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int

The number of writes to the PRIQ that are currently in flight.

ovackflg bool

The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool

The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool

There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool

The value of SMMU_CRO.PRIQEN. The *effective* value is 0 if SMMUEN == 0.

priqenack bool

The value of SMMU_CROACK.PRIQEN.

prod_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool

The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CR0.PRIQEN.

smmuen bool

The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool

The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int

The size of the table in the number of items it can hold.

priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int

The transaction ID of the PPR that aborted.

priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we wrote..

trans_id unsigned int

The transaction ID of the PPR.

priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int

PROD position including the wrap bit.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

ptw_read

Page Table Walk (read). This is the result of the physical access that the SMMU is making.
Fields:

abort enum

Non-zero if the access aborted/failed.

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

data unsigned int

The data fetch if it didn't abort.

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AP21 enum

The access permissions.

AttrIndx210 unsigned int

The attribute index into the MAIR0/1. If AIE is implemented then this is the full index AttrIndx[3:0].

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

NS bool

The encoding is for non-secure if this is a secure fetch.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIIIndex unsigned int

The S2PIIndex if S2PIE is in use, or 0xFFFF if not.

PXN bool

Privileged eXecute Never.

Protected enum

Is the descriptor producing an AssuredTranslation.

SH10 enum

The shareability.

XN bool

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

hwu_pbha unsigned int

Top four bits are appropriate CD.HWU, *bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by CD.HWU0/CD.HWU1**.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nG bool

not Global.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

NSTable bool

The next level table descriptor is forced to non-secure.

PXNTable bool

Force PXN independently of subsequent descriptors.

Protected enum

Is the descriptor capable of producing an AssuredTranslation.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

tth_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AssuredOnly enum

The descriptor is marked as AssuredOnly.

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

HAP21 enum

The access permissions.

MemAttr3_0 enum

The memory attributes.

NS enum

Whether this descriptor forces NS.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIndex unsigned int

The S2PIndex if S2PIE is in use, or 0xFFFF if not.

POE_POIndex unsigned int

The S2POIndex if S2POE is in use, or 0xFFFF if not.

SH10 enum

The shareability.

XN enum

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

s2hwi_pbha unsigned int

Top four bits are STE.S2HWU, bottom bits[62:59] of descriptor. *Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by STE.S2HWU.*

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

PXNTable bool

Force PXN independently of subsequent descriptors.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

tbtb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of

output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

raw_register_end_read

The raw register read transaction. This is the transaction as directed to the register port.

Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

read_data unsigned int

The data read.

raw_register_end_write

The raw register write transaction. This is the transaction as directed to the register port.

Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

raw_register_start_read

The raw register read transaction. This is the transaction as directed to the register port.

Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

raw_register_start_write

The raw register write transaction. This is the transaction as directed to the register port.

Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

write_data unsigned int

The data to write.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string

The text description of the register value read.

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string

The text description of the register value written.

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string

The text description of the register value.

register_read_string

A text representation of the read of a register. Fields:

out string

The text description of the register value read.

register_write_reserved

A text representation of an access to a register address that is reserved or a write to a **RES0** field in a register. Fields:

in string

The text description of the register value.

register_write_string

A text representation of the write of a register. Fields:

in string

The text description of the register value written.

rl_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

s_cmd_sync_completed_irq

“Secure” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_no_action

Secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_sev

Secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_with_error

Secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issued

Secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issuing

Secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_starting_completion_action_irq

Secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

s_cmd_sync_starting_completion_action_sev

Secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

s_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

s_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

s_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

s_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

s_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

s_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

s_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwritable and the queue is now writable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

s_eventq_cmd_sync_unhazardred

The CMD_SYNC has been unhazardred as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

s_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

s_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

s_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace.

This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

s_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

s_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

s_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

s_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

s_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

s_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

sec_override

Controls non-secure accesses to some registers. Fields:

value bool

The value of the signal.

sev

Send a SEV. Fields:

why enum

Why the SEV was generated.

smmu_atc_inv

The CMD_ATC_INV command is sent. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_atc_inv_completed

The CMDQ_ATC_INV command completed. Fields:

cmd_id unsigned int

Command id, if top-bit is set then was issued from the Non-secure CMDQ.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

response enum

The response.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_cmdq enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

smmu_atc_inv_end

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

response enum

The response to the ATC invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_atc_inv_start

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_ats_initial

This is the initial ATS request. Fields:

XT bool

The XT bit.

ia unsigned int

Input address.

max_number_of_replies unsigned int

The maximum number of replies allowed to return.

no_write bool

The NW (no write flag) of the ATS request. If clear then the requester is going to do a write.

pasid_execute_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for execution permissions.

pasid_privileged_mode_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for the privileged mode's permissions.

protected_mode bool

Is the ATS Request protected-mode?.

source_cxl bool

Does the ATS request have Source.CXL set?.

ssd enum

The SSD of the ATS request.

ssd_ns bool

Incoming SSD is non-secure.

streamid unsigned int

StreamID of the ATS request.

substreamid unsigned int

SubstreamID (which is identical to the PASID) of the ATS request. If no PASID-prefix is sent then this is ~0u.

tbu unsigned int

Translation Buffer Unit number.

smmu_ats_reply_failure

This is an ATS reply indicating failure. Fields:

event enum

Equivalent event number that would have been generated for an equivalent ordinary transaction.

failure enum

What is the failure response code?.

state enum

The transaction state of the successfully ATS request.

smmu_ats_reply_success

This is an ATS reply, typically the SMMU will only return a single response, even if the requester indicated it could accept more replies. NOTE that the SMMU responds with 'success' in some cases when a fault is encountered and RW==0. Fields:

N bool

Non-snooped access. If one then the requester must clear the NoSnoop bit on transactions, unless otherwise enabled in a Function-specific manner.

P bool

Privileged mode. These permissions related to privileged mode.

RWX enum

Read/Write/Execute.

U bool

Untranslated access. If one, and RW !=0 then use UntranslatedAccesses for the allowed accesses by RW(X).

cxl_io bool

The CXL.io response.

inner enum

The inner cacheability attributes to use for TranslatedAccesses.

input_address unsigned int

Input address of the ATS request.

instcfg enum

The STE.INSTCFG field.

outer enum

The outer cacheability attributes to use for TranslatedAccesses.

pas enum

The PAS this mapping corresponds to. This holds the same information as the TE bit for realm streams.

privcfg enum

The STE.PRIVCFG field.

shareability unsigned int

The shareability to use for TranslatedAccesses.

size unsigned int

The size of the region covered by this translation.

state enum

The transaction state of the successfully ATS request.

translated_address unsigned int

If $RW \neq 0$ && $U \neq 0$, then the Translated Address that a TranslatedAccess can be made with.

smmu_axi_stream_msi

An SMMU generated MSI is directly sent through the axi_stream_msi_m port, typically connected to the GIC port axi_stream_msi_s. Fields:

TDEST unsigned int

Routing information for the data stream, typically identifying the GIC.

TID unsigned int

Data stream identifier for the SMMU.

axi_stream_msi_addr_to_match unsigned int

Current address to match for SMMU-originated MSIs to send out of the axi_stream_msi_m port.

data unsigned int

The MSI sent.

smmu_final_transaction

This is the transaction group request to remap has completed one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. If it stalls then it will report through this trace source, stall (stag_if_stalling != ~0u) and when resume will issue another smmu_initial_transaction as it undergoes remapping again. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

begin_input_address_range unsigned int

The start of the input address range that is size_of_region_in_bytes.

begin_ipa_range unsigned int

The start of the IPA range that is of size_of_region_in_bytes.

begin_output_address_range unsigned int

The start of the output address range that is of size_of_region_in_bytes.

cmo_point enum

The point associated with the CMO, if applicable.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

ipa_address unsigned int

The IPA of the transaction.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The MECID of the transaction.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

operation enum

The kind of operation that this represents.

output_address unsigned int

The input address of the transaction group.

output_inner enum

Inner cacheability for the output attributes.

output_outer enum

Outer cacheability for the output attributes.

output_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

output_sh enum

Shareability for the output attributes.

output_vmid unsigned int

The output VMID/GBPA.IMPDEF or ~0u if not valid.

size_of_region_in_bytes unsigned int

An imp def size of region for which this translation is valid for.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

stag_if_stalling unsigned int

This is the STAG used by the transaction if it is going to stall. It is ~0u if it is not going to stall.

state enum

The final transaction state.

streamid unsigned int

The StreamID of the transaction. ~0ull if NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_gpt_tlb_invalidate

A GPT TLB invalidate has been initiated. Fields:

address unsigned int

The address as it appears in the operation.

encoded_size unsigned int

The size as it is encoded in the operation.

kind enum

The kind of operation this is.

pgs_in_bytes unsigned int

The PGS size in bytes.

size_in_bytes unsigned int

For range operations, the size as it appears in the operation.

source enum

Where the TLBI came from.

state enum

Is the operation well formed.

trans_id unsigned int

The transaction id of this invalidate.

smmu_gpt_tlb_invalidate_complete

The GPT TLB invalidate completed. Fields:

source enum

Where the TLBI came from.

trans_id unsigned int

The transaction id of this invalidate.

smmu_initial_transaction

This is the transaction group request to remap is going to start one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. A stalling transaction will report through this trace source when it unstalls. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

XT_and_output_pas_checking enum

The XT bit for PCIe Transactions. This specifies the requested check on the output PAS that the device asked for.

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum

The point associated with the CMO, if applicable.

dcmdq_qcp_and_index unsigned int

If this is a DCMDQ fetch being translated then this field indicates the DCMDQ QCP index in bits [23:8] and the index in the page in bits [7:0]. Otherwise this is 0xFFFFFFFF.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The incoming MECID for NoStreamID transactions. ~0u for all other transactions.

mpam_partid unsigned int

The MPAM_PARTID for NoStreamID transactions. ~0u for all other transactions.

mpam_pmg unsigned int

The MPAM_PMG for NoStreamID transactions. ~0u for all other transactions.

mpam_sp enum

The MPAM_SP for NoStreamID transactions. ~0u for all other transactions.

operation enum

The kind of operation that this represents.

protected_mode enum

The PM bit.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_normalize_input_transaction

If the input transaction is normalized before being processed then this traceevent will fire. This is usually dependent on parameters of the implementation. Fields:

incoming_inner enum

The inner cacheability attributes.

incoming_is_instruction bool

The incoming transaction is marked as 'instruction'.

incoming_is_privileged bool

The incoming transaction is marked as 'privileged'.

incoming_outer enum

The outer cacheability attributes.

incoming_pas enum

The PAS of the incoming transaction.

incoming_shareability unsigned int

The incoming shareability.

normalized_inner enum

The normalized inner cacheability attributes.

normalized_is_instruction bool

The incoming transaction is marked as 'instruction'.

normalized_is_privileged bool

The incoming transaction is marked as 'privileged'.

normalized_outer enum

The normalized outer cacheability attributes.

normalized_pas enum

The PAS this mapping corresponds to.

normalized_shareability unsigned int

The normalized shareability.

ssd enum

The SSD of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

trans_id unsigned int

ID of the original transaction.

smmu_pmusnapshot_ack

Acknowledge the pmusnapshot_req to indicate the snapshot has occurred. This is part of a four-phase handshake. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_pmusnapshot_ack_overridden

The value of pmusnapshot_ack was overridden (likely due to being in integration mode). Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_pmusnapshot_ack_override_end

The overriding of the pmusnapshot_ack signal has ended. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

smmu_pmusnapshot_req

Take a snap shot of the PMU values as though SMMU_PMCGR_CAPTURE had been written. This is part of a four-phase handshake. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_poison_tw_data

Poison data has been returned to a table walk transaction. Fields:

bitmap_of_poison unsigned int

The bitmap of which beats of the transaction were poisoned.

is_cas bool

True if this is a compare-and-swap operation.

number_of_64bit_beats unsigned int

Number of beats this transaction fetched.

paddress unsigned int

Physical address of the table walk transaction.

pas enum

The PAS of the bus transaction.

ras_group_id unsigned int

If non-~0u then is the RAS group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

ras_record_index_in_group unsigned int

If non-~0u then is the RAS record index in the group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

what enum

What table walk was being performed.

smmu_pri_resp

The CMD_PRI_RESP command is queued to be sent to the PCIe system. Fields:

auto_response_trans_id unsigned int

trans_id of PRI request we are auto-responding to, or ~0ull if not valid.

cmd_id unsigned int

Command id, or ~0ull if not valid.

cons unsigned int

CONS of the command. ~0u if an auto-response.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_pri_resp_nop

The CMD_PRI_RESP command was NOPped. Fields:

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why the CMD_PRI_RESP was NOPped.

smmu_priq_resp_fake_return

A PRIQ Response is posted to the PCIe subsystem and so has no acknowledgement that it is received. However, in the model then we artificially know when the the PRIQ Response has been delivered to the PCIe subsystem, even if the ATC has not yet acted on it. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

what enum

What happened.

smmu_priq_resp_start

A PRIQ Response has been posted to the PCIe subsystem. As the response is posted then there is no way of knowing when it is received by the EndPoint. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_thread_wait_wake

Traces a thread's wait/wake status. Fields:

current_ticks unsigned int

The current tick count of simulated time.

event enum

What is happening to this thread.

thread_index unsigned int

The ID of this thread.

ticks unsigned int

If the event relates to a time then this is held in this field. Otherwise, 0.

stall_transaction

A transaction is about to stall. Fields:

stag unsigned int

STAG.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_inhibited_by_STALL_MAX

A transaction is about to stall but the maximum number of transactions have stalled and we can't report this one to the event queue (even if non-full). Fields:

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_resuming

A stalled transaction is resuming. Fields:

stag unsigned int

STAG if appropriate, or if was inhibited by STALL_MAX then 0xFAFA.

stallresult enum

What the transaction resumed to do.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ste_cc.STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

ste_cc.STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

ste_entry_allocated

An STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

ste string

A textual description of the STE.

streamid unsigned int

The StreamID of the entry this will match.

sup_btm

The pin is driven. This indicates the system supports BTM. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_cohacc

The pin is driven. This indicates the system supports COHACC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_httu

The pin is driven. This indicates the system supports HTTU. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_sev

The pin is driven. This indicates the system supports SEV. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

tbu0_reset_in

The reset signal of the TBU0. Fields:

value bool

The value of the signal.

tcu_reset_in

The reset signal. Fields:

value bool

The value of the signal.

tlb_entry_allocated

A TLB entry has been allocated. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_end_incl_address unsigned int

The end inclusive address of the output range.

output_start_address unsigned int

The start address of the output range.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

tbi bool

Was the entry formed using Top Byte Ignore (TBI).

vmid unsigned int

VMID if appropriate.

tlb_info_tlb_entries_overlap

A TLB entry was inserted into the TLB and it overlaps an existing entry. This isn't a problem as it was inserted in such a way that it architecturally works. Fields:

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

how_inserted enum

How the entry was inserted.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

verbose_commentary

This is a verbose commentary on the translation process the SMMU is performing. Fields:

output string

The stream output.

warning_MSI_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_pmcg_address_out_of_range_of_oas

The MSI Address of the Performance Monitor Counter Group (PMCG) is out of range of the OAS and so will be silently truncated. Fields:

address unsigned int

The untruncated address of the MSI.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

warning_discarding_interrupt_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HDBSS_IRQEN.

warning_discarding_interrupt_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_S_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_S_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_S_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_S_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HDBSS_IRQEN.

warning_ns_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc string

The textual description of what happened.

warning_s_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

what_going_to_do_with_terminated_event

A terminating transaction has produced an event, this tells you what the model is going to do with the event. Fields:

CD.S bool

The CD.S field if available.

S2 bool

The event is related to Stage 2.

STE.S1STALLD bool

The STE.S1STALLD field if available.

STE.S2S bool

The STE.S2S field if available.

aborts bool

The transaction will abort.

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

is_tr_fault bool

Is a Translation Related fault.

protected_mode bool

The transaction is protected-mode. As such, it cannot stall and will obey the report configuration bits.

reports bool

The transaction will attempt to report.

ssd enum

The SSD of the transaction.

ssd_ns bool

The transaction is classified as SSD non-secure.

supports_stall_model bool

The implementation supports the stall model.

trans_id unsigned int

The transaction id.

why_abort_decision enum

The reason why the transaction aborted/did not abort.

why_report_decision enum

The reason why the transaction reported/did not report.

2.126 MMU_720AE

This section describes the trace sources.

ArchMsg.Error.error

These messages are about activity occurring on the SMMU that is considered an error. Messages will only come out here if parameter `all_error_messages_through_trace` is true. `DISPLAY %{\output}`. Fields:

output string

The stream output.

ArchMsg.Error.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int

The address of the descriptor fetch.

desc_inner enum

Inner cacheability of descriptor.

desc_outer enum

Outer cacheability of descriptor.

desc_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

desc_sh enum

Shareability of descriptor.

ssd enum

The SSD of the transaction.

ssd_ns bool

Is the Security State Determination of the transaction non-secure.

stage unsigned int

The stage at which we had a problem.

streamid unsigned int

The StreamID of the transaction.

substreamid unsigned int

The SubstreamID of the transaction (or ~0u if no substreamid).

trans_id unsigned int

Transaction id.

ArchMsg.Error.ns_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.priq_streamid_truncated

The SMMU received a PCIe PRI request with a StreamID that was larger than that which the SMMU has been configured for. The StreamID that appears in the PRIQ entry will be truncated. Fields:

actual_streamid unsigned int

The actual StreamID that this request has.

sidsize unsigned int

The bit width of the SMMU for StreamIDs, as indicated by SMMU_IDR1.SIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_streamid unsigned int

The truncated StreamID that will appear in the PRIQ entry.

ArchMsg.Error.priq_substreamid_truncated

The SMMU received a PCIe PRI request with a PASID prefix (SubstreamID) that was larger than that which the SMMU has been configured for. The SubstreamID that appears in the PRIQ entry will be truncated. Fields:

actual_substreamid unsigned int

The actual SubstreamID that this request has.

ssidsize unsigned int

The bit width of the SMMU for SubstreamIDs, as indicated by SMMU_IDR1.SSIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_substreamid unsigned int

The truncated SubstreamID that will appear in the PRIQ entry.

ArchMsg.Error.rl_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.rl_priq_streamid_truncated

The SMMU received a PCIe PRI request with a StreamID that was larger than that which the SMMU has been configured for. The StreamID that appears in the PRIQ entry will be truncated. Fields:

actual_streamid unsigned int

The actual StreamID that this request has.

sidsize unsigned int

The bit width of the SMMU for StreamIDs, as indicated by SMMU_IDR1.SIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_streamid unsigned int

The truncated StreamID that will appear in the PRIQ entry.

ArchMsg.Error.rl_priq_substreamid_truncated

The SMMU received a PCIe PRI request with a PASID prefix (SubstreamID) that was larger than that which the SMMU has been configured for. The SubstreamID that appears in the PRIQ entry will be truncated. Fields:

actual_substreamid unsigned int

The actual SubstreamID that this request has.

ssidsize unsigned int

The bit width of the SMMU for SubstreamIDs, as indicated by SMMU_IDR1.SSIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_substreamid unsigned int

The truncated SubstreamID that will appear in the PRIQ entry.

ArchMsg.Error.s_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.tlb_entries_overlap

A TLB entry was attempted to be inserted into the TLB and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

do_f_tlb_conflict bool

Chosen to perform an F_TLB_CONFLICT.

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

why enum

Why it is an error for these two entries to overlap.

ArchMsg.Error.tlb_entry_not_invalidated_due_to_ril

An entry in the cache was not invalidated even though in the right address range because of the RIL fields of the command the entry do not match. Fields:

cmd_num unsigned int

The NUM field of the RIL part of the command.

cmd_ril_tg enum

The RIL_TG field of the RIL part of the command.

cmd_ril_ttl unsigned int

The TTL field of the RIL part of the command, zero means any level. 0x80 means match level 0 (and is from a DVM message).

cmd_scale unsigned int

The SCALE field of the RIL part of the command.

entry_id unsigned int

The entry id that is being invalidated.

tlb_entry string

The TLB entry.

ArchMsg.Error.vatos_sel_vmid_out_of_range

The SMMU_(S_)VATOS_SEL.VMID field was programmed with a VMID that was too wide for this implementation (SMMU_IDR0.VMID16 == 0). DISPLAY %{{ssd_ns:(s-|ns-)}}VMID:{{vmid}} is out of range. Fields:

ssd_ns bool

The security state of the VATOS interface.

vmid unsigned int

The VMID programmed.

ArchMsg.Info.info

These are information messages about what is happening in the SMMU. DISPLAY %{{output}}. Fields:

output string

The stream output.

ArchMsg.Warning.CMD_RESUME_no_transaction_resumed

A CMD_RESUME was issued that matched no transaction. Fields:

stag unsigned int

STAG in the CMD_RESUME.

streamid unsigned int

StreamID in the CMD_RESUME.

streamid_ns bool

The StreamID was for the non-secure world.

ArchMsg.Warning.NoStreamID_bad_pas_or_mpam_sp

When RME is not supported then a NoStreamID transaction with PAS[1] == 1 or MPAM_SP[1] == 1 is treated as though PAS[1] == 0 and MPAM_SP[1] == 0. This is usually a system construction error and is not expected to occur. Fields:

address unsigned int

The Physical Address.

effective_mpam_sp enum

The effective MPAM_SP.

effective_pas enum

The effective PAS.

extendedid unsigned int

The ExtendedID of the transaction.

incoming_mpam_sp enum

The incoming MPAM_SP.

incoming_pas enum

The incoming PAS.

managerid64 unsigned int

The ManagerID64 of the transaction,.

userflags unsigned int

The UserFlags of the transaction.

ArchMsg.Warning.atc_inv_strange

Something was odd about the CMD_ATC_INV. DISPLAY CMD_ATC_INV strange as: %{why}. Fields:

cmd_id unsigned int

Command id.

ssd_of_cmdq enum

The SSD of the CMDQ.

why string

Why the CMD_ATC_INV was strange.

ArchMsg.Warning.bad_axi_stream_msi_addr_to_match_s

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value unsigned int

The default value of the signal we have been assuming.

value unsigned int

The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_bgptm

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_10gptsz

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value unsigned int

The default value of the signal we have been assuming.

value unsigned int

The value of the signal.

ArchMsg.Warning.bad_legacy_tz_en

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_s_gbpa_abort_init

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sec_override

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_btm

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_cohacc

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_httu

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_sev

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_tbu0_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_tbu_fmurstdisable[0]

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_tcu_fmurstdisable

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_tcu_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.contig_bit_gives_too_large_region_for_TxSZ

If the contig bit was used then the size of the contig region would be larger than that indicated by TxSZ. Fields:

desc_kind enum

Descriptor kind.

el enum

Exception level.

input_address unsigned int

Input address.

log2_contig_region_size unsigned int

Log2(contig region size in bytes).

output_address unsigned int

Output address.

stage_and_level unsigned int

The stage in bits [7:4] and the level in [3:0]. Level -1 is 0xF.

vmid unsigned int

VMID if appropriate.

ArchMsg.Warning.contig_bit_has_inconsistent_input_and_output_address

If the contig bit was used then the some bits of the output address held in the descriptor and the input address must match. Fields:

desc_kind enum

Descriptor kind.

el enum

Exception level.

input_address unsigned int

Input address.

log2_contig_region_size unsigned int

Log2(contig region size in bytes).

match_mask unsigned int

Bits that must match.

output_address unsigned int

Output address.

stage_and_level unsigned int

The stage in bits [7:4] and the level in [3:0]. Level -1 is 0xF.

vmid unsigned int

VMID if appropriate.

ArchMsg.Warning.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int

The address of the descriptor fetch.

desc_inner enum

Inner cacheability of descriptor.

desc_outer enum

Outer cacheability of descriptor.

desc_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

desc_sh enum

Shareability of descriptor.

ssd enum

The SSD of the transaction.

ssd_ns bool

Is the Security State Determination of the transaction non-secure.

stage unsigned int

The stage at which we had a problem.

streamid unsigned int

The StreamID of the transaction.

substreamid unsigned int

The SubstreamID of the transaction (or ~0u if no substreamid).

trans_id unsigned int

Transaction id.

ArchMsg.Warning.gpt_read_invalid_descriptor

A GPT read has completed and not found something that looks like a descriptor. Fields:

abort enum

Non-zero if the access aborted/failed.

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

data unsigned int

The data fetch if it didn't abort.

level unsigned int

Level of the walk.

pas_checking enum

The PAS of the address that we are checking.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

ArchMsg.Warning.msi_address_truncated

An MSI was generated, but the address was silently truncated due to the limited downstream address bus width. Fields:

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

truncated_address unsigned int

The truncated address.

untruncated_address unsigned int

The untruncated address.

which enum

Which MSI this is.

ArchMsg.Warning.msi_lost

An MSI was attempted to be sent, but couldn't be sent. Fields:

id unsigned int

ID of this interrupt transaction.

kind enum

What kind of interrupt.

why enum

Why this interrupt was denied.

ArchMsg.Warning.pmcg_non_secure_world

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between security states. Fields:

commentary string

The commentary.

ArchMsg.Warning.pmcg_programming_violates_security

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between different security states. This is under the assumption that an agent from another security state could be writing to the PMCG. Fields:

commentary string

The commentary.

ArchMsg.Warning.priq_auto_response_failed_to_find_STE

The PRIQ was going to generate an auto-response, but failed to find an STE and so is returning a Failure message to the EndPoint which should disable the PRI interface of the EndPoint. Fields:

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

ArchMsg.Warning.priq_overflow_bad_acking

Indicates that an overflow condition was acknowledged by writing to:-
SMMU_PRIQ_CONS.OVACKFLG but an overflow condition did not exist. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

ArchMsg.Warning.priq_smmuen_forces_effective_priqen_low

If SMMUEN == 0, then the effective value of PRIQEN is 0. This warning is triggered when
PRIQEN == 1 && SMMUEN == 0; which may not be what was intended. The PRIQ cannot
be active if SMMUEN == 0.

ArchMsg.Warning.rl_priq_auto_response_failed_to_find_STE

The PRIQ was going to generate an auto-response, but failed to find an STE and so is
returning a Failure message to the EndPoint which should disable the PRI interface of the
EndPoint. Fields:

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

ArchMsg.Warning.rl_priq_overflow_bad_acking

Indicates that an overflow condition was acknowledged by writing to:-
SMMU_PRIQ_CONS.OVACKFLG but an overflow condition did not exist. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

ArchMsg.Warning.rl_priq_smmuen_forces_effective_priqen_low

If SMMUEN == 0, then the effective value of PRIQEN is 0. This warning is triggered when
PRIQEN == 1 && SMMUEN == 0; which may not be what was intended. The PRIQ cannot
be active if SMMUEN == 0.

ArchMsg.Warning.sev_lost

A SEV was lost because it isn't supported according to SMMU_IDRO.SEV. DISPLAY SEV was
lost because: %{why}. Fields:

why enum

Why the SEV was generated.

ArchMsg.Warning.smmu_pcie_rc_is_in_reset_ignoring_atc_invalidate

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that mapped to a PCIe
Root Complex that is in reset. The message will be discarded and act as though completed
successfully. Fields:

port_index unsigned int

The port index (node index) that is in reset but we would have sent it to.

streamid unsigned int

The StreamID that failed to map.

ArchMsg.Warning.smmu_pcie_rc_not_found_for_streamid

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that did not map to a PCIe Root Complex. This might be that the SW used an incorrect StreamID or it might be that the model has not been connected correctly. ATC Invalidate messages complete as though successful and PRI Requests are ignored. Fields:

streamid unsigned int

The StreamID that failed to map.

ArchMsg.Warning.smmu_pmusnapshot

Something strange happened on the pmusnapshot_req/pmusnapshot_ack interface. Fields:

pin_index unsigned int

If the PMCG index corresponds to an array of signals, this is the index in the array, or 0 otherwise.

pmcg_index enum

The PMCG index.

warning string

The warning message.

ArchMsg.Warning.suspicious_overlapping_entries

Two DPT TLB entries are overlapping but they differ in ways that are potentially a SW error. Fields:

new_AC enum

The value of the 'AC' field that controls access to this region.

new_FWB bool

The region is FWB.

new_VMID unsigned int

The VMID, if any, associated with this region.

new_entry_index unsigned int

The entry index of the new DPT TLB entry.

new_entry_is_vmsa_formed bool

The new entry was inserted as a result of VMSA information.

new_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

new_input_start_address unsigned int

The start address of the input range that this matches.

new_output_pas enum

The output PAS of this DPT region.

new_ssd enum

The SSD of the streams this region captures.

new_writeable bool

True if this region is writeable.

old_AC enum

The value of the 'AC' field that controls access to this region.

old_FWB bool

The region is FWB.

old_VMID unsigned int

The VMID, if any, associated with this region.

old_entry_index unsigned int

The entry index of the old DPT TLB entry.

old_entry_is_vmsa_formed bool

The old entry was inserted as a result of VMSA information.

old_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

old_input_start_address unsigned int

The start address of the input range that this matches.

old_output_pas enum

The output PAS of this DPT region.

old_ssd enum

The SSD of the streams this region captures.

old_writeable bool

True if this region is writeable.

pas_differ bool

The output PAS of the two entries differ.

vmids_differ bool

The VMIDs are used by at least one of the AC schemes and are different.

vmsa_formed_writeable_while_DPT_entry_is_not bool

The VMSA-formed entry is writeable but the DPT Entry says it is not writeable.

ArchMsg.Warning.warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the SMMU. DISPLAY %{output}. Fields:

output string

The stream output.

ArchMsg.Warning.warning_effective_EOPD_differs_from_what_would_be_cached_in_TLB

Effective value of EOPD differs from what would be cached in the TLB DISPLAY transaction (%{transaction_id}), sid (%{sid}), ssid (%{ssid}), ssd (%{ssd}), effective EOPD (%{effective_EOPD}), cached EOPD (%{cached_EOPD}). Fields:

cached_EOPD bool

The EOPD value that would be cached in the TLB.

effective_EOPD bool

The effective value of EOPD.

ssd enum

SSD.

streamid unsigned int

StreamID or ~0ull if NoStreamID.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

transaction_id unsigned int

The transaction ID.

DPTTLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

DPTTLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

GPTTLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

GPTTLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

HACDBS_PROCESSING_COMPLETE_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

Copyright © 2023–2025 Arm Limited (or its affiliates). All rights reserved.

Non-Confidential

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

The new value of IRQEN.

R_HACDBS_PROCESSING_COMPLETE_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

R_HDBSS_TABLE_FULL_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

R_HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

R_HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

R_PRIQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irgen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

R_PRIQ_irgen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

R_PRIQ_irgen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

SMMU_CR0ACK_SMMUEN_hazarded_by_priq

The SMMU_r_CR0ACK.SMMUEN cannot acknowledge the change to SMMUEN because there are outstanding PRIQ writes.

SMMU_CR0ACK_SMMUEN_update

The acknowledge to SMMU_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_CR0.SMMUEN completed.

Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_CR0_SMMUEN_write

A write to SMMU_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_GBPA completed. Fields:

last bool

This is the last set completing.

old_value unsigned int

The old value of the set completing.

SMMU_GBPA_update

The Update flag to SMMU_GBPA was lowered. Fields:

new_value unsigned int

The new value of the register.

SMMU_GBPA_write

A write to SMMU_GBPA occurred. Fields:

new_value unsigned int

The new value of the register.

old_value unsigned int

The old value of the register.

SMMU_ROOT_CR0ACK_ACCESSSEN_update

The acknowledge to SMMU_ROOT_CR0.ACCESSSEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_ROOT_CR0ACK_GPCEN_update

The acknowledge to SMMU_ROOT_CR0.GPCEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_ROOT_CR0_ACCESSEN_old_set_complete

A set of transactions associated with the old value of SMMU_ROOT_CR0.ACCESSSEN completed. Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_ROOT_CR0_ACCESSEN_write

A write to SMMU_ROOT_CR0.ACCESSSEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_ROOT_CR0_GPCEN_old_set_complete

A set of transactions associated with the old value of SMMU_ROOT_CR0.GPCEN completed. Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_ROOT_CR0_GPCEN_write

A write to SMMU_ROOT_CR0.GPCEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_R_CR0ACK_SMMUEN_hazarded_by_rl_priq

The SMMU_r_CR0ACK.SMMUEN cannot acknowledge the change to SMMUEN because there are outstanding PRIQ writes.

SMMU_R_CR0ACK_SMMUEN_update

The acknowledge to SMMU_R_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_R_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_R_CR0.SMMUEN completed.

Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_R_CR0_SMMUEN_write

A write to SMMU_R_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_S_CR0ACK_SMMUEN_update

The acknowledge to SMMU_S_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_S_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_S_CR0.SMMUEN completed.

Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_S_CR0_SMMUEN_write

A write to SMMU_S_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_S_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_S_GBPA completed. Fields:

last bool

This is the last set completing.

old_value unsigned int

The old value of the set completing.

SMMU_S_GBPA_update

The Update flag to SMMU_S_GBPA was lowered. Fields:

new_value unsigned int

The new value of the register.

SMMU_S_GBPA_write

A write to SMMU_S_GBPA occurred. Fields:

new_value unsigned int

The new value of the register.

old_value unsigned int

The old value of the register.

S_EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_ERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_HACDBS_PROCESSING_COMPLETE_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_HACDBS_PROCESSING_COMPLETE_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_HACDBS_PROCESSING_COMPLETE_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_HDBSS_TABLE_FULL_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

TLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

TLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

atc_inv_nop

The CMD_ATC_INV command is ignored as a **NOP**. This may be emitted multiple times if the CMD_ATC_INV is being ignored for multiple reasons. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why was NOPped.

atos_complete_fault

The ATOS operation completed with a fault. Fields:

effective_st1translate bool

Because of the settings and/or the ATOS type then the effective st1translate can be different.

fault_faddr unsigned int

The fault FADDR.

fault_faultcode enum

The fault code.

fault_reason enum

The fault reason.

ssd_ns bool

This is a non-secure ATOS operation.

st1translate bool

The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool

The translation suffered a stage 2 translation.

state enum

The final transaction state of the ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_complete_fault_inv_req

The ATOS operation completed, faulted and generated an INV_REQ response. Fields:

ssd_ns bool

This is a non-secure ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

why enum

Why the ATOS operation generated an INV_REQ.

atos_complete_success

The ATOS operation completed successfully. Fields:

base_addr unsigned int

The actual base address of region.

effective_st1translate bool

Because of the settings and/or the ATOS type then the effective st1translate can be different.

par_addr unsigned int

The PAR.ADDR field.

par_mair unsigned int

The memory attributes encoded as a MAIR.

par_ns bool

The PAR.NS field, for an SSD-ns request then this will always be 0.

par_sh enum

Shareability.

par_size bool

The PAR.Size field.

size_in_bytes unsigned int

The actual size in bytes of the region.

ssd_ns bool

This is a non-secure ATOS operation.

st1translate bool

The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool

The translation suffered a stage 2 translation.

state enum

The final transaction state of the ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_run_set

The SMMU_s_GATOS_CTRL.RUN field was set to start the ATOS operation. Fields:

ssd_ns bool

This is a non-secure ATOS operation.

vatos bool

This is a VATOS operation.

atos_starting

The ATOS operation is starting. Fields:

addr unsigned int

The input address to the ATOS operation.

httui bool

Inhibit HTTU update.

ind bool

Instruction Data.

pnu bool

Privileged not User.

rnw bool

Read not Write.

ssd_ns bool

This is a non-secure ATOS operation.

ssec bool

If this is a secure ATOS operation then this is if it is secure or not.

streamid unsigned int

The StreamID requested.

substreamid unsigned int

The SubstreamID requested, or ~0u if no SubstreamID.

type enum

The requested ATOS type.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

axi_stream_msi_addr_to_match_s

Address to use to send SMMU originated MSIs directly to the GIC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value unsigned int

The value of the signal.

cd_cc.CD_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

cd_cc.CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

cd_entry_allocated

An CD entry has been allocated. Fields:

AssuredTranslation bool

The CD (and any L1CD) was fetched from an AssuredOnly stage 2 page and so might be capable of creating AssuredTranslations.

cd string

A textual description of the CD.

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

streamid unsigned int

The StreamID of the entry this will match.

substreamid unsigned int

The SubstreamID of the entry this will match. This may be zero for transactions without a SubstreamID.

conf_system_supports_bgptm

The pin is driven. This indicates system supports broadcast TLBI by PA operations. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

dpttlb_entry_allocated

A DPT TLB entry has been allocated. Fields:

AC enum

The value of the 'AC' field that controls access to this region.

FWB bool

The region is FWB.

VMID unsigned int

The VMID, if any, associated with this region.

index unsigned int

Index of the TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_pas enum

The output PAS of this DPT region.

ssd enum

The SSD of the streams this region captures.

trans_id unsigned int

The trans_id of the transaction that caused this allocation.

vmsa_formed bool

The entry was formed from VMSA information rather than from a DPT walk.

writeable bool

True if this region is writeable.

dpttlb_invalidate_intersects_but_does_not_cover_entry_range

ENCODED_SIZE < size of the region covered by the DPT entry so invalidation is not architecturally guaranteed. No invalidation is performed. Fields:

dpttlb_entry_id unsigned int

ID of the TLB entry.

entry_end_incl_address unsigned int

Last address covered by the TLB entry.

entry_start_address unsigned int

First address covered by the TLB entry.

invalidate_end_incl_address unsigned int

Last address covered by the invalidation range.

invalidate_start_address unsigned int

First address covered by the invalidation range.

ssd enum

The security state of the TLB entry.

dpttlb_overlapping_entries

Two DPT TLB entries are overlapping. Fields:

new_AC enum

The value of the 'AC' field that controls access to this region.

new_FWB bool

The region is FWB.

new_VMID unsigned int

The VMID, if any, associated with this region.

new_entry_index unsigned int

The entry index of the new DPT TLB entry.

new_entry_is_vmsa_formed bool

The new entry was inserted as a result of VMSA information.

new_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

new_input_start_address unsigned int

The start address of the input range that this matches.

new_output_pas enum

The output PAS of this DPT region.

new_ssd enum

The SSD of the streams this region captures.

new_writeable bool

True if this region is writeable.

old_AC enum

The value of the 'AC' field that controls access to this region.

old_FWB bool

The region is FWB.

old_VMID unsigned int

The VMID, if any, associated with this region.

old_entry_index unsigned int

The entry index of the old DPT TLB entry.

old_entry_is_vmsa_formed bool

The old entry was inserted as a result of VMSA information.

old_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

old_input_start_address unsigned int

The start address of the input range that this matches.

old_output_pas enum

The output PAS of this DPT region.

old_ssd enum

The SSD of the streams this region captures.

old_writeable bool

True if this region is writeable.

dvm_tlbinvalidate_complete

The DVM TLB Invalidate message completed. Fields:

id unsigned int

The unique id of this DVM message.

ok bool

The DVM message was OK.

dvm_tlbinvalidate_received

A DVM message for a TLB Invalidate has been received. Fields:

address unsigned int

The VA or IPA to use if match_address.

asid unsigned int

The ASID to match if match_asid.

by_ipa bool

The operation is for an IPA operation if match_address.

id unsigned int

The unique id of this DVM message.

ignored enum

The DVM message was ignored.

last_level bool

The operation is for last level if supported.

match_address bool

Match the address field.

match_asid bool

Match the asid field.

match_vmid bool

Match the vmid field.

num unsigned int

If a range operation, the NUM field. If a single-address operation this is 0.

prot enum

The protection level for which this TLB Invalidate will operate on.

security_world enum

The security world that this will apply to.

smmu_scale unsigned int

If a range operation, then the SCALE field with the meaning in the SMMU architecture which is different to the PE architecture. If a single-address operation this is 0.

stage1_only bool

The operation is for stage 1 only if supported.

tg enum

If a single-address or address-range operation, then the Translation Granule hint. Address-range operations always supply a Translation Granule.

translation_table_level enum

The leaf level of the translation table.

vmid unsigned int

The VMID to match if match_vmid.

found_tlb_entry_has_different_aset

Architecturally, a particular ASID either should be ASET0 or ASET1. However, we have managed to find a TLB entry that has a different ASET than that which we were searching for. This indicates a programming error. You should examine all contexts with this particular ASID/VMID and ensure they are consistent. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_start_address unsigned int

The start address of the input range that this matches.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

vmid unsigned int

VMID if appropriate.

gpf_far

An attempt was made to record a fault in SMMU_ROOT_GPF_FAR. Fields:

fault_address unsigned int

The PA input address that faulted.

fpas enum

The PAS of the input PA that suffered the fault.

is_debug bool

The record is due to a debug transaction.

lost bool

The record is lost because an existing record is active. If `is_debug`, then the record is never written, but this reports if it would have been lost if it was a real transaction.

syndrome enum

The syndrome for the fault.

gpt_cfg_far

An attempt was made to record a fault in SMMU_ROOT_GPT_CFG_FAR. Fields:

cfg_err enum

The configuration syndrome.

fault_address unsigned int

The PA input address that faulted.

fpas enum

The PAS of the input PA that suffered the fault.

is_debug bool

The record is due to a debug transaction.

lost bool

The record is lost because an existing record is active. If `is_debug`, then the record is never written, but this reports if it would have been lost if it was a real transaction.

syndrome enum

The syndrome for the fault.

gpt_read_block_descriptor

A GPT read has completed and found an LOGPT block descriptor. Fields:

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

begin_address unsigned int

The address range this block covers.

data unsigned int

The data fetch if it didn't abort.

end_incl_address unsigned int

The address range this block covers.

gpi enum

GPI.

gpi_violation bool

The descriptor is invalid because the GPI value is invalid.

has_res0_violation bool

The descriptor is invalid because of **RES0** violation.

pas_checking enum

The PAS of the address that we are checking.

trans_id unsigned int

The `trans_id` of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

gpt_read_contig_descriptor

A GPT read has completed and found an L1GPT contig descriptor. Fields:

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

begin_address unsigned int

The address range this block covers.

data unsigned int

The data fetch if it didn't abort.

end_incl_address unsigned int

The address range this block covers.

gpi enum

GPI.

gpi_violation bool

The descriptor is invalid because the GPI value is invalid.

has_res0_violation bool

The descriptor is invalid because of **RES0** violation.

pas_checking enum

The PAS of the address that we are checking.

size_violation bool

The encoded size was not a valid value.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

gpt_read_granules_descriptor

A GPT read has completed and found an L1GPT granules descriptor. Fields:

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

begin_address unsigned int

The address range this block covers.

data unsigned int

The data fetch if it didn't abort.

end_incl_address unsigned int

The address range this block covers.

gpi enum

GPI.

gpi_violation bool

The descriptor is invalid because the GPI value is invalid.

pas_checking enum

The PAS of the address that we are checking.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

which_gpi_granule unsigned int

Which GPI granule the address being checked will use.

gpt_read_table_descriptor

A GPT read has completed and found an LOGPT table descriptor. Fields:

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

data unsigned int

The data fetch if it didn't abort.

has_res0_violation bool

The descriptor is invalid because of **RES0** violation.

misaligned_violation bool

The descriptor is invalid because the base address is misaligned.

out_of_range_violation bool

The descriptor is invalid because the base address is out of range of the PPS.

pas_checking enum

The PAS of the address that we are checking.

table_address unsigned int

The table address.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

gpttlb_entry_allocated

A GPT TLB entry has been allocated. Fields:

GPI enum

The GPI of the entry.

index unsigned int

Index of TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

origin enum

How this entry was formed.

httu_update_abandoned_update

The HTTU update of a descriptor in memory was potentially possible, but it was behind an update that failed to apply cleanly. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

what enum

What this descriptor represents.

httu_update_end_update

The attempted update of a descriptor in memory has occurred. Fields:

is_big_endian bool

The descriptor is big-endian in memory.

original_descriptor unsigned int

The original descriptor value.

result enum

The result of the attempt to update.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int

The new descriptor value that tried to replace the original.

value_that_was_in_memory unsigned int

The value that the compare-and-swap operation returned as the value that was in memory.

httu_update_not_done

A discretionary HTTU update could occur and the implementation choose not to do it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

what enum

What this descriptor represents.

httu_update_start_update

An HTTU update could occur and the implementation chose to try it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

is_big_endian bool

The descriptor will be written to memory as big-endian.

mecid unsigned int

The masked MECID used for the update transaction, or ~0u if not appropriate.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int

The new descriptor value that is going to try replace the original.

what enum

What this descriptor represents.

will_do_AF bool

What the implementation chose to do for the AF update.

will_do_DBM bool

What the implementation chose to do for the DBM update.

integration_mode_end_ras_level_interrupt_restored

RAS level sensitive interrupt restored due to integration mode ending. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being restored.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

value bool

Level of the interrupt signal.

integration_mode_pmcg_interrupt_lost

PMCG interrupt lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

pmcg_interrupt enum

PMCG interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

integration_mode_pmusnapshot_ack_lost

pmusnapshot_ack lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

integration_mode_ras_interrupt_lost

RAS interrupt lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

integration_mode_ras_level_interrupt_lost

RAS level sensitive interrupt lost due to being in integration mode. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

value bool

Level of the interrupt signal.

integration_mode_start_ras_level_interrupt_cleared

RAS level sensitive interrupt cleared due to integration mode starting. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being cleared.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

integration_mode_tcu_evento_lost

Evento lost due to being in integration mode.

integration_mode_tcu_interrupt_lost

Interrupt lost due to being in integration mode. Fields:

interrupt enum

Interrupt that is being dropped.

integration_register_change

An integration register write occurred and it's modified, which drives a signal. Fields:

is_tcu enum

Is TCU integration mode.

new_value bool

New value of the signal.

old_value bool

Old value of the signal.

register enum

The register being modified.

register_value unsigned int

Value written to the register.

signal string

Signal affected by the register write.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

interrupt_returned

An interrupt/MSI returned from downstream. Fields:

InD_NS_PnU enum

Instruction/Data, Non-secure/Secure/Root/Realm, Privileged/User. Bit[1] = PAS[0], and bit[3] = PAS[1].

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

dcmdqcp_and_index unsigned int

If this not a DCMDQ MSI CMD_SYNC, then this is 0xFFFFffff. If it is then the DCMDQ QCP index is in bits[31:16] and the index in the QCP is in [7:0].

gpc_denied_msi bool

True if the MSI was denied as it failed its GPC checks. Thus the field 'ok' will be false.

id unsigned int

ID of this interrupt transaction.

inner_cache enum

The actual attributes of the access.

kind enum

What kind of interrupt.

mecid unsigned int

The MECID of the MSI, if applicable.

mpam_ns bool

For a non-RME system, this is true if the MPAM space is Non-secure. For an RME system, this is MPAM_SP[0].

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP security state of the MPAM partition. 0 – secure, 1 – non-secure, 2 – root, 3 – realm.

msi_valid bool

MSI will attempt to be sent.

ok bool

Did the access return OK or an abort?.

outer_cache enum

The actual attributes of the access.

pas enum

The PAS of the MSI, if applicable.

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum

Shareability.

interrupt_sent

An interrupt is raised. If it sends an MSI then this is *after* any device-dependent transform on the architectural attributes and so may differ from what is programmed. Fields:

InD_NS_PnU enum

Instruction/Data, Non-secure/Secure/Root/Realm, Privileged/User. Bit[1] = PAS[0], and bit[3] = PAS[1].

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

dcmdq_device_id unsigned int

If this is a DCMDQ then this is the DeviceID of the MSI write. Otherwise, 0xFFFF'ffff.

dcmdq_qcp_and_index unsigned int

If this not a DCMDQ MSI CMD_SYNC, then this is 0xFFFF'ffff. If it is then the DCMDQ QCP index is in bits[31:16] and the index in the QCP is in [7:0].

id unsigned int

ID of this interrupt transaction.

inner_cache enum

The actual attributes of the access.

kind enum

What kind of interrupt.

mecid unsigned int

The MECID of the MSI, if applicable.

mpam_ns bool

For a non-RME system, this is true if the MPAM space is Non-secure. For an RME system, this is MPAM_SP[0].

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP security state of the MPAM partition. 0 – secure, 1 – non-secure, 2 – root, 3 – realm.

msi_valid bool

MSI will attempt to be sent.

outer_cache enum

The actual attributes of the access.

pas enum

The PAS of the MSI, if applicable.

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

qSID unsigned int

If this is a DCMDQ then this is the qSID of the MSI write. Otherwise, 0xFFFF'ffff.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum

Shareability.

logptsz

Log2size in bytes of the region covered by an LOGPT entry. The default value is rme_logpt_entry_covers_log2size_in_bytes. This is the value reported in SMMU_ROOT_GPT_BASE_CFG.LOGPTSZ. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value unsigned int

The value of the signal.

l1cd_cc.L1CD_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

l1cd_cc.L1CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

l1cd_entry_allocated

An L1 CD entry has been allocated. Fields:

AssuredTranslation bool

The L1CD was fetched from an AssuredOnly stage 2 page and so might be capable of creating AssuredTranslations.

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

normalised_substreamid unsigned int

The first SubstreamID of the range of SubstreamIDs that this L1CD entry will match.

ns enum

For the non-secure world.

pa_12 unsigned int

The PA of the L2 CD table. This is L2Ptr << 12.

ssd enum

The SSD of the entry.

streamid unsigned int

The StreamID this CD is for.

valid bool

Is the entry valid.

l1ste_cc.L1STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

l1ste_cc.L1STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

l1ste_entry_allocated

An L1 STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

first_streamid_of_range unsigned int

The first StreamID of the range of StreamIDs that this L1STE entry will match.

ns enum

For the non-secure world.

num_entries_in_l2 unsigned int

The number of entries in the L2 table. This is $2^{(\text{Span}-1)}$ or 0 if invalid.

pa_l2 unsigned int

The PA of the L2 ST table. This is $\text{L2Ptr} \ll 6$ and aligned to the size of the table.

ssd enum

The SSD of the entry.

legacy_tz_en

The pin is driven. If high then the SMMU does not support RME. If low and the ID codes indicate support, then the SMMU supports RME. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

level_interrupt_sent

A level interrupt changed state. Fields:

kind enum

What kind of interrupt.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a level RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

set_high bool

Level interrupt state.

ns_cmd_sync_completed_irq

"Non-secure" CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_no_action

Non-secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_sev

Non-secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_with_error

Non-secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_issued

Non-secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_issuing

Non-secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_starting_completion_action_irq

Non-secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

ns_cmd_sync_starting_completion_action_sev

Non-secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

error enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

ns_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

ns_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

ns_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

ns_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

ns_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

ns_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

ns_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

ns_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

ns_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

ns_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

ns_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

ns_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

ns_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

ns_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

pmcg_irq_config

The interrupt configuration of the Performance Monitor Counter Group (PMCG) changed.
Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

SMMU_PMCG_CTRL.IRQEN.

memattr enum

Memory type.

mpam_ns bool

The NS state of the MPAM PARTID and MPAM PMG.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_supported bool

Are MSIs supported for this security world.

ns bool

Non-secure bus attribute.

number_of_interrupts_in_flight unsigned int

The number of interrupts that have been committed to be produced or in flight.

pmcg_index unsigned int

Index of the PMCG.

sh enum

Shareability.

smmu_pmcg_gmpam_Update bool

The SMMU_PMCG_GMPAM.Update flag. Only when this is zero are writes predictable.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen

A trace of SMMU_PMCG_IRQ_CTRL.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen_ack

A trace of SMMU_PMCG_IRQ_CTRLACK.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_merging_interrupts

An interrupt was wanted to be generated, but one was already pending so the two were merged together. Fields:

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_trigger

A PMCG counter has been triggered. Fields:

NoStreamID bool

True if the transaction is a NoStreamID transaction.

counter_index unsigned int

The index of the counter within the PMCG.

event_id unsigned int

The event id that has been triggered.

ns_event bool

Is the event associated with non-secure state.

pmcg_index unsigned int

Index of the PMCG.

prior_counter_value unsigned int

The Counter value *before* the event has incremented it.

ssd enum

The security state associated with the event.

streamid unsigned int

The StreamID associated with the event, if there is one.

tbu_index unsigned int

The TBU index of the transaction, or ~0u if not applicable.

pmu_active_counter

Traces what active counters are in a PMCG and what StreamIDs it might filter on. Those counters that trace StreamIDs for multiple security states, or those that are not filtered by StreamID, will appear multiple times, once for each security state. All active counters for a PMCG are traced one after another. Fields:

NoStreamID bool

True if NoStreamID transactions will be traced.

begin_streamid unsigned int

The start StreamID to filter on.

counter_index unsigned int

The counter index within the PMCG.

end_incl_streamid unsigned int

The end inclusive StreamID to filter on.

evcnt unsigned int

The current count.

event_id unsigned int

The event ID to filter.

ns bool

Are the StreamIDs non-secure?.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd enum

SSD of the StreamID.

tbu_index_to_match unsigned int

The TBU index that must match, or ~0u if no matching applicable.

pmu_all_counters_in_pmcg_became_inactive

The PMCG was tracing some events and now is not tracing any. Fields:

pmcg_index unsigned int

The index of the PMCG.

pmu_capture

For some reason, a capture event occurred. Fields:

pmcg_index unsigned int

The index of the PMCG that the capture occurred on.

why enum

Why did the capture occur?.

pmu_counter_configured_to_use_unsupported_event

An enabled counter was configured to use a unsupported event. Fields:

counter_index unsigned int

The counter index within the PMCG.

event_id unsigned int

The unsupported event id.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

pmu_counter_overflowed

A counter in a particular PMCG overflowed. Fields:

already_overflowed bool

True if the overflow flag was already set.

capture bool

True if it captured the other counter values.

counter_index unsigned int

The counter index within the PMCG.

interrupt bool

True if going to attempt to generate an interrupt.

interrupt_action enum

The interrupt action that is going to occur.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd_ns bool

The PMCG is controlled by the Non-secure security state.

priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool

The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int

The transaction ID of the PPR that caused the overflow.

priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

priq_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.RD_and_RD_wrap.

number_of_pprs unsigned int

The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int

This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int

The number of writes to the PRIQ that are currently in flight.

ovackflg bool

The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool

The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool

There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool

The value of SMMU_CRO.PRIQEN. The *effective* value is 0 if SMMUEN == 0.

priqenack bool

The value of SMMU_CROACK.PRIQEN.

prod_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool

The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CR0.PRIQEN.

smmuen bool

The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool

The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int

The size of the table in the number of items it can hold.

priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int

The transaction ID of the PPR that aborted.

priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we wrote..

trans_id unsigned int

The transaction ID of the PPR.

priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int

PROD position including the wrap bit.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

ptw_read

Page Table Walk (read). This is the result of the physical access that the SMMU is making.

Fields:

abort enum

Non-zero if the access aborted/failed.

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

data unsigned int

The data fetch if it didn't abort.

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AP21 enum

The access permissions.

AttrIndx210 unsigned int

The attribute index into the MAIR0/1. If AIE is implemented then this is the full index AttrIndx[3:0].

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

NS bool

The encoding is for non-secure if this is a secure fetch.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIIIndex unsigned int

The S2PIIndex if S2PIE is in use, or 0xFFFF if not.

PXN bool

Privileged eXecute Never.

Protected enum

Is the descriptor producing an AssuredTranslation.

SH10 enum

The shareability.

XN bool

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

hwu_pbha unsigned int

Top four bits are appropriate CD.HWU, *bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by CD.HWU0/CD.HWU1**.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nG bool

not Global.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

NSTable bool

The next level table descriptor is forced to non-secure.

PXNTable bool

Force PXN independently of subsequent descriptors.

Protected enum

Is the descriptor capable of producing an AssuredTranslation.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

tth_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AssuredOnly enum

The descriptor is marked as AssuredOnly.

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

HAP21 enum

The access permissions.

MemAttr3_0 enum

The memory attributes.

NS enum

Whether this descriptor forces NS.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIndex unsigned int

The S2PIndex if S2PIE is in use, or 0xFFFF if not.

POE_POIndex unsigned int

The S2POIndex if S2POE is in use, or 0xFFFF if not.

SH10 enum

The shareability.

XN enum

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

s2hwi_pbha unsigned int

Top four bits are STE.S2HWU, bottom bits[62:59] of descriptor. *Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by STE.S2HWU.*

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

PXNTable bool

Force PXN independently of subsequent descriptors.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

tbtb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of

output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

raw_register_end_read

The raw register read transaction. This is the transaction as directed to the register port.

Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

read_data unsigned int

The data read.

raw_register_end_write

The raw register write transaction. This is the transaction as directed to the register port.

Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

raw_register_start_read

The raw register read transaction. This is the transaction as directed to the register port.

Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

raw_register_start_write

The raw register write transaction. This is the transaction as directed to the register port.

Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

write_data unsigned int

The data to write.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string

The text description of the register value read.

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string

The text description of the register value written.

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string

The text description of the register value.

register_read_string

A text representation of the read of a register. Fields:

out string

The text description of the register value read.

register_write_reserved

A text representation of an access to a register address that is reserved or a write to a **RES0** field in a register. Fields:

in string

The text description of the register value.

register_write_string

A text representation of the write of a register. Fields:

in string

The text description of the register value written.

rl_cmd_sync_completed_irq

“Realm” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_completed_no_action

Realm CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_completed_sev

Realm CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_completed_with_error

Realm CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_issued

Realm CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_issuing

Realm CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_starting_completion_action_irq

Realm CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

rl_cmd_sync_starting_completion_action_sev

Realm CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

rl_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

rl_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

error enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

rl_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

rl_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

rl_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

rl_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

rl_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwritable and the queue is now writable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

rl_eventq_cmd_sync_unhazardous

The CMD_SYNC has been unhazardous as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

rl_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

rl_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

rl_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

rl_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

rl_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

rl_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

rl_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

rl_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

rl_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

rl_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

rl_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

rl_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

rl_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

rl_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

rl_priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool

The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int

The transaction ID of the PPR that caused the overflow.

rl_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

rl_priq_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.RD_and_RD_wrap.

number_of_pprs unsigned int

The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int

This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int

The number of writes to the PRIQ that are currently in flight.

ovackflg bool

The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool

The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool

There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool

The value of SMMU_CRO.PRIQEN. The *effective* value is 0 if SMMUEN == 0.

priqenack bool

The value of SMMU_CROACK.PRIQEN.

prod_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool

The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CR0.PRIQEN.

smmuen bool

The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool

The value of SMMU_CR0.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int

The size of the table in the number of items it can hold.

rl_priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int

The transaction ID of the PPR that aborted.

rl_priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we wrote..

trans_id unsigned int

The transaction ID of the PPR.

rl_priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int

PROD position including the wrap bit.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

s_cmd_sync_completed_irq

“Secure” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_no_action

Secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_sev

Secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_with_error

Secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issued

Secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issuing

Secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_starting_completion_action_irq

Secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

s_cmd_sync_starting_completion_action_sev

Secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

s_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

s_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

error enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

s_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

s_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

s_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

s_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

s_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwritable and the queue is now writable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

s_eventq_cmd_sync_unhazardous

The CMD_SYNC has been unhazardous as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

s_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

s_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

s_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

s_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

s_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

s_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

s_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_gbpa_abort_init

The pin is driven. This is the reset value of SMMU_S_GBPA.ABORT. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect.

Fields:

value bool

The value of the signal.

s_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

s_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

s_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

sec_override

Controls non-secure accesses to some registers. Fields:

value bool

The value of the signal.

sev

Send a SEV. Fields:

why enum

Why the SEV was generated.

smmu_atc_inv

The CMD_ATC_INV command is sent. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_atc_inv_completed

The CMDQ_ATC_INV command completed. Fields:

cmd_id unsigned int

Command id, if top-bit is set then was issued from the Non-secure CMDQ.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

response enum

The response.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_cmdq enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

smmu_atc_inv_end

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

response enum

The response to the ATC invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_atc_inv_start

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_ats_initial

This is the initial ATS request. Fields:

XT bool

The XT bit.

ia unsigned int

Input address.

max_number_of_replies unsigned int

The maximum number of replies allowed to return.

no_write bool

The NW (no write flag) of the ATS request. If clear then the requester is going to do a write.

pasid_execute_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for execution permissions.

pasid_privileged_mode_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for the privileged mode's permissions.

protected_mode bool

Is the ATS Request protected-mode?.

source_cxl bool

Does the ATS request have Source.CXL set?.

ssd enum

The SSD of the ATS request.

ssd_ns bool

Incoming SSD is non-secure.

streamid unsigned int

StreamID of the ATS request.

substreamid unsigned int

SubstreamID (which is identical to the PASID) of the ATS request. If no PASID-prefix is sent then this is ~0u.

tbu unsigned int

Translation Buffer Unit number.

smmu_ats_reply_failure

This is an ATS reply indicating failure. Fields:

event enum

Equivalent event number that would have been generated for an equivalent ordinary transaction.

failure enum

What is the failure response code?.

state enum

The transaction state of the successfully ATS request.

smmu_ats_reply_success

This is an ATS reply, typically the SMMU will only return a single response, even if the requester indicated it could accept more replies. NOTE that the SMMU responds with 'success' in some cases when a fault is encountered and RW==0. Fields:

N bool

Non-snooped access. If one then the requester must clear the NoSnoop bit on transactions, unless otherwise enabled in a Function-specific manner.

P bool

Privileged mode. These permissions related to privileged mode.

RWX enum

Read/Write/Execute.

U bool

Untranslated access. If one, and RW !=0 then use UntranslatedAccesses for the allowed accesses by RW(X).

cxl_io bool

The CXL.io response.

inner enum

The inner cacheability attributes to use for TranslatedAccesses.

input_address unsigned int

Input address of the ATS request.

instcfg enum

The STE.INSTCFG field.

outer enum

The outer cacheability attributes to use for TranslatedAccesses.

pas enum

The PAS this mapping corresponds to. This holds the same information as the TE bit for realm streams.

privcfg enum

The STE.PRIVCFG field.

shareability unsigned int

The shareability to use for TranslatedAccesses.

size unsigned int

The size of the region covered by this translation.

state enum

The transaction state of the successfully ATS request.

translated_address unsigned int

If RW!=0 && U != 0, then the Translated Address that a TranslatedAccess can be made with.

smmu_axi_stream_msi

An SMMU generated MSI is directly sent through the axi_stream_msi_m port, typically connected to the GIC port axi_stream_msi_s. Fields:

TDEST unsigned int

Routing information for the data stream, typically identifying the GIC.

TID unsigned int

Data stream identifier for the SMMU.

axi_stream_msi_addr_to_match unsigned int

Current address to match for SMMU-originated MSIs to send out of the axi_stream_msi_m port.

data unsigned int

The MSI sent.

smmu_final_transaction

This is the transaction group request to remap has completed one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. If it stalls then it will report through this trace source, stall (stag_if_stalling != ~Ou) and when resume will issue another smmu_initial_transaction as it undergoes remapping again. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

begin_input_address_range unsigned int

The start of the input address range that is size_of_region_in_bytes.

begin_ipa_range unsigned int

The start of the IPA range that is of size_of_region_in_bytes.

begin_output_address_range unsigned int

The start of the output address range that is of size_of_region_in_bytes.

cmo_point enum

The point associated with the CMO, if applicable.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

ipa_address unsigned int

The IPA of the transaction.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The MECID of the transaction.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

operation enum

The kind of operation that this represents.

output_address unsigned int

The input address of the transaction group.

output_inner enum

Inner cacheability for the output attributes.

output_outer enum

Outer cacheability for the output attributes.

output_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

output_sh enum

Shareability for the output attributes.

output_vmid unsigned int

The output VMID/GBPA.IMPDEF or ~0u if not valid.

size_of_region_in_bytes unsigned int

An imp def size of region for which this translation is valid for.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

stag_if_stalling unsigned int

This is the STAG used by the transaction if it is going to stall. It is ~0u if it is not going to stall.

state enum

The final transaction state.

streamid unsigned int

The StreamID of the transaction. ~0ull if NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_gpt_read

A GPT read has completed. Fields:

unsigned int

.

abort enum

Non-zero if the access aborted/failed.

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

adomain enum

The shareability of the access.

data unsigned int

The data fetched if it didn't abort.

inner_cache enum

The architectural attributes used for the access.

level unsigned int

The level of the GPT walk.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of this GPT access.

outer_cache enum

The architectural attributes used for the access.

pas_checking enum

The PAS of the address that we are checking.

post_access_check bool

Is this GPT walk after the access it is checking.

table_base unsigned int

The base address of the table.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

smmu_gpt_tlb_invalidate

A GPT TLB invalidate has been initiated. Fields:

address unsigned int

The address as it appears in the operation.

encoded_size unsigned int

The size as it is encoded in the operation.

kind enum

The kind of operation this is.

pgs_in_bytes unsigned int

The PGS size in bytes.

size_in_bytes unsigned int

For range operations, the size as it appears in the operation.

source enum

Where the TLBI came from.

state enum

Is the operation well formed.

trans_id unsigned int

The transaction id of this invalidate.

smmu_gpt_tlb_invalidate_complete

The GPT TLB invalidate completed. Fields:

source enum

Where the TLBI came from.

trans_id unsigned int

The transaction id of this invalidate.

smmu_initial_transaction

This is the transaction group request to remap is going to start one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. A stalling transaction will report through this trace source when it unstalls. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

XT_and_output_pas_checking enum

The XT bit for PCIe Transactions. This specifies the requested check on the output PAS that the device asked for.

axmmuflow enum

The AxMMUFLOW for this transaction group. storable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-storable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum

The point associated with the CMO, if applicable.

dcmdq_qcp_and_index unsigned int

If this is a DCMDQ fetch being translated then this field indicates the DCMDQ QCP index in bits [23:8] and the index in the page in bits [7:0]. Otherwise this is 0xFFFFffff.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The incoming MECID for NoStreamID transactions. ~0u for all other transactions.

mpam_partid unsigned int

The MPAM_PARTID for NoStreamID transactions. ~0u for all other transactions.

mpam_pmg unsigned int

The MPAM_PMG for NoStreamID transactions. ~0u for all other transactions.

mpam_sp enum

The MPAM_SP for NoStreamID transactions. ~0u for all other transactions.

operation enum

The kind of operation that this represents.

protected_mode enum

The PM bit.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_normalize_input_transaction

If the input transaction is normalized before being processed then this traceevent will fire. This is usually dependent on parameters of the implementation. Fields:

incoming_inner enum

The inner cacheability attributes.

incoming_is_instruction bool

The incoming transaction is marked as 'instruction'.

incoming_is_privileged bool

The incoming transaction is marked as 'privileged'.

incoming_outer enum

The outer cacheability attributes.

incoming_pas enum

The PAS of the incoming transaction.

incoming_shareability unsigned int

The incoming shareability.

normalized_inner enum

The normalized inner cacheability attributes.

normalized_is_instruction bool

The incoming transaction is marked as 'instruction'.

normalized_is_privileged bool

The incoming transaction is marked as 'privileged'.

normalized_outer enum

The normalized outer cacheability attributes.

normalized_pas enum

The PAS this mapping corresponds to.

normalized_shareability unsigned int

The normalized shareability.

ssd enum

The SSD of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

trans_id unsigned int

ID of the original transaction.

smmu_pmusnapshot_ack

Acknowledge the pmusnapshot_req to indicate the snapshot has occurred. This is part of a four-phase handshake. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_pmusnapshot_ack_overridden

The value of pmusnapshot_ack was overridden (likely due to being in integration mode). Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_pmusnapshot_ack_override_end

The overriding of the pmusnapshot_ack signal has ended. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

smmu_pmusnapshot_req

Take a snap shot of the PMU values as though SMMU_PMCG_CAPR.CAPTURE had been written. This is part of a four-phase handshake. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_poison_tw_data

Poison data has been returned to a table walk transaction. Fields:

bitmap_of_poison unsigned int

The bitmap of which beats of the transaction where poisoned.

is_cas bool

True if this is a compare-and-swap operation.

number_of_64bit_beats unsigned int

Number of beats this transaction fetched.

paddress unsigned int

Physical address of the table walk transaction.

pas enum

The PAS of the bus transaction.

ras_group_id unsigned int

If non-~0u then is the RAS group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

ras_record_index_in_group unsigned int

If non-~0u then is the RAS record index in the group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

what enum

What table walk was being performed.

smmu_pri_resp

The CMD_PRI_RESP command is queued to be sent to the PCIe system. Fields:

auto_response_trans_id unsigned int

trans_id of PRI request we are auto-responding to, or ~0u if not valid.

cmd_id unsigned int

Command id, or ~0u if not valid.

cons unsigned int

CONS of the command. ~0u if an auto-response.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_pri_resp_nop

The CMD_PRI_RESP command was NOPped. Fields:

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why the CMD_PRI_RESP was NOPped.

smmu_priq_resp_fake_return

A PRIQ Response is posted to the PCIe subsystem and so has no acknowledgement that it is received. However, in the model then we artificially know when the the PRIQ Response has been delivered to the PCIe subsystem, even if the ATC has not yet acted on it. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

what enum

What happened.

smmu_priq_resp_start

A PRIQ Response has been posted to the PCIe subsystem. As the response is posted then there is no way of knowing when it is received by the EndPoint. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_start_gpt_read

A GPT read is about to be issued. Fields:

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

adomain enum

The shareability of the access.

inner_cache enum

The architectural attributes used for the access.

level unsigned int

The level of the GPT walk.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of this GPT access.

outer_cache enum

The architectural attributes used for the access.

pas_checking enum

The PAS of the address that we are checking.

post_access_check bool

Is this GPT walk after the access it is checking.

read_size unsigned int

The size of the GPT read in bytes.

table_base unsigned int

The base address of the table.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

smmu_thread_wait_wake

Traces a thread's wait/wake status. Fields:

current_ticks unsigned int

The current tick count of simulated time.

event enum

What is happening to this thread.

thread_index unsigned int

The ID of this thread.

ticks unsigned int

If the event relates to a time then this is held in this field. Otherwise, 0.

stall_transaction

A transaction is about to stall. Fields:

stag unsigned int

STAG.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_inhibited_by_STALL_MAX

A transaction is about to stall but the maximum number of transactions have stalled and we can't report this one to the event queue (even if non-full). Fields:

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_resuming

A stalled transaction is resuming. Fields:

stag unsigned int

STAG if appropriate, or if was inhibited by STALL_MAX then 0xFAFA.

stallresult enum

What the transaction resumed to do.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ste_cc.STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

ste_cc.STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

ste_entry_allocated

An STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

ste string

A textual description of the STE.

streamid unsigned int

The StreamID of the entry this will match.

sup_btm

The pin is driven. This indicates the system supports BTM. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_cohacc

The pin is driven. This indicates the system supports COHACC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_httu

The pin is driven. This indicates the system supports HTTU. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_sev

The pin is driven. This indicates the system supports SEV. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

tbu0_reset_in

The reset signal of the TBU0. Fields:

value bool

The value of the signal.

tbu_fmurstdisable[0]

Port which, if asserted, prevents the reset from affecting the FMU registers. Fields:

value bool

The value of the signal.

tcu_fmurstdisable

Port which, if asserted, prevents the reset from affecting the FMU registers. Fields:

value bool

The value of the signal.

tcu_reset_in

The reset signal. Fields:

value bool

The value of the signal.

tlb_entry_allocated

A TLB entry has been allocated. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_end_incl_address unsigned int

The end inclusive address of the output range.

output_start_address unsigned int

The start address of the output range.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

tbi bool

Was the entry formed using Top Byte Ignore (TBI).

vmid unsigned int

VMID if appropriate.

tlb_info_tlb_entries_overlap

A TLB entry was inserted into the TLB and it overlaps an existing entry. This isn't a problem as it was inserted in such a way that it architecturally works. Fields:

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

how_inserted enum

How the entry was inserted.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

verbose_commentary

This is a verbose commentary on the translation process the SMMU is performing. Fields:

output string

The stream output.

warning_MSI_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_R_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_R_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_R_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_R_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_R_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_pmcg_address_out_of_range_of_oas

The MSI Address of the Performance Monitor Counter Group (PMCG) is out of range of the OAS and so will be silently truncated. Fields:

address unsigned int

The untruncated address of the MSI.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

warning_discarding_interrupt_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HDBSS_IRQEN.

warning_discarding_interrupt_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_R_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_R_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_R_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_R_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_R_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_R_IRQ_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_R_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_R_IRQ_CTRL.HDBSS_IRQEN.

warning_discarding_interrupt_R_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_R_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_S_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_S_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_S_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_S_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HDBSS_IRQEN.

warning_ns_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc string

The textual description of what happened.

warning_rl_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

warning_s_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

what_going_to_do_with_terminated_event

A terminating transaction has produced an event, this tells you what the model is going to do with the event. Fields:

CD.S bool

The CD.S field if available.

S2 bool

The event is related to Stage 2.

STE.S1STALLD bool

The STE.S1STALLD field if available.

STE.S2S bool

The STE.S2S field if available.

aborts bool

The transaction will abort.

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

is_tr_fault bool

Is a Translation Related fault.

protected_mode bool

The transaction is protected-mode. As such, it cannot stall and will obey the report configuration bits.

reports bool

The transaction will attempt to report.

ssd enum

The SSD of the transaction.

ssd_ns bool

The transaction is classified as SSD non-secure.

supports_stall_model bool

The implementation supports the stall model.

trans_id unsigned int

The transaction id.

why_abort_decision enum

The reason why the transaction aborted/did not abort.

why_report_decision enum

The reason why the transaction reported/did not report.

2.127 MMU_L1

This section describes the trace sources.

ArchMsg.Error.error

These messages are about activity occurring on the SMMU that is considered an error. Messages will only come out here if parameter `all_error_messages_through_trace` is true. `DISPLAY %{output}`. Fields:

output string

The stream output.

ArchMsg.Error.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int

The address of the descriptor fetch.

desc_inner enum

Inner cacheability of descriptor.

desc_outer enum

Outer cacheability of descriptor.

desc_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

desc_sh enum

Shareability of descriptor.

ssd enum

The SSD of the transaction.

ssd_ns bool

Is the Security State Determination of the transaction non-secure.

stage unsigned int

The stage at which we had a problem.

streamid unsigned int

The StreamID of the transaction.

substreamid unsigned int

The SubstreamID of the transaction (or ~0u if no substreamid).

trans_id unsigned int

Transaction id.

ArchMsg.Error.ns_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.priq_streamid_truncated

The SMMU received a PCIe PRI request with a StreamID) that was larger than that which the SMMU has been configured for. The StreamID that appears in the PRIQ entry will be truncated. Fields:

actual_streamid unsigned int

The actual StreamID that this request has.

sidsize unsigned int

The bit width of the SMMU for StreamIDs, as indicated by SMMU_IDR1.SIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_streamid unsigned int

The truncated StreamID that will appear in the PRIQ entry.

ArchMsg.Error.priq_substreamid_truncated

The SMMU received a PCIe PRI request with a PASID prefix (SubstreamID) that was larger than that which the SMMU has been configured for. The SubstreamID that appears in the PRIQ entry will be truncated. Fields:

actual_substreamid unsigned int

The actual SubstreamID that this request has.

ssidsize unsigned int

The bit width of the SMMU for SubstreamIDs, as indicated by SMMU_IDR1.SSIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_substreamid unsigned int

The truncated SubstreamID that will appear in the PRIQ entry.

ArchMsg.Error.s_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.tlb_entries_overlap

A TLB entry was attempted to be inserted into the TLB and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

do_f_tlb_conflict bool

Chosen to perform an F_TLB_CONFLICT.

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

why enum

Why it is an error for these two entries to overlap.

ArchMsg.Error.tlb_entry_not_invalidated_due_to_ril

An entry in the cache was not invalidated even though in the right address range because of the RIL fields of the command the entry do not match. Fields:

cmd_num unsigned int

The NUM field of the RIL part of the command.

cmd_ril_tg enum

The RIL_TG field of the RIL part of the command.

cmd_ril_ttl unsigned int

The TTL field of the RIL part of the command, zero means any level. 0x80 means match level 0 (and is from a DVM message).

cmd_scale unsigned int

The SCALE field of the RIL part of the command.

entry_id unsigned int

The entry id that is being invalidated.

tlb_entry string

The TLB entry.

ArchMsg.Error.vatos_sel_vmid_out_of_range

The SMMU_(S_)VATOS_SEL.VMID field was programmed with a VMID that was too wide for this implementation (SMMU_IDR0.VMID16 == 0). DISPLAY %{{ssd_ns:(s-|ns-)}}VMID:%{vmid} is out of range. Fields:

ssd_ns bool

The security state of the VATOS interface.

vmid unsigned int

The VMID programmed.

ArchMsg.Info.info

These are information messages about what is happening in the SMMU. DISPLAY %{output}. Fields:

output string

The stream output.

ArchMsg.Warning.CMD_RESUME_no_transaction_resumed

A CMD_RESUME was issued that matched no transaction. Fields:

stag unsigned int

STAG in the CMD_RESUME.

streamid unsigned int

StreamID in the CMD_RESUME.

streamid_ns bool

The StreamID was for the non-secure world.

ArchMsg.Warning.atc_inv_strange

Something was odd about the CMD_ATC_INV. DISPLAY CMD_ATC_INV strange as: %{why}. Fields:

cmd_id unsigned int

Command id.

ssd_of_cmdq enum

The SSD of the CMDQ.

why string

Why the CMD_ATC_INV was strange.

ArchMsg.Warning.bad_axi_stream_msi_addr_to_match_s

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value unsigned int

The default value of the signal we have been assuming.

value unsigned int

The value of the signal.

ArchMsg.Warning.bad_conf_reset_of_SMMU_S_GBPA_ABORT

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sec_override

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_btm

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_cohacc

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_httu

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_sev

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_tbu0_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_tcu_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.contig_bit_gives_too_large_region_for_TxSZ

If the contig bit was used then the size of the contig region would be larger than that indicated by TxSZ. Fields:

desc_kind enum

Descriptor kind.

el enum

Exception level.

input_address unsigned int

Input address.

log2_contig_region_size unsigned int

Log2(contig region size in bytes).

output_address unsigned int

Output address.

stage_and_level unsigned int

The stage in bits [7:4] and the level in [3:0]. Level -1 is 0xF.

vmid unsigned int

VMID if appropriate.

ArchMsg.Warning.contig_bit_has_inconsistent_input_and_output_address

If the contig bit was used then the some bits of the output address held in the descriptor and the input address must match. Fields:

desc_kind enum

Descriptor kind.

el enum

Exception level.

input_address unsigned int

Input address.

log2_contig_region_size unsigned int

Log2(contig region size in bytes).

match_mask unsigned int

Bits that must match.

output_address unsigned int

Output address.

stage_and_level unsigned int

The stage in bits [7:4] and the level in [3:0]. Level -1 is 0xF.

vmid unsigned int

VMID if appropriate.

ArchMsg.Warning.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int

The address of the descriptor fetch.

desc_inner enum

Inner cacheability of descriptor.

desc_outer enum

Outer cacheability of descriptor.

desc_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

desc_sh enum

Shareability of descriptor.

ssd enum

The SSD of the transaction.

ssd_ns bool

Is the Security State Determination of the transaction non-secure.

stage unsigned int

The stage at which we had a problem.

streamid unsigned int

The StreamID of the transaction.

substreamid unsigned int

The SubstreamID of the transaction (or ~0u if no substreamid).

trans_id unsigned int

Transaction id.

ArchMsg.Warning.msi_address_truncated

An MSI was generated, but the address was silently truncated due to the limited downstream address bus width. Fields:

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

truncated_address unsigned int

The truncated address.

untruncated_address unsigned int

The untruncated address.

which enum

Which MSI this is.

ArchMsg.Warning.msi_lost

An MSI was attempted to be sent, but couldn't be sent. Fields:

id unsigned int

ID of this interrupt transaction.

kind enum

What kind of interrupt.

why enum

Why this interrupt was denied.

ArchMsg.Warning.pmcg_non_secure_world

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between security states. Fields:

commentary string

The commentary.

ArchMsg.Warning.pmcg_programming_violates_security

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between different security states. This is under the assumption that an agent from another security state could be writing to the PMCG. Fields:

commentary string

The commentary.

ArchMsg.Warning.priq_auto_response_failed_to_find_STE

The PRIQ was going to generate an auto-response, but failed to find an STE and so is returning a Failure message to the EndPoint which should disable the PRI interface of the EndPoint. Fields:

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

ArchMsg.Warning.priq_overflow_bad_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG but an overflow condition did not exist. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

ArchMsg.Warning.priq_smmuen_forces_effective_priqen_low

If SMMUEN == 0, then the effective value of PRIQEN is 0. This warning is triggered when PRIQEN == 1 && SMMUEN == 0; which may not be what was intended. The PRIQ cannot be active if SMMUEN == 0.

ArchMsg.Warning.sev_lost

A SEV was lost because it isn't supported according to SMMU_IDRO.SEV. DISPLAY SEV was lost because: %{why}. Fields:

why enum

Why the SEV was generated.

ArchMsg.Warning.smmu_pcie_rc_is_in_reset_ignoring_atc_invalidate

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that mapped to a PCIe Root Complex that is in reset. The message will be discarded and act as though completed successfully. Fields:

port_index unsigned int

The port index (node index) that is in reset but we would have sent it to.

streamid unsigned int

The StreamID that failed to map.

ArchMsg.Warning.smmu_pcie_rc_not_found_for_streamid

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that did not map to a PCIe Root Complex. This might be that the SW used an incorrect StreamID or it might be that the model has not been connected correctly. ATC Invalidate messages complete as though successful and PRI Requests are ignored. Fields:

streamid unsigned int

The StreamID that failed to map.

ArchMsg.Warning.smmu_pmusnapshot

Something strange happened on the pmusnapshot_req/pmusnapshot_ack interface. Fields:

pin_index unsigned int

If the PMCG index corresponds to an array of signals, this is the index in the array, or 0 otherwise.

pmcg_index enum

The PMCG index.

warning string

The warning message.

ArchMsg.Warning.suspicious_overlapping_entries

Two DPT TLB entries are overlapping but they differ in ways that are potentially a SW error. Fields:

new_AC enum

The value of the 'AC' field that controls access to this region.

new_FWB bool

The region is FWB.

new_VMID unsigned int

The VMID, if any, associated with this region.

new_entry_index unsigned int

The entry index of the new DPT TLB entry.

new_entry_is_vmsa_formed bool

The new entry was inserted as a result of VMSA information.

new_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

new_input_start_address unsigned int

The start address of the input range that this matches.

new_output_pas enum

The output PAS of this DPT region.

new_ssd enum

The SSD of the streams this region captures.

new_writeable bool

True if this region is writeable.

old_AC enum

The value of the 'AC' field that controls access to this region.

old_FWB bool

The region is FWB.

old_VMID unsigned int

The VMID, if any, associated with this region.

old_entry_index unsigned int

The entry index of the old DPT TLB entry.

old_entry_is_vmsa_formed bool

The old entry was inserted as a result of VMSA information.

old_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

old_input_start_address unsigned int

The start address of the input range that this matches.

old_output_pas enum

The output PAS of this DPT region.

old_ssd enum

The SSD of the streams this region captures.

old_writeable bool

True if this region is writeable.

pas_differ bool

The output PAS of the two entries differ.

vmids_differ bool

The VMIDs are used by at least one of the AC schemes and are different.

vmsa_formed_writeable_while_DPT_entry_is_not bool

The VMSA-formed entry is writeable but the DPT Entry says it is not writeable.

ArchMsg.Warning.warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the SMMU. DISPLAY %{output}. Fields:

output string

The stream output.

ArchMsg.Warning.warning_effective_EOPD_differs_from_what_would_be_cached_in_TLB

Effective value of EOPD differs from what would be cached in the TLB DISPLAY transaction (%{transaction_id}), sid (%{sid}), ssid (%{ssid}), ssd (%{ssd}), effective EOPD (%{effective_EOPD}), cached EOPD (%{cached_EOPD}). Fields:

cached_EOPD bool

The EOPD value that would be cached in the TLB.

effective_EOPD bool

The effective value of EOPD.

ssd enum

SSD.

streamid unsigned int

StreamID or ~0ull if NoStreamID.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

transaction_id unsigned int

The transaction ID.

DPTTLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

DPTTLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

HACDBS_PROCESSING_COMPLETE_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

HACDBS_PROCESSING_COMPLETE_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

HACDBS_PROCESSING_COMPLETE_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

HDBSS_TABLE_FULL_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

MMU_L1_integration_mode_end_ras_level_interrupt_restored

RAS level sensitive interrupt restored due to integration mode ending. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being restored.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

value bool

Level of the interrupt signal.

MMU_L1_integration_mode_pmcg_interrupt_lost

PMCG interrupt lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

pmcg_interrupt enum

PMCG interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

MMU_L1_integration_mode_pmusnapshot_ack_lost

pmusnapshot_ack lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

MMU_L1_integration_mode_ras_interrupt_lost

RAS interrupt lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

MMU_L1_integration_mode_ras_level_interrupt_lost

RAS level sensitive interrupt lost due to being in integration mode. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

value bool

Level of the interrupt signal.

MMU_L1_integration_mode_start_ras_level_interrupt_cleared

RAS level sensitive interrupt cleared due to integration mode starting. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being cleared.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

MMU_L1_integration_mode_tcu_evento_lost

Evento lost due to being in integration mode.

MMU_L1_integration_mode_tcu_interrupt_lost

Interrupt lost due to being in integration mode. Fields:

interrupt enum

Interrupt that is being dropped.

MMU_L1_integration_register_change

An integration register write occurred and it's modified, which drives a signal. Fields:

is_tcu enum

Is TCU integration mode.

new_value bool

New value of the signal.

old_value bool

Old value of the signal.

register enum

The register being modified.

register_value unsigned int

Value written to the register.

signal string

Signal affected by the register write.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

PRIQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

PRIQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

PRIQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

SMMU_CR0ACK_SMMUEN_hazarded_by_priq

The SMMU_r_CR0ACK.SMMUEN cannot acknowledge the change to SMMUEN because there are outstanding PRIQ writes.

SMMU_CR0ACK_SMMUEN_update

The acknowledge to SMMU_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_CR0.SMMUEN completed. Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_CR0_SMMUEN_write

A write to SMMU_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_GBPA completed. Fields:

last bool

This is the last set completing.

old_value unsigned int

The old value of the set completing.

SMMU_GBPA_update

The Update flag to SMMU_GBPA was lowered. Fields:

new_value unsigned int

The new value of the register.

SMMU_GBPA_write

A write to SMMU_GBPA occurred. Fields:

new_value unsigned int

The new value of the register.

old_value unsigned int

The old value of the register.

SMMU_S_CR0ACK_SMMUEN_update

The acknowledge to SMMU_S_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_S_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_S_CR0.SMMUEN completed. Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_S_CR0_SMMUEN_write

A write to SMMU_S_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_S_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_S_GBPA completed. Fields:

last bool

This is the last set completing.

old_value unsigned int

The old value of the set completing.

SMMU_S_GBPA_update

The Update flag to SMMU_S_GBPA was lowered. Fields:

new_value unsigned int

The new value of the register.

SMMU_S_GBPA_write

A write to SMMU_S_GBPA occurred. Fields:

new_value unsigned int

The new value of the register.

old_value unsigned int

The old value of the register.

S_EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irgen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_ERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_HACDBS_PROCESSING_COMPLETE_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_HACDBS_PROCESSING_COMPLETE_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_HACDBS_PROCESSING_COMPLETE_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_HDBSS_TABLE_FULL_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

TLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

TLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

atc_inv_nop

The CMD_ATC_INV command is ignored as a **NOP**. This may be emitted multiple times if the CMD_ATC_INV is being ignored for multiple reasons. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why was NOPped.

atos_complete_fault

The ATOS operation completed with a fault. Fields:

effective_st1translate bool

Because of the settings and/or the ATOS type then the effective st1translate can be different.

fault_faddr unsigned int

The fault FADDR.

fault_faultcode enum

The fault code.

fault_reason enum

The fault reason.

ssd_ns bool

This is a non-secure ATOS operation.

st1translate bool

The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool

The translation suffered a stage 2 translation.

state enum

The final transaction state of the ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_complete_fault_inv_req

The ATOS operation completed, faulted and generated an INV_REQ response. Fields:

ssd_ns bool

This is a non-secure ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

why enum

Why the ATOS operation generated an INV_REQ.

atos_complete_success

The ATOS operation completed successfully. Fields:

base_addr unsigned int

The actual base address of region.

effective_st1translate bool

Because of the settings and/or the ATOS type then the effective st1translate can be different.

par_addr unsigned int

The PAR.ADDR field.

par_mair unsigned int

The memory attributes encoded as a MAIR.

par_ns bool

The PAR.NS field, for an SSD-ns request then this will always be 0.

par_sh enum

Shareability.

par_size bool

The PAR.Size field.

size_in_bytes unsigned int

The actual size in bytes of the region.

ssd_ns bool

This is a non-secure ATOS operation.

st1translate bool

The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool

The translation suffered a stage 2 translation.

state enum

The final transaction state of the ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_run_set

The SMMU_s_GATOS_CTRL.RUN field was set to start the ATOS operation. Fields:

ssd_ns bool

This is a non-secure ATOS operation.

vatos bool

This is a VATOS operation.

atos_starting

The ATOS operation is starting. Fields:

addr unsigned int

The input address to the ATOS operation.

httui bool

Inhibit HTTU update.

ind bool

Instruction Data.

pnu bool

Privileged not User.

rnw bool

Read not Write.

ssd_ns bool

This is a non-secure ATOS operation.

ssec bool

If this is a secure ATOS operation then this is if it is secure or not.

streamid unsigned int

The StreamID requested.

substreamid unsigned int

The SubstreamID requested, or ~0u if no SubstreamID.

type enum

The requested ATOS type.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

axi_stream_msi_addr_to_match_s

Address to use to send SMMU originated MSIs directly to the GIC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value unsigned int

The value of the signal.

cd_cc.CD_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

cd_cc.CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

cd_entry_allocated

An CD entry has been allocated. Fields:

AssuredTranslation bool

The CD (and any L1CD) was fetched from an AssuredOnly stage 2 page and so might be capable of creating AssuredTranslations.

cd string

A textual description of the CD.

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

streamid unsigned int

The StreamID of the entry this will match.

substreamid unsigned int

The SubstreamID of the entry this will match. This may be zero for transactions without a SubstreamID.

conf_reset_of_SMMU_S_GBPA_ABORT

The pin is driven. This is the reset value of SMMU_S_GBPA.ABORT. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

dpttlb_entry_allocated

A DPT TLB entry has been allocated. Fields:

AC enum

The value of the 'AC' field that controls access to this region.

FWB bool

The region is FWB.

VMID unsigned int

The VMID, if any, associated with this region.

index unsigned int

Index of the TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_pas enum

The output PAS of this DPT region.

ssd enum

The SSD of the streams this region captures.

trans_id unsigned int

The trans_id of the transaction that caused this allocation.

vmsa_formed bool

The entry was formed from VMSA information rather than from a DPT walk.

writeable bool

True if this region is writeable.

dpttlb_invalidate_intersects_but_does_not_cover_entry_range

ENCODED_SIZE < size of the region covered by the DPT entry so invalidation is not architecturally guaranteed. No invalidation is performed. Fields:

dpttlb_entry_id unsigned int

ID of the TLB entry.

entry_end_incl_address unsigned int

Last address covered by the TLB entry.

entry_start_address unsigned int

First address covered by the TLB entry.

invalidate_end_incl_address unsigned int

Last address covered by the invalidation range.

invalidate_start_address unsigned int

First address covered by the invalidation range.

ssd enum

The security state of the TLB entry.

dpttlb_overlapping_entries

Two DPT TLB entries are overlapping. Fields:

new_AC enum

The value of the 'AC' field that controls access to this region.

new_FWB bool

The region is FWB.

new_VMID unsigned int

The VMID, if any, associated with this region.

new_entry_index unsigned int

The entry index of the new DPT TLB entry.

new_entry_is_vmsa_formed bool

The new entry was inserted as a result of VMSA information.

new_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

new_input_start_address unsigned int

The start address of the input range that this matches.

new_output_pas enum

The output PAS of this DPT region.

new_ssd enum

The SSD of the streams this region captures.

new_writeable bool

True if this region is writeable.

old_AC enum

The value of the 'AC' field that controls access to this region.

old_FWB bool

The region is FWB.

old_VMID unsigned int

The VMID, if any, associated with this region.

old_entry_index unsigned int

The entry index of the old DPT TLB entry.

old_entry_is_vmsa_formed bool

The old entry was inserted as a result of VMSA information.

old_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

old_input_start_address unsigned int

The start address of the input range that this matches.

old_output_pas enum

The output PAS of this DPT region.

old_ssd enum

The SSD of the streams this region captures.

old_writeable bool

True if this region is writeable.

dvm_tlbinvalidate_complete

The DVM TLB Invalidate message completed. Fields:

id unsigned int

The unique id of this DVM message.

ok bool

The DVM message was OK.

dvm_tlbinvalidate_received

A DVM message for a TLB Invalidate has been received. Fields:

address unsigned int

The VA or IPA to use if match_address.

asid unsigned int

The ASID to match if match_asid.

by_ipa bool

The operation is for an IPA operation if match_address.

id unsigned int

The unique id of this DVM message.

ignored enum

The DVM message was ignored.

last_level bool

The operation is for last level if supported.

match_address bool

Match the address field.

match_asid bool

Match the asid field.

match_vmid bool

Match the vmid field.

num unsigned int

If a range operation, the NUM field. If a single-address operation this is 0.

prot enum

The protection level for which this TLB Invalidate will operate on.

security_world enum

The security world that this will apply to.

smmu_scale unsigned int

If a range operation, then the SCALE field with the meaning in the SMMU architecture which is different to the PE architecture. If a single-address operation this is 0.

stage1_only bool

The operation is for stage 1 only if supported.

tg enum

If a single-address or address-range operation, then the Translation Granule hint. Address-range operations always supply a Translation Granule.

translation_table_level enum

The leaf level of the translation table.

vmid unsigned int

The VMID to match if match_vmid.

found_tlb_entry_has_different_aset

Architecturally, a particular ASID either should be ASET0 or ASET1. However, we have managed to find a TLB entry that has a different ASET than that which we were searching for. This indicates a programming error. You should examine all contexts with this particular ASID/VMID and ensure they are consistent. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_start_address unsigned int

The start address of the input range that this matches.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

vmid unsigned int

VMID if appropriate.

httu_update_abandoned_update

The HTTU update of a descriptor in memory was potentially possible, but it was behind an update that failed to apply cleanly. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

what enum

What this descriptor represents.

httu_update_end_update

The attempted update of a descriptor in memory has occurred. Fields:

is_big_endian bool

The descriptor is big-endian in memory.

original_descriptor unsigned int

The original descriptor value.

result enum

The result of the attempt to update.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int

The new descriptor value that tried to replace the original.

value_that_was_in_memory unsigned int

The value that the compare-and-swap operation returned as the value that was in memory.

httu_update_not_done

A discretionary HTTU update could occur and the implementation choose not to do it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

what enum

What this descriptor represents.

httu_update_start_update

An HTTU update could occur and the implementation chose to try it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

is_big_endian bool

The descriptor will be written to memory as big-endian.

mecid unsigned int

The masked MECID used for the update transaction, or ~0u if not appropriate.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int

The new descriptor value that is going to try replace the original.

what enum

What this descriptor represents.

will_do_AF bool

What the implementation chose to do for the AF update.

will_do_DBM bool

What the implementation chose to do for the DBM update.

interrupt_returned

An interrupt/MSI returned from downstream. Fields:

InD_NS_PnU enum

Instruction/Data, Non-secure/Secure/Root/Realm, Privileged/User. Bit[1] = PAS[0], and bit[3] = PAS[1].

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

dcmdqcp_and_index unsigned int

If this not a DCMDQ MSI CMD_SYNC, then this is 0xFFFFFFFF. If it is then the DCMDQ QCP index is in bits[31:16] and the index in the QCP is in [7:0].

gpc_denied_msi bool

True if the MSI was denied as it failed its GPC checks. Thus the field 'ok' will be false.

id unsigned int

ID of this interrupt transaction.

inner_cache enum

The actual attributes of the access.

kind enum

What kind of interrupt.

mecid unsigned int

The MECID of the MSI, if applicable.

mpam_ns bool

For a non-RME system, this is true if the MPAM space is Non-secure. For an RME system, this is MPAM_SP[0].

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP security state of the MPAM partition. 0 – secure, 1 – non-secure, 2 – root, 3 – realm.

msi_valid bool

MSI will attempt to be sent.

ok bool

Did the access return OK or an abort?.

outer_cache enum

The actual attributes of the access.

pas enum

The PAS of the MSI, if applicable.

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum

Shareability.

interrupt_sent

An interrupt is raised. If it sends an MSI then this is *after* any device-dependent transform on the architectural attributes and so may differ from what is programmed. Fields:

InD_NS_PnU enum

Instruction/Data, Non-secure/Secure/Root/Realm, Privileged/User. Bit[1] = PAS[0], and bit[3] = PAS[1].

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

dcmdq_device_id unsigned int

If this is a DCMDQ then this is the DeviceID of the MSI write. Otherwise, 0xFFFF'ffff.

dcmdq_qcp_and_index unsigned int

If this not a DCMDQ MSI CMD_SYNC, then this is 0xFFFF'ffff. If it is then the DCMDQ QCP index is in bits[31:16] and the index in the QCP is in [7:0].

id unsigned int

ID of this interrupt transaction.

inner_cache enum

The actual attributes of the access.

kind enum

What kind of interrupt.

mecid unsigned int

The MECID of the MSI, if applicable.

mpam_ns bool

For a non-RME system, this is true if the MPAM space is Non-secure. For an RME system, this is MPAM_SP[0].

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP security state of the MPAM partition. 0 – secure, 1 – non-secure, 2 – root, 3 – realm.

msi_valid bool

MSI will attempt to be sent.

outer_cache enum

The actual attributes of the access.

pas enum

The PAS of the MSI, if applicable.

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

qSID unsigned int

If this is a DCMDQ then this is the qSID of the MSI write. Otherwise, 0xFFFF'ffff.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum

Shareability.

l1cd_cc.L1CD_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

l1cd_cc.L1CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

l1cd_entry_allocated

An L1 CD entry has been allocated. Fields:

AssuredTranslation bool

The L1CD was fetched from an AssuredOnly stage 2 page and so might be capable of creating AssuredTranslations.

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

normalised_substreamid unsigned int

The first SubstreamID of the range of SubstreamIDs that this L1CD entry will match.

ns enum

For the non-secure world.

pa_12 unsigned int

The PA of the L2 CD table. This is L2Ptr << 12.

ssd enum

The SSD of the entry.

streamid unsigned int

The StreamID this CD is for.

valid bool

Is the entry valid.

l1ste_cc.L1STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

l1ste_cc.L1STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

l1ste_entry_allocated

An L1 STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

first_streamid_of_range unsigned int

The first StreamID of the range of StreamIDs that this L1STE entry will match.

ns enum

For the non-secure world.

num_entries_in_l2 unsigned int

The number of entries in the L2 table. This is $2^{(\text{Span}-1)}$ or 0 if invalid.

pa_l2 unsigned int

The PA of the L2 ST table. This is $\text{L2Ptr} \ll 6$ and aligned to the size of the table.

ssd enum

The SSD of the entry.

level_interrupt_sent

A level interrupt changed state. Fields:

kind enum

What kind of interrupt.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a level RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

set_high bool

Level interrupt state.

ns_cmd_sync_completed_irq

“Non-secure” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_no_action

Non-secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_sev

Non-secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_with_error

Non-secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_issued

Non-secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_issuing

Non-secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_starting_completion_action_irq

Non-secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

ns_cmd_sync_starting_completion_action_sev

Non-secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd, 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

ns_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

ns_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

ns_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

ns_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

ns_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd, 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

ns_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwritable and the queue is now writable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

ns_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

ns_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

ns_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

ns_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

ns_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

ns_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

ns_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

ns_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

pmcg_irq_config

The interrupt configuration of the Performance Monitor Counter Group (PMCG) changed.
Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

SMMU_PMCG_CTRL.IRQEN.

memattr enum

Memory type.

mpam_ns bool

The NS state of the MPAM PARTID and MPAM PMG.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_supported bool

Are MSIs supported for this security world.

ns bool

Non-secure bus attribute.

number_of_interrupts_in_flight unsigned int

The number of interrupts that have been committed to be produced or in flight.

pmcg_index unsigned int

Index of the PMCG.

sh enum

Shareability.

smmu_pmcg_gmpam_Update bool

The SMMU_PMC_GMPAM.Update flag. Only when this is zero are writes predictable.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen

A trace of SMMU_PMC_GIRQ_CTRL.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen_ack

A trace of SMMU_PMC_GIRQLACK.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_merging_interrupts

An interrupt was wanted to be generated, but one was already pending so the two were merged together. Fields:

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_trigger

A PMCG counter has been triggered. Fields:

NoStreamID bool

True if the transaction is a NoStreamID transaction.

counter_index unsigned int

The index of the counter within the PMCG.

event_id unsigned int

The event id that has been triggered.

ns_event bool

Is the event associated with non-secure state.

pmcg_index unsigned int

Index of the PMCG.

prior_counter_value unsigned int

The Counter value *before* the event has incremented it.

ssd enum

The security state associated with the event.

streamid unsigned int

The StreamID associated with the event, if there is one.

tbu_index unsigned int

The TBU index of the transaction, or ~0u if not applicable.

pmu_active_counter

Traces what active counters are in a PMCG and what StreamIDs it might filter on. Those counters that trace StreamIDs for multiple security states, or those that are not filtered by StreamID, will appear multiple times, once for each security state. All active counters for a PMCG are traced one after another. Fields:

NoStreamID bool

True if NoStreamID transactions will be traced.

begin_streamid unsigned int

The start StreamID to filter on.

counter_index unsigned int

The counter index within the PMCG.

end_incl_streamid unsigned int

The end inclusive StreamID to filter on.

evcnt unsigned int

The current count.

event_id unsigned int

The event ID to filter.

ns bool

Are the StreamIDs non-secure?.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd enum

SSD of the StreamID.

tbu_index_to_match unsigned int

The TBU index that must match, or ~0u if no matching applicable.

pmu_all_counters_in_pmcg_became_inactive

The PMCG was tracing some events and now is not tracing any. Fields:

pmcg_index unsigned int

The index of the PMCG.

pmu_capture

For some reason, a capture event occurred. Fields:

pmcg_index unsigned int

The index of the PMCG that the capture occurred on.

why enum

Why did the capture occur?.

pmu_counter_configured_to_use_unsupported_event

An enabled counter was configured to use a unsupported event. Fields:

counter_index unsigned int

The counter index within the PMCG.

event_id unsigned int

The unsupported event id.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

pmu_counter_overflowed

A counter in a particular PMCG overflowed. Fields:

already_overflowed bool

True if the overflow flag was already set.

capture bool

True if it captured the other counter values.

counter_index unsigned int

The counter index within the PMCG.

interrupt bool

True if going to attempt to generate an interrupt.

interrupt_action enum

The interrupt action that is going to occur.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd_ns bool

The PMCG is controlled by the Non-secure security state.

priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:-
SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool

The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int

The transaction ID of the PPR that caused the overflow.

priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

priq_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.RD_and_RD_wrap.

number_of_pprs unsigned int

The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int

This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int

The number of writes to the PRIQ that are currently in flight.

ovackflg bool

The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool

The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool

There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool

The value of SMMU_CRO.PRIQEN. The *effective* value is 0 if SMMUEN == 0.

priqenack bool

The value of SMMU_CROACK.PRIQEN.

prod_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool

The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CRO.PRIQEN.

smmuen bool

The value of SMMU_CRO.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool

The value of SMMU_CRO.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int

The size of the table in the number of items it can hold.

priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int

The transaction ID of the PPR that aborted.

priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we wrote..

trans_id unsigned int

The transaction ID of the PPR.

priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int

PROD position including the wrap bit.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

ptw_read

Page Table Walk (read). This is the result of the physical access that the SMMU is making.
Fields:

abort enum

Non-zero if the access aborted/failed.

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

data unsigned int

The data fetch if it didn't abort.

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16

KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AP21 enum

The access permissions.

AttrIndx210 unsigned int

The attribute index into the MAIR0/1. If AIE is implemented then this is the full index AttrIndx[3:0].

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

NS bool

The encoding is for non-secure if this is a secure fetch.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIIIndex unsigned int

The S2PIIndex if S2PIE is in use, or 0xFFFF if not.

PXN bool

Privileged eXecute Never.

Protected enum

Is the descriptor producing an AssuredTranslation.

SH10 enum

The shareability.

XN bool

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

hwu_pbha unsigned int

Top four bits are appropriate CD.HWU, *bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by CD.HWU0/CD.HWU1**.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nG bool

not Global.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

NSTable bool

The next level table descriptor is forced to non-secure.

PXNTable bool

Force PXN independently of subsequent descriptors.

Protected enum

Is the descriptor capable of producing an AssuredTranslation.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16

KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

tth_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AssuredOnly enum

The descriptor is marked as AssuredOnly.

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

HAP21 enum

The access permissions.

MemAttr3_0 enum

The memory attributes.

NS enum

Whether this descriptor forces NS.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIIIndex unsigned int

The S2PIIndex if S2PIE is in use, or 0xFFFF if not.

POE_POIndex unsigned int

The S2POIndex if S2POE is in use, or 0xFFFF if not.

SH10 enum

The shareability.

XN enum

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

s2hwu_pbha unsigned int

Top four bits are STE.S2HWU, bottom bits[62:59] of descriptor. *Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by STE.S2HWU.*

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

PXNTable bool

Force PXN independently of subsequent descriptors.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

raw_register_end_read

The raw register read transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

read_data unsigned int

The data read.

raw_register_end_write

The raw register write transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

raw_register_start_read

The raw register read transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

raw_register_start_write

The raw register write transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

write_data unsigned int

The data to write.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string

The text description of the register value read.

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string

The text description of the register value written.

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string

The text description of the register value.

register_read_string

A text representation of the read of a register. Fields:

out string

The text description of the register value read.

register_write_reserved

A text representation of an access to a register address that is reserved or a write.to a **RES0** field in a register. Fields:

in string

The text description of the register value.

register_write_string

A text representation of the write of a register. Fields:

in string

The text description of the register value written.

rl_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

s_cmd_sync_completed_irq

“Secure” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_no_action

Secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_sev

Secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_with_error

Secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issued

Secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issuing

Secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_starting_completion_action_irq

Secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

s_cmd_sync_starting_completion_action_sev

Secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

s_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

s_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

error enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

s_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

s_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

s_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

s_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

s_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwritable and the queue is now writable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

s_eventq_cmd_sync_unhazardded

The CMD_SYNC has been unhazardded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

s_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

s_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

s_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

s_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

s_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

s_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

s_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

s_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

s_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

sec_override

Controls non-secure accesses to some registers. Fields:

value bool

The value of the signal.

sev

Send a SEV. Fields:

why enum

Why the SEV was generated.

smmu_atc_inv

The CMD_ATC_INV command is sent. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_atc_inv_completed

The CMD_ATC_INV command completed. Fields:

cmd_id unsigned int

Command id, if top-bit is set then was issued from the Non-secure CMDQ.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

response enum

The response.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_cmdq enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

smmu_atc_inv_end

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

response enum

The response to the ATC invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_atc_inv_start

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_ats_initial

This is the initial ATS request. Fields:

XT bool

The XT bit.

ia unsigned int

Input address.

max_number_of_replies unsigned int

The maximum number of replies allowed to return.

no_write bool

The NW (no write flag) of the ATS request. If clear then the requester is going to do a write.

pasid_execute_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for execution permissions.

pasid_privileged_mode_requested bool

If there is a PASID (streamid != ~0u) then this represents the requester asking for the privileged mode's permissions.

protected_mode bool

Is the ATS Request protected-mode?.

source_cxl bool

Does the ATS request have Source.CXL set?.

ssd enum

The SSD of the ATS request.

ssd_ns bool

Incoming SSD is non-secure.

streamid unsigned int

StreamID of the ATS request.

substreamid unsigned int

SubstreamID (which is identical to the PASID) of the ATS request. If no PASID-prefix is sent then this is ~0u.

tbu unsigned int

Translation Buffer Unit number.

smmu_ats_reply_failure

This is an ATS reply indicating failure. Fields:

event enum

Equivalent event number that would have been generated for an equivalent ordinary transaction.

failure enum

What is the failure response code?.

state enum

The transaction state of the successfully ATS request.

smmu_ats_reply_success

This is an ATS reply, typically the SMMU will only return a single response, even if the requester indicated it could accept more replies. NOTE that the SMMU responds with 'success' in some cases when a fault is encountered and RW==0. Fields:

N bool

Non-snooped access. If one then the requester must clear the NoSnoop bit on transactions, unless otherwise enabled in a Function-specific manner.

P bool

Privileged mode. These permissions related to privileged mode.

RWX enum

Read/Write/Execute.

U bool

Untranslated access. If one, and RW !=0 then use UntranslatedAccesses for the allowed accesses by RW(X).

cxl_io bool

The CXL.io response.

inner enum

The inner cacheability attributes to use for TranslatedAccesses.

input_address unsigned int

Input address of the ATS request.

instcfg enum

The STE.INSTCFG field.

outer enum

The outer cacheability attributes to use for TranslatedAccesses.

pas enum

The PAS this mapping corresponds to. This holds the same information as the TE bit for realm streams.

privcfg enum

The STE.PRIVCFG field.

shareability unsigned int

The shareability to use for TranslatedAccesses.

size unsigned int

The size of the region covered by this translation.

state enum

The transaction state of the successfully ATS request.

translated_address unsigned int

If RW!=0 && U != 0, then the Translated Address that a TranslatedAccess can be made with.

smmu_axi_stream_msi

An SMMU generated MSI is directly sent through the axi_stream_msi_m port, typically connected to the GIC port axi_stream_msi_s. Fields:

TDEST unsigned int

Routing information for the data stream, typically identifying the GIC.

TID unsigned int

Data stream identifier for the SMMU.

axi_stream_msi_addr_to_match unsigned int

Current address to match for SMMU-originated MSIs to send out of the axi_stream_msi_m port.

data unsigned int

The MSI sent.

smmu_final_transaction

This is the transaction group request to remap has completed one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. If it stalls then it will report through this trace source, stall (stag_if_stalling != ~Ou) and when resume will issue another smmu_initial_transaction as it undergoes remapping again. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

begin_input_address_range unsigned int

The start of the input address range that is size_of_region_in_bytes.

begin_ipa_range unsigned int

The start of the IPA range that is of size_of_region_in_bytes.

begin_output_address_range unsigned int

The start of the output address range that is of size_of_region_in_bytes.

cmo_point enum

The point associated with the CMO, if applicable.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

ipa_address unsigned int

The IPA of the transaction.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The MECID of the transaction.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

operation enum

The kind of operation that this represents.

output_address unsigned int

The input address of the transaction group.

output_inner enum

Inner cacheability for the output attributes.

output_outer enum

Outer cacheability for the output attributes.

output_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

output_sh enum

Shareability for the output attributes.

output_vmid unsigned int

The output VMID/GBPA.IMPDEF or ~0u if not valid.

size_of_region_in_bytes unsigned int

An imp def size of region for which this translation is valid for.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

stag_if_stalling unsigned int

This is the STAG used by the transaction if it is going to stall. It is ~0u if it is not going to stall.

state enum

The final transaction state.

streamid unsigned int

The StreamID of the transaction. ~0ull if NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_gpt_tlb_invalidate

A GPT TLB invalidate has been initiated. Fields:

address unsigned int

The address as it appears in the operation.

encoded_size unsigned int

The size as it is encoded in the operation.

kind enum

The kind of operation this is.

pgs_in_bytes unsigned int

The PGS size in bytes.

size_in_bytes unsigned int

For range operations, the size as it appears in the operation.

source enum

Where the TLBI came from.

state enum

Is the operation well formed.

trans_id unsigned int

The transaction id of this invalidate.

smmu_gpt_tlb_invalidate_complete

The GPT TLB invalidate completed. Fields:

source enum

Where the TLBI came from.

trans_id unsigned int

The transaction id of this invalidate.

smmu_initial_transaction

This is the transaction group request to remap is going to start one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. A stalling transaction will report through this trace source when it unstalls. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

XT_and_output_pas_checking enum

The XT bit for PCIe Transactions. This specifies the requested check on the output PAS that the device asked for.

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum

The point associated with the CMO, if applicable.

dcmdq_qcp_and_index unsigned int

If this is a DCMDQ fetch being translated then this field indicates the DCMDQ QCP index in bits [23:8] and the index in the page in bits [7:0]. Otherwise this is 0xFFFFffff.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The incoming MECID for NoStreamID transactions. ~0u for all other transactions.

mpam_partid unsigned int

The MPAM_PARTID for NoStreamID transactions. ~0u for all other transactions.

mpam_pmg unsigned int

The MPAM_PMG for NoStreamID transactions. ~0u for all other transactions.

mpam_sp enum

The MPAM_SP for NoStreamID transactions. ~0u for all other transactions.

operation enum

The kind of operation that this represents.

protected_mode enum

The PM bit.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_normalize_input_transaction

If the input transaction is normalized before being processed then this traceevent will fire. This is usually dependent on parameters of the implementation. Fields:

incoming_inner enum

The inner cacheability attributes.

incoming_is_instruction bool

The incoming transaction is marked as 'instruction'.

incoming_is_privileged bool

The incoming transaction is marked as 'privileged'.

incoming_outer enum

The outer cacheability attributes.

incoming_pas enum

The PAS of the incoming transaction.

incoming_shareability unsigned int

The incoming shareability.

normalized_inner enum

The normalized inner cacheability attributes.

normalized_is_instruction bool

The incoming transaction is marked as 'instruction'.

normalized_is_privileged bool

The incoming transaction is marked as 'privileged'.

normalized_outer enum

The normalized outer cacheability attributes.

normalized_pas enum

The PAS this mapping corresponds to.

normalized_shareability unsigned int

The normalized shareability.

ssd enum

The SSD of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

trans_id unsigned int

ID of the original transaction.

smmu_pmusnapshot_ack

Acknowledge the pmusnapshot_req to indicate the snapshot has occurred. This is part of a four-phase handshake. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_pmusnapshot_ack_overridden

The value of pmusnapshot_ack was overridden (likely due to being in integration mode). Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_pmusnapshot_ack_override_end

The overriding of the pmusnapshot_ack signal has ended. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

smmu_pmusnapshot_req

Take a snap shot of the PMU values as though SMMU_PMCG_CAPR.CAPTURE had been written. This is part of a four-phase handshake. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_poison_tw_data

Poison data has been returned to a table walk transaction. Fields:

bitmap_of_poison unsigned int

The bitmap of which beats of the transaction where poisoned.

is_cas bool

True if this is a compare-and-swap operation.

number_of_64bit_beats unsigned int

Number of beats this transaction fetched.

paddress unsigned int

Physical address of the table walk transaction.

pas enum

The PAS of the bus transaction.

ras_group_id unsigned int

If non-~0u then is the RAS group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

ras_record_index_in_group unsigned int

If non-~0u then is the RAS record index in the group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

what enum

What table walk was being performed.

smmu_pri_resp

The CMD_PRI_RESP command is queued to be sent to the PCIe system. Fields:

auto_response_trans_id unsigned int

trans_id of PRI request we are auto-responding to, or ~0u if not valid.

cmd_id unsigned int

Command id, or ~0u if not valid.

cons unsigned int

CONS of the command. ~0u if an auto-response.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_pri_resp_nop

The CMD_PRI_RESP command was NOPped. Fields:

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why the CMD_PRI_RESP was NOPped.

smmu_priq_resp_fake_return

A PRIQ Response is posted to the PCIe subsystem and so has no acknowledgement that it is received. However, in the model then we artificially know when the the PRIQ Response has been delivered to the PCIe subsystem, even if the ATC has not yet acted on it. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

what enum

What happened.

smmu_priq_resp_start

A PRIQ Response has been posted to the PCIe subsystem. As the response is posted then there is no way of knowing when it is received by the EndPoint. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_thread_wait_wake

Traces a thread's wait/wake status. Fields:

current_ticks unsigned int

The current tick count of simulated time.

event enum

What is happening to this thread.

thread_index unsigned int

The ID of this thread.

ticks unsigned int

If the event relates to a time then this is held in this field. Otherwise, 0.

stall_transaction

A transaction is about to stall. Fields:

stag unsigned int

STAG.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_inhibited_by_STALL_MAX

A transaction is about to stall but the maximum number of transactions have stalled and we can't report this one to the event queue (even if non-full). Fields:

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_resuming

A stalled transaction is resuming. Fields:

stag unsigned int

STAG if appropriate, or if was inhibited by STALL_MAX then 0xFAFA.

stallresult enum

What the transaction resumed to do.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ste_cc.STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

ste_cc.STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

ste_entry_allocated

An STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

ste string

A textual description of the STE.

streamid unsigned int

The StreamID of the entry this will match.

sup_btm

The pin is driven. This indicates the system supports BTM. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_cohacc

The pin is driven. This indicates the system supports COHACC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_httu

The pin is driven. This indicates the system supports HTTU. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_sev

The pin is driven. This indicates the system supports SEV. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

tbu0_reset_in

The reset signal of the TBU0. Fields:

value bool

The value of the signal.

tcu_reset_in

The reset signal. Fields:

value bool

The value of the signal.

tlb_entry_allocated

A TLB entry has been allocated. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_end_incl_address unsigned int

The end inclusive address of the output range.

output_start_address unsigned int

The start address of the output range.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

tbi bool

Was the entry formed using Top Byte Ignore (TBI).

vmid unsigned int

VMID if appropriate.

tlb_info_tlb_entries_overlap

A TLB entry was inserted into the TLB and it overlaps an existing entry. This isn't a problem as it was inserted in such a way that it architecturally works. Fields:

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

how_inserted enum

How the entry was inserted.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

verbose_commentary

This is a verbose commentary on the translation process the SMMU is performing. Fields:

output string

The stream output.

warning_MSI_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_pmcg_address_out_of_range_of_oas

The MSI Address of the Performance Monitor Counter Group (PMCG) is out of range of the OAS and so will be silently truncated. Fields:

address unsigned int

The untruncated address of the MSI.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

warning_discarding_interrupt_EVENTQ_as_irgen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HDBSS_IRQEN.

warning_discarding_interrupt_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_S_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_S_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_S_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_S_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HDBSS_IRQEN.

warning_ns_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc string

The textual description of what happened.

warning_s_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

what_going_to_do_with_terminated_event

A terminating transaction has produced an event, this tells you what the model is going to do with the event. Fields:

CD.S bool

The CD.S field if available.

S2 bool

The event is related to Stage 2.

STE.S1STALLD bool

The STE.S1STALLD field if available.

STE.S2S bool

The STE.S2S field if available.

aborts bool

The transaction will abort.

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

is_tr_fault bool

Is a Translation Related fault.

protected_mode bool

The transaction is protected-mode. As such, it cannot stall and will obey the report configuration bits.

reports bool

The transaction will attempt to report.

ssd enum

The SSD of the transaction.

ssd_ns bool

The transaction is classified as SSD non-secure.

supports_stall_model bool

The implementation supports the stall model.

trans_id unsigned int

The transaction id.

why_abort_decision enum

The reason why the transaction aborted/did not abort.

why_report_decision enum

The reason why the transaction reported/did not report.

2.128 MMU_S3

This section describes the trace sources.

ArchMsg.Error.error

These messages are about activity occurring on the SMMU that is considered an error. Messages will only come out here if parameter `all_error_messages_through_trace` is true. `DISPLAY %{output}`. Fields:

output string

The stream output.

ArchMsg.Error.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int

The address of the descriptor fetch.

desc_inner enum

Inner cacheability of descriptor.

desc_outer enum

Outer cacheability of descriptor.

desc_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

desc_sh enum

Shareability of descriptor.

ssd enum

The SSD of the transaction.

ssd_ns bool

Is the Security State Determination of the transaction non-secure.

stage unsigned int

The stage at which we had a problem.

streamid unsigned int

The StreamID of the transaction.

substreamid unsigned int

The SubstreamID of the transaction (or ~0u if no substreamid).

trans_id unsigned int

Transaction id.

ArchMsg.Error.ns_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.priq_streamid_truncated

The SMMU received a PCIe PRI request with a StreamID) that was larger than that which the SMMU has been configured for. The StreamID that appears in the PRIQ entry will be truncated. Fields:

actual_streamid unsigned int

The actual StreamID that this request has.

sidsize unsigned int

The bit width of the SMMU for StreamIDs, as indicated by SMMU_IDR1.SIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_streamid unsigned int

The truncated StreamID that will appear in the PRIQ entry.

ArchMsg.Error.priq_substreamid_truncated

The SMMU received a PCIe PRI request with a PASID prefix (SubstreamID) that was larger than that which the SMMU has been configured for. The SubstreamID that appears in the PRIQ entry will be truncated. Fields:

actual_substreamid unsigned int

The actual SubstreamID that this request has.

ssidsize unsigned int

The bit width of the SMMU for SubstreamIDs, as indicated by SMMU_IDR1.SSIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_substreamid unsigned int

The truncated SubstreamID that will appear in the PRIQ entry.

ArchMsg.Error.rl_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.rl_priq_streamid_truncated

The SMMU received a PCIe PRI request with a StreamID) that was larger than that which the SMMU has been configured for. The StreamID that appears in the PRIQ entry will be truncated. Fields:

actual_streamid unsigned int

The actual StreamID that this request has.

sidsize unsigned int

The bit width of the SMMU for StreamIDs, as indicated by SMMU_IDR1.SIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_streamid unsigned int

The truncated StreamID that will appear in the PRIQ entry.

ArchMsg.Error.rl_priq_substreamid_truncated

The SMMU received a PCIe PRI request with a PASID prefix (SubstreamID) that was larger than that which the SMMU has been configured for. The SubstreamID that appears in the PRIQ entry will be truncated. Fields:

actual_substreamid unsigned int

The actual SubstreamID that this request has.

ssidsize unsigned int

The bit width of the SMMU for SubstreamIDs, as indicated by SMMU_IDR1.SSIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_substreamid unsigned int

The truncated SubstreamID that will appear in the PRIQ entry.

ArchMsg.Error.s_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.tlb_entries_overlap

A TLB entry was attempted to be inserted into the TLB and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

do_f_tlb_conflict bool

Chosen to perform an F_TLB_CONFLICT.

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

why enum

Why it is an error for these two entries to overlap.

ArchMsg.Error.tlb_entry_not_invalidated_due_to_ril

An entry in the cache was not invalidated even though in the right address range because of the RIL fields of the command the entry do not match. Fields:

cmd_num unsigned int

The NUM field of the RIL part of the command.

cmd_ril_tg enum

The RIL_TG field of the RIL part of the command.

cmd_ril_ttl unsigned int

The TTL field of the RIL part of the command, zero means any level. 0x80 means match level 0 (and is from a DVM message).

cmd_scale unsigned int

The SCALE field of the RIL part of the command.

entry_id unsigned int

The entry id that is being invalidated.

tlb_entry string

The TLB entry.

ArchMsg.Error.vatos_sel_vmid_out_of_range

The SMMU_(S_)VATOS_SEL.VMID field was programmed with a VMID that was too wide for this implementation (SMMU_IDR0.VMID16 == 0). DISPLAY %{{ssd_ns:(s-|ns-)}}VMID:%{vmid} is out of range. Fields:

ssd_ns bool

The security state of the VATOS interface.

vmid unsigned int

The VMID programmed.

ArchMsg.Info.info

These are information messages about what is happening in the SMMU. DISPLAY %{output}. Fields:

output string

The stream output.

ArchMsg.Warning.CMD_RESUME_no_transaction_resumed

A CMD_RESUME was issued that matched no transaction. Fields:

stag unsigned int

STAG in the CMD_RESUME.

streamid unsigned int

StreamID in the CMD_RESUME.

streamid_ns bool

The StreamID was for the non-secure world.

ArchMsg.Warning.NoStreamID_bad_pas_or_mpam_sp

When RME is not supported then a NoStreamID transaction with PAS[1] == 1 or MPAM_SP[1] == 1 is treated as though PAS[1] == 0 and MPAM_SP[1] == 0. This is usually a system construction error and is not expected to occur. Fields:

address unsigned int

The Physical Address.

effective_mpam_sp enum

The effective MPAM_SP.

effective_pas enum

The effective PAS.

extendedid unsigned int

The ExtendedID of the transaction.

incoming_mpam_sp enum

The incoming MPAM_SP.

incoming_pas enum

The incoming PAS.

managerid64 unsigned int

The ManagerID64 of the transaction,.

userflags unsigned int

The UserFlags of the transaction.

ArchMsg.Warning.atc_inv_strange

Something was odd about the CMD_ATC_INV. DISPLAY CMD_ATC_INV strange as: %{why}.
Fields:

cmd_id unsigned int

Command id.

ssd_of_cmdq enum

The SSD of the CMDQ.

why string

Why the CMD_ATC_INV was strange.

ArchMsg.Warning.bad_axi_stream_msi_addr_to_match_s

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value unsigned int

The default value of the signal we have been assuming.

value unsigned int

The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_bgptm

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_l0gptsz

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value unsigned int

The default value of the signal we have been assuming.

value unsigned int

The value of the signal.

ArchMsg.Warning.bad_legacy_tz_en

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_s_gbpa_abort_init

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sec_override

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_btm

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_cohacc

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive

the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_httu

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_sup_sev

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_tbu0_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_tcu_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.contig_bit_gives_too_large_region_for_TxSZ

If the contig bit was used then the size of the contig region would be larger than that indicated by TxSZ. Fields:

desc_kind enum

Descriptor kind.

el enum

Exception level.

input_address unsigned int

Input address.

log2_contig_region_size unsigned int

Log2(contig region size in bytes).

output_address unsigned int

Output address.

stage_and_level unsigned int

The stage in bits [7:4] and the level in [3:0]. Level -1 is 0xF.

vmid unsigned int

VMID if appropriate.

ArchMsg.Warning.contig_bit_has_inconsistent_input_and_output_address

If the contig bit was used then the some bits of the output address held in the descriptor and the input address must match. Fields:

desc_kind enum

Descriptor kind.

el enum

Exception level.

input_address unsigned int

Input address.

log2_contig_region_size unsigned int

Log2(contig region size in bytes).

match_mask unsigned int

Bits that must match.

output_address unsigned int

Output address.

stage_and_level unsigned int

The stage in bits [7:4] and the level in [3:0]. Level -1 is 0xF.

vmid unsigned int

VMID if appropriate.

ArchMsg.Warning.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int

The address of the descriptor fetch.

desc_inner enum

Inner cacheability of descriptor.

desc_outer enum

Outer cacheability of descriptor.

desc_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

desc_sh enum

Shareability of descriptor.

ssd enum

The SSD of the transaction.

ssd_ns bool

Is the Security State Determination of the transaction non-secure.

stage unsigned int

The stage at which we had a problem.

streamid unsigned int

The StreamID of the transaction.

substreamid unsigned int

The SubstreamID of the transaction (or ~0u if no substreamid).

trans_id unsigned int

Transaction id.

ArchMsg.Warning.gpt_read_invalid_descriptor

A GPT read has completed and not found something that looks like a descriptor. Fields:

abort enum

Non-zero if the access aborted/failed.

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

data unsigned int

The data fetch if it didn't abort.

level unsigned int

Level of the walk.

pas_checking enum

The PAS of the address that we are checking.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

ArchMsg.Warning.msi_address_truncated

An MSI was generated, but the address was silently truncated due to the limited downstream address bus width. Fields:

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

truncated_address unsigned int

The truncated address.

untruncated_address unsigned int

The untruncated address.

which enum

Which MSI this is.

ArchMsg.Warning.msi_lost

An MSI was attempted to be sent, but couldn't be sent. Fields:

id unsigned int

ID of this interrupt transaction.

kind enum

What kind of interrupt.

why enum

Why this interrupt was denied.

ArchMsg.Warning.pmcg_non_secure_world

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between security states. Fields:

commentary string

The commentary.

ArchMsg.Warning.pmcg_programming_violates_security

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between different security states. This is under the assumption that an agent from another security state could be writing to the PMCG. Fields:

commentary string

The commentary.

ArchMsg.Warning.priq_auto_response_failed_to_find_STE

The PRIQ was going to generate an auto-response, but failed to find an STE and so is returning a Failure message to the EndPoint which should disable the PRI interface of the EndPoint. Fields:

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

ArchMsg.Warning.priq_overflow_bad_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG but an overflow condition did not exist. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

ArchMsg.Warning.priq_smmuen_forces_effective_priqen_low

If SMMUEN == 0, then the effective value of PRIQEN is 0. This warning is triggered when PRIQEN == 1 && SMMUEN == 0; which may not be what was intended. The PRIQ cannot be active if SMMUEN == 0.

ArchMsg.Warning.rl_priq_auto_response_failed_to_find_STE

The PRIQ was going to generate an auto-response, but failed to find an STE and so is returning a Failure message to the EndPoint which should disable the PRI interface of the EndPoint. Fields:

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

ArchMsg.Warning.rl_priq_overflow_bad_acking

Indicates that an overflow condition was acknowledged by writing to:-
SMMU_PRIQ_CONS.OVACKFLG but an overflow condition did not exist. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

ArchMsg.Warning.rl_priq_smmuen_forces_effective_priqen_low

If SMMUEN == 0, then the effective value of PRIQEN is 0. This warning is triggered when
PRIQEN == 1 && SMMUEN == 0; which may not be what was intended. The PRIQ cannot
be active if SMMUEN == 0.

ArchMsg.Warning.sev_lost

A SEV was lost because it isn't supported according to SMMU_IDRO.SEV. DISPLAY SEV was
lost because: %{why}. Fields:

why enum

Why the SEV was generated.

ArchMsg.Warning.smmu_pcie_rc_is_in_reset_ignoring_atc_invalidate

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that mapped to a PCIe
Root Complex that is in reset. The message will be discarded and act as though completed
successfully. Fields:

port_index unsigned int

The port index (node index) that is in reset but we would have sent it to.

streamid unsigned int

The StreamID that failed to map.

ArchMsg.Warning.smmu_pcie_rc_not_found_for_streamid

A CMD_PRI_RESP or CMD_ATC_INV was sent with a streamid that did not map to a PCIe
Root Complex. This might be that the SW used an incorrect StreamID or it might be that
the model has not been connected correctly. ATC Invalidate messages complete as though
successful and PRI Requests are ignored. Fields:

streamid unsigned int

The StreamID that failed to map.

ArchMsg.Warning.smmu_pmusnapshot

Something strange happened on the pmusnapshot_req/pmusnapshot_ack interface. Fields:

pin_index unsigned int

If the PMCG index corresponds to an array of signals, this is the index in the array, or 0
otherwise.

pmcg_index enum

The PMCG index.

warning string

The warning message.

ArchMsg.Warning.suspicious_overlapping_entries

Two DPT TLB entries are overlapping but they differ in ways that are potentially a SW error.
Fields:

new_AC enum

The value of the 'AC' field that controls access to this region.

new_FWB bool

The region is FWB.

new_VMID unsigned int

The VMID, if any, associated with this region.

new_entry_index unsigned int

The entry index of the new DPT TLB entry.

new_entry_is_vmsa_formed bool

The new entry was inserted as a result of VMSA information.

new_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

new_input_start_address unsigned int

The start address of the input range that this matches.

new_output_pas enum

The output PAS of this DPT region.

new_ssd enum

The SSD of the streams this region captures.

new_writeable bool

True if this region is writeable.

old_AC enum

The value of the 'AC' field that controls access to this region.

old_FWB bool

The region is FWB.

old_VMID unsigned int

The VMID, if any, associated with this region.

old_entry_index unsigned int

The entry index of the old DPT TLB entry.

old_entry_is_vmsa_formed bool

The old entry was inserted as a result of VMSA information.

old_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

old_input_start_address unsigned int

The start address of the input range that this matches.

old_output_pas enum

The output PAS of this DPT region.

old_ssd enum

The SSD of the streams this region captures.

old_writeable bool

True if this region is writeable.

pas_differ bool

The output PAS of the two entries differ.

vmids_differ bool

The VMIDs are used by at least one of the AC schemes and are different.

vmsa_formed_writeable_while_DPT_entry_is_not bool

The VMSA-formed entry is writeable but the DPT Entry says it is not writeable.

ArchMsg.Warning.warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the SMMU. DISPLAY %{output}. Fields:

output string

The stream output.

ArchMsg.Warning.warning_effective_EOPD_differs_from_what_would_be_cached_in_TLB

Effective value of EOPD differs from what would be cached in the TLB DISPLAY transaction (%{transaction_id}), sid (%{sid}), ssid (%{ssid}), ssd (%{ssd}), effective EOPD (%{effective_EOPD}), cached EOPD (%{cached_EOPD}). Fields:

cached_EOPD bool

The EOPD value that would be cached in the TLB.

effective_EOPD bool

The effective value of EOPD.

ssd enum

SSD.

streamid unsigned int

StreamID or ~0ull if NoStreamID.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

transaction_id unsigned int

The transaction ID.

DPTTLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

DPTTLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

GPTTLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

GPTTLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

HACDBS_PROCESSING_COMPLETE_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irgen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

HACDBS_PROCESSING_COMPLETE_irgen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

HACDBS_PROCESSING_COMPLETE_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

HDBSS_TABLE_FULL_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

MMU_S3_integration_mode_end_ras_level_interrupt_restored

RAS level sensitive interrupt restored due to integration mode ending. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being restored.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

value bool

Level of the interrupt signal.

MMU_S3_integration_mode_pmcg_interrupt_lost

PMCG interrupt lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

pmcg_interrupt enum

PMCG interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

MMU_S3_integration_mode_pmusnapshot_ack_lost

pmusnapshot_ack lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

MMU_S3_integration_mode_ras_interrupt_lost

RAS interrupt lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

MMU_S3_integration_mode_ras_level_interrupt_lost

RAS level sensitive interrupt lost due to being in integration mode. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

value bool

Level of the interrupt signal.

MMU_S3_integration_mode_start_ras_level_interrupt_cleared

RAS level sensitive interrupt cleared due to integration mode starting. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being cleared.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

MMU_S3_integration_mode_tcu_evento_lost

Evento lost due to being in integration mode.

MMU_S3_integration_mode_tcu_interrupt_lost

Interrupt lost due to being in integration mode. Fields:

interrupt enum

Interrupt that is being dropped.

MMU_S3_integration_register_change

An integration register write occurred and it's modified, which drives a signal. Fields:

is_tcu enum

Is TCU integration mode.

new_value bool

New value of the signal.

old_value bool

Old value of the signal.

register enum

The register being modified.

register_value unsigned int

Value written to the register.

signal string

Signal affected by the register write.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

PRIQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

PRIQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

PRIQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

R_EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

R_EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

R_EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

R_GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

R_ERROR_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

R_ERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

R_HACDBS_PROCESSING_COMPLETE_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

R_HACDBS_PROCESSING_COMPLETE_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

R_HACDBS_PROCESSING_COMPLETE_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

R_HDBSS_TABLE_FULL_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

R_HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

R_HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

R_PRIQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

R_PRIQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

R_PRIQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

SMMU_CR0ACK_SMMUEN_hazarded_by_priq

The SMMU_r_CR0ACK.SMMUEN cannot acknowledge the change to SMMUEN because there are outstanding PRIQ writes.

SMMU_CR0ACK_SMMUEN_update

The acknowledge to SMMU_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_CR0.SMMUEN completed. Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_CR0_SMMUEN_write

A write to SMMU_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_GBPA completed. Fields:

last bool

This is the last set completing.

old_value unsigned int

The old value of the set completing.

SMMU_GBPA_update

The Update flag to SMMU_GBPA was lowered. Fields:

new_value unsigned int

The new value of the register.

SMMU_GBPA_write

A write to SMMU_GBPA occurred. Fields:

new_value unsigned int

The new value of the register.

old_value unsigned int

The old value of the register.

SMMU_ROOT_CR0ACK_ACCESSEN_update

The acknowledge to SMMU_ROOT_CR0.ACCESSSEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_ROOT_CR0ACK_GPCEN_update

The acknowledge to SMMU_ROOT_CR0.GPCEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_ROOT_CR0_ACCESSEN_old_set_complete

A set of transactions associated with the old value of SMMU_ROOT_CR0.ACCESSSEN completed. Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_ROOT_CR0_ACCESSEN_write

A write to SMMU_ROOT_CR0.ACCESSSEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_ROOT_CR0_GPCEN_old_set_complete

A set of transactions associated with the old value of SMMU_ROOT_CR0.GPCEN completed.
Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_ROOT_CR0_GPCEN_write

A write to SMMU_ROOT_CR0.GPCEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_R_CR0ACK_SMMUEN_hazarded_by_rl_priq

The SMMU_r_CR0ACK.SMMUEN cannot acknowledge the change to SMMUEN because there are outstanding PRIQ writes.

SMMU_R_CR0ACK_SMMUEN_update

The acknowledge to SMMU_R_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_R_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_R_CR0.SMMUEN completed.
Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_R_CR0_SMMUEN_write

A write to SMMU_R_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_S_CR0ACK_SMMUEN_update

The acknowledge to SMMU_S_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_S_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_S_CR0.SMMUEN completed.

Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_S_CR0_SMMUEN_write

A write to SMMU_S_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_S_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_S_GBPA completed. Fields:

last bool

This is the last set completing.

old_value unsigned int

The old value of the set completing.

SMMU_S_GBPA_update

The Update flag to SMMU_S_GBPA was lowered. Fields:

new_value unsigned int

The new value of the register.

SMMU_S_GBPA_write

A write to SMMU_S_GBPA occurred. Fields:

new_value unsigned int

The new value of the register.

old_value unsigned int

The old value of the register.

S_EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_ERROR_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_ERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_HACDBS_PROCESSING_COMPLETE_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_HACDBS_PROCESSING_COMPLETE_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_HACDBS_PROCESSING_COMPLETE_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_HDBSS_TABLE_FULL_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

TLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

TLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

atc_inv_nop

The CMD_ATC_INV command is ignored as a **NOP**. This may be emitted multiple times if the CMD_ATC_INV is being ignored for multiple reasons. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why was NOPped.

atos_complete_fault

The ATOS operation completed with a fault. Fields:

effective_st1translate bool

Because of the settings and/or the ATOS type then the effective st1translate can be different.

fault_faddr unsigned int

The fault FADDR.

fault_faultcode enum

The fault code.

fault_reason enum

The fault reason.

ssd_ns bool

This is a non-secure ATOS operation.

st1translate bool

The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool

The translation suffered a stage 2 translation.

state enum

The final transaction state of the ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_complete_fault_inv_req

The ATOS operation completed, faulted and generated an INV_REQ response. Fields:

ssd_ns bool

This is a non-secure ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

why enum

Why the ATOS operation generated an INV_REQ.

atos_complete_success

The ATOS operation completed successfully. Fields:

base_addr unsigned int

The actual base address of region.

effective_st1translate bool

Because of the settings and/or the ATOS type then the effective st1translate can be different.

par_addr unsigned int

The PAR.ADDR field.

par_mair unsigned int

The memory attributes encoded as a MAIR.

par_ns bool

The PAR.NS field, for an SSD-ns request then this will always be 0.

par_sh enum

Shareability.

par_size bool

The PAR.Size field.

size_in_bytes unsigned int

The actual size in bytes of the region.

ssd_ns bool

This is a non-secure ATOS operation.

st1translate bool

The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool

The translation suffered a stage 2 translation.

state enum

The final transaction state of the ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_run_set

The SMMU_s_GATOS_CTRL.RUN field was set to start the ATOS operation. Fields:

ssd_ns bool

This is a non-secure ATOS operation.

vatos bool

This is a VATOS operation.

atos_starting

The ATOS operation is starting. Fields:

addr unsigned int

The input address to the ATOS operation.

httui bool

Inhibit HTTU update.

ind bool

Instruction Data.

pnu bool

Privileged not User.

rnw bool

Read not Write.

ssd_ns bool

This is a non-secure ATOS operation.

ssec bool

If this is a secure ATOS operation then this is if it is secure or not.

streamid unsigned int

The StreamID requested.

substreamid unsigned int

The SubstreamID requested, or ~0u if no SubstreamID.

type enum

The requested ATOS type.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

axi_stream_msi_addr_to_match_s

Address to use to send SMMU originated MSIs directly to the GIC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value unsigned int

The value of the signal.

cd_cc.CD_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

cd_cc.cd_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

cd_entry_allocated

An CD entry has been allocated. Fields:

AssuredTranslation bool

The CD (and any L1CD) was fetched from an AssuredOnly stage 2 page and so might be capable of creating AssuredTranslations.

cd string

A textual description of the CD.

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

streamid unsigned int

The StreamID of the entry this will match.

substreamid unsigned int

The SubstreamID of the entry this will match. This may be zero for transactions without a SubstreamID.

conf_system_supports_bgptm

The pin is driven. This indicates system supports broadcast TLBI by PA operations. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

dpttlb_entry_allocated

A DPT TLB entry has been allocated. Fields:

AC enum

The value of the 'AC' field that controls access to this region.

FWB bool

The region is FWB.

VMID unsigned int

The VMID, if any, associated with this region.

index unsigned int

Index of the TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_pas enum

The output PAS of this DPT region.

ssd enum

The SSD of the streams this region captures.

trans_id unsigned int

The trans_id of the transaction that caused this allocation.

vmsa_formed bool

The entry was formed from VMSA information rather than from a DPT walk.

writeable bool

True if this region is writeable.

dpttlb_invalidate_intersects_but_does_not_cover_entry_range

ENCODED_SIZE < size of the region covered by the DPT entry so invalidation is not architecturally guaranteed. No invalidation is performed. Fields:

dpttlb_entry_id unsigned int

ID of the TLB entry.

entry_end_incl_address unsigned int

Last address covered by the TLB entry.

entry_start_address unsigned int

First address covered by the TLB entry.

invalidate_end_incl_address unsigned int

Last address covered by the invalidation range.

invalidate_start_address unsigned int

First address covered by the invalidation range.

ssd enum

The security state of the TLB entry.

dpttlb_overlapping_entries

Two DPT TLB entries are overlapping. Fields:

new_AC enum

The value of the 'AC' field that controls access to this region.

new_FWB bool

The region is FWB.

new_VMID unsigned int

The VMID, if any, associated with this region.

new_entry_index unsigned int

The entry index of the new DPT TLB entry.

new_entry_is_vmsa_formed bool

The new entry was inserted as a result of VMSA information.

new_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

new_input_start_address unsigned int

The start address of the input range that this matches.

new_output_pas enum

The output PAS of this DPT region.

new_ssd enum

The SSD of the streams this region captures.

new_writeable bool

True if this region is writeable.

old_AC enum

The value of the 'AC' field that controls access to this region.

old_FWB bool

The region is FWB.

old_VMID unsigned int

The VMID, if any, associated with this region.

old_entry_index unsigned int

The entry index of the old DPT TLB entry.

old_entry_is_vmsa_formed bool

The old entry was inserted as a result of VMSA information.

old_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

old_input_start_address unsigned int

The start address of the input range that this matches.

old_output_pas enum

The output PAS of this DPT region.

old_ssd enum

The SSD of the streams this region captures.

old_writeable bool

True if this region is writeable.

dvm_tlbinvalidate_complete

The DVM TLB Invalidate message completed. Fields:

id unsigned int

The unique id of this DVM message.

ok bool

The DVM message was OK.

dvm_tlbinvalidate_received

A DVM message for a TLB Invalidate has been received. Fields:

address unsigned int

The VA or IPA to use if match_address.

asid unsigned int

The ASID to match if match_asid.

by_ipa bool

The operation is for an IPA operation if match_address.

id unsigned int

The unique id of this DVM message.

ignored enum

The DVM message was ignored.

last_level bool

The operation is for last level if supported.

match_address bool

Match the address field.

match_asid bool

Match the asid field.

match_vmid bool

Match the vmid field.

num unsigned int

If a range operation, the NUM field. If a single-address operation this is 0.

prot enum

The protection level for which this TLB Invalidate will operate on.

security_world enum

The security world that this will apply to.

smmu_scale unsigned int

If a range operation, then the SCALE field with the meaning in the SMMU architecture which is different to the PE architecture. If a single-address operation this is 0.

stage1_only bool

The operation is for stage 1 only if supported.

tg enum

If a single-address or address-range operation, then the Translation Granule hint. Address-range operations always supply a Translation Granule.

translation_table_level enum

The leaf level of the translation table.

vmid unsigned int

The VMID to match if match_vmid.

found_tlb_entry_has_different_aset

Architecturally, a particular ASID either should be ASET0 or ASET1. However, we have managed to find a TLB entry that has a different ASET than that which we were searching for. This indicates a programming error. You should examine all contexts with this particular ASID/VMID and ensure they are consistent. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_start_address unsigned int

The start address of the input range that this matches.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

vmid unsigned int

VMID if appropriate.

gpf_far

An attempt was made to record a fault in SMMU_ROOT_GPF_FAR. Fields:

fault_address unsigned int

The PA input address that faulted.

fpas enum

The PAS of the input PA that suffered the fault.

is_debug bool

The record is due to a debug transaction.

lost bool

The record is lost because an existing record is active. If `is_debug`, then the record is never written, but this reports if it would have been lost if it was a real transaction.

syndrome enum

The syndrome for the fault.

gpt_cfg_far

An attempt was made to record a fault in `SMMU_ROOT_GPT_CFG_FAR`. Fields:

cfg_err enum

The configuration syndrome.

fault_address unsigned int

The PA input address that faulted.

fpas enum

The PAS of the input PA that suffered the fault.

is_debug bool

The record is due to a debug transaction.

lost bool

The record is lost because an existing record is active. If `is_debug`, then the record is never written, but this reports if it would have been lost if it was a real transaction.

syndrome enum

The syndrome for the fault.

gpt_read_block_descriptor

A GPT read has completed and found an LOGPT block descriptor. Fields:

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

begin_address unsigned int

The address range this block covers.

data unsigned int

The data fetch if it didn't abort.

end_incl_address unsigned int

The address range this block covers.

gpi enum

GPI.

gpi_violation bool

The descriptor is invalid because the GPI value is invalid.

has_res0_violation bool

The descriptor is invalid because of **RES0** violation.

pas_checking enum

The PAS of the address that we are checking.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

gpt_read_contig_descriptor

A GPT read has completed and found an L1GPT contig descriptor. Fields:

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

begin_address unsigned int

The address range this block covers.

data unsigned int

The data fetch if it didn't abort.

end_incl_address unsigned int

The address range this block covers.

gpi enum

GPI.

gpi_violation bool

The descriptor is invalid because the GPI value is invalid.

has_res0_violation bool

The descriptor is invalid because of **RES0** violation.

pas_checking enum

The PAS of the address that we are checking.

size_violation bool

The encoded size was not a valid value.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

gpt_read_granules_descriptor

A GPT read has completed and found an L1GPT granules descriptor. Fields:

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

begin_address unsigned int

The address range this block covers.

data unsigned int

The data fetch if it didn't abort.

end_incl_address unsigned int

The address range this block covers.

gpi enum

GPI.

gpi_violation bool

The descriptor is invalid because the GPI value is invalid.

pas_checking enum

The PAS of the address that we are checking.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

which_gpi_granule unsigned int

Which GPI granule the address being checked will use.

gpt_read_table_descriptor

A GPT read has completed and found an LOGPT table descriptor. Fields:

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

data unsigned int

The data fetch if it didn't abort.

has_res0_violation bool

The descriptor is invalid because of **RES0** violation.

misaligned_violation bool

The descriptor is invalid because the base address is misaligned.

out_of_range_violation bool

The descriptor is invalid because the base address is out of range of the PPS.

pas_checking enum

The PAS of the address that we are checking.

table_address unsigned int

The table address.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

gpttlb_entry_allocated

A GPT TLB entry has been allocated. Fields:

GPI enum

The GPI of the entry.

index unsigned int

Index of TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

origin enum

How this entry was formed.

httu_update_abandoned_update

The HTTU update of a descriptor in memory was potentially possible, but it was behind an update that failed to apply cleanly. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

what enum

What this descriptor represents.

httu_update_end_update

The attempted update of a descriptor in memory has occurred. Fields:

is_big_endian bool

The descriptor is big-endian in memory.

original_descriptor unsigned int

The original descriptor value.

result enum

The result of the attempt to update.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int

The new descriptor value that tried to replace the original.

value_that_was_in_memory unsigned int

The value that the compare-and-swap operation returned as the value that was in memory.

httu_update_not_done

A discretionary HTTU update could occur and the implementation choose not to do it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

what enum

What this descriptor represents.

httu_update_start_update

An HTTU update could occur and the implementation chose to try it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

is_big_endian bool

The descriptor will be written to memory as big-endian.

mecid unsigned int

The masked MECID used for the update transaction, or ~0u if not appropriate.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int

The new descriptor value that is going to try replace the original.

what enum

What this descriptor represents.

will_do_AF bool

What the implementation chose to do for the AF update.

will_do_DBM bool

What the implementation chose to do for the DBM update.

interrupt_returned

An interrupt/MSI returned from downstream. Fields:

InD_NS_PnU enum

Instruction/Data, Non-secure/Secure/Root/Realm, Privileged/User. Bit[1] = PAS[0], and bit[3] = PAS[1].

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

dcmdqcp_and_index unsigned int

If this not a DCMDQ MSI CMD_SYNC, then this is 0xFFFFFFFF. If it is then the DCMDQ QCP index is in bits[31:16] and the index in the QCP is in [7:0].

gpc_denied_msi bool

True if the MSI was denied as it failed its GPC checks. Thus the field 'ok' will be false.

id unsigned int

ID of this interrupt transaction.

inner_cache enum

The actual attributes of the access.

kind enum

What kind of interrupt.

mecid unsigned int

The MECID of the MSI, if applicable.

mpam_ns bool

For a non-RME system, this is true if the MPAM space is Non-secure. For an RME system, this is MPAM_SP[0].

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP security state of the MPAM partition. 0 – secure, 1 – non-secure, 2 – root, 3 – realm.

msi_valid bool

MSI will attempt to be sent.

ok bool

Did the access return OK or an abort?.

outer_cache enum

The actual attributes of the access.

pas enum

The PAS of the MSI, if applicable.

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum

Shareability.

interrupt_sent

An interrupt is raised. If it sends an MSI then this is *after* any device-dependent transform on the architectural attributes and so may differ from what is programmed. Fields:

InD_NS_PnU enum

Instruction/Data, Non-secure/Secure/Root/Realm, Privileged/User. Bit[1] = PAS[0], and bit[3] = PAS[1].

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

dcmdq_device_id unsigned int

If this is a DCMDQ then this is the DeviceID of the MSI write. Otherwise, 0xFFFF'ffff.

dcmdq_qcp_and_index unsigned int

If this not a DCMDQ MSI CMD_SYNC, then this is 0xFFFF'ffff. If it is then the DCMDQ QCP index is in bits[31:16] and the index in the QCP is in [7:0].

id unsigned int

ID of this interrupt transaction.

inner_cache enum

The actual attributes of the access.

kind enum

What kind of interrupt.

mecid unsigned int

The MECID of the MSI, if applicable.

mpam_ns bool

For a non-RME system, this is true if the MPAM space is Non-secure. For an RME system, this is MPAM_SP[0].

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP security state of the MPAM partition. 0 – secure, 1 – non-secure, 2 – root, 3 – realm.

msi_valid bool

MSI will attempt to be sent.

outer_cache enum

The actual attributes of the access.

pas enum

The PAS of the MSI, if applicable.

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

qSID unsigned int

If this is a DCMDQ then this is the qSID of the MSI write. Otherwise, 0xFFFF'ffff.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum

Shareability.

l0gptsz

Log2size in bytes of the region covered by an LOGPT entry. The default value is `rme_l0gpt_entry_covers_log2size_in_bytes`. This is the value reported in `SMMU_ROOT_GPT_BASE_CFG.LOGPTSZ`. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value unsigned int

The value of the signal.

l1cd_cc.L1CD_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

l1cd_cc.L1CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

l1cd_entry_allocated

An L1 CD entry has been allocated. Fields:

AssuredTranslation bool

The L1CD was fetched from an AssuredOnly stage 2 page and so might be capable of creating AssuredTranslations.

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

normalised_substreamid unsigned int

The first SubstreamID of the range of SubstreamIDs that this L1CD entry will match.

ns enum

For the non-secure world.

pa_12 unsigned int

The PA of the L2 CD table. This is `L2Ptr << 12`.

ssd enum

The SSD of the entry.

streamid unsigned int

The StreamID this CD is for.

valid bool

Is the entry valid.

l1ste_cc.L1STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

l1ste_cc.L1STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

l1ste_entry_allocated

An L1 STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

first_streamid_of_range unsigned int

The first StreamID of the range of StreamIDs that this L1STE entry will match.

ns enum

For the non-secure world.

num_entries_in_l2 unsigned int

The number of entries in the L2 table. This is $2^{**}(\text{Span}-1)$ or 0 if invalid.

pa_l2 unsigned int

The PA of the L2 ST table. This is L2Ptr << 6 and aligned to the size of the table.

ssd enum

The SSD of the entry.

legacy_tz_en

The pin is driven. If high then the SMMU does not support RME. If low and the ID codes indicate support, then the SMMU supports RME. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

level_interrupt_sent

A level interrupt changed state. Fields:

kind enum

What kind of interrupt.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a level RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

set_high bool

Level interrupt state.

ns_cmd_sync_completed_irq

“Non-secure” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_no_action

Non-secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_sev

Non-secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_with_error

Non-secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_issued

Non-secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_issuing

Non-secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_starting_completion_action_irq

Non-secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

ns_cmd_sync_starting_completion_action_sev

Non-secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

ns_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

ns_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

ns_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

ns_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

ns_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an ERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-error enum

The current ERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

ns_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

ns_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

ns_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

ns_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

ns_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

ns_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

ns_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

ns_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

ns_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

pmcg_irq_config

The interrupt configuration of the Performance Monitor Counter Group (PMCG) changed.
Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

SMMU_PMCGL_CTRL.IRQEN.

memattr enum

Memory type.

mpam_ns bool

The NS state of the MPAM PARTID and MPAM PMG.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_supported bool

Are MSIs supported for this security world.

ns bool

Non-secure bus attribute.

number_of_interrupts_in_flight unsigned int

The number of interrupts that have been committed to be produced or in flight.

pmcg_index unsigned int

Index of the PMCG.

sh enum

Shareability.

smmu_pmcg_gmpam_Update bool

The SMMU_PMC_GMPAM.Update flag. Only when this is zero are writes predictable.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen

A trace of SMMU_PMC_IRQ_CTRL.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen_ack

A trace of SMMU_PMC_IRQ_CTRLACK.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_merging_interrupts

An interrupt was wanted to be generated, but one was already pending so the two were merged together. Fields:

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_trigger

A PMCG counter has been triggered. Fields:

NoStreamID bool

True if the transaction is a NoStreamID transaction.

counter_index unsigned int

The index of the counter within the PMCG.

event_id unsigned int

The event id that has been triggered.

ns_event bool

Is the event associated with non-secure state.

pmcg_index unsigned int

Index of the PMCG.

prior_counter_value unsigned int

The Counter value *before* the event has incremented it.

ssd enum

The security state associated with the event.

streamid unsigned int

The StreamID associated with the event, if there is one.

tbu_index unsigned int

The TBU index of the transaction, or ~0u if not applicable.

pmu_active_counter

Traces what active counters are in a PMCG and what StreamIDs it might filter on. Those counters that trace StreamIDs for multiple security states, or those that are not filtered by StreamID, will appear multiple times, once for each security state. All active counters for a PMCG are traced one after another. Fields:

NoStreamID bool

True if NoStreamID transactions will be traced.

begin_streamid unsigned int

The start StreamID to filter on.

counter_index unsigned int

The counter index within the PMCG.

end_incl_streamid unsigned int

The end inclusive StreamID to filter on.

evcnt unsigned int

The current count.

event_id unsigned int

The event ID to filter.

ns bool

Are the StreamIDs non-secure?.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd enum

SSD of the StreamID.

tbu_index_to_match unsigned int

The TBU index that must match, or ~0u if no matching applicable.

pmu_all_counters_in_pmcg_became_inactive

The PMCG was tracing some events and now is not tracing any. Fields:

pmcg_index unsigned int

The index of the PMCG.

pmu_capture

For some reason, a capture event occurred. Fields:

pmcg_index unsigned int

The index of the PMCG that the capture occurred on.

why enum

Why did the capture occur?.

pmu_counter_configured_to_use_unsupported_event

An enabled counter was configured to use a unsupported event. Fields:

counter_index unsigned int

The counter index within the PMCG.

event_id unsigned int

The unsupported event id.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

pmu_counter_overflowed

A counter in a particular PMCG overflowed. Fields:

already_overflowed bool

True if the overflow flag was already set.

capture bool

True if it captured the other counter values.

counter_index unsigned int

The counter index within the PMCG.

interrupt bool

True if going to attempt to generate an interrupt.

interrupt_action enum

The interrupt action that is going to occur.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd_ns bool

The PMCG is controlled by the Non-secure security state.

priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool

The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int

The transaction ID of the PPR that caused the overflow.

priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

priq_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.RD_and_RD_wrap.

number_of_pprs unsigned int

The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int

This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int

The number of writes to the PRIQ that are currently in flight.

ovackflg bool

The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool

The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool

There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool

The value of SMMU_CRO.PRIQEN. The *effective* value is 0 if SMMUEN == 0.

priqenack bool

The value of SMMU_CROACK.PRIQEN.

prod_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool

The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CRO.PRIQEN.

smmuen bool

The value of SMMU_CRO.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool

The value of SMMU_CRO.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int

The size of the table in the number of items it can hold.

priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int

The transaction ID of the PPR that aborted.

priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we wrote..

trans_id unsigned int

The transaction ID of the PPR.

priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue.
Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int

PROD position including the wrap bit.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

ptw_read

Page Table Walk (read). This is the result of the physical access that the SMMU is making.
Fields:

abort enum

Non-zero if the access aborted/failed.

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

data unsigned int

The data fetch if it didn't abort.

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AP21 enum

The access permissions.

AttrIdx210 unsigned int

The attribute index into the MAIR0/1. If AIE is implemented then this is the full index AttrIdx[3:0].

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

NS bool

The encoding is for non-secure if this is a secure fetch.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIIIndex unsigned int

The S2PIIndex if S2PIE is in use, or 0xFFFF if not.

PXN bool

Privileged eXecute Never.

Protected enum

Is the descriptor producing an AssuredTranslation.

SH10 enum

The shareability.

XN bool

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

hwu_pbha unsigned int

Top four bits are appropriate CD.HWU, *bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by CD.HWU0/CD.HWU1**.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nG bool

not Global.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

NSTable bool

The next level table descriptor is forced to non-secure.

PXNTable bool

Force PXN independently of subsequent descriptors.

Protected enum

Is the descriptor capable of producing an AssuredTranslation.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttdb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AssuredOnly enum

The descriptor is marked as AssuredOnly.

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

HAP21 enum

The access permissions.

MemAttr3_0 enum

The memory attributes.

NS enum

Whether this descriptor forces NS.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIndex unsigned int

The S2PIndex if S2PIE is in use, or 0xFFFF if not.

POE_POIndex unsigned int

The S2POIndex if S2POE is in use, or 0xFFFF if not.

SH10 enum

The shareability.

XN enum

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

s2hwu_pbha unsigned int

Top four bits are STE.S2HWU, *bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by STE.S2HWU.*

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

PXNTable bool

Force PXN independently of subsequent descriptors.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

raw_register_end_read

The raw register read transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

read_data unsigned int

The data read.

raw_register_end_write

The raw register write transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

raw_register_start_read

The raw register read transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

raw_register_start_write

The raw register write transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

write_data unsigned int

The data to write.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string

The text description of the register value read.

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string

The text description of the register value written.

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string

The text description of the register value.

register_read_string

A text representation of the read of a register. Fields:

out string

The text description of the register value read.

register_write_reserved

A text representation of an access to a register address that is reserved or a write to a **RES0** field in a register. Fields:

in string

The text description of the register value.

register_write_string

A text representation of the write of a register. Fields:

in string

The text description of the register value written.

rl_cmd_sync_completed_irq

“Realm” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_completed_no_action

Realm CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_completed_sev

Realm CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_completed_with_error

Realm CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_issued

Realm CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_issuing

Realm CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmd_sync_starting_completion_action_irq

Realm CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

rl_cmd_sync_starting_completion_action_sev

Realm CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

rl_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

rl_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

rl_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

rl_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

rl_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

rl_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

rl_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

rl_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

rl_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

rl_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

rl_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

rl_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

rl_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

rl_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

rl_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

rl_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

rl_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

rl_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

rl_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

rl_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

rl_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

rl_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

rl_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

rl_priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool

The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int

The transaction ID of the PPR that caused the overflow.

rl_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

rl_priq_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.RD_and_RD_wrap.

number_of_pprs unsigned int

The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int

This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int

The number of writes to the PRIQ that are currently in flight.

ovackflg bool

The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool

The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool

There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool

The value of SMMU_CRO.PRIQEN. The *effective* value is 0 if SMMUEN == 0.

priqenack bool

The value of SMMU_CROACK.PRIQEN.

prod_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool

The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CRO.PRIQEN.

smmuen bool

The value of SMMU_CRO.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool

The value of SMMU_CRO.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int

The size of the table in the number of items it can hold.

rl_priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int

The transaction ID of the PPR that aborted.

rl_priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we wrote..

trans_id unsigned int

The transaction ID of the PPR.

rl_priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue.

Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int

PROD position including the wrap bit.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

s_cmd_sync_completed_irq

“Secure” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_no_action

Secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_sev

Secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_with_error

Secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issued

Secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issuing

Secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_starting_completion_action_irq

Secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

s_cmd_sync_starting_completion_action_sev

Secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

s_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

s_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

s_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

s_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

s_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

s_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

s_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwriteable and the queue is now writeable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

s_eventq_cmd_sync_unhazardded

The CMD_SYNC has been unhazardded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

s_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

s_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

s_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

s_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

s_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

s_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

s_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_gbpa_abort_init

The pin is driven. This is the reset value of SMMU_S_GBPA.ABORT. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

s_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

s_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

s_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

sec_override

Controls non-secure accesses to some registers. Fields:

value bool

The value of the signal.

sev

Send a SEV. Fields:

why enum

Why the SEV was generated.

smmu_atc_inv

The CMD_ATC_INV command is sent. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_atc_inv_completed

The CMD_ATC_INV command completed. Fields:

cmd_id unsigned int

Command id, if top-bit is set then was issued from the Non-secure CMDQ.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

response enum

The response.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_cmdq enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

smmu_atc_inv_end

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

response enum

The response to the ATC invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_atc_inv_start

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_ats_initial

This is the initial ATS request. Fields:

XT bool

The XT bit.

ia unsigned int

Input address.

max_number_of_replies unsigned int

The maximum number of replies allowed to return.

no_write bool

The NW (no write flag) of the ATS request. If clear then the requester is going to do a write.

pasid_execute_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for execution permissions.

pasid_privileged_mode_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for the privileged mode's permissions.

protected_mode bool

Is the ATS Request protected-mode?.

source_cxl bool

Does the ATS request have Source.CXL set?.

ssd enum

The SSD of the ATS request.

ssd_ns bool

Incoming SSD is non-secure.

streamid unsigned int

StreamID of the ATS request.

substreamid unsigned int

SubstreamID (which is identical to the PASID) of the ATS request. If no PASID-prefix is sent then this is ~0u.

tbu unsigned int

Translation Buffer Unit number.

smmu_ats_reply_failure

This is an ATS reply indicating failure. Fields:

event enum

Equivalent event number that would have been generated for an equivalent ordinary transaction.

failure enum

What is the failure response code?.

state enum

The transaction state of the successfully ATS request.

smmu_ats_reply_success

This is an ATS reply, typically the SMMU will only return a single response, even if the requester indicated it could accept more replies. NOTE that the SMMU responds with 'success' in some cases when a fault is encountered and RW==0. Fields:

N bool

Non-snooped access. If one then the requester must clear the NoSnoop bit on transactions, unless otherwise enabled in a Function-specific manner.

P bool

Privileged mode. These permissions related to privileged mode.

RWX enum

Read/Write/Execute.

U bool

Untranslated access. If one, and RW !=0 then use UntranslatedAccesses for the allowed accesses by RW(X).

cxl_io bool

The CXL.io response.

inner enum

The inner cacheability attributes to use for TranslatedAccesses.

input_address unsigned int

Input address of the ATS request.

instcfg enum

The STE.INSTCFG field.

outer enum

The outer cacheability attributes to use for TranslatedAccesses.

pas enum

The PAS this mapping corresponds to. This holds the same information as the TE bit for realm streams.

privcfg enum

The STE.PRIVCFG field.

shareability unsigned int

The shareability to use for TranslatedAccesses.

size unsigned int

The size of the region covered by this translation.

state enum

The transaction state of the successfully ATS request.

translated_address unsigned int

If $RW \neq 0$ && $U \neq 0$, then the Translated Address that a TranslatedAccess can be made with.

smmu_axi_stream_msi

An SMMU generated MSI is directly sent through the axi_stream_msi_m port, typically connected to the GIC port axi_stream_msi_s. Fields:

TDEST unsigned int

Routing information for the data stream, typically identifying the GIC.

TID unsigned int

Data stream identifier for the SMMU.

axi_stream_msi_addr_to_match unsigned int

Current address to match for SMMU-originated MSIs to send out of the axi_stream_msi_m port.

data unsigned int

The MSI sent.

smmu_final_transaction

This is the transaction group request to remap has completed one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. If it stalls then it will report through this trace source, stall (stag_if_stalling != ~0u) and when resume will issue another smmu_initial_transaction as it undergoes remapping again. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

begin_input_address_range unsigned int

The start of the input address range that is size_of_region_in_bytes.

begin_ipa_range unsigned int

The start of the IPA range that is of size_of_region_in_bytes.

begin_output_address_range unsigned int

The start of the output address range that is of size_of_region_in_bytes.

cmo_point enum

The point associated with the CMO, if applicable.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

ipa_address unsigned int

The IPA of the transaction.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The MECID of the transaction.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

operation enum

The kind of operation that this represents.

output_address unsigned int

The input address of the transaction group.

output_inner enum

Inner cacheability for the output attributes.

output_outer enum

Outer cacheability for the output attributes.

output_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

output_sh enum

Shareability for the output attributes.

output_vmid unsigned int

The output VMID/GBPA.IMPDEF or ~0u if not valid.

size_of_region_in_bytes unsigned int

An imp def size of region for which this translation is valid for.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

stag_if_stalling unsigned int

This is the STAG used by the transaction if it is going to stall. It is ~0u if it is not going to stall.

state enum

The final transaction state.

streamid unsigned int

The StreamID of the transaction. ~0ull if NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_gpt_read

A GPT read has completed. Fields:

unsigned int

.

abort enum

Non-zero if the access aborted/failed.

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

adomain enum

The shareability of the access.

data unsigned int

The data fetched if it didn't abort.

inner_cache enum

The architectural attributes used for the access.

level unsigned int

The level of the GPT walk.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of this GPT access.

outer_cache enum

The architectural attributes used for the access.

pas_checking enum

The PAS of the address that we are checking.

post_access_check bool

Is this GPT walk after the access it is checking.

table_base unsigned int

The base address of the table.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

smmu_gpt_tlb_invalidate

A GPT TLB invalidate has been initiated. Fields:

address unsigned int

The address as it appears in the operation.

encoded_size unsigned int

The size as it is encoded in the operation.

kind enum

The kind of operation this is.

pgs_in_bytes unsigned int

The PGS size in bytes.

size_in_bytes unsigned int

For range operations, the size as it appears in the operation.

source enum

Where the TLBI came from.

state enum

Is the operation well formed.

trans_id unsigned int

The transaction id of this invalidate.

smmu_gpt_tlb_invalidate_complete

The GPT TLB invalidate completed. Fields:

source enum

Where the TLBI came from.

trans_id unsigned int

The transaction id of this invalidate.

smmu_initial_transaction

This is the transaction group request to remap is going to start one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. A stalling transaction will report through this trace source when it unstalls. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

XT_and_output_pas_checking enum

The XT bit for PCIe Transactions. This specifies the requested check on the output PAS that the device asked for.

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum

The point associated with the CMO, if applicable.

dcmdq_qcp_and_index unsigned int

If this is a DCMDQ fetch being translated then this field indicates the DCMDQ QCP index in bits [23:8] and the index in the page in bits [7:0]. Otherwise this is 0xFFFFFFFF.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The incoming MECID for NoStreamID transactions. ~0u for all other transactions.

mpam_partid unsigned int

The MPAM_PARTID for NoStreamID transactions. ~0u for all other transactions.

mpam_pmg unsigned int

The MPAM_PMG for NoStreamID transactions. ~0u for all other transactions.

mpam_sp enum

The MPAM_SP for NoStreamID transactions. ~0u for all other transactions.

operation enum

The kind of operation that this represents.

protected_mode enum

The PM bit.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_normalize_input_transaction

If the input transaction is normalized before being processed then this traceevent will fire. This is usually dependent on parameters of the implementation. Fields:

incoming_inner enum

The inner cacheability attributes.

incoming_is_instruction bool

The incoming transaction is marked as 'instruction'.

incoming_is_privileged bool

The incoming transaction is marked as 'privileged'.

incoming_outer enum

The outer cacheability attributes.

incoming_pas enum

The PAS of the incoming transaction.

incoming_shareability unsigned int

The incoming shareability.

normalized_inner enum

The normalized inner cacheability attributes.

normalized_is_instruction bool

The incoming transaction is marked as 'instruction'.

normalized_is_privileged bool

The incoming transaction is marked as 'privileged'.

normalized_outer enum

The normalized outer cacheability attributes.

normalized_pas enum

The PAS this mapping corresponds to.

normalized_shareability unsigned int

The normalized shareability.

ssd enum

The SSD of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xffffffff if no SubstreamID.

trans_id unsigned int

ID of the original transaction.

smmu_pmusnapshot_ack

Acknowledge the pmusnapshot_req to indicate the snapshot has occurred. This is part of a four-phase handshake. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_pmusnapshot_ack_overridden

The value of pmusnapshot_ack was overridden (likely due to being in integration mode). Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_pmusnapshot_ack_override_end

The overriding of the pmusnapshot_ack signal has ended. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

smmu_pmusnapshot_req

Take a snap shot of the PMU values as though SMMU_PMCG_CAPR.CAPTURE had been written. This is part of a four-phase handshake. Fields:

pin_index unsigned int

The pin index of the signal, or ~0u if not relevant.

pmcg_index enum

The PMCG index.

value bool

The value of the signal.

smmu_poison_tw_data

Poison data has been returned to a table walk transaction. Fields:

bitmap_of_poison unsigned int

The bitmap of which beats of the transaction where poisoned.

is_cas bool

True if this is a compare-and-swap operation.

number_of_64bit_beats unsigned int

Number of beats this transaction fetched.

paddress unsigned int

Physical address of the table walk transaction.

pas enum

The PAS of the bus transaction.

ras_group_id unsigned int

If non-~0u then is the RAS group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

ras_record_index_in_group unsigned int

If non-~0u then is the RAS record index in the group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

what enum

What table walk was being performed.

smmu_pri_resp

The CMD_PRI_RESP command is queued to be sent to the PCIe system. Fields:

auto_response_trans_id unsigned int

trans_id of PRI request we are auto-responding to, or ~0ull if not valid.

cmd_id unsigned int

Command id, or ~0ull if not valid.

cons unsigned int

CONS of the command. ~0u if an auto-response.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_pri_resp_nop

The CMD_PRI_RESP command was NOPped. Fields:

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why the CMD_PRI_RESP was NOPped.

smmu_priq_resp_fake_return

A PRIQ Response is posted to the PCIe subsystem and so has no acknowledgement that it is received. However, in the model then we artificially know when the the PRIQ Response has been delivered to the PCIe subsystem, even if the ATC has not yet acted on it. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

what enum

What happened.

smmu_priq_resp_start

A PRIQ Response has been posted to the PCIe subsystem. As the response is posted then there is no way of knowing when it is received by the EndPoint. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_start_gpt_read

A GPT read is about to be issued. Fields:

address_checking unsigned int

The address that we are checking.

address_gptdesc unsigned int

The address of the GPT descriptor.

adomain enum

The shareability of the access.

inner_cache enum

The architectural attributes used for the access.

level unsigned int

The level of the GPT walk.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of this GPT access.

outer_cache enum

The architectural attributes used for the access.

pas_checking enum

The PAS of the address that we are checking.

post_access_check bool

Is this GPT walk after the access it is checking.

read_size unsigned int

The size of the GPT read in bytes.

table_base unsigned int

The base address of the table.

trans_id unsigned int

The trans_id of the transaction we are checking if appropriate.

what_checking enum

What kind of access are we checking.

smmu_thread_wait_wake

Traces a thread's wait/wake status. Fields:

current_ticks unsigned int

The current tick count of simulated time.

event enum

What is happening to this thread.

thread_index unsigned int

The ID of this thread.

ticks unsigned int

If the event relates to a time then this is held in this field. Otherwise, 0.

stall_transaction

A transaction is about to stall. Fields:

stag unsigned int

STAG.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_inhibited_by_STALL_MAX

A transaction is about to stall but the maximum number of transactions have stalled and we can't report this one to the event queue (even if non-full). Fields:

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_resuming

A stalled transaction is resuming. Fields:

stag unsigned int

STAG if appropriate, or if was inhibited by STALL_MAX then 0xFAFA.

stallresult enum

What the transaction resumed to do.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ste_cc.STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

ste_cc.STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

ste_entry_allocated

An STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

ste string

A textual description of the STE.

streamid unsigned int

The StreamID of the entry this will match.

sup_btm

The pin is driven. This indicates the system supports BTM. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_cohacc

The pin is driven. This indicates the system supports COHACC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_httu

The pin is driven. This indicates the system supports HTTU. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

sup_sev

The pin is driven. This indicates the system supports SEV. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

tbu0_reset_in

The reset signal of the TBU0. Fields:

value bool

The value of the signal.

tcu_reset_in

The reset signal. Fields:

value bool

The value of the signal.

tlb_entry_allocated

A TLB entry has been allocated. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_end_incl_address unsigned int

The end inclusive address of the output range.

output_start_address unsigned int

The start address of the output range.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

tbi bool

Was the entry formed using Top Byte Ignore (TBI).

vmid unsigned int

VMID if appropriate.

tlb_info_tlb_entries_overlap

A TLB entry was inserted into the TLB and it overlaps an existing entry. This isn't a problem as it was inserted in such a way that it architecturally works. Fields:

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

how_inserted enum

How the entry was inserted.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

verbose_commentary

This is a verbose commentary on the translation process the SMMU is performing. Fields:

output string

The stream output.

warning_MSI_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.
Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_R_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_R_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_R_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_R_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_R_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_pmcg_address_out_of_range_of_oas

The MSI Address of the Performance Monitor Counter Group (PMCG) is out of range of the OAS and so will be silently truncated. Fields:

address unsigned int

The untruncated address of the MSI.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

warning_discarding_interrupt_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HDBSS_IRQEN.

warning_discarding_interrupt_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_R_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_R_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_R_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_R_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_R_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_R_IRQ_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_R_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_R_IRQ_CTRL.HDBSS_IRQEN.

warning_discarding_interrupt_R_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_R_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_S_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_S_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_S_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_S_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HDBSS_IRQEN.

warning_ns_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc string

The textual description of what happened.

warning_rl_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

warning_s_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which_enum

Which GERROR was acknowledge when there was no active error.

what_going_to_do_with_terminated_event

A terminating transaction has produced an event, this tells you what the model is going to do with the event. Fields:

CD.S bool

The CD.S field if available.

S2 bool

The event is related to Stage 2.

STE.S1STALLD bool

The STE.S1STALLD field if available.

STE.S2S bool

The STE.S2S field if available.

aborts bool

The transaction will abort.

axmmuflow_enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

is_tr_fault bool

Is a Translation Related fault.

protected_mode bool

The transaction is protected-mode. As such, it cannot stall and will obey the report configuration bits.

reports bool

The transaction will attempt to report.

ssd_enum

The SSD of the transaction.

ssd_ns bool

The transaction is classified as SSD non-secure.

supports_stall_model bool

The implementation supports the stall model.

trans_id unsigned int

The transaction id.

why_abort_decision_enum

The reason why the transaction aborted/did not abort.

why_report_decision enum

The reason why the transaction reported/did not report.

2.129 Mali_C10

This section describes the trace sources.

ISP_Irq

IRQ signal %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_STATE bool

The IRQ state.

ISP_Read

Register address: %{REG_ADDRESS} Value: %{VALUE}. Fields:

REG_ADDRESS unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

ISP_Reset

Reset %{IN_RESET:(YES|NO)}. Fields:

IN_RESET bool

Reset state is IN_RESET or NOT_IN_RESET.

ISP_Write

Register address: %{REG_ADDRESS} Value %{VALUE}. Fields:

REG_ADDRESS unsigned int

The address of the register write.

VALUE unsigned int

Write Value to the register.

2.130 Mali_C55

This section describes the trace sources.

ISP_Irq

IRQ signal %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_STATE bool

The IRQ state.

ISP_Read

Register address: %{REG_ADDRESS} Value: %{VALUE}. Fields:

REG_ADDRESS unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

ISP_Reset

Reset %{IN_RESET:(YES|NO)}. Fields:

IN_RESET bool

Reset state is IN_RESET or NOT_IN_RESET.

ISP_Write

Register address: %{REG_ADDRESS} Value %{VALUE}. Fields:

REG_ADDRESS unsigned int

The address of the register write.

VALUE unsigned int

Write Value to the register.

2.131 Mali_C71

This section describes the trace sources.

ISP_Irq

IRQ signal %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_STATE bool

The IRQ state.

ISP_Read

Register address: %{REG_ADDRESS} Value: %{VALUE}. Fields:

REG_ADDRESS unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

ISP_Reset

Reset %{IN_RESET:(YES|NO)}. Fields:

IN_RESET bool

Reset state is IN_RESET or NOT_IN_RESET.

ISP_Write

Register address: %{REG_ADDRESS} Value %{VALUE}. Fields:

REG_ADDRESS unsigned int

The address of the register write.

VALUE unsigned int

Write Value to the register.

2.132 Mali_C720AE

This section describes the trace sources.

ISP_Irq

IRQ signal %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_STATE bool

The IRQ state.

ISP_Read

Register address: %{REG_ADDRESS} Value: %{VALUE}. Fields:

REG_ADDRESS unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

ISP_Reset

Reset %{IN_RESET:(YES|NO)}. Fields:

IN_RESET bool

Reset state is IN_RESET or NOT_IN_RESET.

ISP_Write

Register address: %{REG_ADDRESS} Value %{VALUE}. Fields:

REG_ADDRESS unsigned int

The address of the register write.

VALUE unsigned int

Write Value to the register.

2.133 Mali_C78

This section describes the trace sources.

ISP_Irq

IRQ signal %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_STATE bool

The IRQ state.

ISP_Read

Register address: %{REG_ADDRESS} Value: %{VALUE}. Fields:

REG_ADDRESS unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

ISP_Reset

Reset %{IN_RESET:(YES|NO)}. Fields:

IN_RESET bool

Reset state is IN_RESET or NOT_IN_RESET.

ISP_Write

Register address: %{REG_ADDRESS} Value %{VALUE}. Fields:

REG_ADDRESS unsigned int

The address of the register write.

VALUE unsigned int

Write Value to the register.

2.134 Mali_G1

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset.
Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

INFO_GpuDmiAcquired

GPU acquired DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiFailed

GPU failed to acquire DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiRevoked

GPU lost DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuStatsMemoryAccess

Statistics about memory access performance, emitted every 1000000 accesses. Fields:

READ_ACCESSES_WITHOUT_DMI unsigned int

Total number of read accesses performed without DMI.

READ_ACCESSES_WITH_DMI unsigned int

Total number of read accesses performed with DMI.

WRITE_ACCESSES_WITHOUT_DMI unsigned int

Total number of write accesses performed without DMI.

WRITE_ACCESSES_WITH_DMI unsigned int

Total number of write accesses performed with DMI.

INFO_Irq

IRQ signal received (%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_NAME string

The IRQ name.

IRQ_STATE bool

The IRQ state.

INFO_ReadRegister

GPU Register Offset: %{REG_OFFSET} Value: %{VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register read.

REG_OFFSET unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

INFO_Reset

GPU Reset %{STATE:(START|END)}. Fields:

STATE bool

Reset state is start or end.

INFO_WriteRegister

GPU Register Offset: %{REG_OFFSET} Updated: From value %{VALUE} To value %{UPDATED_VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register updated.

REG_OFFSET unsigned int

The address of the register updated.

UPDATED_VALUE unsigned int

New Value in the register.

VALUE unsigned int

Old Value in the register.

WARN_AccessToUnimplementedRegister

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

WARN_ReadToWriteOnlyRegister

GPU Register Read to address: %{ADDR} FAILED as the register is write-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

WARN_WriteToReadOnlyRegister

GPU Register Write to address: %{ADDR} FAILED as the register is read-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

2.135 Mali_G71

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

INFO_GpuDmiAcquired

GPU acquired DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiFailed

GPU failed to acquire DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiRevoked

GPU lost DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuStatsMemoryAccess

Statistics about memory access performance, emitted every 1000000 accesses. Fields:

READ_ACCESSSES_WITHOUT_DMI unsigned int

Total number of read accesses performed without DMI.

READ_ACCESSSES_WITH_DMI unsigned int

Total number of read accesses performed with DMI.

WRITE_ACCESSSES_WITHOUT_DMI unsigned int

Total number of write accesses performed without DMI.

WRITE_ACCESSSES_WITH_DMI unsigned int

Total number of write accesses performed with DMI.

INFO_Irq

IRQ signal received ({IRQ_NAME}) state {IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_NAME string

The IRQ name.

IRQ_STATE bool

The IRQ state.

INFO_ReadRegister

GPU Register Offset: {REG_OFFSET} Value: {VALUE} RegName: {REG_NAME}. Fields:

REG_NAME string

The name of the register read.

REG_OFFSET unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

INFO_Reset

GPU Reset {STATE:(START|END)}. Fields:

STATE bool

Reset state is start or end.

INFO_WriteRegister

GPU Register Offset: {REG_OFFSET} Updated: From value {VALUE} To value {UPDATED_VALUE} RegName: {REG_NAME}. Fields:

REG_NAME string

The name of the register updated.

REG_OFFSET unsigned int

The address of the register updated.

UPDATED_VALUE unsigned int

New Value in the register.

VALUE unsigned int

Old Value in the register.

WARN_AccessToUnimplementedRegister

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

WARN_ReadToWriteOnlyRegister

GPU Register Read to address: %{ADDR} FAILED as the register is write-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

WARN_WriteToReadOnlyRegister

GPU Register Write to address: %{ADDR} FAILED as the register is read-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

2.136 Mali_G710

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

INFO_GpuDmiAcquired

GPU acquired DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiFailed

GPU failed to acquire DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiRevoked

GPU lost DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuStatsMemoryAccess

Statistics about memory access performance, emitted every 1000000 accesses. Fields:

READ_ACCESSES_WITHOUT_DMI unsigned int

Total number of read accesses performed without DMI.

READ_ACCESSES_WITH_DMI unsigned int

Total number of read accesses performed with DMI.

WRITE_ACCESSES_WITHOUT_DMI unsigned int

Total number of write accesses performed without DMI.

WRITE_ACCESSES_WITH_DMI unsigned int

Total number of write accesses performed with DMI.

INFO_Irq

IRQ signal received (%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_NAME string

The IRQ name.

IRQ_STATE bool

The IRQ state.

INFO_ReadRegister

GPU Register Offset: %{REG_OFFSET} Value: %{VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register read.

REG_OFFSET unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

INFO_Reset

GPU Reset %{STATE:(START|END)}. Fields:

STATE bool

Reset state is start or end.

INFO_WriteRegister

GPU Register Offset: %{REG_OFFSET} Updated: From value %{VALUE} To value %{UPDATED_VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register updated.

REG_OFFSET unsigned int

The address of the register updated.

UPDATED_VALUE unsigned int

New Value in the register.

VALUE unsigned int

Old Value in the register.

WARN_AccessToUnimplementedRegister

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

WARN_ReadToWriteOnlyRegister

GPU Register Read to address: %{ADDR} FAILED as the register is write-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

WARN_WriteToReadOnlyRegister

GPU Register Write to address: %{ADDR} FAILED as the register is read-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

2.137 Mali_G715

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

INFO_GpuDmiAcquired

GPU acquired DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiFailed

GPU failed to acquire DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiRevoked

GPU lost DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuStatsMemoryAccess

Statistics about memory access performance, emitted every 1000000 accesses. Fields:

READ_ACCESSSES_WITHOUT_DMI unsigned int

Total number of read accesses performed without DMI.

READ_ACCESSSES_WITH_DMI unsigned int

Total number of read accesses performed with DMI.

WRITE_ACCESSSES_WITHOUT_DMI unsigned int

Total number of write accesses performed without DMI.

WRITE_ACCESSSES_WITH_DMI unsigned int

Total number of write accesses performed with DMI.

INFO_Irq

IRQ signal received ({IRQ_NAME}) state {IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_NAME string

The IRQ name.

IRQ_STATE bool

The IRQ state.

INFO_ReadRegister

GPU Register Offset: {REG_OFFSET} Value: {VALUE} RegName: {REG_NAME}. Fields:

REG_NAME string

The name of the register read.

REG_OFFSET unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

INFO_Reset

GPU Reset {STATE:(START|END)}. Fields:

STATE bool

Reset state is start or end.

INFO_WriteRegister

GPU Register Offset: {REG_OFFSET} Updated: From value {VALUE} To value {UPDATED_VALUE} RegName: {REG_NAME}. Fields:

REG_NAME string

The name of the register updated.

REG_OFFSET unsigned int

The address of the register updated.

UPDATED_VALUE unsigned int

New Value in the register.

VALUE unsigned int

Old Value in the register.

WARN_AccessToUnimplementedRegister

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

WARN_ReadToWriteOnlyRegister

GPU Register Read to address: %{ADDR} FAILED as the register is write-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

WARN_WriteToReadOnlyRegister

GPU Register Write to address: %{ADDR} FAILED as the register is read-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

2.138 Mali_G720

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

INFO_GpuDmiAcquired

GPU acquired DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiFailed

GPU failed to acquire DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiRevoked

GPU lost DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuStatsMemoryAccess

Statistics about memory access performance, emitted every 1000000 accesses. Fields:

READ_ACCESSES_WITHOUT_DMI unsigned int

Total number of read accesses performed without DMI.

READ_ACCESSES_WITH_DMI unsigned int

Total number of read accesses performed with DMI.

WRITE_ACCESSES_WITHOUT_DMI unsigned int

Total number of write accesses performed without DMI.

WRITE_ACCESSES_WITH_DMI unsigned int

Total number of write accesses performed with DMI.

INFO_Irq

IRQ signal received (%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_NAME string

The IRQ name.

IRQ_STATE bool

The IRQ state.

INFO_ReadRegister

GPU Register Offset: %{REG_OFFSET} Value: %{VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register read.

REG_OFFSET unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

INFO_Reset

GPU Reset %{STATE:(START|END)}. Fields:

STATE bool

Reset state is start or end.

INFO_WriteRegister

GPU Register Offset: %{REG_OFFSET} Updated: From value %{VALUE} To value %{UPDATED_VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register updated.

REG_OFFSET unsigned int

The address of the register updated.

UPDATED_VALUE unsigned int

New Value in the register.

VALUE unsigned int

Old Value in the register.

WARN_AccessToUnimplementedRegister

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

WARN_ReadToWriteOnlyRegister

GPU Register Read to address: %{ADDR} FAILED as the register is write-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

WARN_WriteToReadOnlyRegister

GPU Register Write to address: %{ADDR} FAILED as the register is read-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

2.139 Mali_G725

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

INFO_GpuDmiAcquired

GPU acquired DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiFailed

GPU failed to acquire DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiRevoked

GPU lost DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuStatsMemoryAccess

Statistics about memory access performance, emitted every 1000000 accesses. Fields:

READ_ACCESSSES_WITHOUT_DMI unsigned int

Total number of read accesses performed without DMI.

READ_ACCESSSES_WITH_DMI unsigned int

Total number of read accesses performed with DMI.

WRITE_ACCESSSES_WITHOUT_DMI unsigned int

Total number of write accesses performed without DMI.

WRITE_ACCESSSES_WITH_DMI unsigned int

Total number of write accesses performed with DMI.

INFO_Irq

IRQ signal received ({IRQ_NAME}) state {IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_NAME string

The IRQ name.

IRQ_STATE bool

The IRQ state.

INFO_ReadRegister

GPU Register Offset: {REG_OFFSET} Value: {VALUE} RegName: {REG_NAME}. Fields:

REG_NAME string

The name of the register read.

REG_OFFSET unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

INFO_Reset

GPU Reset {STATE:(START|END)}. Fields:

STATE bool

Reset state is start or end.

INFO_WriteRegister

GPU Register Offset: {REG_OFFSET} Updated: From value {VALUE} To value {UPDATED_VALUE} RegName: {REG_NAME}. Fields:

REG_NAME string

The name of the register updated.

REG_OFFSET unsigned int

The address of the register updated.

UPDATED_VALUE unsigned int

New Value in the register.

VALUE unsigned int

Old Value in the register.

WARN_AccessToUnimplementedRegister

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

WARN_ReadToWriteOnlyRegister

GPU Register Read to address: %{ADDR} FAILED as the register is write-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

WARN_WriteToReadOnlyRegister

GPU Register Write to address: %{ADDR} FAILED as the register is read-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

2.140 Mali_G76

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

INFO_GpuDmiAcquired

GPU acquired DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiFailed

GPU failed to acquire DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiRevoked

GPU lost DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuStatsMemoryAccess

Statistics about memory access performance, emitted every 1000000 accesses. Fields:

READ_ACCESSES_WITHOUT_DMI unsigned int

Total number of read accesses performed without DMI.

READ_ACCESSES_WITH_DMI unsigned int

Total number of read accesses performed with DMI.

WRITE_ACCESSES_WITHOUT_DMI unsigned int

Total number of write accesses performed without DMI.

WRITE_ACCESSES_WITH_DMI unsigned int

Total number of write accesses performed with DMI.

INFO_Irq

IRQ signal received (%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_NAME string

The IRQ name.

IRQ_STATE bool

The IRQ state.

INFO_ReadRegister

GPU Register Offset: %{REG_OFFSET} Value: %{VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register read.

REG_OFFSET unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

INFO_Reset

GPU Reset %{STATE:(START|END)}. Fields:

STATE bool

Reset state is start or end.

INFO_WriteRegister

GPU Register Offset: %{REG_OFFSET} Updated: From value %{VALUE} To value %{UPDATED_VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register updated.

REG_OFFSET unsigned int

The address of the register updated.

UPDATED_VALUE unsigned int

New Value in the register.

VALUE unsigned int

Old Value in the register.

WARN_AccessToUnimplementedRegister

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

WARN_ReadToWriteOnlyRegister

GPU Register Read to address: %{ADDR} FAILED as the register is write-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

WARN_WriteToReadOnlyRegister

GPU Register Write to address: %{ADDR} FAILED as the register is read-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

2.141 Mali_G78AE

This section describes the trace sources.

CloseWindow

Access Window Index: %{AW_ID} Partition Index: %{PT_ID} Owinging Group Index: %{GROUP_ID}. Fields:

AW_ID signed int

Closed access window index.

GROUP_ID signed int

Resource group that owns the window/partition.

PT_ID signed int

Partition index for which the window was closed.

MessageToGroup

Originating Window: \${AW_ID} Receiving Group \${GROUP_ID} Value 0: %{VAL0} Value 1: %{VAL1}. Fields:

AW_ID signed int

Originating Access Window.

GROUP_ID signed int

Destination Resource Group.

VAL0 unsigned int

Message Value 0.

VAL1 unsigned int

Message Value 1.

MessageToWindow

Originating Group: \${GROUP_ID} Receiving Window \${AW_ID} Value 0: %{VAL0} Value 1: %{VAL1}. Fields:

AW_ID signed int

Destination Access Window.

GROUP_ID signed int

Originating Resource Group.

VAL0 unsigned int

Message Value 0.

VAL1 unsigned int

Message Value 1.

OpenWindow

Access Window Index: %{AW_ID} Partition Index: %{PT_ID} Owning Group Index: %{GROUP_ID} Stream ID: \${SID} Protected Stream ID: %{PSID}. Fields:

AW_ID signed int

Opened access window index.

GROUP_ID signed int

Resource group that owns the window/partition.

PSID unsigned int

Protected StreamID of the window.

PT_ID signed int

Partition index for which the window was opened.

SID unsigned int

StreamID of the window.

PartitionIRQ

IRQ type: %{TYPE} State: %{STATE} Partition index: %{PARTITION} Access Window index: %{WINDOW}. Fields:

PARTITION unsigned int

Index of the partition that raised the interrupt.

STATE enum

Interrupt state.

TYPE enum

Type of the interrupt.

WINDOW unsigned int

Access Window opened for the partition.

PartitionManagerReset

Reset Type: %{TYPE}. Fields:

TYPE enum

Type of the reset.

PartitionResetSignal

Partition Index: %{PARTITION} Signal State: %{STATE}. Fields:

INDEX unsigned int

Partition Index.

STATE enum

Reset signal state.

ReadRegister

PTM Register Page: \${PAGE_TYPE} Page Index \${PAGE_ID} GPU Register Offset: \${REG_OFFSET} Value: \${VALUE}. Fields:

PAGE_ID unsigned int

Index of the PTM register page (0 if only one instance exists).

PAGE_TYPE string

Type of the PTM register page.

REG_OFFSET unsigned int

Offset into the register page.

VALUE unsigned int

Read Value from the register.

RemapDecision

Access Address: \${ADDR} Decision: \${DECISION}. Fields:

ADDR unsigned int

Address of memory access.

DECISION enum

What remap decision has been made.

RemapDecisionRevoked

Reason for revoke \${REASON}. Fields:

REASON enum

Reason for the revoke.

ResourceIRQ

IRQ type: \${TYPE} Index: \${INDEX} State: \${STATE} Status Register: \${STATUS}. Fields:

INDEX unsigned int

IRQ index.

STATE enum

Interrupt state.

STATUS unsigned int

IRQ status register.

TYPE enum

Type of the interrupt.

SystemIRQ

IRQ type: %{TYPE} State: %{STATE} Status Register 0: %{STATUS0} Status Register 1: %{STATUS1} Status Register 2: %{STATUS2}. Fields:

STATE enum

Interrupt state.

STATUS0 unsigned int

IRQ status register 0.

STATUS1 unsigned int

IRQ status register 1.

STATUS2 unsigned int

IRQ status register 2.

TYPE enum

Type of the interrupt.

WriteRegister

PTM Register Page: \${PAGE_TYPE} Page Index \${PAGE_ID} GPU Register Offset: %{REG_OFFSET} Value: %{VALUE}. Fields:

PAGE_ID unsigned int

Index of the PTM register page (0 if only one instance exists).

PAGE_TYPE string

Type of the PTM register page.

REG_OFFSET unsigned int

Offset into the register page.

VALUE unsigned int

Value written to the register.

2.142 Mali_T624

This section describes the trace sources.

INFO_AccessInReset

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as GPU is being reset. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

INFO_GpuDmiAcquired

GPU acquired DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiFailed

GPU failed to acquire DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuDmiRevoked

GPU lost DMI over address range [%{ADDR_LO},%{ADDR_HI}]. Fields:

ADDR_HI unsigned int

High-address of the DMI pointer.

ADDR_LO unsigned int

Low-address of the DMI pointer.

INFO_GpuStatsMemoryAccess

Statistics about memory access performance, emitted every 1000000 accesses. Fields:

READ_ACCESSES_WITHOUT_DMI unsigned int

Total number of read accesses performed without DMI.

READ_ACCESSES_WITH_DMI unsigned int

Total number of read accesses performed with DMI.

WRITE_ACCESSES_WITHOUT_DMI unsigned int

Total number of write accesses performed without DMI.

WRITE_ACCESSES_WITH_DMI unsigned int

Total number of write accesses performed with DMI.

INFO_Irq

IRQ signal received (%{IRQ_NAME}) state %{IRQ_STATE:(SET|CLEAR)}. Fields:

IRQ_NAME string

The IRQ name.

IRQ_STATE bool

The IRQ state.

INFO_ReadRegister

GPU Register Offset: %{REG_OFFSET} Value: %{VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register read.

REG_OFFSET unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

INFO_Reset

GPU Reset %{STATE:(START|END)}. Fields:

STATE bool

Reset state is start or end.

INFO_WriteRegister

GPU Register Offset: %{REG_OFFSET} Updated: From value %{VALUE} To value %{UPDATED_VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register updated.

REG_OFFSET unsigned int

The address of the register updated.

UPDATED_VALUE unsigned int

New Value in the register.

VALUE unsigned int

Old Value in the register.

WARN_AccessToUnimplementedRegister

GPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

WARN_ReadToWriteOnlyRegister

GPU Register Read to address: %{ADDR} FAILED as the register is write-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

WARN_WriteToReadOnlyRegister

GPU Register Write to address: %{ADDR} FAILED as the register is read-only RegName: %{REG_NAME}. Fields:

ADDR unsigned int

Address of the accessed register.

REG_NAME string

The name of the register updated.

2.143 MessageHandlingUnitV2

This section describes the trace sources.

RECV_ArchMsg.Warning.MemoryMapped_AccessAborted

DISPLAY Receiver is asleep, access to message registers BLOCKED, address=%{VALUE}.

Fields:

OFFSET unsigned int

Offset of address within the MHU.

RECV_ArchMsg.Warning.MemoryMapped_ReadReserved

DISPLAY Reserved location attempting to be read. Fields:

OFFSET unsigned int

Offset of address within the MHU.

RECV_ArchMsg.Warning.MemoryMapped_ReadWriteOnlyReg

DISPLAY Write-only register %{REG_NAME} attempting to be read. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being read.

RECV_ArchMsg.Warning.MemoryMapped_WriteReadOnlyReg

DISPLAY Read-only register %{REG_NAME} attempting to be written with value %{VALUE}.

Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being written.

VALUE unsigned int

Value written.

RECV_ArchMsg.Warning.MemoryMapped_WriteReserved

DISPLAY Reserved location attempting to be written with value %{VALUE}. Fields:

OFFSET unsigned int

Offset of address within the MHU.

VALUE unsigned int

Value written.

RECV_MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being read.

VALUE unsigned int

Value returned.

RECV_MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being written.

UPDATED_VALUE unsigned int

New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int

Value written.

SEND_ArchMsg.Warning.MemoryMapped_AccessAborted

DISPLAY Receiver is asleep, access to message registers BLOCKED, address=%{VALUE}.

Fields:

OFFSET unsigned int

Offset of address within the MHU.

SEND_ArchMsg.Warning.MemoryMapped_ReadReserved

DISPLAY Reserved location attempting to be read. Fields:

OFFSET unsigned int

Offset of address within the MHU.

SEND_ArchMsg.Warning.MemoryMapped_ReadWriteOnlyReg

DISPLAY Write-only register %{REG_NAME} attempting to be read. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being read.

SEND_ArchMsg.Warning.MemoryMapped_WriteReadOnlyReg

DISPLAY Read-only register %{REG_NAME} attempting to be written with value %{VALUE}. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being written.

VALUE unsigned int

Value written.

SEND_ArchMsg.Warning.MemoryMapped_WriteReserved

DISPLAY Reserved location attempting to be written with value %{VALUE}. Fields:

OFFSET unsigned int

Offset of address within the MHU.

VALUE unsigned int

Value written.

SEND_MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being read.

VALUE unsigned int

Value returned.

SEND_MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being written.

UPDATED_VALUE unsigned int

New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int

Value written.

2.144 MessageHandlingUnitV3

This section describes the trace sources.

MHU:InterruptCombinedMailbox

Trace interrupt to combined mailbox. Fields:

LEVEL string

level of interrupt signal.

MHU:InterruptCombinedPostbox

Trace interrupt to combined postbox. Fields:

LEVEL string

level of interrupt signal.

MHU:InterruptReceiverFastChannel

Trace interrupt to receiver fast channel. Fields:

CHANNEL unsigned int

channel of interrupt signal.

LEVEL string

level of interrupt signal.

MHU:InterruptReceiverFastChannelGroup

Trace interrupt to receiver fast group. Fields:

GROUP unsigned int

fast channel group of interrupt signal.

LEVEL string

level of interrupt signal.

MHU_RECV:MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being read.

VALUE unsigned int

Value returned.

MHU_RECV:MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being written.

UPDATED_VALUE unsigned int

New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int

Value written.

MHU_SEND:MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being read.

VALUE unsigned int

Value returned.

MHU_SEND:MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the MHU.

REG_NAME string

Name of the register being written.

UPDATED_VALUE unsigned int

New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int

Value written.

MailboxRecvDoorbellMessage

Receive Doorbell Message at Mailbox. Fields:

CHANNEL unsigned int

Channel message received on.

VALUE unsigned int

Value received.

MailboxRecvFastChannel32Message

Receive Fast Channel 32 Message at Mailbox. Fields:

CHANNEL unsigned int

Channel message received on.

VALUE unsigned int

Value received.

MailboxRecvFastChannel64Message

Receive Fast Channel 64 Message at Mailbox. Fields:

CHANNEL unsigned int

Channel message received on.

VALUE unsigned int

Value received.

PostboxSendDoorbellMessage

Send Message from Doorbell Postbox. Fields:

CHANNEL unsigned int

Channel message sent on.

VALUE unsigned int

Value written.

PostboxSendFastChannel32Message

Send Message from Fast Channel 32 Postbox. Fields:

CHANNEL unsigned int

Channel message sent on.

VALUE unsigned int

Value written.

PostboxSendFastChannel64Message

Send Message from Fast Channel 64 Postbox. Fields:

CHANNEL unsigned int

Channel message sent on.

VALUE unsigned int

Value written.

2.145 MetaDataController

This section describes the trace sources.

ArchMsg.Error.error_tagged_access_in_no_metadata_region

Tagged data access in a region without metadata. Fields:

PA unsigned int

Physical address the data access is made into.

PAS enum

Physical Address Space.

COMPONENT_BUSY

This component is now in use. The request has to wait until the component is ready . Fields:

Component string

Name of the component in use.

READ_METADATA

Read metadata from end-point storage. Fields:

ACCESS_SIZE_IN_BYTES unsigned int

Size in Bytes.

ADDRESS unsigned int

Address to read.

METADATA unsigned int

Metadata content.

READ_OFFSET_IN_ADDRESS unsigned int

Offset in master's storage.

WRITE_METADATA

Write metadata to end-point storage. Fields:

ACCESS_SIZE_IN_BYTES unsigned int

Size in Bytes.

ADDRESS unsigned int

Address to write.

METADATA unsigned int

Metadata content.

WRITE_OFFSET_IN_ADDRESS unsigned int

Offset in master's storage.

2.146 NI700

This section describes the trace sources.

ArchMsg.Error.MemoryMapped_AddressInvalid

DISPLAY Register access attempted to %{ADDRESS} does not fall into %{REG_SPACE_BASE} - %{REG_SPACE_END}. This range is where registers may be found. Fields:

ADDRESS unsigned int

Address of Access that entered RegisterInterface to the Register Space in the Interconnect.

REG_SPACE_BASE unsigned int

Register Space Base Address.

REG_SPACE_END unsigned int

Register Space End Address.

ArchMsg.Warning.MemoryMapped_ReadDisallowed

DISPLAY Read of %{REG_NAME}{%{Reg_Ownership}} not allowed from PASpace=%{PASpace}; will be read-as-zero. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being read.

Reg_Ownership string

Register Ownership.

ArchMsg.Warning.MemoryMapped_ReadReserved

DISPLAY Reserved offset %{OFFSET} attempting to be read. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

ArchMsg.Warning.MemoryMapped_ReadWriteOnlyReg

DISPLAY Write-only register %{REG_NAME} attempting to be read; will read-as-zero. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

REG_NAME string

Name of the register being read.

ArchMsg.Warning.MemoryMapped_UnalignedReadAccess

DISPLAY Read attempted to %{OFFSET} and not aligned to 32 or 64-bit. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

ArchMsg.Warning.MemoryMapped_UnalignedWriteAccess

DISPLAY Write attempted to %{OFFSET} and not aligned to 32 or 64-bit. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

ArchMsg.Warning.MemoryMapped_WriteDisallowed

DISPLAY Write to %{REG_NAME}{%{Reg_Ownership}}=%{VALUE} not allowed from PASpace=%{PASpace}; will be ignored. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being read.

Reg_Ownership string

Register Ownership.

VALUE unsigned int

Value.

ArchMsg.Warning.MemoryMapped_WriteReadOnlyReg

DISPLAY Read-only register %{REG_NAME} attempting to be written with value %{VALUE}. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

REG_NAME string

Name of the register being written.

VALUE unsigned int

Value written.

ArchMsg.Warning.MemoryMapped_WriteReserved

DISPLAY Reserved offset %{OFFSET} attempting to be written with value %{VALUE}. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

VALUE unsigned int

Value written.

IDM_Access_Control_Transaction_Abort

DISPLAY Access to memory location %{ADDR} being aborted at isolated %{DOMAIN} %{PORT}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

The domain of the xxNI isolated by IDM access control.

PORT unsigned int

The index of the xxNI isolated by IDM access control.

IDM_Reset_Transaction_Abort

DISPLAY Access to memory location %{ADDR} being aborted at reset %{DOMAIN} %{PORT}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

The domain of the xxNI under IDM reset.

PORT unsigned int

The index of the xxNI under IDM reset.

MPAM_Override

DISPLAY Overriding MPAM_PMG=%{MPAM_PMG} MPAM_PARTID=%{MPAM_PARTID} MPAM_NS=%{MPAM_NS} of access to memory location %{ADDR} from %{DOMAIN} %{PORT}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

The source domain of the xSNI whose transaction attributes are being overridden.

MPAM_NS unsigned int

Overriding value for the MPAM_NS transaction attribute.

MPAM_PARTID unsigned int

Overriding value for the MPAM_PARTID transaction attribute.

MPAM_PMG unsigned int

Overriding value for the MPAM_PMG transaction attribute.

PORT unsigned int

The index of the xSNI whose transaction attributes are being overridden.

MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being read.

VALUE unsigned int

Value returned.

MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being written.

UPDATED_VALUE unsigned int

New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int

Value written.

Routing

DISPLAY Access to memory location %{ADDR} is routed to port %{PORT} in %{DOMAIN}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

Downstream domain to which access is routed.

PORT unsigned int

Downstream index to which access is routed.

Transaction_Abort

DISPLAY The transaction accessing memory location %{ADDR} from %{PORT} in %{DOMAIN} was aborted. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

Upstream domain where the access is coming from.

PORT unsigned int

Upstream index of the port where the access is coming from.

2.147 NI710AE

This section describes the trace sources.

ArchMsg.Error.MemoryMapped_AddressInvalid

DISPLAY Register access attempted to %{ADDRESS} does not fall into %{REG_SPACE_BASE} - %{REG_SPACE_END}. This range is where registers may be found. Fields:

ADDRESS unsigned int

Address of Access that entered RegisterInterface to the Register Space in the Interconnect.

REG_SPACE_BASE unsigned int

Register Space Base Address.

REG_SPACE_END unsigned int

Register Space End Address.

ArchMsg.Warning.MemoryMapped_ReadDisallowed

DISPLAY Read of %{REG_NAME}{%{Reg_Ownership}} not allowed from PASpace=%{PASpace}; will be read-as-zero. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being read.

Reg_Ownership string

Register Ownership.

ArchMsg.Warning.MemoryMapped_ReadReserved

DISPLAY Reserved offset %{OFFSET} attempting to be read. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

ArchMsg.Warning.MemoryMapped_ReadWriteOnlyReg

DISPLAY Write-only register %{REG_NAME} attempting to be read; will read-as-zero. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

REG_NAME string

Name of the register being read.

ArchMsg.Warning.MemoryMapped_UnalignedReadAccess

DISPLAY Read attempted to %{OFFSET} and not aligned to 32 or 64-bit. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

ArchMsg.Warning.MemoryMapped_UnalignedWriteAccess

DISPLAY Write attempted to %{OFFSET} and not aligned to 32 or 64-bit. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

ArchMsg.Warning.MemoryMapped_WriteDisallowed

DISPLAY Write to %{REG_NAME}{%{Reg_Ownership}}=%{VALUE} not allowed from PASpace=%{PASpace}; will be ignored. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being read.

Reg_Ownership string

Register Ownership.

VALUE unsigned int

Value.

ArchMsg.Warning.MemoryMapped_WriteReadOnlyReg

DISPLAY Read-only register %{REG_NAME} attempting to be written with value %{VALUE}. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

REG_NAME string

Name of the register being written.

VALUE unsigned int

Value written.

ArchMsg.Warning.MemoryMapped_WriteReserved

DISPLAY Reserved offset %{OFFSET} attempting to be written with value %{VALUE}. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

VALUE unsigned int

Value written.

Disallowed xMNI APU txn

DISPLAY Transaction originating from %{xSNI} to address %{addr} targeting %{xMNI} failed due to insufficient xMNI APU permissions. Fields:

addr unsigned int

Address of memory location.

xMNI string

Downstream xMNI.

xSNI string

Upstream xSNI.

Disallowed xSNI APU txn

DISPLAY Transaction originating from %{xSNI} to address %{addr} failed due to insufficient xSNI APU permissions. Fields:

addr unsigned int

Address of memory location.

xSNI string

Upstream xSNI.

FMU Error Packet Dropped

DISPLAY Error Packet Dropped: Node ID 0x%{node_id:x}, Node type 0x%{node_type:x} SMEN 0x%{smen:x}, SM 0x%{errsm:x}. Fields:

errsm unsigned int

Error Safety Mechanism bitmask.

node_id unsigned int

Node identifier.

node_type unsigned int

Node type identifier.

smen unsigned int

Enabled Safety Mechanism bitmask.

IDM_Access_Control_Transaction_Abort

DISPLAY Access to memory location %{ADDR} being aborted at isolated %{DOMAIN} %{PORT}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

The domain of the xxNI isolated by IDM access control.

PORT unsigned int

The index of the xxNI isolated by IDM access control.

IDM_Reset_Transaction_Abort

DISPLAY Access to memory location %{ADDR} being aborted at reset %{DOMAIN} %{PORT}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

The domain of the xxNI under IDM reset.

PORT unsigned int

The index of the xxNI under IDM reset.

MPAM_Override

DISPLAY Overriding MPAM_PMG=%{MPAM_PMG} MPAM_PARTID=%{MPAM_PARTID} MPAM_NS=%{MPAM_NS} of access to memory location %{ADDR} from %{DOMAIN} %{PORT}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

The source domain of the xSNI whose transaction attributes are being overridden.

MPAM_NS unsigned int

Overriding value for the MPAM_NS transaction attribute.

MPAM_PARTID unsigned int

Overriding value for the MPAM_PARTID transaction attribute.

MPAM_PMG unsigned int

Overriding value for the MPAM_PMG transaction attribute.

PORT unsigned int

The index of the xSNI whose transaction attributes are being overridden.

MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being read.

VALUE unsigned int

Value returned.

MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being written.

UPDATED_VALUE unsigned int

New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int

Value written.

Routing

DISPLAY Access to memory location %{ADDR} is routed to port %{PORT} in %{DOMAIN}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

Downstream domain to which access is routed.

PORT unsigned int

Downstream index to which access is routed.

Transaction_Abort

DISPLAY The transaction accessing memory location %{ADDR} from %{PORT} in %{DOMAIN} was aborted. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

Upstream domain where the access is coming from.

PORT unsigned int

Upstream index of the port where the access is coming from.

2.148 NOC_S3

This section describes the trace sources.

ArchMsg.Error.MemoryMapped_AddressInvalid

DISPLAY Register access attempted to %{ADDRESS} does not fall into %{REG_SPACE_BASE} - %{REG_SPACE_END}. This range is where registers may be found. Fields:

ADDRESS unsigned int

Address of Access that entered RegisterInterface to the Register Space in the Interconnect.

REG_SPACE_BASE unsigned int

Register Space Base Address.

REG_SPACE_END unsigned int

Register Space End Address.

ArchMsg.Warning.MemoryMapped_ReadDisallowed

DISPLAY Read of %{REG_NAME}{%{Reg_Ownership}} not allowed from PASpace=%{PASpace}; will be read-as-zero. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being read.

Reg_Ownership string

Register Ownership.

ArchMsg.Warning.MemoryMapped_ReadReserved

DISPLAY Reserved offset %{OFFSET} attempting to be read. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

ArchMsg.Warning.MemoryMapped_ReadWriteOnlyReg

DISPLAY Write-only register %{REG_NAME} attempting to be read; will read-as-zero. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

REG_NAME string

Name of the register being read.

ArchMsg.Warning.MemoryMapped_UnalignedReadAccess

DISPLAY Read attempted to %{OFFSET} and not aligned to 32 or 64-bit. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

ArchMsg.Warning.MemoryMapped_UnalignedWriteAccess

DISPLAY Write attempted to %{OFFSET} and not aligned to 32 or 64-bit. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

ArchMsg.Warning.MemoryMapped_WriteDisallowed

DISPLAY Write to %{REG_NAME}{%{Reg_Ownership}}=%{VALUE} not allowed from PASpace=%{PASpace}; will be ignored. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being read.

Reg_Ownership string

Register Ownership.

VALUE unsigned int

Value.

ArchMsg.Warning.MemoryMapped_WriteReadOnlyReg

DISPLAY Read-only register %{REG_NAME} attempting to be written with value %{VALUE}.

Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

REG_NAME string

Name of the register being written.

VALUE unsigned int

Value written.

ArchMsg.Warning.MemoryMapped_WriteReserved

DISPLAY Reserved offset %{OFFSET} attempting to be written with value %{VALUE}. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

VALUE unsigned int

Value written.

Default Target Used

DISPLAY is %{ADDR} is being routed to the default target port %{PORT} in %{DOMAIN}.

Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

Downstream domain to which access is routed.

PORT unsigned int

Downstream index to which access is routed.

Disallowed xMNI APU txn

DISPLAY Transaction originating from %{xSNI} to address %{addr} targeting %{xMNI} failed due to insufficient xMNI APU permissions. Fields:

addr unsigned int

Address of memory location.

xMNI string

Downstream xMNI.

xSNI string

Upstream xSNI.

Disallowed xSNI APU txn

DISPLAY Transaction originating from %{xSNI} to address %{addr} failed due to insufficient xSNI APU permissions. Fields:

addr unsigned int

Address of memory location.

xSNI string

Upstream xSNI.

IDM_Access_Control_Transaction_Abort

DISPLAY Access to memory location %{ADDR} being aborted at isolated %{DOMAIN} %{PORT}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

The domain of the xxNI isolated by IDM access control.

PORT unsigned int

The index of the xxNI isolated by IDM access control.

IDM_Reset_Transaction_Abort

DISPLAY Access to memory location %{ADDR} being aborted at reset %{DOMAIN} %{PORT}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

The domain of the xxNI under IDM reset.

PORT unsigned int

The index of the xxNI under IDM reset.

MPAM_Override

DISPLAY Overriding MPAM_PMG=%{MPAM_PMG} MPAM_PARTID=%{MPAM_PARTID} MPAM_NS=%{MPAM_NS} of access to memory location %{ADDR} from %{DOMAIN} %{PORT}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

The source domain of the xSNI whose transaction attributes are being overridden.

MPAM_NS unsigned int

Overriding value for the MPAM_NS transaction attribute.

MPAM_PARTID unsigned int

Overriding value for the MPAM_PARTID transaction attribute.

MPAM_PMG unsigned int

Overriding value for the MPAM_PMG transaction attribute.

PORT unsigned int

The index of the xSNI whose transaction attributes are being overridden.

MemoryMapped_Read

Trace read from a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being read.

VALUE unsigned int

Value returned.

MemoryMapped_Write

Trace write to a memory-mapped register. Fields:

OFFSET unsigned int

Offset of address within the Interconnect.

PASpace string

Physical Address Space.

REG_NAME string

Name of the register being written.

UPDATED_VALUE unsigned int

New value read back from the register; for write-only registers this will be equal to VALUE.

VALUE unsigned int

Value written.

Programmable_Address_Map

DISPLAY Programmable Address Map of %{SNI} is %{MMAP}. Fields:

MMAP string

Memory map.

SNI string

Upstream SNI.

Routing

DISPLAY Access to memory location %{ADDR} is routed to port %{PORT} in %{DOMAIN}. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

Downstream domain to which access is routed.

PORT unsigned int

Downstream index to which access is routed.

Transaction_Abort

DISPLAY The transaction accessing memory location %{ADDR} from %{PORT} in %{DOMAIN} was aborted. Fields:

ADDR unsigned int

Address of memory location being accessed.

DOMAIN enum

Upstream domain where the access is coming from.

PORT unsigned int

Upstream index of the port where the access is coming from.

2.149 PL011_Uart

This section describes the trace sources.

pl011_character_in

A character was received. Fields:

char unsigned int

The character received.

fifo_overflow bool

If true, then the character was lost as the fifo was full.

tick unsigned int

The count of ticks from simulation start that the UART has received.

pl011_character_out

A character was written to the UART to output. Fields:

char unsigned int

The output character.

fifo_overflow bool

If true, then the character was lost as the fifo was full.

tick unsigned int

The count of ticks from simulation start that the UART has received.

pl011_line_buffered_out

The buffered output of character_out. The buffer is flushed when any control character is received. The control characters do not form part of the buffer. The buffer's size is limited to 255 characters and truncation is indicated by an appended '...' . Fields:

buffer string

The line buffer.

tick unsigned int

The count of ticks from simulation start that the UART has received at the point at which it receives the control character that flushes the buffer.

2.150 PL310_L2CC

This section describes the trace sources.

CACHE_READ_HIT

A line read hit occurred. Fields:

addr unsigned int

Address of transaction.

cache_line_index unsigned int

Cache line index.

ns bool

Non-secure.

CACHE_READ_MISS

A line read miss occurred. Fields:

addr unsigned int

Address of transaction.

ns bool

Non-secure.

CACHE_WRITE_HIT

A line write hit occurred. Fields:

addr unsigned int

Address of transaction.

cache_line_index unsigned int

Cache line index.

ns bool

Non-secure.

CACHE_WRITE_MISS

A line write miss occurred. Fields:

addr unsigned int

Address of transaction.

ns bool

Non-secure.

cache_line_eviction

The cache is starting to evict a line to downstream. Fields:

addr unsigned int

Address.

cache_line_index unsigned int

Cache line index.

data unsigned int

Data being evicted.

memory_attributes enum

Memory attributes.

ns bool

Non-secure.

cache_line_refill

The cache refilled a line from downstream. Fields:

addr unsigned int

Address.

cache_line_index unsigned int

Cache line index.

data unsigned int

Data or empty on error.

memory_attributes enum

Memory attributes.

ns bool

Non-secure.

cache_line_refill_start

The cache is starting to refill a line from downstream. Fields:

addr unsigned int

Address.

cache_line_index unsigned int

Cache line index.

memory_attributes enum

Memory attributes.

ns bool

Non-secure.

interrupt_status

The raw interrupt status. Fields:

mask_of_new_bit unsigned int

A mask of which bit was changed.

new_value unsigned int

New interrupt status value.

register_read

A register read occurred. Fields:

data unsigned int

Data read.

name string

The register name.

ns bool

Access is non-secure.

offset unsigned int

Offset of register in file.

ok bool

True if a valid register.

register_write

A register write occurred. Fields:

data unsigned int

Data written.

name string

The register name.

ns bool

Access is non-secure.

offset unsigned int

Offset of register in file.

ok bool

True if ok.

2.151 PPUv0

This section describes the trace sources.

PPU_AccessToUnimplementedRegister

DISPLAY PPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

PPU_ReadToWriteOnlyRegister

DISPLAY PPU Register Read to address: %{ADDR} FAILED as the register is write-only. Fields:

ADDR unsigned int

Address of the accessed register.

PPU_RegRead

DISPLAY PPU Register Offset: %{REG_OFFSET} Value: %{VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register read.

REG_OFFSET unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

PPU_RegWrite

DISPLAY PPU Register Offset: %{REG_OFFSET} Updated: From value %{VALUE} To value %{UPDATED_VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register updated.

REG_OFFSET unsigned int

The address of the register updated.

UPDATED_VALUE unsigned int

New Value in the register.

VALUE unsigned int

Old Value in the register.

PPU_WriteToReadOnlyRegister

DISPLAY PPU Register Write to address: %{ADDR} FAILED as the register is read-only.
Fields:

ADDR unsigned int

Address of the accessed register.

2.152 PPUv1

This section describes the trace sources.

PPU_AccessToUnimplementedRegister

DISPLAY PPU Register %{READ:(WRITE|READ)} to address: %{ADDR} FAILED as the register is unimplemented. Fields:

ADDR unsigned int

Address of the accessed register.

READ bool

Transaction type is read or write.

PPU_ReadToWriteOnlyRegister

DISPLAY PPU Register Read to address: %{ADDR} FAILED as the register is write-only.
Fields:

ADDR unsigned int

Address of the accessed register.

PPU_RegRead

DISPLAY PPU Register Offset: %{REG_OFFSET} Value: %{VALUE} RegName: %{REG_NAME}.
Fields:

REG_NAME string

The name of the register read.

REG_OFFSET unsigned int

The address of the register read.

VALUE unsigned int

Read Value from the register.

PPU_RegWrite

DISPLAY PPU Register Offset: %{REG_OFFSET} Updated: From value %{VALUE} To value %{UPDATED_VALUE} RegName: %{REG_NAME}. Fields:

REG_NAME string

The name of the register updated.

REG_OFFSET unsigned int

The address of the register updated.

UPDATED_VALUE unsigned int

New Value in the register.

VALUE unsigned int

Old Value in the register.

PPU_WriteToReadOnlyRegister

DISPLAY PPU Register Write to address: %{ADDR} FAILED as the register is read-only.
Fields:

ADDR unsigned int

Address of the accessed register.

key_registers_value_when_power_state_change

trace the key register value when power state may change. Fields:

PPU_DISR unsigned int

.

PPU_IISR unsigned int

.

PPU_ISR unsigned int

.

PPU_PWPR unsigned int

.

PPU_PWSR unsigned int

.

Source string

.

lock_status

The current PPU OFF lock status is %{STATUS}. Fields:

STATUS enum

The status of PPU OFF lock.

pactive_port_status

Detected PACTIVE port signal change %{PORT_STATUS} with value %{SIG_VALUE:x}. Fields:

PORT_STATUS enum

The status of PPU PACTIVE port.

SIG_VALUE unsigned int

The value of PACTIVE signal.

receive_wakerequest

trace the wakerequest event. Fields:

Wakerequest string

PPU is receiving Wakerequest.

transition_status

The current PPU transition status is %{STATUS}. Fields:

STATUS enum

The status of PPU transition.

wakerequest_failed

The wakerequest failed and PPU_ISR is %{PPU_ISR}, PPU_IISR is %{PPU_IISR}. Fields:

PPU_IISR unsigned int

The value of PPU_IISR when wakerequest is failed.

PPU_ISR unsigned int

The value of PPU_ISR when wakerequest is failed.

2.153 PVBUS2AMBAPV

This section describes the trace sources.

READ_ACCESS

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

LATENCY unsigned int

Time downstream (ticks).

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

READ_ACCESS_START

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

USER_FLAGS unsigned int

Core specific additional signals.

WRITE_ACCESS

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

LATENCY unsigned int

Time downstream (ticks).

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

WRITE_ACCESS_START

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

USER_FLAGS unsigned int

Core specific additional signals.

2.154 PVBUS2AMBAPVACE

This section describes the trace sources.

ACE_DVM

ACE dvm trace message. Fields:

MSG string

DVM Message.

ACE_SNOOP

ACE snoop trace data. Fields:

ADDR_END_INCL unsigned int

Physical address of access - end inclusive.

ADDR_START unsigned int

Physical address of access - start.

IS_DATATRANS bool

Is a data transfer?.

IS_ERROR bool

Is an error?.

IS_PASSDIRTY bool

Is pass dirty?.

IS_SHARED bool

Is shared?.

IS_WASUNIQUE bool

Was unique?.

NS unsigned int

Is a non secure transaction?.

PAS enum

Physical Address Space of the transaction.

Snoop enum

Encodes the ACE operation: 0 ReadNoSnoop, 1 ReadOnce, 2 ReadClean, 3 ReadShared, 4 ReadNotSharedDirty, 5 ReadUnique, 6 CleanShared, 7 CleanInvalid, 8 MakeInvalid, 9 CleanUnique, 10 MakeUnique, 11 WriteNoSnoop, 12 PseudoWriteOnce, 13 WriteUnique, 14 WriteLineUnique, 15 WriteBack, 16 WriteClean, 17 Evict, 18 Default, 19 MemoryBarrier, 20 SynchronisationBarrier, 21 NoOperation, 22 DebugRead, 23 DebugWrite.

READ_ACCESS

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

LATENCY unsigned int

Time downstream (ticks).

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

READ_ACCESS_START

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

USER_FLAGS unsigned int

Core specific additional signals.

WRITE_ACCESS

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

LATENCY unsigned int

Time downstream (ticks).

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

WRITE_ACCESS_START

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

USER_FLAGS unsigned int

Core specific additional signals.

2.155 PVBusBridge

This section describes the trace sources.

BRIDGE_DMI

DMI information from PVBus to AMBA-PV bridge. Fields:

ADDR unsigned int

Address of the operation.

Access string

R = Read, W = Write, r = Prefetch only read, w = Prefetch only write, I = Invalidate.

Op string

D = Downstream call, N = New range received, I = Invalidate from downstream, M = invalidate from upstream monitor.

R_END unsigned int

Range end.

R_PTR unsigned int

Range pointer.

R_START unsigned int

Range start.

2.156 PVBusExclusiveMonitor

This section describes the trace sources.

GLOBAL_MONITOR

Global monitor activity. Fields:

MANAGER_ID unsigned int

Indicates the manager associated with this monitor.

NS enum

Secure state of the region monitored.

PADDR unsigned int

Physical address of the region monitored.

SIZE unsigned int

Size of the region monitored.

STATE enum

State of the monitor (Open/Exclusive).

TRIGGER enum

Reason the monitor changed state.

WIDTH unsigned int

Width in bytes of the access which created the exclusive region.

MONITOR_TRANSACTION

Transactions observed by the monitor. Fields:

DATA unsigned int

The data transferred by the transaction.

MANAGER_ID unsigned int

Identifies the manager of this transaction.

NS enum

Secure state of the transaction.

PADDR unsigned int

Physical address of the transaction.

RESPONSE enum

The transaction result.

TYPE enum

Type of transaction.

WIDTH unsigned int

Width in bytes of the access.

2.157 PVBusGICv3Comms

This section describes the trace sources.

ArchMsg.Warning.GICv3CommsPVBus_PacketTooBig

DISPLAY Received incoming PVBus packet that is too large to be sent over GICv3Comms connection (length = %{LENGTH}, data[0] (packet type) = 0x%{DATA_0:x}, index/manager ID = %{INDEX}). Fields:

DATA_0 unsigned int

First byte of the packet (normally data type).

INDEX unsigned int

Index of GICv3Comms connection that the message should have been sent to (based on AXI manager ID).

LENGTH unsigned int

Number bytes in data packet.

ArchMsg.Warning.GICv3CommsPVBus_UnknownDestination

DISPLAY Received incoming PVBus packet that indicates that it should be sent to an unconnected destination (index/manager ID = %{INDEX}, length = %{LENGTH}, data[0] (packet type) = 0x%{DATA_0:x}). Fields:

DATA unsigned int

The message data.

DATA_0 unsigned int

First byte of the packet (normally data type).

INDEX unsigned int

Index of GICv3Comms connection that the message should have been sent to (based on AXI manager ID).

LENGTH unsigned int

Number bytes in data packet.

GICv3CommsPVBUS_FailedMessage

Processed message from connected GICv3Comms port and sent out, but PVBUS transaction failed. Fields:

DATA unsigned int

The message data.

INDEX unsigned int

Index of GICv3Comms connection that message came in on.

LENGTH unsigned int

Message length in bytes.

GICv3CommsPVBUS_ProcessedMessage

Processed message from connected GICv3Comms port. Fields:

DATA unsigned int

The message data.

INDEX unsigned int

Index of GICv3Comms connection that message came in on.

LENGTH unsigned int

Message length in bytes.

GICv3CommsPVBUS_ReceiveAXIManagerID

DISPLAY Received AXI manager ID %{MANAGER_ID:x} for connection %{INDEX}. Fields:

INDEX unsigned int

Index of GICv3Comms connection that message came in on.

MANAGER_ID unsigned int

Manager ID value recieved.

GICv3CommsPVBUS_SentViaGICv3Comms

Packet received via PVBUS and sent via GICv3 Comms to connected distributor/CPU. Fields:

DATA unsigned int

The message data.

INDEX unsigned int

Index of GICv3Comms connection that the message should have been sent to (based on AXI manager ID).

LENGTH unsigned int

Number bytes in data packet.

2.158 PVBusLogger

This section describes the trace sources.

READ_ACCESS

Trace access at this point in the PVBus hierarchy. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

LATENCY unsigned int

Time downstream (ticks).

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

READ_ACCESS_START

Trace access at this point in the PVBUS hierarchy. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

USER_FLAGS unsigned int

Core specific additional signals.

WRITE_ACCESS

Trace access at this point in the PVBUS hierarchy. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

LATENCY unsigned int

Time downstream (ticks).

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

WRITE_ACCESS_START

Trace access at this point in the PVBUS hierarchy. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

USER_FLAGS unsigned int

Core specific additional signals.

2.159 PVBusMapper

This section describes the trace sources.

ArchMsg.Error.BusActiveDuringReset

Transactions recieved at the bus slave port whilst reset was asserted.

ArchMsg.Warning.BusDeadlockDetected

A potential bus deadlock has been detected. Fields:

INTERCONNECT_RESET bool

Downstream bus interconnect reset.

INTERMEDIARY_RESET bool

Bus mapper intermediary reset.

SLAVE_RESET bool

Downstream bus slave reset.

2.160 PVBusMaster

This section describes the trace sources.

ArchMsg.Warning.BusDeadlockDetected

A potential bus deadlock has been detected. Fields:

INTERCONNECT_RESET bool

Bus interconnect reset.

MASTER_RESET bool

Bus master reset.

SLAVE_RESET bool

Bus slave reset.

2.161 PVBusSlave

This section describes the trace sources.

ATOMIC_SLAVE_ACCESS

Information on the atomic operation at slave side. Fields:

ACCESS_RESULT enum

Result of atomic access.

COMPARE_VALUE unsigned int

Value to be compared with memory by CAS.

LOAD_VALUE unsigned int

Value to be loaded from memory as a result of atomic operation.

MANAGER unsigned int

ID of manager which initiated the transaction.

NS bool

Transaction is Non-Secure.

OPERAND_VALUE unsigned int

Incoming operand value provided by core.

OPERATION unsigned int

Type of atomic operation.

PADDR unsigned int

Physical address.

STORE_VALUE unsigned int

Value to be stored to memory as a result of atomic operation.

ArchMsg.Warning.uninitialized_data_read

Unwritten data read warning for ACCESSMODE_TRACKED_MEMORY. DISPLAY At %{PADDR:x}, %{WIDTH:d}bit read contains uninitialized bytes in position %{MASK:x} Uninitialized bytes in position %{MASK_COMPLETE:x}. Fields:

MASK unsigned int

Set bits indicate uninitialized data in bits [63:0].

MASK2 unsigned int

Set bits indicate uninitialized data in bits [127:64].

MASK_COMPLETE unsigned int

Set bits indicate uninitialized data in bits [(WIDTH - 1):0].

PADDR unsigned int

Physical address.

WIDTH unsigned int

Bit width of access.

ArchMsg.Warning.unmonitored_exclusive_access

Exclusive access to address not covered by an exclusive monitor. DISPLAY Exclusive %{NS:(|non-}secure %{DIRECTION:(write to|read from)} physical address %{PADDR:x} not covered by an exclusive monitor. Fields:

DIRECTION enum

Access direction (read/write).

NS bool

Transaction is Non-Secure.

PADDR unsigned int

Physical address.

DMI_BUS_SLAVE

Information on DMI memory operations at slave side. Fields:

ADDRESS unsigned int

Address of DMI operation.

DMI_OPERATION enum

DMI Operation.

SIZE unsigned int

Size of DMI operation.

STORAGE unsigned int

Storage pointer.

2.162 PVCache

This section describes the trace sources.

ALLOC_LINEFILL

The system allocated a complete line fill into the RAMs. This happens when the cache has to read the data for a line fill from potentially upstream or downstream. Fields:

ENTRY_INDEX unsigned int

The entry index the line has been loaded into.

MANAGER_ID unsigned int

The manager ID for the associated transaction.

MEMORY_ATTRIBUTES unsigned int

The memory attributes used for the allocation. bits[3:0] are the inner ACACHE, bits[7:4] are the outer ACACHE, bits[9:8] are ADOMAIN, bits[12:10] are APROT, the rest are undocumented.

NS_ADDR unsigned int

The security world and address of the first byte of the line, the MSB encodes the NS bit.

PAS enum

The Physical Address Space.

ALLOC_WRITE

The system allocated a complete line write into the RAMs. This happens when the cache receives a complete cache line write. It need not read from anywhere. Fields:

ENTRY_INDEX unsigned int

The entry index the line has been written into.

MEMORY_ATTRIBUTES unsigned int

The memory attributes used for the allocation. bits[3:0] are the inner ACACHE, bits[7:4] are the outer ACACHE, bits[9:8] are ADOMAIN, bits[12:10] are APROT, the rest are undocumented.

NS_ADDR unsigned int

The security world and address of the first byte of the line, the MSB encodes the NS bit.

PAS enum

The Physical Address Space.

ATOMIC_SLAVE_ACCESS

Information on the atomic operation at slave side. Fields:

ACCESS_RESULT enum

Result of atomic access.

COMPARE_VALUE unsigned int

Value to be compared with memory by CAS.

LOAD_VALUE unsigned int

Value to be loaded from memory as a result of atomic operation.

MANAGER unsigned int

ID of manager which initiated the transaction.

NS bool

Transaction is Non-Secure.

OPERAND_VALUE unsigned int

Incoming operand value provided by core.

OPERATION enum

Type of atomic operation.

PADDR unsigned int

Physical address.

PAS enum

The Physical Address Space.

STORE_VALUE unsigned int

Value to be stored to memory as a result of atomic operation.

ArchMsg.Error.cached_attributes_mismatch

Attributes differ between page and line in cache from same page. DISPLAY Mismatch in attributes for page including address `%{NS_ADDR[63]:(s|ns)}-%{NS_ADDR[62:0]:x} %{LINES:d}` cache lines are allocated with attributes: inner-`%{LINEATTR[3:0]:(device-|device-|noncacheable-non-bufferable|noncacheable|wRmb|wRmB|WT-cacheable|WB-cacheable|Rwmb|RwmB|WT-cacheable|WB-cacheable|RWmb|RWmB|WT-cacheable|WB-cacheable)}%{LINEATTR[3:0.14:13]:(nGnRnE|nGRnE?|GnRnE?|GRnE?|nGnRE|nGRE|GnRE?|GRE|)}%{LINEATTR[15]:(|-transient)}` outer-`%{LINEATTR[7:4]:(device-|`

device-|noncacheable-non-bufferable|noncacheable|wRmb|wRmB|WT-cacheable|WB-cacheable|Rwmb|RwmB|WT-cacheable|WB-cacheable|RWmb|RWmB|WT-cacheable|WB-cacheable)%{LINEATTR[7:4.14:13]:(nGnRnE|nGRnE?|GnRnE?|GRnE?|nGnRE|nGRE|GnRE?|GRE))}%{LINEATTR[16]:(|-transient)} shareability: %{LINEATTR[9:8]:(nsh|ish|osh|sys)}%{LINEATTR[21.24]:(|TranslatedAccess|NonStallable|TransFaultFlow)}%{LINEATTR[22]:(|NonAddressBasedRouted)}%{LINEATTR[25]:(|HasMetaData)}%{LINEATTR[26]:(|ReservedImpDef)}%{LINEATTR[27]:(|-StreamTransaction)}%{LINEATTR[28]:(|-nse)}%{LINEATTR[29]:(|-nse2)}%{LINEATTR[31]:(|-HasMutatingMetaDataOp)} but transaction attributes are: inner-%{TXATTR[3:0]:(device-|device-|noncacheable-non-bufferable|noncacheable|wRmb|wRmB|WT-cacheable|WB-cacheable|Rwmb|RwmB|WT-cacheable|WB-cacheable|RWmb|RWmB|WT-cacheable|WB-cacheable)}%{TXATTR[3:0.14:13]:(nGnRnE|nGRnE?|GnRnE?|GRnE?|nGnRE|nGRE|GnRE?|GRE))}%{TXATTR[15]:(|-transient)} outer-%{TXATTR[7:4]:(device-|device-|noncacheable-non-bufferable|noncacheable|wRmb|wRmB|WT-cacheable|WB-cacheable|Rwmb|RwmB|WT-cacheable|WB-cacheable|RWmb|RWmB|WT-cacheable|WB-cacheable)}%{TXATTR[7:4.14:13]:(nGnRnE|nGRnE?|GnRnE?|GRnE?|nGnRE|nGRE|GnRE?|GRE))}%{TXATTR[16]:(|-transient)} shareability: %{TXATTR[9:8]:(nsh|ish|osh|sys)}%{TXATTR[21.24]:(|TranslatedAccess|NonStallable|TransFaultFlow)}%{TXATTR[22]:(|NonAddressBasedRouted)}%{TXATTR[25]:(|HasMetaData)}%{TXATTR[26]:(|ReservedImpDef)}%{TXATTR[27]:(|-StreamTransaction)}%{TXATTR[28]:(|-nse)}%{TXATTR[29]:(|-nse2)}%{TXATTR[31]:(|-HasMutatingMetaDataOp)}. PRIMARY KEY NS_ADDR. Fields:

LINEATTR unsigned int

Attributes of the cache allocated lines.

LINES unsigned int

Number of cache lines already allocated.

NS_ADDR unsigned int

The security world and address of the first byte of the page, the MSB encodes the NS bit.

PAS enum

The Physical Address Space.

TXATTR unsigned int

Attributes of the transaction.

ArchMsg.Error.cached_attributes_mismatch#lineinfo

Information about allocated lines in page. DISPLAY %{TAG[1]:(u|U)}%{TAG[2]:(d|D)}-%{TAG[63:61]:(s|rt|ns|rl|sa|na6|nsp|na7)}-%{PADDR}-%{TAG[59:58]:(nsh|ish|osh|sys)}%{TAG[56]:(|-iHittable)}%{TAG[57]:(|-oHittable)}. Fields:

PADDR unsigned int

address of this cache line.

TAG unsigned int

tag data of this cache line.

ArchMsg.Warning.ns_s_dirty_hit

Cache hit at S and NS versions of the same physical address DISPLAY At PAddr %{PADDR} Line index %{INDEX0} is for %{TAG0[1]:(u|U)}%{TAG0[2]:(d|D)}-%{TAG0[63:61]:(s|

rt|ns|rl|sa|na6|nsp|na7}}-%{PADDR}-%{TAG0[59:58]:(nsh|ish|osh|sys}}%{TAG0[56]:(|-iHittable}}%{TAG0[57]:(|-oHittable}} Line index %{|INDEX1} is for %{|TAG1[1]:(u|U}}%{TAG1[2]:(d|D}}-%{TAG1[63:61]:(s|rt|ns|rl|sa|na6|nsp|na7}}-%{PADDR}-%{TAG1[59:58]:(nsh|ish|osh|sys}}%{TAG1[56]:(|-iHittable}}%{TAG1[57]:(|-oHittable}} i.e. same address but different security regimes and one or more are dirty This is not an error if different memory is backing the lines, but otherwise can cause unpredictable cache incoherency. PRIMARY KEY PADDR. Fields:

INDEX0 unsigned int

The cache line index of the affected cache line.

INDEX1 unsigned int

The cache line index of the other regime cache line.

PADDR unsigned int

The address of the affected cache line.

TAG0 unsigned int

The tag data of the affected cache line.

TAG1 unsigned int

The tag data of the other regime cache line.

CACHE_READ_HIT

Read access cache hit. Note that this trace source causes a large slowdown in the simulation.

Fields:

IS_PRELOAD enum

Is the access a preload.

IS_SHARED enum

Is the access shared.

LATENCY unsigned int

Cache latency in ticks per access.

MANAGER_ID unsigned int

Indicates the manager ID associated with this monitor.

CACHE_READ_MISS

Read access cache miss and cache miss latency. Fields:

IS_PRELOAD enum

Is the access a preload.

IS_SHARED enum

Is the access shared.

LATENCY unsigned int

Cache miss latency in ticks per access.

MANAGER_ID unsigned int

Indicates the manager ID associated with this monitor.

CACHE_WRITE_HIT

Write access cache hit. Note that this trace source causes a large slowdown in the simulation. Fields:

IS_PRELOAD enum

Is the access a preload.

IS_SHARED enum

Is the access shared.

LATENCY unsigned int

Cache latency in ticks per access.

MANAGER_ID unsigned int

Indicates the manager ID associated with this monitor.

CACHE_WRITE_MISS

Write access cache miss and cache miss latency. Fields:

IS_PRELOAD enum

Is the access a preload.

IS_SHARED enum

Is the access shared.

LATENCY unsigned int

Cache miss latency in ticks per access.

MANAGER_ID unsigned int

Indicates the manager ID associated with this monitor.

DVM_Message

DISPLAY DVM_msg (%{DVM_MESSAGE}). Fields:

DVM_MESSAGE string

The DVM Message.

ENTRY_BECOMES_INVALID

An entry is now invalid. The cause could be any reason. Fields:

ENTRY_INDEX unsigned int

The entry index that has become invalid.

ENTRY_SET_DIRTY

Entry change, clean/dirty. Fields:

ENTRY_INDEX unsigned int

The entry index that has become clean or dirty.

STATUS unsigned int

True if the line was made dirty.

ERROR_MIXED_ATTRIBUTES_LINE

Mismatched line and transaction attributes. Fields:

ENTRY_INDEX unsigned int

The entry index that has collided.

NS_ADDR unsigned int

The security world and address of the first byte of the line, the MSB encodes the NS bit.

PAS enum

The Physical Address Space.

ERROR_MIXED_ATTRIBUTES_PAGE

Attributes differ between page and lines in cache from the same page. Fields:

NS_ADDR unsigned int

The security world and address of the first byte of the page, the MSB encodes the NS bit.

PAS enum

The Physical Address Space.

EVICTION

A line was evicted from the cache. Fields:

ADDRESS unsigned int

Base address of the victim cache line.

CLEAN bool

If true the cache retained the cache line after writing the dirty data.

ENTRY_INDEX unsigned int

The entry index of the victim.

NON_SECURE bool

If true the victim was NonSecure.

PAS enum

Physical Address Space.

IMPRECISE_ABORT

An operation produced an imprecise abort. Usually this is a WriteBack/WriteClean operation receiving an error response. Fields:

ADDRESS unsigned int

Address of the transaction that imprecise aborted.

DECERR bool

True if this is a DECERR response.

DOWNSTREAM_PORT_INDEX unsigned int

The downstream port index that received the imprecise abort.

NS bool

The NS state of the transaction (true is non-secure).

PAS enum

The Physical Address Space.

MAINTENANCE_CLEAN_SET_WAY

A cache maintenance by set-way operation occurred, possibly the 'clean' part of a clean-and-invalidate operation. Fields:

ENTRY_INDEX unsigned int

The entry index the set-way operation has mapped to.

IS_NON_SECURE bool

If the invalidate operation is non-secure (and so only affects non-secure lines), or secure (and so affects both).

PAS enum

Physical Address Space.

STATE enum

Line transformation incurred.

MAINTENANCE_INVALIDATE_ALL

A cache maintenance invalidate-all operation occurred. Fields:

IS_NON_SECURE bool

True if the invalidate operation is non-secure or realm, otherwise false: * Non-secure invalidates only non-secure lines * Secure invalidates secure and non-secure lines * Realm invalidates realm and non-secure lines * Root invalidates lines from any world.

PAS enum

The Physical Address Space.

MAINTENANCE_INV_SET_WAY

A cache maintenance by set-way operation occurred, possibly the 'invalidate' part of a clean-and-invalidate operation. Fields:

ENTRY_INDEX unsigned int

The entry index the set-way operation has mapped to.

IS_NON_SECURE bool

If the invalidate operation is non-secure (and so only affects non-secure lines), or secure (and so affects both).

PAS enum

The Physical Address Space.

STATE enum

Line transformation incurred.

change_dvm_disabled_ports

This reports a bitmap of which ports are disabled to receive DVM messages. Fields:

new_bitmap unsigned int

The new bitmap of disabled ports.

new_bitmap_list unsigned int

A list of port numbers that were disabled.

old_bitmap unsigned int

The old bitmap of disabled ports.

old_bitmap_list unsigned int

A list of port numbers that were disabled.

change_upstream_disabled_ports

This reports a bitmap of which upstream ports of the cache are *disabled* and so no snoop requests are sent to them. Fields:

new_bitmap unsigned int

The bitmap of the first 32 upstream ports that are disabled.

new_bitmap_list unsigned int

A list of port numbers that were disabled.

old_bitmap unsigned int

The bitmap of the first 32 upstream ports that are disabled.

old_bitmap_list unsigned int

A list of port numbers that were disabled.

entry_after_far_atomic

A cache line has had a far atomic applied to it. Fields:

atomic_operation enum

The operation that operated on this line.

be bool

The far atomic's big-endian flag.

data unsigned int

The data in the cache line.

entry_begin_address unsigned int

The start address of the entry.

entry_index unsigned int

The entry index in the cache.

incoming_data unsigned int

The incoming data from the far atomic. For CAS operations then this is compare-value and then the replacement-value.

manager_id unsigned int

The manager ID for the associated transaction.

ns enum

The security state of the line.

pas enum

The Physical Address Space.

prior_data unsigned int

The data that will be returned as the 'prior' data of the far atomic.

trans_begin_address unsigned int

The start address of the transaction.

entry_after_read

A cache line has been read. Fields:

ace_operation enum

The ACE operation that operated on this line.

data unsigned int

The data in the cache line.

dirty bool

Is the line ACE-dirty.

entry_begin_address unsigned int

The start address of the entry.

entry_index unsigned int

The entry index in the cache.

ns enum

The security state of the line.

pas enum

The Physical Address Space.

snoop bool

This transaction is a snoop transaction.

trans_begin_address unsigned int

The start address of the transaction.

unique bool

Is the line ACE-unique.

entry_after_write

A cache line has been written. Fields:

ace_operation enum

The ACE operation that operated on this line.

data unsigned int

The data in the cache line.

entry_begin_address unsigned int

The start address of the entry.

entry_index unsigned int

The entry index in the cache.

ns enum

The security state of the line.

pas enum

The Physical Address Space.

trans_begin_address unsigned int

The start address of the transaction.

2.163 PVCache64

This section describes the trace sources.

ALLOC_LINEFILL

The system allocated a complete line fill into the RAMs. This happens when the cache has to read the data for a line fill from potentially upstream or downstream. Fields:

ENTRY_INDEX unsigned int

The entry index the line has been loaded into.

MANAGER_ID unsigned int

The manager ID for the associated transaction.

MEMORY_ATTRIBUTES unsigned int

The memory attributes used for the allocation. bits[3:0] are the inner ACACHE, bits[7:4] are the outer ACACHE, bits[9:8] are ADOMAIN, bits[12:10] are APROT, the rest are undocumented.

NS_ADDR unsigned int

The security world and address of the first byte of the line, the MSB encodes the NS bit.

PAS enum

The Physical Address Space.

ALLOC_WRITE

The system allocated a complete line write into the RAMs. This happens when the cache receives a complete cache line write. It need not read from anywhere. Fields:

ENTRY_INDEX unsigned int

The entry index the line has been written into.

MEMORY_ATTRIBUTES unsigned int

The memory attributes used for the allocation. bits[3:0] are the inner ACACHE, bits[7:4] are the outer ACACHE, bits[9:8] are ADOMAIN, bits[12:10] are APROT, the rest are undocumented.

NS_ADDR unsigned int

The security world and address of the first byte of the line, the MSB encodes the NS bit.

PAS enum

The Physical Address Space.

ATOMIC_SLAVE_ACCESS

Information on the atomic operation at slave side. Fields:

ACCESS_RESULT enum

Result of atomic access.

COMPARE_VALUE unsigned int

Value to be compared with memory by CAS.

LOAD_VALUE unsigned int

Value to be loaded from memory as a result of atomic operation.

MANAGER unsigned int

ID of manager which initiated the transaction.

NS bool

Transaction is Non-Secure.

OPERAND_VALUE unsigned int

Incoming operand value provided by core.

OPERATION enum

Type of atomic operation.

PADDR unsigned int

Physical address.

PAS enum

The Physical Address Space.

STORE_VALUE unsigned int

Value to be stored to memory as a result of atomic operation.

ArchMsg.Error.cached_attributes_mismatch

Attributes differ between page and line in cache from same page. DISPLAY Mismatch in attributes for page including address `%{NS_ADDR[63]:(s|ns)}-%{NS_ADDR[62:0]:x} %{LINES:d}` cache lines are allocated with attributes: inner-`%{LINEATTR[3:0]:(device-|device-|noncacheable-non-bufferable|noncacheable|wRmb|wRmB|WT-cacheable|WB-cacheable|Rwmb|RwmB|WT-cacheable|WB-cacheable|RWmb|RWmB|WT-cacheable|WB-cacheable)}%{LINEATTR[3:0.14:13]:(nGnRnE|nGRnE?|GnRnE?|GRnE?|nGnRE|nGRE|GnRE?|GRE|)}%{LINEATTR[15]:(|-transient)}` outer-`%{LINEATTR[7:4]:(device-|`

device-|noncacheable-non-bufferable|noncacheable|wRmb|wRmB|WT-cacheable|WB-cacheable|Rwmb|RwmB|WT-cacheable|WB-cacheable|RWmb|RWmB|WT-cacheable|WB-cacheable)%{LINEATTR[7:4.14:13]:(nGnRnE|nGRnE?|GnRnE?|GRnE?|nGnRE|nGRE|GnRE?|GRE|)%{LINEATTR[16]:(|-transient)} shareability: %{LINEATTR[9:8]:(nsh|ish|osh|sys)}%{LINEATTR[21.24]:(|TranslatedAccess|NonStallable|TransFaultFlow)}%{LINEATTR[22]:(|NonAddressBasedRouted)}%{LINEATTR[25]:(|HasMetaData)}%{LINEATTR[26]:(|ReservedImpDef)}%{LINEATTR[27]:(|-StreamTransaction)}%{LINEATTR[28]:(|-nse)}%{LINEATTR[29]:(|-nse2)}%{LINEATTR[31]:(|-HasMutatingMetaDataOp)} but transaction attributes are: inner-%{TXATTR[3:0]:(device-|device-|noncacheable-non-bufferable|noncacheable|wRmb|wRmB|WT-cacheable|WB-cacheable|Rwmb|RwmB|WT-cacheable|WB-cacheable|RWmb|RWmB|WT-cacheable|WB-cacheable)}%{TXATTR[3:0.14:13]:(nGnRnE|nGRnE?|GnRnE?|GRnE?|nGnRE|nGRE|GnRE?|GRE|)%{TXATTR[15]:(|-transient)} outer-%{TXATTR[7:4]:(device-|device-|noncacheable-non-bufferable|noncacheable|wRmb|wRmB|WT-cacheable|WB-cacheable|Rwmb|RwmB|WT-cacheable|WB-cacheable|RWmb|RWmB|WT-cacheable|WB-cacheable)}%{TXATTR[7:4.14:13]:(nGnRnE|nGRnE?|GnRnE?|GRnE?|nGnRE|nGRE|GnRE?|GRE|)%{TXATTR[16]:(|-transient)} shareability: %{TXATTR[9:8]:(nsh|ish|osh|sys)}%{TXATTR[21.24]:(|TranslatedAccess|NonStallable|TransFaultFlow)}%{TXATTR[22]:(|NonAddressBasedRouted)}%{TXATTR[25]:(|HasMetaData)}%{TXATTR[26]:(|ReservedImpDef)}%{TXATTR[27]:(|-StreamTransaction)}%{TXATTR[28]:(|-nse)}%{TXATTR[29]:(|-nse2)}%{TXATTR[31]:(|-HasMutatingMetaDataOp)}. PRIMARY KEY NS_ADDR. Fields:

LINEATTR unsigned int

Attributes of the cache allocated lines.

LINES unsigned int

Number of cache lines already allocated.

NS_ADDR unsigned int

The security world and address of the first byte of the page, the MSB encodes the NS bit.

PAS enum

The Physical Address Space.

TXATTR unsigned int

Attributes of the transaction.

ArchMsg.Error.cached_attributes_mismatch#lineinfo

Information about allocated lines in page. DISPLAY %{TAG[1]:(u|U)}%{TAG[2]:(d|D)}-%{TAG[63:61]:(s|rt|ns|rl|sa|na6|nsp|na7)}-%{PADDR}-%{TAG[59:58]:(nsh|ish|osh|sys)}%{TAG[56]:(|-iHittable)}%{TAG[57]:(|-oHittable)}. Fields:

PADDR unsigned int

address of this cache line.

TAG unsigned int

tag data of this cache line.

ArchMsg.Warning.ns_s_dirty_hit

Cache hit at S and NS versions of the same physical address DISPLAY At PAddr %{PADDR} Line index %{INDEX0} is for %{TAG0[1]:(u|U)}%{TAG0[2]:(d|D)}-%{TAG0[63:61]:(s|

rt|ns|rl|sa|na6|nsp|na7}}-%{PADDR}-%{TAG0[59:58]:(nsh|ish|osh|sys}}%{TAG0[56]:(|-iHittable}}%{TAG0[57]:(|-oHittable}} Line index %{|INDEX1} is for %{|TAG1[1]:(u|U)}%{|TAG1[2]:(d|D)}-%{TAG1[63:61]:(s|rt|ns|rl|sa|na6|nsp|na7}}-%{PADDR}-%{TAG1[59:58]:(nsh|ish|osh|sys}}%{TAG1[56]:(|-iHittable}}%{TAG1[57]:(|-oHittable}} i.e. same address but different security regimes and one or more are dirty This is not an error if different memory is backing the lines, but otherwise can cause unpredictable cache incoherency. PRIMARY KEY PADDR. Fields:

INDEX0 unsigned int

The cache line index of the affected cache line.

INDEX1 unsigned int

The cache line index of the other regime cache line.

PADDR unsigned int

The address of the affected cache line.

TAG0 unsigned int

The tag data of the affected cache line.

TAG1 unsigned int

The tag data of the other regime cache line.

CACHE_READ_HIT

Read access cache hit. Note that this trace source causes a large slowdown in the simulation. Fields:

IS_PRELOAD enum

Is the access a preload.

IS_SHARED enum

Is the access shared.

LATENCY unsigned int

Cache latency in ticks per access.

MANAGER_ID unsigned int

Indicates the manager ID associated with this monitor.

CACHE_READ_MISS

Read access cache miss and cache miss latency. Fields:

IS_PRELOAD enum

Is the access a preload.

IS_SHARED enum

Is the access shared.

LATENCY unsigned int

Cache miss latency in ticks per access.

MANAGER_ID unsigned int

Indicates the manager ID associated with this monitor.

CACHE_WRITE_HIT

Write access cache hit. Note that this trace source causes a large slowdown in the simulation. Fields:

IS_PRELOAD enum

Is the access a preload.

IS_SHARED enum

Is the access shared.

LATENCY unsigned int

Cache latency in ticks per access.

MANAGER_ID unsigned int

Indicates the manager ID associated with this monitor.

CACHE_WRITE_MISS

Write access cache miss and cache miss latency. Fields:

IS_PRELOAD enum

Is the access a preload.

IS_SHARED enum

Is the access shared.

LATENCY unsigned int

Cache miss latency in ticks per access.

MANAGER_ID unsigned int

Indicates the manager ID associated with this monitor.

DVM_Message

DISPLAY DVM_msg (%{DVM_MESSAGE}). Fields:

DVM_MESSAGE string

The DVM Message.

ENTRY_BECOMES_INVALID

An entry is now invalid. The cause could be any reason. Fields:

ENTRY_INDEX unsigned int

The entry index that has become invalid.

ENTRY_SET_DIRTY

Entry change, clean/dirty. Fields:

ENTRY_INDEX unsigned int

The entry index that has become clean or dirty.

STATUS unsigned int

True if the line was made dirty.

ERROR_MIXED_ATTRIBUTES_LINE

Mismatched line and transaction attributes. Fields:

ENTRY_INDEX unsigned int

The entry index that has collided.

NS_ADDR unsigned int

The security world and address of the first byte of the line, the MSB encodes the NS bit.

PAS enum

The Physical Address Space.

ERROR_MIXED_ATTRIBUTES_PAGE

Attributes differ between page and lines in cache from the same page. Fields:

NS_ADDR unsigned int

The security world and address of the first byte of the page, the MSB encodes the NS bit.

PAS enum

The Physical Address Space.

EVICTION

A line was evicted from the cache. Fields:

ADDRESS unsigned int

Base address of the victim cache line.

CLEAN bool

If true the cache retained the cache line after writing the dirty data.

ENTRY_INDEX unsigned int

The entry index of the victim.

NON_SECURE bool

If true the victim was NonSecure.

PAS enum

Physical Address Space.

IMPRECISE_ABORT

An operation produced an imprecise abort. Usually this is a WriteBack/WriteClean operation receiving an error response. Fields:

ADDRESS unsigned int

Address of the transaction that imprecise aborted.

DECERR bool

True if this is a DECERR response.

DOWNSTREAM_PORT_INDEX unsigned int

The downstream port index that received the imprecise abort.

NS bool

The NS state of the transaction (true is non-secure).

PAS enum

The Physical Address Space.

MAINTENANCE_CLEAN_SET_WAY

A cache maintenance by set-way operation occurred, possibly the 'clean' part of a clean-and-invalidate operation. Fields:

ENTRY_INDEX unsigned int

The entry index the set-way operation has mapped to.

IS_NON_SECURE bool

If the invalidate operation is non-secure (and so only affects non-secure lines), or secure (and so affects both).

PAS enum

Physical Address Space.

STATE enum

Line transformation incurred.

MAINTENANCE_INVALIDATE_ALL

A cache maintenance invalidate-all operation occurred. Fields:

IS_NON_SECURE bool

True if the invalidate operation is non-secure or realm, otherwise false: * Non-secure invalidates only non-secure lines * Secure invalidates secure and non-secure lines * Realm invalidates realm and non-secure lines * Root invalidates lines from any world.

PAS enum

The Physical Address Space.

MAINTENANCE_INV_SET_WAY

A cache maintenance by set-way operation occurred, possibly the 'invalidate' part of a clean-and-invalidate operation. Fields:

ENTRY_INDEX unsigned int

The entry index the set-way operation has mapped to.

IS_NON_SECURE bool

If the invalidate operation is non-secure (and so only affects non-secure lines), or secure (and so affects both).

PAS enum

The Physical Address Space.

STATE enum

Line transformation incurred.

change_dvm_disabled_ports

This reports a bitmap of which ports are disabled to receive DVM messages. Fields:

new_bitmap unsigned int

The new bitmap of disabled ports.

new_bitmap_list unsigned int

A list of port numbers that were disabled.

old_bitmap unsigned int

The old bitmap of disabled ports.

old_bitmap_list unsigned int

A list of port numbers that were disabled.

change_upstream_disabled_ports

This reports a bitmap of which upstream ports of the cache are *disabled* and so no snoop requests are sent to them. Fields:

new_bitmap unsigned int

The bitmap of the first 32 upstream ports that are disabled.

new_bitmap_list unsigned int

A list of port numbers that were disabled.

old_bitmap unsigned int

The bitmap of the first 32 upstream ports that are disabled.

old_bitmap_list unsigned int

A list of port numbers that were disabled.

entry_after_far_atomic

A cache line has had a far atomic applied to it. Fields:

atomic_operation enum

The operation that operated on this line.

be bool

The far atomic's big-endian flag.

data unsigned int

The data in the cache line.

entry_begin_address unsigned int

The start address of the entry.

entry_index unsigned int

The entry index in the cache.

incoming_data unsigned int

The incoming data from the far atomic. For CAS operations then this is compare-value and then the replacement-value.

manager_id unsigned int

The manager ID for the associated transaction.

ns enum

The security state of the line.

pas enum

The Physical Address Space.

prior_data unsigned int

The data that will be returned as the 'prior' data of the far atomic.

trans_begin_address unsigned int

The start address of the transaction.

entry_after_read

A cache line has been read. Fields:

ace_operation enum

The ACE operation that operated on this line.

data unsigned int

The data in the cache line.

dirty bool

Is the line ACE-dirty.

entry_begin_address unsigned int

The start address of the entry.

entry_index unsigned int

The entry index in the cache.

ns enum

The security state of the line.

pas enum

The Physical Address Space.

snoop bool

This transaction is a snoop transaction.

trans_begin_address unsigned int

The start address of the transaction.

unique bool

Is the line ACE-unique.

entry_after_write

A cache line has been written. Fields:

ace_operation enum

The ACE operation that operated on this line.

data unsigned int

The data in the cache line.

entry_begin_address unsigned int

The start address of the entry.

entry_index unsigned int

The entry index in the cache.

ns enum

The security state of the line.

pas enum

The Physical Address Space.

trans_begin_address unsigned int

The start address of the transaction.

2.164 PVMemoryProtectionEngine

This section describes the trace sources.

EC_MATCH

Access is made with owning encryption context (PAS, MECID). Fields:

IS_READ bool

Whether read or write access.

MECID unsigned int

MECID of the page.

PAGE_BASE unsigned int

Base address of page.

PAS enum

Physical address space of the page.

PAGE_OWNERSHIP_UPDATE

Encryption context (PAS, MECID) ownership update of 4KiB page is updated. Fields:

NEW_MECID unsigned int

New MECID of the page.

NEW_PAS enum

New Physical address space.

OLD_MECID unsigned int

Old MECID of the page.

OLD_PAS enum

Old Physical address space.

PAGE_BASE unsigned int

Base address of page.

PAGE_STATUS

Status of 4KiB page. Fields:

PAGE_BASE unsigned int

Base address of page.

Status enum

Status of page.

PAS_MISMATCH

Access is made with non-owning encryption context (PAS, MECID). Fields:

IS_READ bool

Whether read or write access.

NEW_MECID unsigned int

New MECID of the page.

NEW_PAS enum

New Physical address space.

OLD_MECID unsigned int

Old MECID of the page.

OLD_PAS enum

Old Physical address space.

PAGE_BASE unsigned int

Base address of page.

2.165 PVWriteBuffer

This section describes the trace sources.

ATOMIC_SLAVE_ACCESS

Information on the atomic operation at slave side. Fields:

ACCESS_RESULT enum

Result of atomic access.

COMPARE_VALUE unsigned int

Value to be compared with memory by CAS.

LOAD_VALUE unsigned int

Value to be loaded from memory as a result of atomic operation.

MANAGER unsigned int

ID of manager which initiated the transaction.

NS bool

Normal(true), Secure(false).

OPERAND_VALUE unsigned int

Incoming operand value provided by core.

OPERATION unsigned int

Type of atomic operation.

PADDR unsigned int

Physical address.

PAS enum

The physical address space.

STORE_VALUE unsigned int

Value to be stored to memory as a result of atomic operation.

WRITE_BUFFER_CONTENTS

Contents of a Line in WriteBuffer before/after updating them. Fields:

ADDRESS unsigned int

Address.

BEFORE_UPDATE bool

Before update.

DATA unsigned int

Data content.

LINE_INDEX unsigned int

Line index.

METADATA unsigned int

MetaData value.

NS bool

Normal(true), Secure(false).

PAS enum

The physical address space.

WRITE_BUFFER_HIT

An access hits in WriteBuffer. Fields:

ADDRESS unsigned int

Address.

IS_IMMEDIATELY_SERVED_BY_WB bool

true: This access is serviced in WriteBuffer? false: Sent downstream.

IS_READ bool

Is Read.

NS bool

Normal(true), Secure(false).

PAS enum

The physical address space.

WRITE_BUFFER_READ_DATA_DOWNSTREAM

Read one line of data from downstream. Fields:

ADDRESS unsigned int

Address.

DATA unsigned int

Data content.

NS bool

Normal(true), Secure(false).

PAS enum

The physical address space.

WRITE_BUFFER_READ_METADATA_DOWNSTREAM

Read one MetadataElement_t from downstream. Fields:

ADDRESS unsigned int

Address.

METADATA unsigned int

MetaData read from downstream.

NS bool

Normal(true), Secure(false).

PAS enum

The physical address space.

WRITE_BUFFER_WARNING_RESET_WHEN_DIRTY

Reset received whilst dirty lines exist in the write buffer.

WRITE_BUFFER_WARNING_RESET_WHEN_IN_TRANSACTIONAL_STATE

Reset received whilst the write buffer contains TME Transactional state.

2.166 SMMUv3AEM

This section describes the trace sources.

ArchMsg.Error.error

These messages are about activity occurring on the SMMU that is considered an error. Messages will only come out here if parameter `all_error_messages_through_trace` is true. `DISPLAY %{\output}`. Fields:

output string

The stream output.

ArchMsg.Error.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int

The address of the descriptor fetch.

desc_inner enum

Inner cacheability of descriptor.

desc_outer enum

Outer cacheability of descriptor.

desc_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

desc_sh enum

Shareability of descriptor.

ssd enum

The SSD of the transaction.

ssd_ns bool

Is the Security State Determination of the transaction non-secure.

stage unsigned int

The stage at which we had a problem.

streamid unsigned int

The StreamID of the transaction.

substreamid unsigned int

The SubstreamID of the transaction (or ~0u if no substreamid).

trans_id unsigned int

Transaction id.

ArchMsg.Error.ns_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.priq_streamid_truncated

The SMMU received a PCIe PRI request with a StreamID that was larger than that which the SMMU has been configured for. The StreamID that appears in the PRIQ entry will be truncated. Fields:

actual_streamid unsigned int

The actual StreamID that this request has.

sidsize unsigned int

The bit width of the SMMU for StreamIDs, as indicated by SMMU_IDR1.SIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_streamid unsigned int

The truncated StreamID that will appear in the PRIQ entry.

ArchMsg.Error.priq_substreamid_truncated

The SMMU received a PCIe PRI request with a PASID prefix (SubstreamID) that was larger than that which the SMMU has been configured for. The SubstreamID that appears in the PRIQ entry will be truncated. Fields:

actual_substreamid unsigned int

The actual SubstreamID that this request has.

ssidsize unsigned int

The bit width of the SMMU for SubstreamIDs, as indicated by SMMU_IDR1.SSIDSIZE.

trans_id unsigned int

The transaction ID that identifies this request.

trunc_substreamid unsigned int

The truncated SubstreamID that will appear in the PRIQ entry.

ArchMsg.Error.s_cmdq

There is an error associated with the command queue. Fields:

cmd_id unsigned int

Command ID of the command in error.

cons unsigned int

CONS of the command.

what string

What is wrong.

ArchMsg.Error.tlb_entries_overlap

A TLB entry was attempted to be inserted into the TLB and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

do_f_tlb_conflict bool

Chosen to perform an F_TLB_CONFLICT.

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

why enum

Why it is an error for these two entries to overlap.

ArchMsg.Error.tlb_entry_not_invalidated_due_to_ril

An entry in the cache was not invalidated even though in the right address range because of the RIL fields of the command the entry do not match. Fields:

cmd_num unsigned int

The NUM field of the RIL part of the command.

cmd_ril_tg enum

The RIL_TG field of the RIL part of the command.

cmd_ril_ttl unsigned int

The TTL field of the RIL part of the command, zero means any level. 0x80 means match level 0 (and is from a DVM message).

cmd_scale unsigned int

The SCALE field of the RIL part of the command.

entry_id unsigned int

The entry id that is being invalidated.

tlb_entry string

The TLB entry.

ArchMsg.Error.vatos_sel_vmid_out_of_range

The SMMU_(S_)VATOS_SEL.VMID field was programmed with a VMID that was too wide for this implementation (SMMU_IDR0.VMID16 == 0). DISPLAY %**{ssd_ns:(s-|ns-)}**VMID:%**{vmid}** is out of range. Fields:

ssd_ns bool

The security state of the VATOS interface.

vmid unsigned int

The VMID programmed.

ArchMsg.Info.info

These are information messages about what is happening in the SMMU. DISPLAY %{output}.
Fields:

output string

The stream output.

ArchMsg.Warning.CMD_RESUME_no_transaction_resumed

A CMD_RESUME was issued that matched no transaction. Fields:

stag unsigned int

STAG in the CMD_RESUME.

streamid unsigned int

StreamID in the CMD_RESUME.

streamid_ns bool

The StreamID was for the non-secure world.

ArchMsg.Warning.atc_inv_strange

Something was odd about the CMD_ATC_INV. DISPLAY CMD_ATC_INV strange as: %{why}.
Fields:

cmd_id unsigned int

Command id.

ssd_of_cmdq enum

The SSD of the CMDQ.

why string

Why the CMD_ATC_INV was strange.

ArchMsg.Warning.bad_axi_stream_msi_addr_to_match_s

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value unsigned int

The default value of the signal we have been assuming.

value unsigned int

The value of the signal.

ArchMsg.Warning.bad_conf_reset_of_SMMU_GBPA_ABORT

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_conf_reset_of_SMMU_S_GBPA_ABORT

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_btm

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_cohacc

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_httu

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_conf_system_supports_sev

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.bad_reset_in

The signal was not driven at reset by the external system, but was driven after we first started using the default value we had assumed. The external system, if it is going to drive the signal, must do so at first reset so that both sides of the connection can agree on the value of this signal. Fields:

default_value bool

The default value of the signal we have been assuming.

value bool

The value of the signal.

ArchMsg.Warning.contig_bit_gives_too_large_region_for_TxSZ

If the contig bit was used then the size of the contig region would be larger than that indicated by TxSZ. Fields:

desc_kind enum

Descriptor kind.

el enum

Exception level.

input_address unsigned int

Input address.

log2_contig_region_size unsigned int

Log2(contig region size in bytes).

output_address unsigned int

Output address.

stage_and_level unsigned int

The stage in bits [7:4] and the level in [3:0]. Level -1 is 0xF.

vmid unsigned int

VMID if appropriate.

ArchMsg.Warning.contig_bit_has_inconsistent_input_and_output_address

If the contig bit was used then the some bits of the output address held in the descriptor and the input address must match. Fields:

desc_kind enum

Descriptor kind.

el enum

Exception level.

input_address unsigned int

Input address.

log2_contig_region_size unsigned int

Log2(contig region size in bytes).

match_mask unsigned int

Bits that must match.

output_address unsigned int

Output address.

stage_and_level unsigned int

The stage in bits [7:4] and the level in [3:0]. Level -1 is 0xF.

vmid unsigned int

VMID if appropriate.

ArchMsg.Warning.fetch_from_memory_type_not_supporting_httu

A descriptor fetch from an HTTU-enabled translation regime to an unsupported memory type was made. Whilst the fetch itself may succeed, if an update to the descriptor was attempted then it would fail. Fields:

address unsigned int

The address of the descriptor fetch.

desc_inner enum

Inner cacheability of descriptor.

desc_outer enum

Outer cacheability of descriptor.

desc_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

desc_sh enum

Shareability of descriptor.

ssd enum

The SSD of the transaction.

ssd_ns bool

Is the Security State Determination of the transaction non-secure.

stage unsigned int

The stage at which we had a problem.

streamid unsigned int

The StreamID of the transaction.

substreamid unsigned int

The SubstreamID of the transaction (or ~0u if no substreamid).

trans_id unsigned int

Transaction id.

ArchMsg.Warning.msi_address_truncated

An MSI was generated, but the address was silently truncated due to the limited downstream address bus width. Fields:

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

truncated_address unsigned int

The truncated address.

untruncated_address unsigned int

The untruncated address.

which enum

Which MSI this is.

ArchMsg.Warning.msi_lost

An MSI was attempted to be sent, but couldn't be sent. Fields:

id unsigned int

ID of this interrupt transaction.

kind enum

What kind of interrupt.

why enum

Why this interrupt was denied.

ArchMsg.Warning.pmcg_non_secure_world

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between security states. Fields:

commentary string

The commentary.

ArchMsg.Warning.pmcg_programming_violates_security

A commentary on potential mis-programming of the PMCG when transitioning the PMCG between different security states. This is under the assumption that an agent from another security state could be writing to the PMCG. Fields:

commentary string

The commentary.

ArchMsg.Warning.priq_auto_response_failed_to_find_STE

The PRIQ was going to generate an auto-response, but failed to find an STE and so is returning a Failure message to the EndPoint which should disable the PRI interface of the EndPoint. Fields:

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

ArchMsg.Warning.priq_overflow_bad_acking

Indicates that an overflow condition was acknowledged by writing to:- SMMU_PRIQ_CONS.OVACKFLG but an overflow condition did not exist. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

ArchMsg.Warning.priq_smmuen_forces_effective_priqen_low

If SMMUEN == 0, then the effective value of PRIQEN is 0. This warning is triggered when PRIQEN == 1 && SMMUEN == 0; which may not be what was intended. The PRIQ cannot be active if SMMUEN == 0.

ArchMsg.Warning.sev_lost

A SEV was lost because it isn't supported according to SMMU_IDRO.SEV. DISPLAY SEV was lost because: %{why}. Fields:

why enum

Why the SEV was generated.

ArchMsg.Warning.suspicious_overlapping_entries

Two DPT TLB entries are overlapping but they differ in ways that are potentially a SW error. Fields:

new_AC enum

The value of the 'AC' field that controls access to this region.

new_FWB bool

The region is FWB.

new_VMID unsigned int

The VMID, if any, associated with this region.

new_entry_index unsigned int

The entry index of the new DPT TLB entry.

new_entry_is_vmsa_formed bool

The new entry was inserted as a result of VMSA information.

new_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

new_input_start_address unsigned int

The start address of the input range that this matches.

new_output_pas enum

The output PAS of this DPT region.

new_ssd enum

The SSD of the streams this region captures.

new_writeable bool

True if this region is writeable.

old_AC enum

The value of the 'AC' field that controls access to this region.

old_FWB bool

The region is FWB.

old_VMID unsigned int

The VMID, if any, associated with this region.

old_entry_index unsigned int

The entry index of the old DPT TLB entry.

old_entry_is_vmsa_formed bool

The old entry was inserted as a result of VMSA information.

old_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

old_input_start_address unsigned int

The start address of the input range that this matches.

old_output_pas enum

The output PAS of this DPT region.

old_ssd enum

The SSD of the streams this region captures.

old_writeable bool

True if this region is writeable.

pas_differ bool

The output PAS of the two entries differ.

vmids_differ bool

The VMIDs are used by at least one of the AC schemes and are different.

vmsa_formed_writeable_while_DPT_entry_is_not bool

The VMSA-formed entry is writeable but the DPT Entry says it is not writeable.

ArchMsg.Warning.warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the SMMU. DISPLAY %{output}. Fields:

output string

The stream output.

ArchMsg.Warning.warning_effective_EOPD_differs_from_what_would_be_cached_in_TLB

Effective value of EOPD differs from what would be cached in the TLB DISPLAY transaction (%{transaction_id}), sid (%{sid}), ssid (%{ssid}), ssd (%{ssd}), effective EOPD (%{effective_EOPD}), cached EOPD (%{cached_EOPD}). Fields:

cached_EOPD bool

The EOPD value that would be cached in the TLB.

effective_EOPD bool

The effective value of EOPD.

ssd enum

SSD.

streamid unsigned int

StreamID or ~0ull if NoStreamID.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

transaction_id unsigned int

The transaction ID.

DPTTLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

DPTTLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

EVENTQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

HACDBS_PROCESSING_COMPLETE_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool
read-allocate attribute.

sh enum
Shareability.

smmu_idr0_msi bool
Are MSIs supported for this security world.

tr bool
transient attribute.

wa bool
write-allocate attributes.

HACDBS_PROCESSING_COMPLETE_irqen
The IRQEN has been changed. Fields:

new_value bool
The new value of IRQEN.

HACDBS_PROCESSING_COMPLETE_irqen_ack
The IRQEN change has been acked. Fields:

new_value bool
The new value of IRQEN.

HDBSS_TABLE_FULL_config
Configuration of interrupt updated. Fields:

address unsigned int
Address of the MSI.

data unsigned int
Data payload of the MSI.

irqen bool
Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum
Memory type.

ns bool
PAS of bus attribute is non-secure.

pas enum
PAS of the MSI.

ra bool
read-allocate attribute.

sh enum
Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

PRIQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

PRIQ_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

PRIQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

SMMU_CR0ACK_SMMUEN_hazarded_by_priq

The SMMU_r_CR0ACK.SMMUEN cannot acknowledge the change to SMMUEN because there are outstanding PRIQ writes.

SMMU_CR0ACK_SMMUEN_update

The acknowledge to SMMU_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_CR0.SMMUEN completed. Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_CR0_SMMUEN_write

A write to SMMU_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_GBPA completed. Fields:

last bool

This is the last set completing.

old_value unsigned int

The old value of the set completing.

SMMU_GBPA_update

The Update flag to SMMU_GBPA was lowered. Fields:

new_value unsigned int

The new value of the register.

SMMU_GBPA_write

A write to SMMU_GBPA occurred. Fields:

new_value unsigned int

The new value of the register.

old_value unsigned int

The old value of the register.

SMMU_S_CR0ACK_SMMUEN_update

The acknowledge to SMMU_S_CR0.SMMUEN was performed. Fields:

new_value bool

The new value of the register.

SMMU_S_CR0_SMMUEN_old_set_complete

A set of transactions associated with the old value of SMMU_S_CR0.SMMUEN completed. Fields:

last bool

This is the last set completing.

old_value bool

The old value of the set completing.

SMMU_S_CR0_SMMUEN_write

A write to SMMU_S_CR0.SMMUEN occurred. Fields:

new_value bool

The new value of the register.

old_value bool

The old value of the register.

SMMU_S_GBPA_old_set_complete

A set of transactions associated with the old value of SMMU_S_GBPA completed. Fields:

last bool

This is the last set completing.

old_value unsigned int

The old value of the set completing.

SMMU_S_GBPA_update

The Update flag to SMMU_S_GBPA was lowered. Fields:

new_value unsigned int

The new value of the register.

SMMU_S_GBPA_write

A write to SMMU_S_GBPA occurred. Fields:

new_value unsigned int

The new value of the register.

old_value unsigned int

The old value of the register.

S_EVENTQ_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irgen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_EVENTQ_irgen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_EVENTQ_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_GERROR_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_GERROR_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_GERROR_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_HACDBS_PROCESSING_COMPLETE_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_HACDBS_PROCESSING_COMPLETE_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_HACDBS_PROCESSING_COMPLETE_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

S_HDBSS_TABLE_FULL_config

Configuration of interrupt updated. Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

Appropriate bit of SMMU_s_IRQ_CTRL controlling this interrupt.

memattr enum

Memory type.

ns bool

PAS of bus attribute is non-secure.

pas enum

PAS of the MSI.

ra bool

read-allocate attribute.

sh enum

Shareability.

smmu_idr0_msi bool

Are MSIs supported for this security world.

tr bool

transient attribute.

wa bool

write-allocate attributes.

S_HDBSS_TABLE_FULL_irqen

The IRQEN has been changed. Fields:

new_value bool

The new value of IRQEN.

S_HDBSS_TABLE_FULL_irqen_ack

The IRQEN change has been acked. Fields:

new_value bool

The new value of IRQEN.

TLB.tlb_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

TLB.tlb_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

atc_inv_nop

The CMD_ATC_INV command is ignored as a **NOP**. This may be emitted multiple times if the CMD_ATC_INV is being ignored for multiple reasons. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why was NOPped.

atos_complete_fault

The ATOS operation completed with a fault. Fields:

effective_st1translate bool

Because of the settings and/or the ATOS type then the effective st1translate can be different.

fault_faddr unsigned int

The fault FADDR.

fault_faultcode enum

The fault code.

fault_reason enum

The fault reason.

ssd_ns bool

This is a non-secure ATOS operation.

st1translate bool

The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool

The translation suffered a stage 2 translation.

state enum

The final transaction state of the ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_complete_fault_inv_req

The ATOS operation completed, faulted and generated an INV_REQ response. Fields:

ssd_ns bool

This is a non-secure ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

why enum

Why the ATOS operation generated an INV_REQ.

atos_complete_success

The ATOS operation completed successfully. Fields:

base_addr unsigned int

The actual base address of region.

effective_st1translate bool

Because of the settings and/or the ATOS type then the effective st1translate can be different.

par_addr unsigned int

The PAR.ADDR field.

par_mair unsigned int

The memory attributes encoded as a MAIR.

par_ns bool

The PAR.NS field, for an SSD-ns request then this will always be 0.

par_sh enum

Shareability.

par_size bool

The PAR.Size field.

size_in_bytes unsigned int

The actual size in bytes of the region.

ssd_ns bool

This is a non-secure ATOS operation.

st1translate bool

The StreamID/SubstreamID combination should have been translated by stage 1.

st2translate bool

The translation suffered a stage 2 translation.

state enum

The final transaction state of the ATOS operation.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

atos_run_set

The SMMU_s_GATOS_CTRL.RUN field was set to start the ATOS operation. Fields:

ssd_ns bool

This is a non-secure ATOS operation.

vatos bool

This is a VATOS operation.

atos_starting

The ATOS operation is starting. Fields:

addr unsigned int

The input address to the ATOS operation.

httui bool

Inhibit HTTU update.

ind bool

Instruction Data.

pnu bool

Privileged not User.

rnw bool

Read not Write.

ssd_ns bool

This is a non-secure ATOS operation.

ssec bool

If this is a secure ATOS operation then this is if it is secure or not.

streamid unsigned int

The StreamID requested.

substreamid unsigned int

The SubstreamID requested, or ~0u if no SubstreamID.

type enum

The requested ATOS type.

vatos_vmid unsigned int

The VMID of the VATOS operation, or ~0u if not a VATOS operation.

axi_stream_msi_addr_to_match_s

Address to use to send SMMU originated MSIs directly to the GIC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value unsigned int

The value of the signal.

cd_cc.CD_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

cd_cc.CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

cd_entry_allocated

An CD entry has been allocated. Fields:

AssuredTranslation bool

The CD (and any L1CD) was fetched from an AssuredOnly stage 2 page and so might be capable of creating AssuredTranslations.

cd string

A textual description of the CD.

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

streamid unsigned int

The StreamID of the entry this will match.

substreamid unsigned int

The SubstreamID of the entry this will match. This may be zero for transactions without a SubstreamID.

conf_reset_of_SMMU_GBPA_ABORT

The pin is driven. This is the reset value of SMMU_GBPA.ABORT. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

conf_reset_of_SMMU_S_GBPA_ABORT

The pin is driven. This is the reset value of SMMU_S_GBPA.ABORT. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

conf_system_supports_btm

The pin is driven. This indicates the system supports BTM. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

conf_system_supports_cohacc

The pin is driven. This indicates the system supports COHACC. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

conf_system_supports_httu

The pin is driven. This indicates the system supports HTTU. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

conf_system_supports_sev

The pin is driven. This indicates the system supports SEV. This pin is sampled on the negedge of the reset pin and has to be driven beforehand for the value to take effect. Fields:

value bool

The value of the signal.

dpttlb_entry_allocated

A DPT TLB entry has been allocated. Fields:

AC enum

The value of the 'AC' field that controls access to this region.

FWB bool

The region is FWB.

VMID unsigned int

The VMID, if any, associated with this region.

index unsigned int

Index of the TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_pas enum

The output PAS of this DPT region.

ssd enum

The SSD of the streams this region captures.

trans_id unsigned int

The trans_id of the transaction that caused this allocation.

vmsa_formed bool

The entry was formed from VMSA information rather than from a DPT walk.

writeable bool

True if this region is writeable.

dpttlb_invalidate_intersects_but_does_not_cover_entry_range

ENCODED_SIZE < size of the region covered by the DPT entry so invalidation is not architecturally guaranteed. No invalidation is performed. Fields:

dpttlb_entry_id unsigned int

ID of the TLB entry.

entry_end_incl_address unsigned int

Last address covered by the TLB entry.

entry_start_address unsigned int

First address covered by the TLB entry.

invalidate_end_incl_address unsigned int

Last address covered by the invalidation range.

invalidate_start_address unsigned int

First address covered by the invalidation range.

ssd enum

The security state of the TLB entry.

dpttlb_overlapping_entries

Two DPT TLB entries are overlapping. Fields:

new_AC enum

The value of the 'AC' field that controls access to this region.

new_FWB bool

The region is FWB.

new_VMID unsigned int

The VMID, if any, associated with this region.

new_entry_index unsigned int

The entry index of the new DPT TLB entry.

new_entry_is_vmsa_formed bool

The new entry was inserted as a result of VMSA information.

new_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

new_input_start_address unsigned int

The start address of the input range that this matches.

new_output_pas enum

The output PAS of this DPT region.

new_ssd enum

The SSD of the streams this region captures.

new_writeable bool

True if this region is writeable.

old_AC enum

The value of the 'AC' field that controls access to this region.

old_FWB bool

The region is FWB.

old_VMID unsigned int

The VMID, if any, associated with this region.

old_entry_index unsigned int

The entry index of the old DPT TLB entry.

old_entry_is_vmsa_formed bool

The old entry was inserted as a result of VMSA information.

old_input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

old_input_start_address unsigned int

The start address of the input range that this matches.

old_output_pas enum

The output PAS of this DPT region.

old_ssd enum

The SSD of the streams this region captures.

old_writeable bool

True if this region is writeable.

dvm_tlbinvalidate_complete

The DVM TLB Invalidate message completed. Fields:

id unsigned int

The unique id of this DVM message.

ok bool

The DVM message was OK.

dvm_tlbinvalidate_received

A DVM message for a TLB Invalidate has been received. Fields:

address unsigned int

The VA or IPA to use if match_address.

asid unsigned int

The ASID to match if match_asid.

by_ipa bool

The operation is for an IPA operation if match_address.

id unsigned int

The unique id of this DVM message.

ignored enum

The DVM message was ignored.

last_level bool

The operation is for last level if supported.

match_address bool

Match the address field.

match_asid bool

Match the asid field.

match_vmid bool

Match the vmid field.

num unsigned int

If a range operation, the NUM field. If a single-address operation this is 0.

prot enum

The protection level for which this TLB Invalidate will operate on.

security_world enum

The security world that this will apply to.

smmu_scale unsigned int

If a range operation, then the SCALE field with the meaning in the SMMU architecture which is different to the PE architecture. If a single-address operation this is 0.

stage1_only bool

The operation is for stage 1 only if supported.

tg enum

If a single-address or address-range operation, then the Translation Granule hint. Address-range operations always supply a Translation Granule.

translation_table_level enum

The leaf level of the translation table.

vmid unsigned int

The VMID to match if match_vmid.

found_tlb_entry_has_different_aset

Architecturally, a particular ASID either should be ASET0 or ASET1. However, we have managed to find a TLB entry that has a different ASET than that which we were searching for. This indicates a programming error. You should examine all contexts with this particular ASID/VMID and ensure they are consistent. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_start_address unsigned int

The start address of the input range that this matches.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

vmid unsigned int

VMID if appropriate.

httu_update_abandoned_update

The HTTU update of a descriptor in memory was potentially possible, but it was behind an update that failed to apply cleanly. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

what enum

What this descriptor represents.

httu_update_end_update

The attempted update of a descriptor in memory has occurred. Fields:

is_big_endian bool

The descriptor is big-endian in memory.

original_descriptor unsigned int

The original descriptor value.

result enum

The result of the attempt to update.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int

The new descriptor value that tried to replace the original.

value_that_was_in_memory unsigned int

The value that the compare-and-swap operation returned as the value that was in memory.

httu_update_not_done

A discretionary HTTU update could occur and the implementation choose not to do it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

what enum

What this descriptor represents.

httu_update_start_update

An HTTU update could occur and the implementation chose to try it. A mandatory_do_if_linked_performed means that this is a stage 2 leaf descriptor that maps a subsequent stage 1 leaf descriptor whose update is discretionary and if that subsequent discretionary update is going to occur then this update becomes mandatory. Fields:

AF enum

Whether an AF update should/could occur.

DBM enum

Whether a DBM update should/could occur.

address unsigned int

Address of HTTU update.

httu_inner enum

Inner cacheability of descriptor to update.

httu_outer enum

Outer cacheability of descriptor to update.

httu_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

httu_sh enum

Shareability of descriptor to update.

is_big_endian bool

The descriptor will be written to memory as big-endian.

mecid unsigned int

The masked MECID used for the update transaction, or ~0u if not appropriate.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

original_descriptor unsigned int

The original descriptor that the model observed.

stage_and_level unsigned int

The stage (bits[7:4]) and level (bits[3:0]). A level of 0xF means -1.

trans_id unsigned int

The transaction id that this HTTU update is associated with.

try_to_change_to_descriptor unsigned int

The new descriptor value that is going to try replace the original.

what enum

What this descriptor represents.

will_do_AF bool

What the implementation chose to do for the AF update.

will_do_DBM bool

What the implementation chose to do for the DBM update.

integration_mode_end_ras_level_interrupt_restored

RAS level sensitive interrupt restored due to integration mode ending. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being restored.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

value bool

Level of the interrupt signal.

integration_mode_pmcg_interrupt_lost

PMCG interrupt lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

pmcg_interrupt enum

PMCG interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

integration_mode_ras_interrupt_lost

RAS interrupt lost due to being in integration mode. Fields:

is_tcu enum

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

integration_mode_ras_level_interrupt_lost

RAS level sensitive interrupt lost due to being in integration mode. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being dropped.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

value bool

Level of the interrupt signal.

integration_mode_start_ras_level_interrupt_cleared

RAS level sensitive interrupt cleared due to integration mode starting. Fields:

is_tcu bool

Is TCU integration mode.

ras_interrupt enum

RAS interrupt being cleared.

tbu_index unsigned int

TBU index. ~0u if it's TCU.

integration_mode_tcu_evento_lost

Evento lost due to being in integration mode.

integration_mode_tcu_interrupt_lost

Interrupt lost due to being in integration mode. Fields:

interrupt enum

Interrupt that is being dropped.

interrupt_returned

An interrupt/MSI returned from downstream. Fields:

InD_NS_PnU enum

Instruction/Data, Non-secure/Secure/Root/Realm, Privileged/User. Bit[1] = PAS[0], and bit[3] = PAS[1].

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

dcmdqcp_and_index unsigned int

If this not a DCMDQ MSI CMD_SYNC, then this is 0xFFFFFFFF. If it is then the DCMDQ QCP index is in bits[31:16] and the index in the QCP is in [7:0].

gpc_denied_msi bool

True if the MSI was denied as it failed its GPC checks. Thus the field 'ok' will be false.

id unsigned int

ID of this interrupt transaction.

inner_cache enum

The actual attributes of the access.

kind enum

What kind of interrupt.

mecid unsigned int

The MECID of the MSI, if applicable.

mpam_ns bool

For a non-RME system, this is true if the MPAM space is Non-secure. For an RME system, this is MPAM_SP[0].

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP security state of the MPAM partition. 0 – secure, 1 – non-secure, 2 – root, 3 – realm.

msi_valid bool

MSI will attempt to be sent.

ok bool

Did the access return OK or an abort?.

outer_cache enum

The actual attributes of the access.

pas enum

The PAS of the MSI, if applicable.

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum

Shareability.

interrupt_sent

An interrupt is raised. If it sends an MSI then this is *after* any device-dependent transform on the architectural attributes and so may differ from what is programmed. Fields:

InD_NS_PnU enum

Instruction/Data, Non-secure/Secure/Root/Realm, Privileged/User. Bit[1] = PAS[0], and bit[3] = PAS[1].

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

dcmdq_device_id unsigned int

If this is a DCMDQ then this is the DeviceID of the MSI write. Otherwise, 0xFFFF'ffff.

dcmdq_qcp_and_index unsigned int

If this not a DCMDQ MSI CMD_SYNC, then this is 0xFFFF'ffff. If it is then the DCMDQ QCP index is in bits[31:16] and the index in the QCP is in [7:0].

id unsigned int

ID of this interrupt transaction.

inner_cache enum

The actual attributes of the access.

kind enum

What kind of interrupt.

mecid unsigned int

The MECID of the MSI, if applicable.

mpam_ns bool

For a non-RME system, this is true if the MPAM space is Non-secure. For an RME system, this is MPAM_SP[0].

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP security state of the MPAM partition. 0 – secure, 1 – non-secure, 2 – root, 3 – realm.

msi_valid bool

MSI will attempt to be sent.

outer_cache enum

The actual attributes of the access.

pas enum

The PAS of the MSI, if applicable.

pmcg_index_and_counter unsigned int

If this is a PMCG interrupt, then the top 16 bits are the PMCG index, the lower 16 bits are counter index.

qSID unsigned int

If this is a DCMDQ then this is the qSID of the MSI write. Otherwise, 0xFFFF'ffff.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

sh enum

Shareability.

l1cd_cc.L1CD_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

l1cd_cc.L1CD_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

l1cd_entry_allocated

An L1 CD entry has been allocated. Fields:

AssuredTranslation bool

The L1CD was fetched from an AssuredOnly stage 2 page and so might be capable of creating AssuredTranslations.

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

normalised_substreamid unsigned int

The first SubstreamID of the range of SubstreamIDs that this L1CD entry will match.

ns enum

For the non-secure world.

pa_12 unsigned int

The PA of the L2 CD table. This is L2Ptr << 12.

ssd enum

The SSD of the entry.

streamid unsigned int

The StreamID this CD is for.

valid bool

Is the entry valid.

l1ste_cc.L1STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

l1ste_cc.L1STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

l1ste_entry_allocated

An L1 STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

first_streamid_of_range unsigned int

The first StreamID of the range of StreamIDs that this L1STE entry will match.

ns enum

For the non-secure world.

num_entries_in_l2 unsigned int

The number of entries in the L2 table. This is $2^{*(\text{Span}-1)}$ or 0 if invalid.

pa_l2 unsigned int

The PA of the L2 ST table. This is $\text{L2Ptr} \ll 6$ and aligned to the size of the table.

ssd enum

The SSD of the entry.

level_interrupt_sent

A level interrupt changed state. Fields:

kind enum

What kind of interrupt.

ras_error_group_id_node_id_and_record_index_in_node unsigned int

If this is a level RAS interrupt then this is the error group record id in bits[23:16], the node_id in [15:8] and the record index in the node in [7:0].

set_high bool

Level interrupt state.

ns_cmd_sync_completed_irq

“Non-secure” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_no_action

Non-secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_sev

Non-secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_completed_with_error

Non-secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_issued

Non-secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_issuing

Non-secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmd_sync_starting_completion_action_irq

Non-secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

ns_cmd_sync_starting_completion_action_sev

Non-secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

ns_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd, 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

ns_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

ns_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

ns_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

ns_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

ns_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd, 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

ns_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwritable and the queue is now writable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

ns_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

ns_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

ns_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

ns_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

ns_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

ns_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

ns_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

ns_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

ns_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

ns_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

ns_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

pmcg_irq_config

The interrupt configuration of the Performance Monitor Counter Group (PMCG) changed.
Fields:

address unsigned int

Address of the MSI.

data unsigned int

Data payload of the MSI.

irqen bool

SMMU_PMCG_CTRL.IRQEN.

memattr enum

Memory type.

mpam_ns bool

The NS state of the MPAM PARTID and MPAM PMG.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

msi_supported bool

Are MSIs supported for this security world.

ns bool

Non-secure bus attribute.

number_of_interrupts_in_flight unsigned int

The number of interrupts that have been committed to be produced or in flight.

pmcg_index unsigned int

Index of the PMCG.

sh enum

Shareability.

smmu_pmcg_gmpam_Update bool

The SMMU_PMC_GMPAM.Update flag. Only when this is zero are writes predictable.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen

A trace of SMMU_PMC_GIRQ_CTRL.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_irqen_ack

A trace of SMMU_PMC_GIRQLACK.IRQEN. Fields:

new_value bool

The new value of IRQEN.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_merging_interrupts

An interrupt was wanted to be generated, but one was already pending so the two were merged together. Fields:

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

pmcg_trigger

A PMCG counter has been triggered. Fields:

NoStreamID bool

True if the transaction is a NoStreamID transaction.

counter_index unsigned int

The index of the counter within the PMCG.

event_id unsigned int

The event id that has been triggered.

ns_event bool

Is the event associated with non-secure state.

pmcg_index unsigned int

Index of the PMCG.

prior_counter_value unsigned int

The Counter value *before* the event has incremented it.

ssd enum

The security state associated with the event.

streamid unsigned int

The StreamID associated with the event, if there is one.

tbu_index unsigned int

The TBU index of the transaction, or ~0u if not applicable.

pmu_active_counter

Traces what active counters are in a PMCG and what StreamIDs it might filter on. Those counters that trace StreamIDs for multiple security states, or those that are not filtered by StreamID, will appear multiple times, once for each security state. All active counters for a PMCG are traced one after another. Fields:

NoStreamID bool

True if NoStreamID transactions will be traced.

begin_streamid unsigned int

The start StreamID to filter on.

counter_index unsigned int

The counter index within the PMCG.

end_incl_streamid unsigned int

The end inclusive StreamID to filter on.

evcnt unsigned int

The current count.

event_id unsigned int

The event ID to filter.

ns bool

Are the StreamIDs non-secure?.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd enum

SSD of the StreamID.

tbu_index_to_match unsigned int

The TBU index that must match, or ~0u if no matching applicable.

pmu_all_counters_in_pmcg_became_inactive

The PMCG was tracing some events and now is not tracing any. Fields:

pmcg_index unsigned int

The index of the PMCG.

pmu_capture

For some reason, a capture event occurred. Fields:

pmcg_index unsigned int

The index of the PMCG that the capture occurred on.

why enum

Why did the capture occur?.

pmu_counter_configured_to_use_unsupported_event

An enabled counter was configured to use a unsupported event. Fields:

counter_index unsigned int

The counter index within the PMCG.

event_id unsigned int

The unsupported event id.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

pmu_counter_overflowed

A counter in a particular PMCG overflowed. Fields:

already_overflowed bool

True if the overflow flag was already set.

capture bool

True if it captured the other counter values.

counter_index unsigned int

The counter index within the PMCG.

interrupt bool

True if going to attempt to generate an interrupt.

interrupt_action enum

The interrupt action that is going to occur.

pmcg_index unsigned int

The index of the PMCG that this counter belongs to.

ssd_ns bool

The PMCG is controlled by the Non-secure security state.

priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

priq_overflow_acking

Indicates that an overflow condition was acknowledged by writing to:-
SMMU_PRIQ_CONS.OVACKFLG. Fields:

new_ovackflg bool

The new value of the SMMU_PRIQ_CONS.OVACKFLG.

priq_overflow_asserting

Indicates that we are toggling the SMMU_PRIQ_PROD.OVFLG because we lost a PRI request due to the PRIQ being full and an existing overflow condition does not already exist. Fields:

new_ovflg bool

The new value of the SMMU_PRIQ_PROD.OVFLG.

trans_id unsigned int

The transaction ID of the PPR that caused the overflow.

priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

priq_state

The trace of various fields that indicate the state of the PRIQ. Fields:

cons_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.RD_and_RD_wrap.

number_of_pprs unsigned int

The number of PPRs as indicated by the CONS/PROD.

number_of_pprs_still_to_deal_with unsigned int

This is the number of PPRs that are currently waiting to either be written to the PRIQ, or auto-responded to.

number_of_priq_writes_in_flight unsigned int

The number of writes to the PRIQ that are currently in flight.

ovackflg bool

The OVACKFLG which if different to OVFLG is used to indicate that the PRIQ overflowed.

ovflg bool

The OVFLG which if different to OVACKFLG is used to indicate that the PRIQ overflowed.

priq_abt_err bool

There is an active SMMU_GERROR{N}.PRIQ_ABT_ERR.

priqen bool

The value of SMMU_CRO.PRIQEN. The *effective* value is 0 if SMMUEN == 0.

priqenack bool

The value of SMMU_CROACK.PRIQEN.

prod_incl_wrap unsigned int

The value of SMMU_PRIQ.CONS.WR_and_WR_wrap.

queue_disabled_due_to_prior_programming_error bool

The queue was disabled as the programmer got CONS/PROD into an inconsistent state. The model will disable the PRIQ until SW disables and re-enables the queue via SMMU_CRO.PRIQEN.

smmuen bool

The value of SMMU_CRO.SMMUEN. If this is 0 then the effective PRIQEN is 0.

smmuenack bool

The value of SMMU_CRO.SMMUEN. If this is 0 then the effective PRIQEN is 0.

table_size_in_elements unsigned int

The size of the table in the number of items it can hold.

priq_write_aborted

A PRIQ write aborted. The PRIQ now goes into an error state and will start auto-responding to PRI requests. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we were trying to write.

trans_id unsigned int

The transaction ID of the PPR that aborted.

priq_write_ok

A PRIQ write completed OK. Fields:

prod_incl_wrap unsigned int

The PROD including the Wrap bit where we wrote..

trans_id unsigned int

The transaction ID of the PPR.

priq_write_start

A PRIQ request has been received and is going to be attempt to be written to the queue. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

prod_incl_wrap unsigned int

PROD position including the wrap bit.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

ptw_read

Page Table Walk (read). This is the result of the physical access that the SMMU is making.
Fields:

abort enum

Non-zero if the access aborted/failed.

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

data unsigned int

The data fetch if it didn't abort.

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_stl_invalid_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16

KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_leaf_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AP21 enum

The access permissions.

AttrIndx210 unsigned int

The attribute index into the MAIR0/1. If AIE is implemented then this is the full index AttrIndx[3:0].

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

NS bool

The encoding is for non-secure if this is a secure fetch.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIIIndex unsigned int

The S2PIIndex if S2PIE is in use, or 0xFFFF if not.

PXN bool

Privileged eXecute Never.

Protected enum

Is the descriptor producing an AssuredTranslation.

SH10 enum

The shareability.

XN bool

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

hwu_pbha unsigned int

Top four bits are appropriate CD.HWU, *bottom bits[62:59] of descriptor. Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by CD.HWU0/CD.HWU1**.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nG bool

not Global.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st1_table_long_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

NSTable bool

The next level table descriptor is forced to non-secure.

PXNTable bool

Force PXN independently of subsequent descriptors.

Protected enum

Is the descriptor capable of producing an AssuredTranslation.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16

KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_invalid_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is invalid. Fields:

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_leaf_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a block or page and this is the decode. Fields:

AF bool

Access Flag.

AMEC enum

Use Primary or Alternative MECID.

AssuredOnly enum

The descriptor is marked as AssuredOnly.

DBM bool

Dirty Bit Modifier. This only has meaning if running in AArch64 mode.

HAP21 enum

The access permissions.

MemAttr3_0 enum

The memory attributes.

NS enum

Whether this descriptor forces NS.

PIE_Dirty enum

The Dirty bit if S2PIE is in use.

PIE_PIIIndex unsigned int

The S2PIIndex if S2PIE is in use, or 0xFFFF if not.

POE_POIndex unsigned int

The S2POIndex if S2POE is in use, or 0xFFFF if not.

SH10 enum

The shareability.

XN enum

eXecute Never.

contiguous bool

Contiguous hint.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

nT bool

SMMUv3.2: If true then do not cache this entry in such a way that it can cause a TLB conflict abort (F_TLB_CONFLICT). The entry must produce a consistent result.

ns enum

Non-Secure on the bus.

output_address unsigned int

Output address.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

s2hwu_pbha unsigned int

Top four bits are STE.S2HWU, bottom bits[62:59] of descriptor. *Page Based Hardware Attributes: only valid on a bit-per-bit basis enabled by STE.S2HWU.*

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ptw_read_st2_table_descriptor

Page Table Walk (read). The descriptor that the PTW fetched is a Table, this decodes the fields. Fields:

AF enum

.

APTable enum

Remove permissions independently of subsequent descriptors.

PXNTable bool

Force PXN independently of subsequent descriptors.

TableAddress unsigned int

Address of the next table.

XNTable bool

Force XN independently of subsequent descriptors.

desckind enum

The kind of descriptor.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

ns enum

Non-Secure on the bus.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

raw_register_end_read

The raw register read transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

read_data unsigned int

The data read.

raw_register_end_write

The raw register write transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

The address of the transaction.

id unsigned int

Id of this transaction.

ok bool

Was the access OK? The bus response will always be OK, but is the register access reasonable.

pas enum

The PAS of the transaction.

raw_register_start_read

The raw register read transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

raw_register_start_write

The raw register write transaction. This is the transaction as directed to the register port.
Fields:

address unsigned int

Address of transaction.

id unsigned int

Id of this transaction. Top bit is set if is a debug transaction.

ns enum

Is the transaction non-secure?.

number_of_beats unsigned int

Number of beats.

pas enum

The PAS of the transaction.

size_of_beat_in_bytes unsigned int

Size of each beat in bytes.

write_data unsigned int

The data to write.

register_disallowed_read_string

A text representation of the read of a register that was disallowed. Fields:

out string

The text description of the register value read.

register_disallowed_write_string

A text representation of the write of a register write that was disallowed. Fields:

in string

The text description of the register value written.

register_read_reserved

A text representation of an access to a register address that is reserved. Fields:

in string

The text description of the register value.

register_read_string

A text representation of the read of a register. Fields:

out string

The text description of the register value read.

register_write_reserved

A text representation of an access to a register address that is reserved or a write.to a **RES0** field in a register. Fields:

in string

The text description of the register value.

register_write_string

A text representation of the write of a register. Fields:

in string

The text description of the register value written.

reset_in

The reset signal. Fields:

value bool

The value of the signal.

rl_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

rl_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

s_cmd_sync_completed_irq

“Secure” CMD_SYNC completed its IRQ action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_no_action

Secure CMD_SYNC completed, there was no CMD_SYNC action (SIG_NONE). Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_sev

Secure CMD_SYNC completed its action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_completed_with_error

Secure CMD_SYNC completed, however, there was an error associated with the completion of the CMD_SYNC. Fields:

error enum

The error associated with the CMD_SYNC.

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issued

Secure CMD_SYNC has now completed issuing and we now know if something is hazarding the CMD_SYNC from completing. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

hazarded bool

The CMD_SYNC is currently hazarded from completing.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_issuing

Secure CMD_SYNC is starting to issue, we are going to start accounting for which things have to be part of the prior set of things that have to complete before the CMD_SYNC can complete. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmd_sync_starting_completion_action_irq

Secure CMD_SYNC starting IRQ completion action. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

msiaddress unsigned int

The MSI address to use (or 0 if not sending an MSI).

msidata unsigned int

The MSI data to send.

s_cmd_sync_starting_completion_action_sev

Secure CMD_SYNC starting its completion action of SIG_SEV. Fields:

cmd_id unsigned int

The ID of the command being issued.

cons_incl_wrap unsigned int

CONS pointer of CMD_SYNC.

is_synthetic bool

This is a synthetic sync. The cons_incl_wrap is 0xFFFF'ffff.

s_cmdq_cmd_sync_error

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. The timeout will be attached to the next CMD_SYNC on the queue on which the invalidate was launched. Fields:

cerror enum

The CERROR to attach.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

herror enum

The HERROR to attach, or HERROR_NONE if we are attaching a CERROR.

s_cmdq_cmd_sync_error_delivered

The CMD_SYNC can fault if an ATC Invalidate timeout occurs. This is the CMD_SYNC delivering that fault. Fields:

cerror enum

The CERROR to attach.

cmd_id unsigned int

Command ID of the CMD_SYNC.

s_cmdq_ecmdq_enack

Trace the changes to ENACK. Fields:

cerror enum

The error being exposed, if any.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

enack bool

The value of ENACK.

forced_error bool

The queue was enabled with ERR != ERRACK and so the implementation chooses to trigger the error reporting mechanism.

s_cmdq_issue

A command is actually being executed. Fields:

cmd_id unsigned int

Command ID of the command being executed.

cons unsigned int

CONS of the command.

what string

What is being executed.

s_cmdq_pointers_state

The command queue pointers. Fields:

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd. 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

disable_fetch bool

The model has decided that as you programmed PROD/CONS inconsistently that it would not fetch as it has no confidence as to which are commands and which are not.

q_issuable_and_issued_cons unsigned int

The CONS pointer of the region that is issuable and/or issued (including wrap).

q_issuable_and_issued_prod unsigned int

The PROD pointer of the region that is issuable and/or issued (including wrap).

q_programmer_cons unsigned int

The CONS pointer as seen by the programmer (including wrap).

q_programmer_prod unsigned int

The PROD pointer as seen by the programmer (including wrap).

q_unfetched_cons unsigned int

The CONS pointer of the region unfetched (including wrap).

q_unfetched_prod unsigned int

The PROD pointer of the region unfetched (including wrap).

s_cmdq_state

A description of what the CMDQ can do now. Fields:

can_cerror bool

There is a CERROR that can be recognised.

can_cmd_sync bool

There is a CMD_SYNC that can be recognised.

can_fetch bool

The SMMU can fetch.

can_herror bool

There is an HERROR that can be recognised.

can_issue bool

There are fetched commands that are eligible to be issued.

can_update_cons bool

The programmer view of CMDQ_CONS can be moved to say some have been consumed.

cmd_queue unsigned int

The top bits indicate the CMDQ id. These bits are attached to all cmd_ids generated for this queue. The bits [63:44] contain the queue ID. [63:62] 0: s-ssd, 1: reserved, 2: ns-ssd, 3: rl-ssd [61] is ECMDQ [59:52] QCP index [51:44] ECMDQ index in QCP.

cmd_sync enum

Why a CMD_SYNC cannot be issued.

cmdqen bool

CMDQEN, when enabled then the CMDQ can fetch commands.

cmdqen_1_to_0_unacknowledged bool

CMDQEN has been set to 0, but we have yet to acknowledge it.

current-real-cerror enum

The current CERROR that would be visible to the programmer if there was an error.

fetch-disabled_due_to_programmer_error bool

The PROD/CONS pointer was inconsistent and the model decided to stop processing commands.

fetch-number_of_unfetched_commands unsigned int

The number of commands that have yet to be fetched from memory, or ~0u if CMDQEN == 0.

fetch-state enum

The state of the fetch state machine.

fetch-too_many_commands_outstanding_so_not_fetching_any_more bool

If there are too many issued commands, or pending to be issued then we won't fetch any more.

issue-number_of_issuable_commands unsigned int

The number of commands that have been fetched but not yet issued.

issue-number_of_unissuable_commands unsigned int

This might include commands behind an illegal command, or behind a CMD_SYNC. Under some circumstances this can include a command representing an external abort.

issue-state enum

The internal issued state machine state.

outstanding_fetches_since_reset unsigned int

The number of outstanding fetches.

synthetic_sync_can_be_completed bool

The synthetic sync that is outstanding can be completed.

waiting_for_synthetic_sync bool

There is a synthetic sync that is outstanding.

s_eventq_adding_to_cmd_sync_prior_set

The event created by the specified transaction id must become visible to the programmer before the CMD_SYNC can complete. Fields:

trans_id unsigned int

The transaction id that caused the event.

s_eventq_auto_retry_stalled_transaction

A transaction that was stalled but not yet reported on the Event Queue was retried. The retry can happen if the transaction didn't write because it was de-duplicated behind a reported stalling transaction and that stalling transaction was CMD_RESUMEd, or if the queue was unwritable and the queue is now writable. Fields:

trans_id unsigned int

Transaction id of the auto-retried transaction.

why enum

Why the transaction retried.

s_eventq_cmd_sync_unhazarded

The CMD_SYNC has been unhazarded as the prior set is empty and as much of it as required is visible in the programmers' view. Fields:

prod_incl_wrap unsigned int

The prod index including wrap bit that was required to become visible.

prog_prod_incl_wrap unsigned int

The current programmer-visible prod including wrap bit.

s_eventq_eventqen_and_eventqenack

Trace the values of EVENTQEN and EVENTQENACK as they change. Fields:

about enum

Some more information about the queue state.

cons_incl_wrap unsigned int

The CONS pointer (including wrap bits).

eventqen bool

EVENTQEN.

eventqenack bool

EVENTQENACK.

prod_incl_wrap unsigned int

The PROD pointer (including wrap bits).

s_eventq_external_abort

A particular eventq record got an external abort. The event will subsequently appear in the ns/s_eventq_lost_event_records trace. Fields:

prod unsigned int

The prod pointer (excluding wrap bit) of the event record that aborted.

trans_id unsigned int

The transaction id that produced the event record that aborted.

s_eventq_lost_event_records

Event records that are lost and never record appear on this trace. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD index of the event if appropriate or ~0u otherwise.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_overflow_acknowledged

When events are lost then they appear on the eventq_lost_event_records_* trace. This will activate the overflow flag in the corresponding SMMU_s_EVENTQ_PROD register. Software can then acknowledge that flag using the overflow acknowledge flag in SMMU_s_EVENTQ_CONS. Fields:

bad bool

If true then the programmer has attempted to acknowledge an overflow condition that didn't exist.

count_of_events_lost_due_to_overflow unsigned int

This is the number of events that were lost because the event queue was full. This does not include any lost because of an EVENTQ_ABT_ERR.

s_eventq_pending_event_records

Event records that are pending to be dealt with by the eventq state machine. A specific event can be traced multiple times if it becomes part of the prior set of transactions of a CMD_SYNC that has to complete before the CMD_SYNC is allowed to be completed. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code.

is_prior_set bool

The transaction forms part of the prior set of a CMD_SYNC that have to become visible (or thrown away if necessary) before the CMD_SYNC can complete.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_prod_cons_updated

This records when the programmer visible PROD/CONS pointer is updated. More can be visible in memory than are advertised in the programmer-visible PROD pointer. This also traces the latest PROD that could have been advertised. Fields:

mem_prod unsigned int

The PROD pointer value for all records that are visible in the memory.

num_events_available unsigned int

The number of events available to the programmer.

prog_cons unsigned int

The programmer-visible CONS pointer.

prog_prod unsigned int

The programmer-visible PROD pointer.

what enum

What changed?.

s_eventq_raising_eventq_abt_err

EVENTQ_ABT_ERR can now be raised.

s_eventq_removing_from_cmd_sync_prior_set

The event captured by a CMD_SYNC and created by the specified transaction id is now in memory. Fields:

prod unsigned int

The prod index (no wrap bit) that must become visible to the programmer to see this record. If not head_of_line then the record will not become visible and this field is meaningless.

reason enum

The reason the event was removed.

trans_id unsigned int

The transaction id that caused the event.

s_eventq_stashing_unreported_stalled_transaction_for_auto_retry

A stall event record would have been lost, instead it is stashed away to auto-retry when it can. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

reason enum

The reason the record was lost.

trans_id unsigned int

The transaction id that this corresponds to.

s_eventq_write_event

An event is committed to being written. Fields:

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_eventq_write_event_visible_in_memory

An event is now visible in memory. Fields:

abort bool

The write aborted.

dword0 unsigned int

Double word 0 of event.

dword1 unsigned int

Double word 1 of event.

dword2 unsigned int

Double word 2 of event.

dword3 unsigned int

Double word 3 of event.

event enum

Event code that was thrown away.

prod unsigned int

The PROD pointer (without wrap) that this event will be written to.

stall_event bool

Describes an event for a stalled transaction.

trans_id unsigned int

Transaction ID that generated this event.

s_gerror_inverted

A GERROR bit was attempted to be inverted to record a fault. Fields:

already_different_to_gerrorn bool

True if the bit was already different to the corresponding bit in GERRORN and so it was not inverted.

gerrorn unsigned int

GERRORN register value.

interrupt_potentially_sent bool

An interrupt is potentially sent, depending on IRQEN.
GERROR(N).MSI_GERROR_ABT_ERR does not send an interrupt.

new_gerror unsigned int

GERROR register value after any inversion.

which enum

Which bit was attempted to be inverted.

s_gerrorn_acknowledge

A GERROR was acknowledged by SW. Fields:

which enum

Which GERROR was acknowledged.

s_priq_auto_response

A PRIQ auto response is generated. Fields:

prgindex unsigned int

The PRG Index of the response.

resp enum

The response to send.

streamid unsigned int

The StreamID of the response.

substreamid unsigned int

The PASID/SubstreamID attached to the response, or ~0u if there is none.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_lost_ppr

The PRIQ is not reporting a PPR into the queue. It may or may not generate an auto-response. Fields:

is_stop_marker bool

The PPR being lost is a Stop Marker.

resp enum

What, if any, auto-response will be.

trans_id unsigned int

The ID of the PPR that is being lost.

why enum

Why the PPR is being lost.

s_priq_received

A PRIQ Request has been received and is queued waiting processing. This does not mean that it has been written to the PRIQ but has been placed in a pending queue awaiting a decision about what to do about it. Fields:

L bool

The Last in the Page Request Group (PRG).

R bool

Read permission is requested.

W bool

Read permission is requested.

prgindex unsigned int

The Page Request Group (PRG) index that is being used to identify this request to the EndPoint.

stop_marker bool

If LRW == 0b100 then this indicates this is a stop marker.

streamid unsigned int

The StreamID this request is associated with.

substreamid unsigned int

The SubstreamID (PASID) this request is associated with, of ~0u if no SubstreamID.

substreamid_P bool

If has a SubstreamID (!= ~0u) then Privileged Mode Requested.

substreamid_X bool

If has a SubstreamID (!= ~0u) then Execution Requested (R must also be 1).

trans_id unsigned int

The transaction ID that identifies this request.

untranslated_address unsigned int

The Untranslated Address that this is requesting.

sev

Send a SEV. Fields:

why enum

Why the SEV was generated.

smmu_atc_inv

The CMD_ATC_INV command is sent. Fields:

address unsigned int

Untranslated Address to invalidate.

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

global bool

Global flag.

log2_size_in_bytes unsigned int

Log 2 of the size in bytes of the region to invalidate.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight issued from the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_queue enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_atc_inv_completed

The CMD_ATC_INV command completed. Fields:

cmd_id unsigned int

Command id, if top-bit is set then was issued from the Non-secure CMDQ.

ns_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Non-secure CMDQ.

ns_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Non-secure CMDQ.

response enum

The response.

rl_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Realm CMDQ.

rl_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Realm CMDQ.

s_number_in_flight unsigned int

Number of ATC invalidates in flight now this one has completed, that were issued by the Secure CMDQ.

s_number_waiting_to_go_out unsigned int

The total number of ATC invalidates waiting to be pushed out from the Secure CMDQ.

ssd_of_cmdq enum

The SSD of the CMDQ.

ssd_of_streamid enum

The SSD of the StreamID.

smmu_atc_inv_end

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

response enum

The response to the ATC invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_atc_inv_start

An ATC invalidate request has been started. Fields:

PASID_global bool

If has a SubstreamID (PASID) then if it is 'global' or not.

address unsigned int

The Untranslated Address to use.

log2_size_in_bytes unsigned int

Log2 of the size of the region in bytes to invalidate.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_ats_initial

This is the initial ATS request. Fields:

XT bool

The XT bit.

ia unsigned int

Input address.

max_number_of_replies unsigned int

The maximum number of replies allowed to return.

no_write bool

The NW (no write flag) of the ATS request. If clear then the requester is going to do a write.

pasid_execute_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for execution permissions.

pasid_privileged_mode_requested bool

If there is a PASID (substreamid != ~0u) then this represents the requester asking for the privileged mode's permissions.

protected_mode bool

Is the ATS Request protected-mode?.

source_cxl bool

Does the ATS request have Source.CXL set?.

ssd enum

The SSD of the ATS request.

ssd_ns bool

Incoming SSD is non-secure.

streamid unsigned int

StreamID of the ATS request.

substreamid unsigned int

SubstreamID (which is identical to the PASID) of the ATS request. If no PASID-prefix is sent then this is ~0u.

tbu unsigned int

Translation Buffer Unit number.

smmu_ats_reply_failure

This is an ATS reply indicating failure. Fields:

event enum

Equivalent event number that would have been generated for an equivalent ordinary transaction.

failure enum

What is the failure response code?.

state enum

The transaction state of the successfully ATS request.

smmu_ats_reply_success

This is an ATS reply, typically the SMMU will only return a single response, even if the requester indicated it could accept more replies. NOTE that the SMMU responds with 'success' in some cases when a fault is encountered and RW==0. Fields:

N bool

Non-snooped access. If one then the requester must clear the NoSnoop bit on transactions, unless otherwise enabled in a Function-specific manner.

P bool

Privileged mode. These permissions related to privileged mode.

RWX enum

Read/Write/Execute.

U bool

Untranslated access. If one, and RW !=0 then use UntranslatedAccesses for the allowed accesses by RW(X).

cxl_io bool

The CXL.io response.

inner enum

The inner cacheability attributes to use for TranslatedAccesses.

input_address unsigned int

Input address of the ATS request.

instcfg enum

The STE.INSTCFG field.

outer enum

The outer cacheability attributes to use for TranslatedAccesses.

pas enum

The PAS this mapping corresponds to. This holds the same information as the TE bit for realm streams.

privcfg enum

The STE.PRIVCFG field.

shareability unsigned int

The shareability to use for TranslatedAccesses.

size unsigned int

The size of the region covered by this translation.

state enum

The transaction state of the successfully ATS request.

translated_address unsigned int

If RW!=0 && U != 0, then the Translated Address that a TranslatedAccess can be made with.

smmu_axi_stream_msi

An SMMU generated MSI is directly sent through the axi_stream_msi_m port, typically connected to the GIC port axi_stream_msi_s. Fields:

TDEST unsigned int

Routing information for the data stream, typically identifying the GIC.

TID unsigned int

Data stream identifier for the SMMU.

axi_stream_msi_addr_to_match unsigned int

Current address to match for SMMU-originated MSIs to send out of the axi_stream_msi_m port.

data unsigned int

The MSI sent.

smmu_final_transaction

This is the transaction group request to remap has completed one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. If it stalls then it will report through this trace source, stall (stag_if_stalling != ~Ou) and when resume will issue another smmu_initial_transaction as it undergoes remapping again. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

axmmuflow enum

The AxMMUFLOW for this transaction group. stallable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-stallable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

begin_input_address_range unsigned int

The start of the input address range that is size_of_region_in_bytes.

begin_ipa_range unsigned int

The start of the IPA range that is of size_of_region_in_bytes.

begin_output_address_range unsigned int

The start of the output address range that is of size_of_region_in_bytes.

cmo_point enum

The point associated with the CMO, if applicable.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

ipa_address unsigned int

The IPA of the transaction.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The MECID of the transaction.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

mpam_sp enum

The MPAM_SP of the transaction.

operation enum

The kind of operation that this represents.

output_address unsigned int

The input address of the transaction group.

output_inner enum

Inner cacheability for the output attributes.

output_outer enum

Outer cacheability for the output attributes.

output_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

output_sh enum

Shareability for the output attributes.

output_vmid unsigned int

The output VMID/GBPA.IMPDEF or ~0u if not valid.

size_of_region_in_bytes unsigned int

An imp def size of region for which this translation is valid for.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

stag_if_stalling unsigned int

This is the STAG used by the transaction if it is going to stall. It is ~0u if it is not going to stall.

state enum

The final transaction state.

streamid unsigned int

The StreamID of the transaction. ~0ull if NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_gpt_tlb_invalidate

A GPT TLB invalidate has been initiated. Fields:

address unsigned int

The address as it appears in the operation.

encoded_size unsigned int

The size as it is encoded in the operation.

kind enum

The kind of operation this is.

pgs_in_bytes unsigned int

The PGS size in bytes.

size_in_bytes unsigned int

For range operations, the size as it appears in the operation.

source enum

Where the TLBI came from.

state enum

Is the operation well formed.

trans_id unsigned int

The transaction id of this invalidate.

smmu_gpt_tlb_invalidate_complete

The GPT TLB invalidate completed. Fields:

source enum

Where the TLBI came from.

trans_id unsigned int

The transaction id of this invalidate.

smmu_initial_transaction

This is the transaction group request to remap is going to start one set of remapping. For ordinary transactions, this represents a bundle of transactions with the same attributes but different addresses within a certain range around the address. A stalling transaction will report through this trace source when it unstalls. This trace source can also represent part of the process for ATOS/ATS or finding STE.PPAR for PRI requests that need to be auto-responded to. Fields:

XT_and_output_pas_checking enum

The XT bit for PCIe Transactions. This specifies the requested check on the output PAS that the device asked for.

axmmuflow enum

The AxMMUFLOW for this transaction group. storable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-storable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

cmo_point enum

The point associated with the CMO, if applicable.

dcmdq_qcp_and_index unsigned int

If this is a DCMDQ fetch being translated then this field indicates the DCMDQ QCP index in bits [23:8] and the index in the page in bits [7:0]. Otherwise this is 0xFFFFffff.

input_address unsigned int

The input address of the transaction group.

input_inner enum

Inner cacheability for the input attributes.

input_outer enum

Outer cacheability for the input attributes.

input_prot enum

The instruction/data, bus-ns/s and privileged/user marking.

input_sh enum

Shareability for the input attributes.

kind enum

The kind of access this transaction group that this represents.

mecid unsigned int

The incoming MECID for NoStreamID transactions. ~0u for all other transactions.

mpam_partid unsigned int

The MPAM_PARTID for NoStreamID transactions. ~0u for all other transactions.

mpam_pmg unsigned int

The MPAM_PMG for NoStreamID transactions. ~0u for all other transactions.

mpam_sp enum

The MPAM_SP for NoStreamID transactions. ~0u for all other transactions.

operation enum

The kind of operation that this represents.

protected_mode enum

The PM bit.

ssd enum

The SSD of the transaction.

ssd_ns enum

The security state of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFffff if no SubstreamID.

tbu unsigned int

Translation Buffer Unit number.

trans_id unsigned int

Transaction id. Top bit set if debug transaction.

smmu_normalize_input_transaction

If the input transaction is normalized before being processed then this traceevent will fire. This is usually dependent on parameters of the implementation. Fields:

incoming_inner enum

The inner cacheability attributes.

incoming_is_instruction bool

The incoming transaction is marked as 'instruction'.

incoming_is_privileged bool

The incoming transaction is marked as 'privileged'.

incoming_outer enum

The outer cacheability attributes.

incoming_pas enum

The PAS of the incoming transaction.

incoming_shareability unsigned int

The incoming shareability.

normalized_inner enum

The normalized inner cacheability attributes.

normalized_is_instruction bool

The incoming transaction is marked as 'instruction'.

normalized_is_privileged bool

The incoming transaction is marked as 'privileged'.

normalized_outer enum

The normalized outer cacheability attributes.

normalized_pas enum

The PAS this mapping corresponds to.

normalized_shareability unsigned int

The normalized shareability.

ssd enum

The SSD of the transaction.

streamid unsigned int

The StreamID of the transaction. ~0ull means NoStreamID.

substreamid unsigned int

The SubstreamID of the transaction or 0xFFFFFFFF if no SubstreamID.

trans_id unsigned int

ID of the original transaction.

smmu_poison_tw_data

Poison data has been returned to a table walk transaction. Fields:

bitmap_of_poison unsigned int

The bitmap of which beats of the transaction where poisoned.

is_cas bool

True if this is a compare-and-swap operation.

number_of_64bit_beats unsigned int

Number of beats this transaction fetched.

paddress unsigned int

Physical address of the table walk transaction.

pas enum

The PAS of the bus transaction.

ras_group_id unsigned int

If non-~0u then is the RAS group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

ras_record_index_in_group unsigned int

If non-~0u then is the RAS record index in the group that we wish to attach the error to. Otherwise will use the IMP DEF policy.

what enum

What table walk was being performed.

smmu_pri_resp

The CMD_PRI_RESP command is queued to be sent to the PCIe system. Fields:

auto_response_trans_id unsigned int

trans_id of PRI request we are auto-responding to, or ~0ull if not valid.

cmd_id unsigned int

Command id, or ~0ull if not valid.

cons unsigned int

CONS of the command. ~0u if an auto-response.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

smmu_pri_resp_nop

The CMD_PRI_RESP command was NOPped. Fields:

cmd_id unsigned int

Command id.

cons unsigned int

CONS of the command.

prgindex unsigned int

PRG Index.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

The SSD of the StreamID this corresponds to.

streamid unsigned int

StreamID in the invalidate command.

substreamid unsigned int

SubstreamID or ~0u if SSValid == false.

why enum

Why the CMD_PRI_RESP was NOPped.

smmu_priq_resp_fake_return

A PRIQ Response is posted to the PCIe subsystem and so has no acknowledgement that it is received. However, in the model then we artificially know when the the PRIQ Response has been delivered to the PCIe subsystem, even if the ATC has not yet acted on it. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

what enum

What happened.

smmu_priq_resp_start

A PRIQ Response has been posted to the PCIe subsystem. As the response is posted then there is no way of knowing when it is received by the EndPoint. Fields:

prgindex unsigned int

The PRG Index this request corresponds to.

response enum

If has a SubstreamID (PASID) then if it is 'global' or not.

ssd enum

SSD of response.

streamid unsigned int

The StreamID to use.

substreamid unsigned int

The SubstreamID to use (or ~0u if not used). This corresponds to the PASID.

smmu_thread_wait_wake

Traces a thread's wait/wake status. Fields:

current_ticks unsigned int

The current tick count of simulated time.

event enum

What is happening to this thread.

thread_index unsigned int

The ID of this thread.

ticks unsigned int

If the event relates to a time then this is held in this field. Otherwise, 0.

stall_transaction

A transaction is about to stall. Fields:

stag unsigned int

STAG.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_inhibited_by_STALL_MAX

A transaction is about to stall but the maximum number of transactions have stalled and we can't report this one to the event queue (even if non-full). Fields:

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

stall_transaction_resuming

A stalled transaction is resuming. Fields:

stag unsigned int

STAG if appropriate, or if was inhibited by STALL_MAX then 0xFAFA.

stallresult enum

What the transaction resumed to do.

streamid unsigned int

StreamID.

streamid_ns bool

The StreamID was for the non-secure world.

trans_id unsigned int

Transaction id.

start_ptw_read

Page Table Walk (read). This is the start of the physical access that the SMMU is making. Fields:

adomain enum

The actual attributes of the access that was used, after IMP DEF mangling.

aprot enum

The actual attributes of the access that was used, after IMP DEF mangling. PAS[1] (bit[3]), Instruction/Data (bit[2]), PAS[0] (bit[1]), Privileged/User (bit[0]).

desckind enum

The kind of descriptor.

inner_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

input_address unsigned int

Input address this lookup is for (after TBI normalisation).

mecid unsigned int

The MECID of the TTD fetch.

mpam_pmg_and_partid unsigned int

Bits[23:16] are the MPAM PMG. Bits[15:0] are the physical PARTID.

ns enum

Non-Secure on the bus.

outer_cache enum

The actual attributes of the access that was used, after IMP DEF mangling.

pa_address unsigned int

Physical address.

pas enum

The PAS of the TTD fetch.

ssd enum

SSD of the transaction.

ssd_ns enum

Security state of stream.

streamid unsigned int

The StreamID this is for.

substreamid unsigned int

The SubstreamID this is for.

trans_id unsigned int

Transaction id.

ttb_grain_stage_and_level unsigned int

Which TTB used in bits[31:24]. Which Grain size used in bit[23:16]:- 0 – 4 KiB 1 – 16 KiB 2 – 64 KiB 3 – 64 KiB ARMv8.2 where descriptor bits [15:12] for bits [51:48] of output address 4 – 4 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:12]} 5 – 16 KiB FEAT_LPA2 where address is {bits[9:8], bits[49:14], 2'b00} 6 – 64 KiB ARMv8.2 where descriptor bits [15:12] are ignored Stage in bits[15:8]. Level in bits[7:0], level -1 is 0xF.

ste_cc.STE_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

ste_cc.STE_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

ste_entry_allocated

An STE entry has been allocated. Fields:

entry_id unsigned int

The id of the cache entry. Top bit is set if is a debug entry.

ns enum

For the non-secure world.

ssd enum

The SSD of the entry.

ste string

A textual description of the STE.

streamid unsigned int

The StreamID of the entry this will match.

tlb_entry_allocated

A TLB entry has been allocated. Fields:

aset unsigned int

The ASET of this entry.

asid unsigned int

ASID if appropriate.

index unsigned int

Index of TLB entry.

input_end_incl_address unsigned int

The end inclusive address of the input range that this matches.

input_start_address unsigned int

The start address of the input range that this matches.

output_end_incl_address unsigned int

The end inclusive address of the output range.

output_start_address unsigned int

The start address of the output range.

scheme enum

The tagging scheme used.

ssd enum

The SSD of the tagging scheme.

ssd_ns enum

Security State.

tbi bool

Was the entry formed using Top Byte Ignore (TBI).

vmid unsigned int

VMID if appropriate.

tlb_info_tlb_entries_overlap

A TLB entry was inserted into the TLB and it overlaps an existing entry. This isn't a problem as it was inserted in such a way that it architecturally works. Fields:

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

how_inserted enum

How the entry was inserted.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

verbose_commentary

This is a verbose commentary on the translation process the SMMU is performing. Fields:

output string

The stream output.

warning_MSI_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size. Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_PRIQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_EVENTQ_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_GERROR_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HACDBS_PROCESSING_COMPLETE_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_S_HDBSS_TABLE_FULL_address_out_of_range_of_oas

The MSI address is configured outside of the range of the downstream address bus size.

Fields:

address unsigned int

The untruncated address of the MSI.

warning_MSI_pmcg_address_out_of_range_of_oas

The MSI Address of the Performance Monitor Counter Group (PMCG) is out of range of the OAS and so will be silently truncated. Fields:

address unsigned int

The untruncated address of the MSI.

pmcg_index unsigned int

Index of the PMCG.

ssd_ns bool

True if this PMCG controlled by the non-secure world.

warning_discarding_interrupt_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.HDBSS_IRQEN.

warning_discarding_interrupt_PRIQ_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_CTRL.PRIQ_IRQEN.

warning_discarding_interrupt_S_EVENTQ_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.EVENTQ_IRQEN.

warning_discarding_interrupt_S_GERROR_as_irqen_low

Interrupt generation is turned off by SMMU_S_IRQ_CTRL.GERROR_IRQEN.

warning_discarding_interrupt_S_HACDBS_PROCESSING_COMPLETE_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HACDBS_IRQEN.

warning_discarding_interrupt_S_HDBSS_TABLE_FULL_as_irqen_low

Interrupt generation is turned off by SMMU_IRQ_S_CTRL.HDBSS_IRQEN.

warning_ns_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

warning_reg_after_doesnt_match_written_value

A write occurred that tried to set bits in a register, that for one reason or another, failed to get written. Fields:

desc string

The textual description of what happened.

warning_s_gerrorn_bad_acknowledge

A GERROR was acknowledged by SW in the GERRORN register that did not have an active error. The result is **UNPREDICTABLE** if this will generate an interrupt or not. Fields:

which enum

Which GERROR was acknowledge when there was no active error.

what_going_to_do_with_terminated_event

A terminating transaction has produced an event, this tells you what the model is going to do with the event. Fields:

CD.S bool

The CD.S field if available.

S2 bool

The event is related to Stage 2.

STE.S1STALLD bool

The STE.S1STALLD field if available.

STE.S2S bool

The STE.S2S field if available.

aborts bool

The transaction will abort.

axmmuflow enum

The AxMMUFLOW for this transaction group. storable – allow the transaction to be stalled if configured. translated-access – is a PCIe Translated Access non-storable – do not stall transaction even if configured. transfault-flow – do not report for Translation Related Faults, but tell client device to use a page request mechanism instead (for example PRI).

is_tr_fault bool

Is a Translation Related fault.

protected_mode bool

The transaction is protected-mode. As such, it cannot stall and will obey the report configuration bits.

reports bool

The transaction will attempt to report.

ssd enum

The SSD of the transaction.

ssd_ns bool

The transaction is classified as SSD non-secure.

supports_stall_model bool

The implementation supports the stall model.

trans_id unsigned int

The transaction id.

why_abort_decision enum

The reason why the transaction aborted/did not abort.

why_report_decision enum

The reason why the transaction reported/did not report.

2.167 SMMUv3TestEngine

This section describes the trace sources.

access_denied_due_to_security

The access was denied as the frame and the security PCTRL.SSD_NS did not allow access.

Fields:

address unsigned int

Address.

frame_in_set unsigned int

Which frame in the 64 KiB set it belongs to.

is_read bool

Is the transaction a read.

ns bool

Is the PAS of the transaction non-secure.

pas enum

The pas of the transaction.

priv bool

Is the set the privileged set of frames?.

set_pair unsigned int

Which 128 KiB set-pair it belongs to.

ssd enum

The SSD of the frame.

ssd_ns bool

The SSD NS of the frame.

frame_misconfigured_trace

The frame was written but is misconfigured. Fields:

cmd unsigned int

The command that is running.

frame_in_set unsigned int

Which frame in the 64 KiB set it belongs to.

priv bool

Is the set the privileged set of frames?.

set_pair unsigned int

Which 128 KiB set-pair it belongs to.

why enum

Why it is misconfigured?.

why_data unsigned int

Data related to why it is misconfigured:- src-attributes-illegal : the halfword attributes bits[15-0], NoStreamID bit[16] ,SSD bits[20-17] and PAS bits[24-21] dest-attributes-illegal : the halfword attributes bits[15-0], NoStreamID bit[16] ,SSD bits[20-17] and PAS bits[24-21] msi-attributes-illegal : the halfword attributes bits[15-0], NoStreamID bit[16] ,SSD bits[20-17] and PAS bits[24-21] downstream-port-index-out-of-range : port index substreamid-out-of-range : SubstreamID SUM64, begin is not aligned to uint64_t : begin SUM64, end_incl is not aligned to uint64_t : end_incl PCIe MSIAddress field should be 0/1 : msiaddress PCIe MSIData field should be < 2048 : msidata PCIe SSD not either Realm or Non-Secure : ssd range-* : the end_incl.

msi_aborted

An MSI aborted. Fields:

frame unsigned int

Frame generating MSI.

msiaddress_or_pcie_msi_enable unsigned int

MSI address, or in PCIe enable MSI.

msiattr unsigned int

MSI attributes. Ignored for PCIe.

msidata_or_pcie_msi_index unsigned int

MSI data, or in PCIe the MSI index to use.

pcie_result enum

If this MSI was generated on PCIe then the result.

streamid unsigned int

StreamID.

substreamid unsigned int

SubstreamID.

msi_generated

An MSI is generated for the specified work load. Fields:

frame unsigned int

Frame generating MSI.

msiaddress unsigned int

MSI address.

msiattr unsigned int

MSI attributes.

msidata unsigned int

MSI data.

streamid unsigned int

StreamID.

substreamid unsigned int

SubstreamID.

read_access

A successful read access occurred. Fields:

address unsigned int

Address.

data unsigned int

The data that was read.

frame_in_set unsigned int

Which frame in the 64 KiB set it belongs to.

ns bool

Is the PAS of the transaction non-secure.

offset unsigned int

Offset of the first byte read.

pas enum

The pas of the transaction.

priv bool

Is the set the privileged set of frames?.

set_pair unsigned int

Which 128 KiB set-pair it belongs to.

ssd enum

The SSD of the frame.

work_completed

The specified work was completed. Fields:

frame unsigned int

Frame that completed.

work_memcpy

A frame has been setup to do memcpy. Fields:

attributes unsigned int

Attributes.

begin unsigned int

begin address.

dest unsigned int

Destination address.

end_incl unsigned int

End inclusive address.

frame unsigned int

Frame setup.

msiaddress unsigned int

The msiaddress field.

msiattr unsigned int

The msiattr field.

msidata unsigned int

The msidata field.

seed unsigned int

Seed.

streamid unsigned int

The streamid to use if controllable.

stride unsigned int

Stride.

substreamid unsigned int

The substreamid to use if controllable.

work_rand48

A frame has been setup to do rand48. Fields:

attributes unsigned int

Attributes.

begin unsigned int

begin address.

end_incl unsigned int

End inclusive address.

frame unsigned int

Frame setup.

msiaddress unsigned int

The msiaddress field.

msiattr unsigned int

The msiattr field.

msidata unsigned int

The msidata field.

seed unsigned int

Seed.

streamid unsigned int

The streamid to use if controllable.

stride unsigned int

Stride.

substreamid unsigned int

The substreamid to use if controllable.

work_sum64

A frame has been setup to do sum64. Fields:

attributes unsigned int

Attributes.

begin unsigned int

begin address.

end_incl unsigned int

End inclusive address.

frame unsigned int

Frame setup.

msiaddress unsigned int

The msiaddress field.

msiattr unsigned int

The msiattr field.

msidata unsigned int

The msidata field.

seed unsigned int

Seed.

start_of_sum unsigned int

The value of udata[1] that is the initial value that we start adding to.

streamid unsigned int

The streamid to use if controllable.

stride unsigned int

Stride.

substreamid unsigned int

The substreamid to use if controllable.

work_unit_memcpy_finished

Part (or all) of the memcpy engine has finished a work unit. Fields:

attr unsigned int

Source/Destination attributes from the frame.

dest_addr unsigned int

Destination address.

frame unsigned int

Frame doing work.

number_of_bytes unsigned int

Number of bytes for this work unit.

ok bool

Transfer was OK.

src_addr unsigned int

Source address.

work_unit_memcpy_started

Part (or all) of the memcpy engine has started a work unit. Fields:

attr unsigned int

Source/Destination attributes from the frame.

dest_addr unsigned int

Destination address.

frame unsigned int

Frame doing work.

number_of_bytes unsigned int

Number of bytes for this work unit.

src_addr unsigned int

Source address.

work_unit_rand48_finished

Part (or all) of the rand48 engine has finished a work unit. Fields:

attr unsigned int

Source/Destination attributes from the frame.

dest_addr unsigned int

Source address.

frame unsigned int

Frame doing work.

number_of_bytes unsigned int

Number of bytes for this work unit.

ok bool

Transfer was OK.

seed_for_work_unit unsigned int

The seed used for the work unit.

work_unit_rand48_started

Part (or all) of the rand48 engine has started a work unit. Fields:

attr unsigned int

Source/Destination attributes from the frame.

dest_addr unsigned int

Destination address.

frame unsigned int

Frame doing work.

number_of_bytes unsigned int

Number of bytes for this work unit.

seed_for_work_unit unsigned int

The seed used for the work unit.

work_unit_sum64_finished

Part (or all) of the sum64 engine has finished a work unit. Fields:

attr unsigned int

Source/Destination attributes from the frame.

frame unsigned int

Frame doing work.

number_of_bytes unsigned int

Number of bytes for this work unit.

ok bool

Transfer was OK.

running_sum unsigned int

The current running sum.

src_addr unsigned int

Source address.

work_unit_sum64_started

Part (or all) of the sum64 engine has started a work unit. Fields:

attr unsigned int

Source/Destination attributes from the frame.

frame unsigned int

Frame doing work.

number_of_bytes unsigned int

Number of bytes for this work unit.

src_addr unsigned int

Source address.

write_access

A successful write access occurred. Fields:

address unsigned int

Address.

data unsigned int

The data that was read.

frame_in_set unsigned int

Which frame in the 64 KiB set it belongs to.

ns bool

Is the PAS of the transaction non-secure.

offset unsigned int

Offset of the first byte read.

pas enum

The pas of the transaction.

priv bool

Is the set the privileged set of frames?.

set_pair unsigned int

Which 128 KiB set-pair it belongs to.

ssd enum

The SSD of the frame.

write_denied_as_running

The write was denied as the frame is running. Fields:

address unsigned int

Address.

cmd unsigned int

The command that is running.

frame_in_set unsigned int

Which frame in the 64 KiB set it belongs to.

priv bool

Is the set the privileged set of frames?.

set_pair unsigned int

Which 128 KiB set-pair it belongs to.

write_to_PCTRL_SSD_NS_ignored_trace

The write to PCTRL.SSD was ignored because the transaction is trying to change the frame to security state. The rest of the write to PCTRL has taken effect. Fields:

address unsigned int

Address.

frame_in_set unsigned int

Which frame in the 64 KiB set it belongs to.

pas enum

The pas of the transaction.

set_pair unsigned int

Which 128 KiB set-pair it belongs to.

ssd enum

The SSD of the frame.

2.168 SSU

This section describes the trace sources.

Safety Mechanisms registers

Safety Mechanisms registers Trace: . Fields:

ERR_CTRL unsigned int

.

ERR_FR unsigned int

.

ERR_STATUS unsigned int

.

SMEN unsigned int

.

SMERR unsigned int

.

Source string

.

Status Control Register

Status Control Register Update: . Fields:

CNTRL_REG_VAL unsigned int

.

register_value_change

Register %{REG_NAME}: Type %{REG_TYPE}: Previous value %{PREV_VAL}: Current value %{CURR_VAL}. Fields:

CURR_VAL unsigned int

Current register value.

OFFSET unsigned int

Register offset.

PREV_VAL unsigned int

Previous register value.

REG_NAME string

Register name.

REG_TYPE string

Register type.

WRITE_VAL unsigned int

Value to be written into the register.

ssu_state_change

SSU STATE TRANSITION: %{PREV_STATE} -> %{CURR_STATE}. Fields:

CURR_STATE string

CURRENT SSU STATE.

PREV_STATE string

PREVIOUS SSU STATE.

2.169 SYSTEM_FMU

This section describes the trace sources.

interrupt_status

The status of %{ERR_TYPE} interrupt is %{STATUS}. Fields:

INTERRUPT_TYPE string

Type of interrupt whose status is shown.

STATUS string

Set/Clear status of the interrupt.

key_registers_values

Trace the key FMU register's values. Fields:

ERRGSR unsigned int

.

ERRGSR2 unsigned int

.

SMEN unsigned int

.

SMERR unsigned int

.

Source string

.

lock_status

The FMU Access KEY register changed from %{PREV_ACCESS_KEY_STATUS} to %{CURR_ACCESS_KEY_STATUS}. Fields:

CURR_ACCESS_KEY_STATUS string

Current lock status of the FMU KEY register.

PREV_ACCESS_KEY_STATUS string

Previous lock status of the FMU KEY register.

register_value_change

Register %{REG_NAME}: Type %{REG_TYPE}: Previous value %{PREV_VAL}: Current value %{CURR_VAL}. Fields:

CURR_VAL unsigned int

Current register value.

OFFSET unsigned int

Register offset.

PREV_VAL unsigned int

Previous register value.

REG_NAME string

Register name.

REG_TYPE string

Register type.

WRITE_VAL unsigned int

Value to be written into the register.

upstream_fmu_signals

Received %{ERROR_TYPE} interrupt from Upstream FMU index %{UPSTREAM_FMU_INDEX} with status %{STATUS}. Fields:

ERROR_TYPE string

The type of error received by SystemFMU.

STATUS string

Set/Clear status of the incoming interrupt.

UPSTREAM_FMU_INDEX unsigned int

The index of the upstream FMU sending the signal.

2.170 SharedR

This section describes the trace sources.

dsu.register_read

DISPLAY Core %{core} makes %{is_debug:normal|debug} read access to DSU register %{reg_name}, and value %{value} is returned. Fields:

core unsigned int

core from which this read access comes from.

is_debug bool

true if this transaction is debug one, false otherwise.

reg_name string

Name of the register to which this read access is made.

value unsigned int

register value which is returned.

dsu.register_write

DISPLAY Core %{core} makes %{is_debug:normal|debug} write access to DSU register %{reg_name}, with value %{value} and write mask %{mask}. Fields:

core unsigned int

core from which this write access comes from.

is_debug bool

true if this transaction is debug one, false otherwise.

mask unsigned int

mask applied to the value.

reg_name string

Name of the register to which this write access is made.

value unsigned int

register value to be written.

dsu.register_write_ignored

DISPLAY Write access to %{reg_name} is made, which has been ignored. Fields:

reg_name string

Name of the register to which this write access is made.

dsu.utility_bus.access

DISPLAY %{is_debug:Normal|Debug} %{is_read:write|read} access has been made to UtilityBus to access %{component_accessed} %{access_is_to_cluster_reg:to %{target_core} core}. Fields:

access_is_to_cluster_reg bool

true if this access is against cluster registers, false otherwise.

component_accessed string

component to which this transaction is made.

is_debug bool

true if the access is a debug one, false otherwise.

is_read bool

true if the access is a read one, false otherwise.

offset unsigned int

Offset to the utility bus base address used to identify which register is being accessed.

target_core unsigned int

is the target core if the transaction is to core register.

dsu.utility_bus.access_is_razwi

DISPLAY %{is_read:Write|Read} access has been made to UtilityBus with offset %{offset}, but this access results in **RAZWI** because %{msg}. Fields:

is_read bool

true if the access is a read one, false otherwise.

msg string

the reason why this access is **RAZWI**.

offset unsigned int

Offset to the base address of utility bus used to identify which register is being accessed.

2.171 SignalDriver

This section describes the trace sources.

SIGNAL

Input signal to IRQgen driven. Fields:

Source enum

What triggered the signal change.

Value enum

Value of signal being driven.

2.172 SignalLogger

This section describes the trace sources.

SIGNAL

Input signal to SignalLogger driven. Fields:

Value enum

Value of signal being driven.

2.173 TLB

This section describes the trace sources.

ArchMsg.Error.normal_nsh_wb_cacheable_access

TLB Fill: Normal memory with non-shareable and inner/outer-WriteBack attributes. Fields:

EL unsigned int

Exception level of translation regime.

NON_SECURE unsigned int

Security state of translation regime.

PBase unsigned int

Physical address (stage1+2) of the start of the region covered by the TLB entry.

VBase unsigned int

Virtual page number of the start of the region covered by the TLB entry.

MMU_TLB_CONFLICT

TLB conflict. Fields:

AMEC bool

Alternative MECID.

ASID unsigned int

The Address Space Identifier of this TLB entry.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

MANAGER_ID_64 unsigned int

ManagerID64 number in a multi processor. Lowest 8 bits matches CORE_NUM field.

NS enum

Secure state in which TLB Entry will match.

PAGESIZE unsigned int

Size of the region (log2).

PBASE unsigned int

Physical base address of the region.

REGIME_EL enum

Entry matches in this translation regime.

VBASE unsigned int

Virtual base address of the region.

VMID unsigned int

Virtual Machine Identifier.

nG enum

Flag indicating whether ASID will be matched.

MMU_TLB_EVICT

TLB evict. Fields:

AMEC bool

Alternative MECID.

ASID unsigned int

The Address Space Identifier of this TLB entry.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

IS_CLEAN_STAGE2_DIRTY bool

Is entry being evicted or just its S2 Dirty state being cleaned.

MANAGER_ID_64 unsigned int

ManagerID64 number in a multi processor. Lowest 8 bits matches CORE_NUM field.

NS enum

Secure state in which TLB Entry will match.

PAGESIZE unsigned int

Size of the region (log2).

PAS enum

The Physical Address Space of the page.

PBASE unsigned int

Physical base address of the region.

REGIME_EL enum

Entry matches in this translation regime.

SECURITY_STATE enum

The Current Security State.

VBASE unsigned int

Virtual base address of the region.

VMID unsigned int

Virtual Machine Identifier.

nG enum

Flag indicating whether ASID will be matched.

MMU_TLB_FILL

TLB fill. Fields:

AMEC bool

Alternative MECID.

ASID unsigned int

The Address Space Identifier of this TLB entry.

ASSURED bool

Whether translation is assured.

CORE_NUM unsigned int

Core number in a multi processor.

EPAN bool

Enhanced PAN cached value for this page.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MANAGER_ID_64 unsigned int

ManagerID64 number in a multi processor. Lowest 8 bits matches CORE_NUM field.

MEMTYPE enum

Memory type.

NS enum

Secure state in which TLB Entry will match.

NSDesc enum

Secure state of transactions made using the TLB Entry.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PAGESIZE unsigned int

Size of the region (log2).

PAS enum

The Physical Address Space of the page.

PBASE unsigned int

Physical base address of the region.

PXN bool

Privileged Execute Never.

REGIME_EL enum

Entry matches in this translation regime.

SECURITY_STATE enum

The Current Security State.

SH enum

Shareability.

SIDE enum

Inst / Data.

TCMA bool

Is the relevant TCMA/TCMA0/TCMA1 bit enabled.

VBASE unsigned int

Virtual base address of the region.

VMID unsigned int

Virtual Machine Identifier.

X16HINT bool

16 Entry Contiguous Hint.

XN bool

Execute Never.

XS bool

Limited TLBI XS value for this page.

nG enum

Flag indicating whether ASID will be matched.

MMU_TLB_FLUSH

TLB flush.

MMU_TLB_FLUSH_ADDR

TLB flush, match address. Fields:

ADDR unsigned int

Address.

NS bool

Is Non-Secure.

NSHYP bool

Is Non-Secure HYP.

MMU_TLB_FLUSH_ADDR_RANGE

TLB flush, match address range. Fields:

ADDR_FIRST unsigned int

First address in range.

ADDR_LAST unsigned int

Last address in range.

NS bool

Is Non-Secure.

NSHYP bool

Is Non-Secure HYP.

MMU_TLB_FLUSH_ALL

TLB flush all entries.

MMU_TLB_FLUSH_ASID

TLB flush, match ASID. Fields:

ASID unsigned int

ASID of TLB flush.

MMU_TLB_FLUSH_VMID

TLB flush, match VMID. Fields:

VMID unsigned int

VMID of TLB flush.

MMU_TLB_HIT

TLB accesses hit. Fields:

ASID unsigned int

The Address Space Identifier of this TLB entry.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

MANAGER_ID_64 unsigned int

ManagerID64 number in a multi processor. Lowest 8 bits matches CORE_NUM field.

NS enum

Secure state in which TLB Entry will match.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual Machine Identifier.

MMU_TLB_MISS

TLB access miss. Fields:

ASID unsigned int

The Address Space Identifier of this TLB entry.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

MANAGER_ID_64 unsigned int

ManagerID64 number in a multi processor. Lowest 8 bits matches CORE_NUM field.

NS enum

Secure state in which TLB Entry will match.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual Machine Identifier.

MMU_TLB_SPILL

TLB removals caused by fill to a occupied slot.

2.174 Value64Logger

This section describes the trace sources.

VALUE

Input signal to ValueLogger driven. Fields:

Value unsigned int

Value of signal being driven.

2.175 ValueLogger

This section describes the trace sources.

VALUE

Input signal to ValueLogger driven. Fields:

Value unsigned int

Value of signal being driven.

2.176 VirtioBlockDevice

This section describes the trace sources.

data_read

The data read by the device. Fields:

addr unsigned int

Address.

data unsigned int

The data read.

ns bool

Non-secure access.

data_read_abort

The data read by the device aborted. Fields:

addr unsigned int

Address.

ns bool

Non-secure access.

size_in_bytes unsigned int

The data size in bytes.

data_read_start

The data read by the device. Fields:

addr unsigned int

Address.

ns bool

Non-secure access.

size_in_bytes unsigned int

The size to read.

data_write

The data write by the device completed successfully. Fields:

addr unsigned int

Address.

ns bool

Non-secure access.

size_in_bytes unsigned int

The size of the write that completed successfully.

data_write_abort

The data write by the device aborted. Fields:

addr unsigned int

Address.

ns bool

Non-secure access.

size_in_bytes unsigned int

The size of the write that aborted.

data_write_start

The data attempted to be written by the device. Fields:

addr unsigned int

Address.

data unsigned int

The data attempted to be written.

ns bool

Non-secure access.

register_read

A read of the register file. Fields:

addr unsigned int

Address.

data unsigned int

Data read.

what enum

What region of MMIO space it accessed.

register_read_abort

A read of the register file caused an abort. Fields:

addr unsigned int

Address.

what enum

What region of MMIO space it accessed.

width_in_bytes unsigned int

Width of data read.

register_write

A write of the register file. Fields:

addr unsigned int

Address.

data unsigned int

Data written.

what enum

What region of MMIO space it accessed.

register_write_abort

A write of the register file caused an abort. Fields:

addr unsigned int

Address.

data unsigned int

Data attempted to be written.

what enum

What region of MMIO space it accessed.

2.177 VirtioPCIBlockDevice

This section describes the trace sources.

data_read

The data read by the device. Fields:

addr unsigned int

Address.

data unsigned int

The data read.

ns bool

Non-secure access.

data_read_abort

The data read by the device aborted. Fields:

addr unsigned int

Address.

ns bool

Non-secure access.

size_in_bytes unsigned int

The data size in bytes.

data_read_start

The data read by the device. Fields:

addr unsigned int

Address.

ns bool

Non-secure access.

size_in_bytes unsigned int

The size to read.

data_write

The data write by the device completed successfully. Fields:

addr unsigned int

Address.

ns bool

Non-secure access.

size_in_bytes unsigned int

The size of the write that completed successfully.

data_write_abort

The data write by the device aborted. Fields:

addr unsigned int

Address.

ns bool

Non-secure access.

size_in_bytes unsigned int

The size of the write that aborted.

data_write_start

The data attempted to be written by the device. Fields:

addr unsigned int

Address.

data unsigned int

The data attempted to be written.

ns bool

Non-secure access.

register_read

A read of the register file. Fields:

addr unsigned int

Address.

data unsigned int

Data read.

what enum

What region of MMIO space it accessed.

register_read_abort

A read of the register file caused an abort. Fields:

addr unsigned int

Address.

what enum

What region of MMIO space it accessed.

width_in_bytes unsigned int

Width of data read.

register_write

A write of the register file. Fields:

addr unsigned int

Address.

data unsigned int

Data written.

what enum

What region of MMIO space it accessed.

register_write_abort

A write of the register file caused an abort. Fields:

addr unsigned int

Address.

data unsigned int

Data attempted to be written.

what enum

What region of MMIO space it accessed.

2.178 VirtualEthernetCrossover

This section describes the trace sources.

FRAME

Trace Ethernet frames as they go through. Fields:

data string

ASCII encoded packet data. Each line starts with a hex packet offset (in bytes) followed by up to 16 space separated bytes encoded as 2 hex digits. This data can be read by the tool text2pcap to generate a file which can be read by wireshark.

source enum

Identifies the source port from which the frame originated.

2.179 atc

This section describes the trace sources.

ArchMsg.Error.error

These messages are about activity occurring on the ATC that is considered an error. DISPLAY %{output}. Fields:

output string

The stream output.

ArchMsg.Info.info

These are information messages about what is happening in the ATC. DISPLAY %{output}. Fields:

output string

The stream output.

ArchMsg.Warning.atc_pri_allocation_changed_whilest_not_stopped

The PRI has PRGs in flight that were using credit_used credits, however, the PRI interface was disabled and the allocation of credits changed. Fields:

credits_used unsigned int

The number of credits currently in use by in-flight PRGs.

new_allocation unsigned int

The new allocation of credits set in the PRI header.

ArchMsg.Warning.atc_pri_allocation_reduced_below_current_credits_used

The PRI has PRGs in flight that were using credit_used credits, however, the PRI interface was disabled and the allocation of credits changed to a value less than that of those that are currently in use. The SW should probably of first have serviced the outstanding PRGs and

then waited for the interface to report Stopped before reducing the allocation. The PCIe spec is unclear as to the required behaviour. The model will continue to count credits. It will not allow the PRI interface to be re-enabled until Stopped (this is an implementation defined choice) and so when successfully re-enabled will then obey the new allocation. Fields:

credits_used unsigned int

The number of credits currently in use by in-flight PRGs.

new_allocation unsigned int

The new allocation of credits set in the PRI header.

ArchMsg.Warning.atc_pri_members_of_prg_inconsistent

A client has formed a PRG and all the members of the PRG should have the same execute mode and privilege request in. However, this PRG member has different ones to the first. PCIe says that the effect is undefined. The trace source pri_members_of_prg traces all members of the group. Fields:

PRGIndex unsigned int

The PRGIndex of this request.

expected_execute bool

The expected execute permission requested.

expected_priv bool

The expected privilege permission requested.

member_index unsigned int

The index of this member within the PRG.

number_of_members unsigned int

The number of members in this PRG.

page_address unsigned int

Page address of the request.

priv bool

Privileged permissions requested. Valid only for those requests with a PASID (SubstreamID).

rwX enum

Requested Read/Write/Execute permissions. Execute permission are only available for those requests with a PASID (SubstreamID), and read permission will automatically be asked for as well.

ssd enum

The SSD of the PRG.

streamid unsigned int

The StreamID of the PRI request.

substreamid unsigned int

The SubstreamID sent with the PRG request.

trans_id unsigned int

The transaction id of the failing ATS transaction.

ArchMsg.Warning.atc_pri_reset_receivedWhilstOutputtingPRG

The ATC was in the process of sending the members of a PRG to the SMMU but before it had finished sending them, then a PRI Reset or signal reset occurred and the rest of the PRG will not be sent. The may leave a partial PRG in the PRI queue of the SMMU. Note the difference to having sent the entire PRG (including Last) and then receiving some sort of reset. Fields:

id unsigned int

The ID of this request.

number_of_PRG_members unsigned int

The number of members of the PRG, or 0 if run out of credits or PRGIndexes.

prgindex unsigned int

The PRGIndex expected, or ~0u if run out of credits or PRGIndexes.

signal_reset bool

True if it was a signal reset, false if it was a PRI Reset via the PRI Capability Header.

ssd enum

The SSD of the stream.

substreamid unsigned int

The expected PASID on the *response*.

which_member_was_being_sent unsigned int

The index of which member of the PRG was being sent whilst we received reset. All subsequent members of the PRG will not be sent.

ArchMsg.Warning.atc_pri_response_Response_Failure

A PRI Response has been received with a Response Failure. The PRI interface is required to disable itself, set RF in the header and will wake all waiting PRGs, forcing them to fault. Fields:

pasid unsigned int

The PASID prefix on the response, or ~0u if none.

prgindex unsigned int

The PRGIndex in the response.

response enum

The response code.

ssd enum

The SSD of the stream.

ArchMsg.Warning.atc_pri_response_ignored_as_RF_set

Any PRI Responses received whilst the RF (Response Failure) bit of the PRI header is required to be ignored by the PCIe specification. This is a response being ignored due to that reason. Fields:

pasid unsigned int

The PASID prefix on the response, or ~0u if none.

prgindex unsigned int

The PRGIndex in the response.

response enum

The response code.

ssd enum

The SSD of the stream.

ArchMsg.Warning.pri_enabled_with_zero_allocation

The PRI interface was enabled but the assigned credit allocation is zero. There is no useful way that the PRI interface can operate in this state and the model will fault any transaction that needs to use PRI. Fields:

capacity unsigned int

The PRI Credit Capacity for this device.

ArchMsg.Warning.warning

These messages are about unusual (but not necessarily incorrect) activity occurring on the ATC. DISPLAY %{output}. Fields:

output string

The stream output.

atc_commentary

A commentary from the cache about what is going on. Fields:

output string

The stream output.

atc_entry

This monitors the formation or change of an atc entry. Fields:

CXL_io bool

The response's value for CXL.io.

XT_and_checking enum

The input XT / PAS checking intent.

atc_entry_id unsigned int

An ID identifying this entry.

change_inconsistent_nug bool

The change was inconsistent in NUG, and was ignored. This is almost certainly an error.

change_inconsistent_permissions bool

The change was inconsistent in the permissions granted that were known before. The change was rejected for known changes. This may represent an error.

change_inconsistent_remap bool

The input and/or output address ranges were changed. This may represent an error.

id unsigned int

The ID of the transaction that caused this fill.

input_address_begin unsigned int

The input address range covered by this entry.

input_address_end_incl unsigned int

The input address range covered by this entry.

is_protected_mode bool

Is a protected mode transaction.

nugrwxrwx_change string

The N, U, G (or TE bit) and rwxrwx flags before and after any change.

output_XT_and_checking enum

The output XT / PAS checking intent on ATS Translated Transactions.

output_address_begin unsigned int

The output address range covered by this entry.

output_address_end_incl unsigned int

The output address range covered by this entry.

reply_is_cacheable bool

The reply was cacheable and so changed the known permissions.

ssd enum

The SSD of the stream.

substreamid unsigned int

The SubstreamID of the entry.

atc_entry_allocated

An ATC entry has been allocated. Fields:

XT_and_checking enum

The input XT / PAS checking intent.

atc_entry_id unsigned int

Index of ATC entry.

input_address_begin unsigned int

The input address range covered by this entry.

input_address_end_incl unsigned int

The input address range covered by this entry.

is_CXL_io bool

The entry is CXL.io.

is_protected_mode bool

Is a protected mode transaction.

nugrwxrwx string

N, U, G bits and which permissions are unknown ('?'), granted (r/w/x) and denied ('-').
For rl-Streams, the G bit is the TE bit and traced as 'T' or '-!.

output_XT_and_checking enum

The output XT / PAS checking intent on ATS Translated Transactions.

output_address_begin unsigned int

The input address range covered by this entry.

output_address_end_incl unsigned int

The input address range covered by this entry.

pas enum

The PAS that this entry obtained from the SMMU.

ssd enum

The security state (SSD) of the entry.

substreamid unsigned int

The SubstreamID of the entry.

atc_entry_invalidated

An entry in the cache has been invalidated. Fields:

entry_id unsigned int

The entry id that is being invalidated.

reason enum

Why the entry is being invalidated.

atc_entry_none_formed

An ATC entry was attempted to be created but the ATS request forbade it being created.
Fields:

XT_and_checking enum

The input XT / PAS checking intent.

fault enum

Fault reason.

id unsigned int

The ID of the transaction that caused this fill.

input_address unsigned int

The input address range covered by this entry.

is_protected_mode bool

Is a protected mode transaction.

ssd enum

The SSD of the stream.

substreamid unsigned int

The SubstreamID that would have been used.

atc_inv_wait

An ATC Invalidate has to wait before completing because of outstanding transactions that are using the entry. Fields:

atc_inv_id unsigned int

The ID of the ATC Invalidate transaction.

atc_inv_woke

An ATC Invalidate had to wait before completing because of outstanding transactions that are using the entry. This is it waking up. Fields:

atc_inv_id unsigned int

The ID of the ATC Invalidate transaction.

because_of_reset bool

The ATC Invalidate was killed because of reset.

atc_invalidate

An ATC Invalidate message was received. Fields:

Global_if_substreamid bool

If has a SubstreamID then the Global flag.

aligned_address unsigned int

The aligned address to invalidate.

atc_inv_id unsigned int

The ID of this ATC Invalidate message.

atc_inv_ssd enum

The SSD of the ATC Invalidate message.

size_mask unsigned int

The mask implied by the Size field.

substreamid unsigned int

The SubstreamID (or ~0u if no SubstreamID).

atc_invalidate_kills_in_flight_ats

If an ATC Invalidate comes in whilst an ATS request is in flight that is affected by that ATC invalidate then it is killed and will be remade. Fields:

Global_if_substreamid bool

If has a SubstreamID then the Global flag.

aligned_address unsigned int

The aligned address to invalidate.

atc_id unsigned int

The ID of the ATC that caused the ATS request.

atc_inv_id unsigned int

The ID of this ATC Invalidate message.

atc_inv_ssd enum

The SSD of the ATC Invalidate message.

size_mask unsigned int

The mask implied by the Size field.

substreamid unsigned int

The SubstreamID (or ~0u if no SubstreamID).

atc_pri_allocation_reduced_whilest_client_forming_prg

The client device was creating a PRG whilst the allocation for the PRI was changed. This left the PRI unable to satisfy the client device's request and we have to ask the client again what to do. Fields:

credits_used unsigned int

The number of credits currently in use by in-flight PRGs.

new_allocation unsigned int

The new allocation of credits set in the PRI header.

atc_pri_ats_transaction_failed

The ATS transaction failed to get the required permissions from the SMMU. PRI has been enabled so it now tries to form a PRI request. Fields:

allocation unsigned int

The number of credits allocated to this device.

capacity unsigned int

The advertised capacity of the device.

credits_used unsigned int

The number of credits that are in use by in-flight PRG requests.

pri_enabled bool

The PRI interface is enabled.

priv bool

Privileged mode requested.

rx enum

Requested Read/Write/Execute permissions. Execute permission are only available for those requests with a PASID (SubstreamID), and read permission will automatically be asked for as well.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID of the request.

substreamid unsigned int

The SubstreamID (PASID) of the request or ~0u if none.

trans_id unsigned int

The transaction id of the ATS request.

untranslated_address unsigned int

The untranslated address of the ATS request.

atc_pri_client_device_chose_not_to_form_a_prg

The client device was given an opportunity to form a PRG and it chose not to. Instead the transaction will be faulted. Fields:

trans_id unsigned int

The id of the failing ATS request.

atc_pri_could_not_form_prg_due_to_lack_of_prgindexes_or_credits

The client device was told that it couldn't form a PRG because of a lack of free PRGIndexes or because there were no free credits. The client device has the opportunity to either fault the transaction or to wait for some to become free. Fields:

trans_id unsigned int

The id of the failing ATS request.

wait bool

The client device chose to wait.

atc_pri_is_stopped

Traces why the PRI interface reports itself as stopped or not. Fields:

Stopped bool

Is the PRI Stopped?.

client_device_forming_requests bool

The number of requests to the client device that are forming a PRG.

credits_outstanding bool

The number of outstanding credits in outstanding PRGs.

atc_pri_members_of_prg

A client has formed a PRG and this describes each member of that PRG. Fields:

PRGIndex unsigned int

The PRGIndex of this request.

member_index unsigned int

The index of this member within the PRG.

number_of_members unsigned int

The number of members in this PRG.

page_address unsigned int

Page address of the request.

priv bool

Privileged permissions requested. Valid only for those requests with a PASID (SubstreamID).

rwX enum

Requested Read/Write/Execute permissions. Execute permission are only available for those requests with a PASID (SubstreamID), and read permission will automatically be asked for as well.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID of the PRI request.

substreamid unsigned int

The SubstreamID sent with the PRG request.

trans_id unsigned int

The transaction id of the failing ATS transaction.

atc_pri_outstanding_prg_request_killed_by_PRI_Reset_or_Response_Failure

This indicates that a PRI request (or one that was waiting for credits or a PRGIndexes to become free) was killed because either:- * software used PRI Reset in the PCIe PRI header, or * a PRI response was received with Response Failure, the effect of which is to kill all requests waiting for a PRG response. Fields:

trans_id unsigned int

The transaction id of the ATS request that formed the PRI request.

atc_pri_outstanding_prg_when_interface_disabled

The PRI interface was disabled but there are outstanding PRI requests that have to be completed before the interface is stopped. Fields:

credits unsigned int

The number of credits that this group uses.

expected_PASID_on_response unsigned int

The expected PASID that should be on the PRI response (or ~0u if none expected).

prgindex unsigned int

The PRGIndex of the outstanding request.

trans_id unsigned int

The transaction id of the ATS request that formed the PRI request.

atc_pri_prg_request

A PRI Page Request Group (PRG) has . Fields:

PASID_on_response unsigned int

The expected PASID on the response, or ~0u if none.

allocation unsigned int

The number of credits allowed to be used.

credits_used unsigned int

The number of credits in use now.

number_of_members unsigned int

The number of members in the group.

prgindex unsigned int

The PRGIndex used.

trans_id unsigned int

The transaction id of the failing ATS transaction.

atc_pri_response_unrecognised_causes_uprgi

A PRI Response has been received that doesn't match a waiting PRG. The UPRGI bit in the PRI header will be set and then this response will be ignored. Fields:

match_PRG_currently_committing bool

This is true if the PRI Response does match a PRG that is currently being sent to the SMMU, but because it is not yet complete then it should not have received a response yet and so the device treats this as UPRGI.

pasid unsigned int

The PASID prefix on the response, or ~0u if none.

prgindex unsigned int

The PRGIndex in the response.

response enum

The response code.

ssd enum

The SSD of the stream.

atc_pri_response_valid

A PRI Response has been received that is valid and we are going to wake up some threads of activity. Fields:

credits_to_return unsigned int

Credits that were used by the PRG and are now returned.

pasid unsigned int

The PASID prefix on the response, or ~0u if none.

prgindex unsigned int

The PRGIndex in the response.

response enum

The response code.

ssd enum

The SSD of the stream.

atc_pri_throwing_away_ppr

A client device asked for too many PRI Page Requests (PPR) in the PRG. The model is discarding PPRs to form the PRG. Fields:

page_address unsigned int

Page address of the request.

priv bool

Privileged permissions requested. Valid only for those requests with a PASID (SubstreamID).

rwX enum

Requested Read/Write/Execute permissions. Execute permission are only available for those requests with a PASID (SubstreamID), and read permission will automatically be asked for as well.

ssd enum

The SSD of the stream.

streamid unsigned int

The StreamID of the PRI request.

substreamid unsigned int

SubstreamID (PASID), or ~0u if none.

trans_id unsigned int

The transaction id of the failing ATS transaction.

atc_pri_waiting

Track a transaction that is waiting for a PRI request. Fields:

id unsigned int

The ID of this request.

number_of_PRG_members unsigned int

The number of members of the PRG, or 0 if run out of credits or PRGIndexes.

prgindex unsigned int

The PRGIndex expected, or ~0u if run out of credits or PRGIndexes.

sleeping bool

True if this is the trace of the transaction sleeping, false if it is waking.

ssd enum

The SSD of the stream.

substreamid unsigned int

The expected PASID on the *response*.

atc_pri_woken_response

A transaction that was waiting for a PRI Response has been woken. Fields:

action enum

The action now to take now woken.

id unsigned int

The ID of this request.

prgindex unsigned int

The PRGIndex expected, or ~0u if run out of credits or PRGIndexes.

ssd enum

The SSD of the stream.

substreamid unsigned int

The expected PASID on the *response*.

control_write

This indicates a write to one of the control field of the ATC. Fields:

comments enum

Comments on the change.

value_after_write unsigned int

The value that the field was after the write.

which enum

Which control field was written to.

written_value unsigned int

The value that was written.

error_atc_entries_overlap

An ATC entry was attempted to be inserted into the ATC and was determined that it overlaps an existing entry. This check is not perfect but will catch simple errors. Fields:

end_address_of_new_entry unsigned int

End address of new entry.

end_address_of_old_entry unsigned int

End address of old entry.

index_of_new_entry unsigned int

Index of new entry.

index_of_old_entry unsigned int

Index of old entry.

start_address_of_new_entry unsigned int

Start address of new entry.

start_address_of_old_entry unsigned int

Start address of old entry.

final_remap_request

The final ATS result of the remap request. If this fails then PRI might be applied. In addition, PRI might make this remap request retry multiple times and is tracked by the `retry_number`. Fields:

XT_and_checking enum

The input XT / PAS checking intent.

address unsigned int

Address of the request.

id unsigned int

ID of ATC transaction.

if_ATST_send_substreamid bool

If we make an ATS-TranslatedAccess then send any SubstreamID (PASID) with the transaction also.

inner enum

The inner memory attribute.

instruction bool

Is an instruction access.

is_debug bool

Is a debug.

is_protected_mode bool

Is a protected mode transaction.

is_read bool

Is a read request.

outer enum

The outer memory attribute.

output_XT_and_checking enum

The output XT / PAS checking intent on ATS Translated Transactions.

output_address unsigned int

Output address.

privileged bool

Is a privileged access.

produced_ATST_transaction bool

The ATC produced an ATS-TranslatedTransaction.

result enum

The result of the translation.

retry_number unsigned int

The number of times this transaction has retried.

ssd enum

The SSD of the transaction.

substreamid unsigned int

Substream ID of the request (or ~0u if no SubstreamID).

initial_remap_request

The remap request for a bunch of transactions round this address. PRI might make this remap request retry multiple times and is tracked by the `retry_number` field. Fields:

XT_and_checking enum

The input XT / PAS checking intent.

address unsigned int

Address of the request.

id unsigned int

Unique ID of this request.

if_ATST_send_substreamid bool

If we make an ATS-TranslatedAccess then send any SubstreamID (PASID) with the transaction also.

instruction bool

Is an instruction access.

is_debug bool

Is a debug.

is_protected_mode bool

Is a protected mode transaction.

is_read bool

Is a read request.

privileged bool

Is a privileged access.

retry_number unsigned int

The number of times this transaction has retried.

ssd enum

The SSD of the transaction.

substreamid unsigned int

Substream ID of the request (or ~0u if no SubstreamID).

same_as

This request is the same as the specified other ATC transaction. Fields:

atc_entry_id unsigned int

ID of the ATC Entry that it uses (or ~0ull if not relevant).

id unsigned int

ID of ATC transaction.

same_as_id unsigned int

ID of the ATC transaction it is the same as.

2.180 v7_VGIC

This section describes the trace sources.

debug_out

Debug trace from the VGIC model, this contains implementation detail that is unlikely to be generally useful. Fields:

message string

The message from the VGIC.

sequence_id unsigned int

Each successive message is labeled with an increasing number.

gic_log_errors_out

Errors from the VGIC model. Fields:

message string

The message from the VGIC.

sequence_id unsigned int

Each successive message is labeled with an increasing number.

gic_log_fatal_out

Fatal error from the VGIC model. Fields:

message string

The message from the VGIC.

gic_log_warnings_out

Warnings from the VGIC model. Fields:

message string

The message from the VGIC.

sequence_id unsigned int

Each successive message is labeled with an increasing number.

vgic_cfgsdisable

The VGIC CFGSDISABLE pin has changed its state, this (un)locks down some configuration registers. Fields:

state bool

The state of the signal.

vgic_distributor_register_access

Distributor interface accesses on the VGIC. Fields:

cpu_id unsigned int

The CPU that is making the request.

data unsigned int

The data in the access aligned to the LSB.

is_read enum

Is the access a read?.

offset enum

Register within interface, top bit indicates NS state.

offset_in_word unsigned int

The offset of the access in the word.

size_in_bytes unsigned int

The size of the access in bytes.

vgic_fiq_out

The FIQ output signal to the core. Fields:

cpu_id unsigned int

The CPU id.

state bool

The state of the signal.

vgic_hypervisor_register_access

Hypervisor interface register accesses. Fields:

cpu_id unsigned int

The CPU that is making the request.

data unsigned int

The data in the access aligned to the LSB.

is_read enum

Is the access a read?.

offset enum

Register within interface, top bit indicates NS state.

offset_in_word unsigned int

The offset of the access in the word.

size_in_bytes unsigned int

The size of the access in bytes.

vgic_irq_out

The IRQ output signal to the core. Fields:

cpu_id unsigned int

The CPU id.

state bool

The state of the signal.

vgic_legacy_fiq_in

The legacy FIQ input signal into the VGIC. Fields:

cpu_id unsigned int

The CPU id. There is one legacy IRQ/FIQ per core.

state bool

The state of the signal.

vgic_legacy_irq_in

The legacy IRQ input signal into the VGIC. Fields:

cpu_id unsigned int

The CPU id. There is one legacy IRQ/FIQ per core.

state bool

The state of the signal.

vgic_physical_register_access

Physical interface accesses on the VGIC. Fields:

cpu_id unsigned int

The CPU that is making the request.

data unsigned int

The data in the access aligned to the LSB.

is_read enum

Is the access a read?.

offset enum

Register within interface, top bit indicates NS state.

offset_in_word unsigned int

The offset of the access in the word.

size_in_bytes unsigned int

The size of the access in bytes.

vgic_reset

The reset pin on the VGIC has been changed. Fields:

state bool

The state of the SPI signal.

vgic_spi

Shared Peripheral Interrupt signal changed. Fields:

id unsigned int

The interrupt id this will generate. SPIs start at ID 32 and so you will only see ids of >= 32.

state bool

The state of the SPI signal.

vgic_vfiq_out

The VFIQ output signal to the core. Fields:

cpu_id unsigned int

The CPU id.

state bool

The state of the signal.

vgic_virq_out

The VIRQ output signal to the core. Fields:

cpu_id unsigned int

The CPU id.

state bool

The state of the signal.

vgic_virtual_machine_register_access

Virtual machine interface register accesses. Fields:

cpu_id unsigned int

The CPU that is making the request.

data unsigned int

The data in the access aligned to the LSB.

is_read enum

Is the access a read?.

offset enum

Register within interface, top bit indicates NS state.

offset_in_word unsigned int

The offset of the access in the word.

size_in_bytes unsigned int

The size of the access in bytes.

vgic_virtual_maintenance_interrupt

The VGIC is signaling that it needs software help from the hypervisor to maintain the VGIC interfaces. Fields:

cpu_id unsigned int

The CPU id.

state bool

The state of the signal.

vgic_wakeup_fiq

The wakeup FIQ signal. Fields:

cpu_id unsigned int

The CPU id.

state bool

The state of the signal.

vgic_wakeup_irq

The wakeup IRQ signal. Fields:

cpu_id unsigned int

The CPU id.

state bool

The state of the signal.

PRE-1121-V1.0

Product and document information

Read the information in these sections to understand the release status of the product and documentation, and the conventions used in Arm documents.

Product status

All products and services provided by Arm require deliverables to be prepared and made available at different levels of completeness. The information in this document indicates the appropriate level of completeness for the associated deliverables.

Product completeness status

The information in this document is Final, that is for a developed product.

Revision history

These sections can help you understand how the document has changed over time.

Document release information

The Document history table gives the issue number and the released date for each released issue of this document.

Document history

Issue	Date	Confidentiality	Change
1130-00	19 November 2025	Non-Confidential	Update for v11.30
1129-00	16 May 2025	Non-Confidential	Update for v11.29
1128-00	19 February 2025	Non-Confidential	Update for v11.28
1127-00	16 September 2024	Non-Confidential	Update for v11.27
1126-00	19 June 2024	Non-Confidential	Update for v11.26
1125-00	13 March 2024	Non-Confidential	Update for v11.25.
1124-00	6 December 2023	Non-Confidential	Update for v11.24.
1123-00	13 September 2023	Non-Confidential	Update for v11.23.
1122-00	14 June 2023	Non-Confidential	Update for v11.22.
1121-00	22 March 2023	Non-Confidential	First release.

Change history

For information about the functional changes to Fast Models, see the [Fast Models Release Notes](#).

Conventions

The following subsections describe conventions used in Arm documents.

Glossary

The Arm Glossary is a list of terms used in Arm documentation, together with definitions for those terms. The Arm Glossary does not contain terms that are industry standard unless the Arm meaning differs from the generally accepted meaning.

See the Arm Glossary for more information: developer.arm.com/glossary.

Typographic conventions

Arm documentation uses typographical conventions to convey specific meaning.

Convention	Use
italic	Citations.
bold	Interface elements, such as menu names. Terms in descriptive lists, where appropriate.
monospace	Text that you can enter at the keyboard, such as commands, file and program names, and source code.
monospace <u>underline</u>	A permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.
<and>	Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example: <div>MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2></div>
SMALL CAPITALS	Terms that have specific technical meanings as defined in the <i>Arm® Glossary</i> . For example, IMPLEMENTATION DEFINED , IMPLEMENTATION SPECIFIC , UNKNOWN , and UNPREDICTABLE .

We recommend the following. If you do not follow these recommendations your system might not work.

Your system requires the following. If you do not follow these requirements your system will not work.

You are at risk of causing permanent damage to your system or your equipment, or harming yourself.

This information is important and needs your attention.

A useful tip that might make it easier, better or faster to perform a task.

A reminder of something important that relates to the information you are reading.

Useful resources

This document contains information that is specific to this product. See the following resources for other useful information.

Arm documents are available on developer.arm.com/documentation.

Confidential documents are only available to licensees, when logged in. Each document link in the tables below provides direct access to the online version of the document.

Arm product resources	Document ID	Confidentiality
